15. Prove that the circles $x^2 + y^2 + 2ax + 2by = 0$ and $x^2 + y^2 + 2a_1x + 2b_1y = 0$ touch each other, if $ab_1 = a_1b$.

16. Find the equations of common tangents to the circles $x^2 + y^2 - 24x + 2y + 120 = 0$ and $x^2 + y^2 + 20x - 6y - 116 = 0$.

Session 7

Angle of Intersection of Two Circles, Radical Axis, Radical Centre, Co-axial System of Circles, Limiting Point, Image of the Circle by the Line Mirror

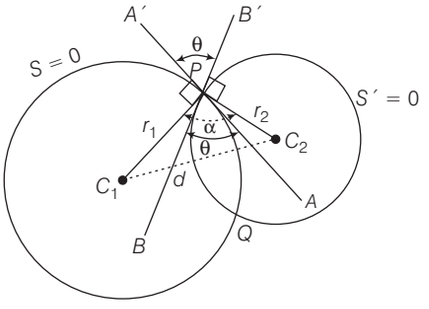
Angle of Intersection of Two Circles

Let the two circles

$$S \equiv x^2 + y^2 + 2gx + 2fy + c = 0$$

and $\quad S' \equiv x^2 + y^2 + 2g_1 x + 2f_1 y + c_1 = 0$

intersect each other at the points P and Q.The angle θ between two circles $S = 0$ and $S' = 0$ is defined as the angle between the tangents to the two circles at the point of intersection.



C_1 and C_2 are the centres of circles

$S = 0$ and $S' = 0$, then

$$C_1 \equiv (-g, -f) \quad \text{and} \quad C_2 \equiv (-g_1, -f_1)$$

and radii of circles $S = 0$ and $S' = 0$ are

$$r_1 = \sqrt{(g^2 + f^2 - c)} \text{ and } r_2 = \sqrt{(g_1^2 + f_1^2 - c_1)}$$

Let $\quad d = |C_1C_2| =$ Distance between their centres

$$= \sqrt{(-g + g_1)^2 + (-f + f_1)^2}$$

$$= \sqrt{(g^2 + f^2 + g_1^2 + f_1^2 - 2gg_1 - 2ff_1)}$$

Now, in ΔC_1PC_2, $\cos\alpha = \left(\dfrac{r_1^2 + r_2^2 - d^2}{2r_1r_2}\right)$ $\left(\because \alpha + \theta + 90° + 90° = 360°\right)$

or $\quad \cos(180° - \theta) = \left(\dfrac{r_1^2 + r_2^2 - d^2}{2r_1r_2}\right) \quad (\therefore \alpha = 180° - \theta)$

$$\therefore \quad \cos\theta = \left|\frac{r_1^2 + r_2^2 - d^2}{2r_1r_2}\right| \quad \ldots(i)$$

Orthogonal Intersection of Circles

If the angle between the circles is 90°, i.e. $\theta = 90°$, then the circles are said to be **orthogonal circles** or we say that the circles cut each other **orthogonally**.

Then, from Eq. (i), $0 = \dfrac{r_1^2 + r_2^2 - d^2}{2r_1r_2}$

or $\quad r_1^2 + r_2^2 - d^2 = 0$ or $r_1^2 + r_2^2 = d^2$

$$\Rightarrow \quad g^2 + f^2 - c + g_1^2 + f_1^2 - c_1 = g^2 + f^2 + g_1^2 + f_1^2 - 2gg_1 - 2ff_1$$

or $\quad 2gg_1 + 2ff_1 = c + c_1$

Remark

Equation of a circle cutting the three circles $x^2 + y^2 + 2g_ix + 2f_iy + c_i = 0$ $(i = 1, 2, 3)$ orthogonally is

$$\begin{vmatrix} x^2 + y^2 & x & y & 1 \\ -c_1 & g_1 & f_1 & -1 \\ -c_2 & g_2 & f_2 & -1 \\ -c_3 & g_3 & f_3 & -1 \end{vmatrix}$$

Example 75. Find the angle between the circles

$$S : x^2 + y^2 - 4x + 6y + 11 = 0$$

and $\quad S' : x^2 + y^2 - 2x + 8y + 13 = 0$

Sol. Centres and radii of circles S and S' are

$$C_1(2, -3),\ r_1 = \sqrt{2},\ C_2(1, -4),\ r_2 = 2.$$

Distance between centres, $d = |C_1C_2|$

$$= \sqrt{(2 - 1)^2 + (-3 + 4)^2} = \sqrt{2}$$

If angle between the circles is θ, then

$$\cos\theta = \left|\frac{r_1^2 + r_2^2 - d^2}{2r_1r_2}\right|$$

$$\cos\theta = \left|\frac{2+4-2}{2\cdot\sqrt{2}\cdot 2}\right| = \frac{1}{\sqrt{2}}$$

$\therefore \quad \theta = 45°$

Example 76. Show that the circles $x^2 + y^2 - 6x + 4y + 4 = 0$ and $x^2 + y^2 + x + 4y + 1 = 0$ cut orthogonally.

Sol. Comparing the given circles by general equation of circles

$$x^2 + y^2 + 2gx + 2fy + c = 0$$

and $\quad x^2 + y^2 + 2g_1x + 2f_1y + c_1 = 0$

then, $\quad g = -3,\ f = 2,\ c = 4$

and $\quad g_1 = \frac{1}{2},\ f_1 = 2,\ c_1 = 1$

Then, given circles cut orthogonally, if

$$2gg_1 + 2ff_1 = c + c_1$$

We have, $\quad 2\times(-3)\times\frac{1}{2} + 2\times 2\times 2 = 4 + 1$

$\Rightarrow \quad -3 + 8 = 5$ or $5 = 5$.

Hence, the given circles cut each other orthogonally.

Example 77. Find the equation of the circle which cuts the circle $x^2 + y^2 + 5x + 7y - 4 = 0$ orthogonally, has its centre on the line $x = 2$ and passes through the point $(4, -1)$.

Sol. Let the required circle be

$$x^2 + y^2 + 2gx + 2fy + c = 0 \quad \ldots(i)$$

Since, $(4, -1)$ lie on Eq. (i), then

$$17 + 8g - 2f + c = 0 \quad \ldots(ii)$$

Centre of Eq. (i) is $(-g, -f)$

Since, centre lie on $x = 2$ then $-g = 2$

$\therefore \quad g = -2 \quad \ldots(iii)$

From Eq. (ii), $1 - 2f + c = 0 \quad \ldots(iv)$

and given circle is

$$x^2 + y^2 + 5x + 7y - 4 = 0 \quad \ldots(v)$$

Given the circles Eqs. (i) and (v) cut each other orthogonally,

$\therefore \quad 2g\times\frac{5}{2} + 2f\times\frac{7}{2} = c - 4$

or $\quad 5g + 7f = c - 4$

$\quad -10 + 7f = c - 4$ [from Eq. (iii)]

or $\quad -6 + 7f - c = 0 \quad \ldots(vi)$

Solving Eqs. (iv) and (vi), we get

$$f = 1 \quad \text{and} \quad c = 1$$

Substituting the values of g, f, c in Eq. (i), we get

$$x^2 + y^2 - 4x + 2y + 1 = 0$$

Example 78. Find the equations of the two circles which intersect the circles $x^2 + y^2 - 6y + 1 = 0$ and $x^2 + y^2 - 4y + 1 = 0$ orthogonally and touch the line $3x + 4y + 5 = 0$.

Sol. Let the required circle be

$$x^2 + y^2 + 2gx + 2fy + c = 0 \quad \ldots(i)$$

and given circles are $x^2 + y^2 - 6y + 1 = 0 \quad \ldots(ii)$

and $\quad x^2 + y^2 - 4y + 1 = 0 \quad \ldots(iii)$

Since, Eq. (i) cuts Eq. (ii) and Eq. (iii) orthogonally

$\therefore \quad 2g\times 0 + 2f\times(-3) = c + 1$

or $\quad -6f = c + 1 \quad \ldots(iv)$

and $\quad 2g\times 0 + 2f\times(-2) = c + 1$

or $\quad -4f = c + 1 \quad \ldots(v)$

Solving, Eqs. (iv) and (v), we get

$$f = 0 \quad \text{and} \quad c = -1$$

From Eq. (i), $\quad x^2 + y^2 + 2gx - 1 = 0 \quad \ldots(vi)$

centre and radius of Eq. (vi) are $(-g, 0)$ and $\sqrt{(g^2+1)}$, respectively.

Since, $3x + 4y + 5 = 0$ is tangent of Eq. (vi), then length of perpendicular from $(-g, 0)$ to this line = radius of circle

or $\quad \frac{|-3g + 0 + 5|}{\sqrt{(9+16)}} = \sqrt{(g^2+1)}$

$$|-3g + 5| = 5\sqrt{(g^2+1)}$$

or $\quad (-3g+5)^2 = 25(g^2+1)$

or $\quad 9g^2 + 25 - 30g = 25g^2 + 25$

or $\quad 16g^2 + 30g = 0$

$\therefore \quad g = 0 \quad \text{and} \quad g = -\frac{15}{8}$

Equations of circles are from Eq. (vi),

$$x^2 + y^2 - 1 = 0 \quad \text{and} \quad x^2 + y^2 - \frac{15}{4}x - 1 = 0$$

or $\quad x^2 + y^2 - 1 = 0 \quad \text{and} \quad 4x^2 + 4y^2 - 15x - 4 = 0.$

Example 79. ***Prove that the two circles, which pass through (0, a) and*** $(0, -a)$ ***and touch the line*** $y = mx + c$ ***, will cut orthogonally, if*** $c^2 = a^2(2 + m^2)$

Sol. Let the equation of the circles be

$$x^2 + y^2 + 2gx + 2fy + d = 0 \quad \ldots(i)$$

Since, these circles pass through $(0, a)$ and $(0, -a)$, then

$$a^2 + 2fa + d = 0 \quad \ldots(ii)$$

and $\quad a^2 - 2fa + d = 0 \quad \ldots(iii)$

Solving, Eq. (ii) and Eq. (iii), we get $f = 0$ and $d = -a^2$.

Substituting these values of f and d in Eq. (i), we obtain

$$x^2 + y^2 + 2gx - a^2 = 0 \quad \ldots(iv)$$

Now, $y = mx + c$ touch this circle, therefore, length of the perpendicular from the centre = radius

$$\frac{|-mg - 0 + c|}{\sqrt{1 + m^2}} = \sqrt{(g^2 + a^2)}$$

$$(c - mg)^2 = (1 + m^2)(g^2 + a^2)$$

or $$g^2 + 2mcg + a^2(1 + m^2) - c^2 = 0$$

Let g_1, g_2 are the roots of this equation

$$\therefore \quad g_1 g_2 = a^2(1 + m^2) - c^2 \qquad ...(v)$$

Now, the equations of the two circles represented by Eq. (iv) are

$$x^2 + y^2 + 2g_1 x - a^2 = 0$$

and $$x^2 + y^2 + 2g_2 x - a^2 = 0.$$

These two circles will be cuts orthogonal, if

$$2g_1 g_2 + 0 = -a^2 - a^2$$

or $$g_1 g_2 = -a^2 \qquad ...(vi)$$

From Eqs. (v) and (vi),

$$-a^2 = a^2(1 + m^2) - c^2$$

or $$c^2 = a^2(2 + m^2)$$

which is the required condition.

Example 80. Find the equation of the circle which cuts orthogonally each of the three circles given below :

$x^2 + y^2 - 2x + 3y - 7 = 0$, $x^2 + y^2 + 5x - 5y + 9 = 0$

and $x^2 + y^2 + 7x - 9x + 29 = 0$.

Sol. Let the required circle be

$$x^2 + y^2 + 2gx + 2fy + c = 0 \qquad ...(i)$$

Since, it is orthogonal to three given circles respectively, therefore

$$2g \times (-1) + 2f \times \frac{3}{2} = c - 7$$

or $$-2g + 3f = c - 7 \qquad ...(ii)$$

$$2g \times \frac{5}{2} + 2f \times \left(-\frac{5}{2}\right) = c + 9$$

or $$5g - 5f = c + 9 \qquad ...(iii)$$

and $$2g \times \frac{7}{2} + 2f \times \left(-\frac{9}{2}\right) = c + 29$$

or $$7g - 9f = c + 29 \qquad ...(iv)$$

Subtracting, Eq. (ii) from Eq. (iii),

$$7g - 8f = 16 \qquad ...(v)$$

and subtracting Eq. (iii) from Eq. (iv),

$$2g - 4f = 20 \qquad ...(vi)$$

Solving Eq. (v) and Eq. (vi), we get

$$g = -8 \quad \text{and} \quad f = -9$$

Putting the values of g and f in Eq. (iii)

$$-40 + 45 = c + 9$$

$$\Rightarrow \quad 5 = c + 9$$

or $$c = -4$$

Substituting the values of g, f, c in Eq. (i), then required circle is

$$x^2 + y^2 - 16x - 18y - 4 = 0$$

Radical Axis

The radical axis of two circles is the locus of a point which moves such that the lengths of the tangents drawn from it to the two circles are equal.

Consider, $$S \equiv x^2 + y^2 + 2gx + 2fy + c = 0 \qquad ...(i)$$

and $$S' \equiv x^2 + y^2 + 2g_1 x + 2f_1 y + c_1 = 0 \qquad ...(ii)$$

Let $P(x_1, y_1)$ be a point such that

$$|PA| = |PB|$$

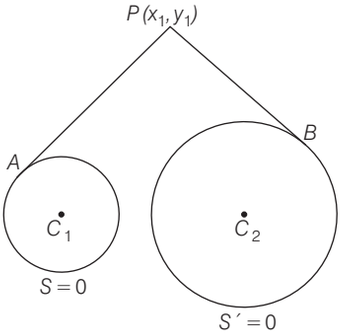
$$\Rightarrow \quad \sqrt{(x_1^2 + y_1^2 + 2gx_1 + 2fy_1 + c)} = \sqrt{(x_1^2 + y_1^2 + 2g_1 x_1 + 2f_1 y_1 + c_1)}$$

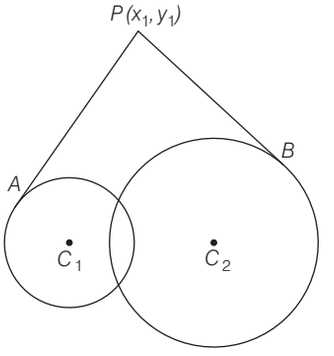
On squaring, $$x_1^2 + y_1^2 + 2gx_1 + 2fy_1 + c = x_1^2 + y_1^2 + 2g_1 x_1 + 2f_1 y_1 + c_1$$

$$\Rightarrow \quad 2(g - g_1)x_1 + 2(f - f_1)y_1 + c - c_1 = 0$$

$\therefore$ Locus of $P(x_1, y_1)$ is

$$2(g - g_1)x + 2(f - f_1)y + c - c_1 = 0$$

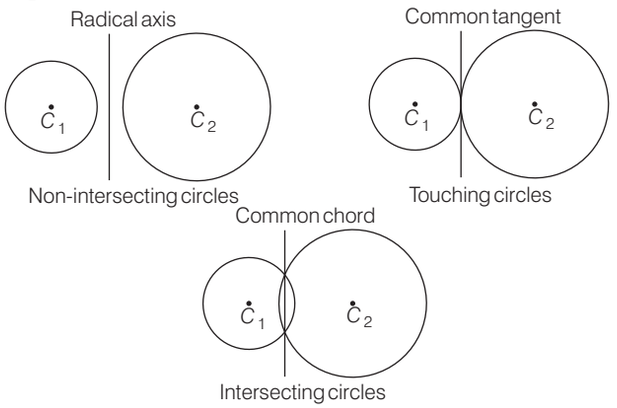




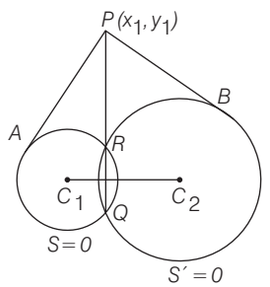
which is the required equation of radical axis of the given circles. Clearly this is a straight line.

Some Properties of the Radical Axis

(i) **The radical axis and common chord are identical :** Since, the radical axis and common chord of two circles $S=0$ and $S'=0$ are the same straight line $S-S'=0$, they are identical. The only difference is that the common chord exists only if the circles intersect in two real points, while the radical axis exists for all pair of circles irrespective of their position.



The position of the radical axis of the two circles geometrically is shown below:



From Euclidian geometry

$$(PA)^2 = PR \cdot PQ = (PB)^2$$

(ii) **The radical axis is perpendicular to the straight line which joins the centres of the circles :**

Consider, $S \equiv x^2 + y^2 + 2gx + 2fy + c = 0$ ...(i)

and $S_1 \equiv x^2 + y^2 + 2g_1x + 2f_1y + c_1 = 0$ ...(ii)

Since, $C_1 \equiv (-g, -f)$ and $C_2 \equiv (-g_1, -f_1)$ are the centres of the circles Eqs. (i) and (ii), then slope of

$$C_1C_2 = \frac{-f_1 + f}{-g_1 + g} = \frac{f - f_1}{g - g_1} = m_1 \quad \text{(say)}$$

Equation of the radical axis is

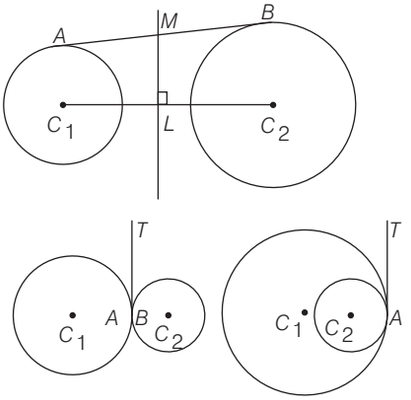
$$2(g - g_1)x + 2(f - f_1)y + c - c_1 = 0$$

Slope of radical axis is $-\dfrac{(g - g_1)}{f - f_1} = m_2$ (say)

$\therefore$ $m_1m_2 = -1$

Hence, C_1C_2 and radical axis are perpendicular to each other.

(iii) **The radical axis bisects common tangents of two circles :** Let AB be the common tangent. If it meets the radical axis LM in M, then MA and MB are two tangents to the circles. Hence, $MA = MB$ since lengths of tangents are equal from any point on radical axis. Hence, radical axis bisects the common tangent AB.



If the two circles touch each other externally or internally, then A and B coincide. In this case the common tangent itself becomes the radical axis.

(iv) **The radical axis of three circles taken in pairs are concurrent :** Let the equations of three circles be

$$S_1 \equiv x^2 + y^2 + 2g_1x + 2f_1y + c_1 = 0 \quad \text{...(i)}$$

$$S_2 \equiv x^2 + y^2 + 2g_2x + 2f_2y + c_2 = 0 \quad \text{...(ii)}$$

$$S_3 \equiv x^2 + y^2 + 2g_3x + 2f_3y + c_3 = 0 \quad \text{...(iii)}$$

The radical axis of the above three circles taken in pairs are given by

$$S_1 - S_2 \equiv 2x(g_1 - g_2) + 2y(f_1 - f_2) + c_1 - c_2 = 0 \quad \text{...(iv)}$$

$$S_2 - S_3 \equiv 2x(g_2 - g_3) + 2y(f_2 - f_3) + c_2 - c_3 = 0 \quad \text{...(v)}$$

$$S_3 - S_1 \equiv 2x(g_3 - g_1) + 2y(f_3 - f_1) + c_3 - c_1 = 0 \quad \text{...(vi)}$$

Adding Eqs. (iv), (v) and (vi), we find LHS vanished identically. Thus, the three lines are concurrent.

(v) **If two circles cut a third circle orthogonally, the radical axis of the two circles will pass through the centre of the third circle.**

OR

The locus of the centre of a circle cutting two given circles orthogonally is the radical axis of the two circles.

Let $S_1 \equiv x^2 + y^2 + 2g_1x + 2f_1y + c_1 = 0$ ...(i)

$S_2 \equiv x^2 + y^2 + 2g_2x + 2f_2y + c_2 = 0$ ...(ii)

$S_3 \equiv x^2 + y^2 + 2g_3x + 2f_3y + c_3 = 0$ ...(iii)

Since, Eqs. (i) and (ii) both cut Eq. (iii) orthogonally

$\therefore \quad 2g_1g_3 + 2f_1f_3 = c_1 + c_3$

and $\quad 2g_2g_3 + 2f_2f_3 = c_2 + c_3$

Subtracting, we get

$$2g_3(g_1 - g_2) + 2f_3(f_1 - f_2) = c_1 - c_2 \quad \text{...(iv)}$$

Now, radical axis of Eqs. (i) and (ii) is

$$S_1 - S_2 = 0$$

or $\quad 2x(g_1 - g_2) + 2y(f_1 - f_2) + c_1 - c_2 = 0$

Since, it will pass through the centre of Eq. (iii) circle

$\therefore -2g_3(g_1 - g_2) - 2f_3(f_1 - f_2) + c_1 - c_2 = 0$

or $2g_3(g_1 - g_2) + 2f_3(f_1 - f_2) = c_1 - c_2$ ...(v)

which is true by Eq. (iv),

Remark

Radical axis need not always pass through the mid-point of the line joining the centres of the two circles.

Example 81. If two circles $x^2 + y^2 + 2gx + 2fy = 0$ and $x^2 + y^2 + 2g'x + 2f'y = 0$ touch each other, then $f'g = fg'$.

Sol. If two circles touch each other, then their radical axis is their common tangent.

$\therefore$ Radical axis of two circles is

$$(x^2 + y^2 + 2gx + 2fy) - (x^2 + y^2 + 2g'x + 2f'y) = 0$$

or $\quad 2x(g - g') + 2y(f - f') = 0$

or $\quad x(g - g') + y(f - f') = 0$ ...(i)

If this touches the circle $x^2 + y^2 + 2gx + 2fy = 0$, then the length of perpendicular from its centre $(-g, -f)$ to (i) =radius $\sqrt{(g^2 + f^2)}$ of the circle

i.e. $\quad \dfrac{|-g(g - g') - f(f - f')|}{\sqrt{(g - g')^2 + (f - f')^2}} = \sqrt{g^2 + f^2}$

or $\quad \{(-(g^2 + f^2) + gg' + ff')\}^2$

$$= (g^2 + f^2)\{(g - g')^2 + (f + f')^2\}$$

or $\quad (g^2 + f^2)^2 + (gg' + ff')^2 - 2(g^2 + f^2)(gg' + ff')$

$$= (g^2 + f^2)\{(g^2 + f^2) + (g'^2 + f'^2) - 2(gg' + ff')\}$$

or $(gg' + ff')^2 = (g^2 + f^2)(g'^2 + f'^2)$

On simplifying, $\quad 2gg'ff' = g^2f'^2 + f^2g'^2$

or $\quad (gf' - g'f)^2 = 0$

or $\quad gf' = g'f$

Aliter : If two circles touch each other, then

distance between their centres = sum or difference of their radii

$$\sqrt{(g - g')^2 + (f - f')^2} = \sqrt{(g^2 + f^2)} \pm \sqrt{(g'^2 + f'^2)}$$

or $\quad \sqrt{(g^2 + f^2 + g'^2 + f'^2 - 2gg' - 2ff')}$

$$= \sqrt{(g^2 + f^2)} \pm \sqrt{(g'^2 + f'^2)}$$

On squaring, we have

$$g^2 + f^2 + g'^2 + f'^2 - 2gg' - 2ff'$$

$$= g^2 + f^2 + g'^2 + f'^2 \pm 2\sqrt{(g^2 + f^2)}\sqrt{(g'^2 + f'^2)}$$

or $(gg' + ff') = \pm\sqrt{(g^2 + f^2)(g'^2 + f'^2)}$

Again, on squaring both sides, we get

$$g^2g'^2 + f^2f'^2 + 2gg'ff' = g^2g'^2 + g^2f'^2 + f^2g'^2 + f^2f'^2$$

or $\quad g^2f'^2 + f^2g'^2 - 2gg'ff' = 0$

or $\quad (gf' - g'f)^2 = 0$

or $\quad gf' - g'f = 0$

or $\quad gf' = g'f$

Example 82. A and B are two fixed points and P moves so that $PA = nPB$. Show that locus of P is a circle and for different values of n all the circles have a common radical axis.

Sol. Let $A \equiv (a, 0)$, $B \equiv (-a, 0)$ and $P \equiv (h, k)$

$\therefore \quad PA = \sqrt{(h - a)^2 + k^2}$

$$PB = \sqrt{(h + a)^2 + k^2}$$

Since, $\quad PA = nPB$

or $\quad (PA)^2 = n^2(PB)^2$

$\Rightarrow \quad \{(h - a)^2 + k^2\} = n^2\{(h + a)^2 + k^2\}$

$\Rightarrow \quad (h^2 + k^2 - 2ah + a^2) = n^2(h^2 + k^2 + 2ah + a^2)$

$\Rightarrow \quad (1 - n^2)h^2 + (1 - n^2)k^2 - 2ah(1 + n^2) + (1 - n^2)a^2 = 0$

or $\quad h^2 + k^2 - 2ah\dfrac{(1 + n^2)}{(1 - n^2)} + a^2 = 0$

$\therefore$ Locus of P is $\quad x^2 + y^2 - \left(\dfrac{1 + n^2}{1 - n^2}\right)2ax + a^2 = 0$

which is a circle. For different values of n.

If two different values of n are n_1 and n_2, then circles are

$$x^2 + y^2 - \left(\frac{1 + n_1^2}{1 - n_1^2}\right)2ax + a^2 = 0 \quad \text{...(i)}$$

and $\quad x^2 + y^2 - \left(\dfrac{1 + n_2^2}{1 - n_2^2}\right)2ax + a^2 = 0$ ...(ii)

$\therefore$ Radical axis of Eqs. (i) and (ii) is

$$2ax\left\{\frac{1+n_2^2}{1-n_2^2}-\frac{1+n_1^2}{1-n_1^2}\right\}=0$$

or $x=0$ or Y-axis.

Hence, for different values of n the circles have a common radical axis.

Example 83. Show that the difference of the squares of the tangents to two coplanar circles from any point P in the plane of the circles varies as the perpendicular from P on their radical axis. Also, prove that the locus of a point such that the difference of the squares of the tangents from it to two given circles is constant is a line parallel to their radical axis.

Sol. Let the two circles be

$$S_1 \equiv x^2+y^2+2g_1x+2f_1y+c_1=0 \quad ...(i)$$

and $$S_2 \equiv x^2+y^2+2g_2x+2f_2y+c_2=0 \quad ...(ii)$$

and let $P=(h,k)$

$\therefore$ Radical axis of Eqs. (i) and (ii) is

$$2(g_1-g_2)x+2(f_1-f_2)y+c_1-c_2=0 \quad ...(iii)$$

Let length of tangents from $P(h,k)$ on Eqs. (i) and (ii) are l_1 and l_2, then

$$l_1=\sqrt{S_1}=\sqrt{(h^2+k^2+2g_1h+2f_1k+c_1)}$$

and $$l_2=\sqrt{S_2}=\sqrt{(h^2+k^2+2g_2h+2f_2k+c_2)}$$

According to the question,

$$l_1^2-l_2^2=2(g_1-g_2)h+2(f_1-f_2)k+c_1-c_2 \quad ...(iv)$$

Let p be the perpendicular distance from $P(h,k)$ on Eq. (iii),

$$\therefore \quad p=\frac{|2(g_1-g_2)h+2(f_1-f_2)k+c_1-c_2|}{\sqrt{4(g_1-g_2)^2+4(f_1-f_2)^2}} \quad ...(v)$$

From Eqs. (iv) and (v), we get

$$p=\frac{|l_1^2-l_2^2|}{2\sqrt{(g_1-g_2)^2+(f_1-f_2)^2}}$$

or $$\frac{|l_1^2-l_2^2|}{p}=2\sqrt{(g_1-g_2)^2+(f_1-f_2)^2}=\text{constant}$$

$\therefore \quad |l_1^2-l_2^2| \propto p$

Locus of $P(h,k)$ in Eq. (iv) is

$$2(g_1-g_2)x+2(f_1-f_2)y+c_1-c_2=(l_1^2-l_2^2)$$

a line which is parallel to Eq. (iii).

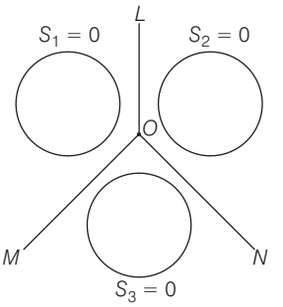
Radical Centre

The radical axes of three circles, taken in pairs, meet in a point, which is called their radical centre. Let the three circles be

$$S_1=0 \quad ...(i)$$

$$S_2=0 \quad ...(ii)$$

$$S_3=0 \quad ...(iii)$$



Let OL, OM and ON be radical axes of the pair sets of circles

$$\{S_1=0, S_2=0\}, \{S_3=0, S_1=0\}$$

and $$\{S_2=0, S_3=0\} \text{ respectively.}$$

Equations of OL, OM and ON are respectively

$$S_1-S_2=0 \quad ...(iv)$$

$$S_3-S_1=0 \quad ...(v)$$

$$S_2-S_3=0 \quad ...(vi)$$

Let the straight lines Eqs. (iv) and (v) i.e. OL and OM meet in O. The equation of any straight line passing through O is

$$(S_1-S_2)+\lambda(S_3-S_1)=0$$

where λ is any constant.

For $\lambda=1$ this equation becomes

$$S_2-S_3=0$$

which is, by Eq. (vi), equation of ON.

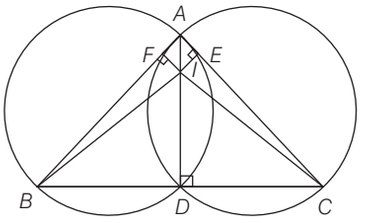
Thus, the third radical axis also passes through the point where the Eqs. (iv) and (v) meet. In the above figure O is the **radical centre.**

Properties of Radical Centre

1. Coordinates of radical centre can be found by solving the equations

$$S_1=S_2=S_3=0$$

2. **The radical centre of three circles described on the sides of a triangle as diameters is the orthocentre of the triangle :**



Draw perpendicular from A on BC.

$\therefore \quad \angle ADB = \angle ADC = \pi/2$

Therefore, the circles whose diameters are AB and AC passes through D and A. Hence, AD is their radical axis. Similarly, the radical axis of the circles on AB and BC as diameters is the perpendicular line from B on CA and radical axis of the circles on BC and CA as diameters is the perpendicular line from C on AB. Hence, the radial axis of three circles meet in a point. This point I is radical centre but here radical centre is the point of intersection of altitudes i.e. AD, BE and CF. Hence, radical centre = orthocentre.

3. The radical centre of three given circles will be the centre of a fourth circle which cuts all the three circles orthogonally and the radius of the fourth circle is the length of tangent drawn from radical centre of the three given circles to any of these circles.

   Let the fourth circle be $(x-h)^2+(y-k)^2=r^2$, where (h, k) is centre of this circle and r be the radius. The centre of circle is the radical centre of the given circles and r is the length of tangent from (h, k) to any of the given three circles.

Example 84. Find the radical centre of circles $x^2+y^2+3x+2y+1=0$, $x^2+y^2-x+6y+5=0$ and $x^2+y^2+5x-8y+15=0$. Also, find the equation of the circle cutting them orthogonally.

Sol. **:** Given circles are

$$S_1 \equiv x^2+y^2+3x+2y+1=0$$
$$S_2 \equiv x^2+y^2-x+6y+5=0$$
$$S_3 \equiv x^2+y^2+5x-8y+15=0$$

Equations of two radical axes are

$$S_1-S_2 \equiv 4x-4y-4=0 \quad \text{or} \quad x-y-1=0$$

and $\quad S_2-S_3 \equiv -6x+14y-10=0 \quad \text{or} \quad 3x-7x+5=0$

Solving them the radical centre is (3, 2) also, if r is the length of the tangent drawn from the radical centre (3, 2) to any one of the given circles, say S_1, we have

$$r=\sqrt{S_1}=\sqrt{3^2+2^2+3\cdot 3+2\cdot 2+1}=\sqrt{27}$$

Hence, (3, 2) is the centre and $\sqrt{27}$ is the radius of the circle intersecting them orthogonally.

$\therefore$ Its equation is

$(x-3)^2+(y-2)^2=r^2=27$ or $x^2+y^2-6x-4y-14=0$

Aliter : Let $x^2+y^2+2gx+2fy+c=0$ be the equation of the circle cutting the given circles orthogonally.

$$\therefore \quad 2g\left(\frac{3}{2}\right)+2f(1)=c+1$$

or $\quad 3g+2f=c+1 \quad \ldots(i)$

$$2g\left(-\frac{1}{2}\right)+2f(3)=c+5$$

or $\quad -g+6f=c+5 \quad \ldots(ii)$

and $\quad 2g\left(\frac{5}{2}\right)+2f(-4)=c+15$

or $\quad 5g-8f=c+15 \quad \ldots(iii)$

Solving, Eqs. (i), (ii) and (iii), we get

$$g=-3,\ f=-2 \text{ and } c=-14$$

$\therefore$ Equation of required circle is

$$x^2+y^2-6x-4y-14=0$$

Example 85. ***Find the radical centre of three circles described on the three sides*** $4x-7y+10=0$, $x+y-5=0$ ***and*** $7x+4y-15=0$ ***of a triangle as diameters.***

Sol. Since, the radical centre of three circles described on the sides of a triangle as diameters is the orthocentre of the triangle.

$\therefore$ Radical centre = orthocentre

Given sides are $\quad 4x-7y+10=0 \quad \ldots(i)$

$$x+y-5=0 \quad \ldots(ii)$$
$$7x+4y-15=0 \quad \ldots(iii)$$

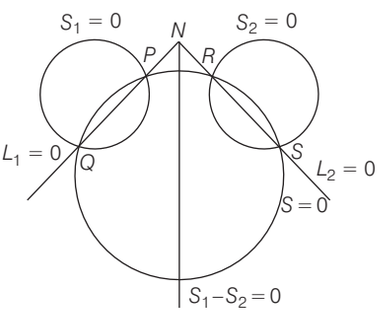
Since, lines Eqs. (i) and (iii) are perpendiculars the point of intersection of Eqs. (i) and (iii) is (1, 2), the orthocentre of the triangle. Hence, radical centre is (1, 2).

Example 86. Prove that if the four points of intersection of the circles $x^2+y^2+ax+by+c=0$ and $x^2+y^2+a'x+b'y+c'=0$ by the lines $Ax+By+C=0$ and $A'x+B'y+C'=0$ respectively are concyclic, then

$$\begin{vmatrix} a-a' & b-b' & c-c' \\ A & B & C \\ A' & B' & C' \end{vmatrix}=0$$

Sol. The given circles and given lines are

$$S_1 \equiv x^2+y^2+ax+by+c=0$$
$$S_2 \equiv x^2+y^2+a'x+b'y+c'=0$$
$$L_1 \equiv Ax+By+C=0$$
$$L_2 \equiv A'x+B'y+C'=0$$



Let $S_1 = 0$ meet $L_1 = 0$ at two points P and Q and $S_2 = 0$ meet $L_2 = 0$ at two points R and S.

Further P,Q, R and S are given to be concyclic. Let the circle through them is

$$x^2 + y^2 + 2gx + 2fy + \lambda = 0 \quad \text{...(i)}$$

Radical axis of $S_1 = 0$ and $S_2 = 0$ is

$$S_1 - S_2 = 0$$

$$\Rightarrow \quad (a - a')x + (b - b')y + c - c' = 0 \quad \text{...(ii)}$$

The radical axis of $S_1 = 0$ and $S = 0$ is $L_1 = 0$

or $\quad Ax + By + C = 0 \quad \text{...(iii)}$

and radical axis of $S_2 = 0$ and $S = 0$ is $L_2 = 0$

or $\quad A'x + B'y + C' = 0 \quad \text{...(iv)}$

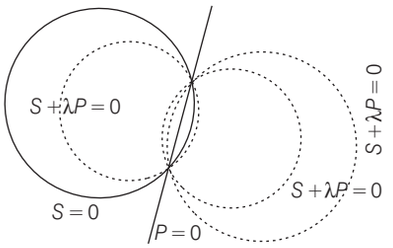
Since, the radical axes of any three circles taken in pairs are concurrent. (i.e. lines Eqs. (ii), (iii) and (iv) are concurrent).

we have $\begin{vmatrix} a - a' & b - b' & c - c' \\ A & B & C \\ A' & B' & C' \end{vmatrix} = 0$

Co-axial System of Circles

A system (or a family) of circles, every pair of which have the same radical axis, are called co-axial circles.

(1) The equation of a system of co-axial circles, when the equation of the radical axis and of one circle of the system are



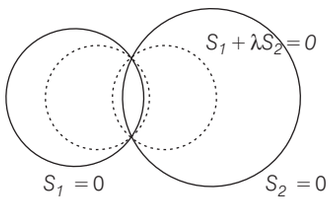
$$P \equiv lx + my + n = 0$$

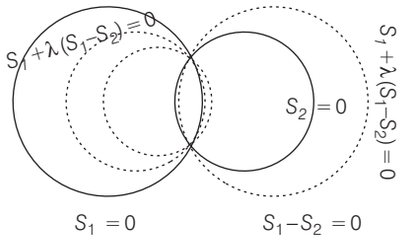
and $\quad S \equiv x^2 + y^2 + 2gx + 2fy + c = 0$

respectively, is

$$S + \lambda P = 0 \ (\lambda \text{ is an arbitrary constant})$$

(2) The equation of a co-axial system of circles, where the equation of any two circles of the system are





$$S_1 \equiv x^2 + y^2 + 2g_1x + 2f_1y + c_1 = 0$$

and $\quad S_2 \equiv x^2 + y^2 + 2g_2x + 2f_2y + c_2 = 0$

respectively is

$$S_1 + \lambda(S_1 - S_2) = 0 \qquad (\lambda \neq -1)$$

or $\quad S_2 + \lambda_1(S_1 - S_2) = 0 \qquad (\lambda_1 \neq -1)$

Other form $S_1 + \lambda S_2 = 0 \qquad (\lambda \neq -1)$

(3) The equation of a system of co-axial circles in the simplest form is

$$x^2 + y^2 + 2gx + c = 0$$

where, g is variable and c, a constant.

The common radical axis is the Y-axis (since centre on X-axis) and the equation of a system of other co-axial circles in the simplest form is

$$x^2 + y^2 + 2fy + c = 0$$

where, f is variable and c, a constant (since centre on Y-axis). The common radical axis is the X-axis.

Example 87. *Find the equation of the system of circles co-axial with the circles*

$$x^2 + y^2 + 4x + 2y + 1 = 0$$

and $x^2 + y^2 - 2x + 6y - 6 = 0$

Also, find the equation of that particular circle whose centre lies on the radical axis.

Sol. Given circles are

$$S_1 \equiv x^2 + y^2 + 4x + 2y + 1 = 0$$

and $\quad S_2 \equiv x^2 + y^2 - 2x + 6y - 6 = 0$

$\therefore$ Radical axis is $\quad S_1 - S_2 = 0$

i.e. $\quad 6x - 4y + 7 = 0 \quad \text{...(i)}$

Now, system of co-axial circle is

$$S_1 + \lambda (S_1 - S_2) = 0$$

$$\Rightarrow \quad (x^2 + y^2 + 4x + 2y + 1) + \lambda(6x - 4y + 7) = 0$$

$$\Rightarrow \quad x^2 + y^2 + 2x(2 + 3\lambda) + 2y(1 - 2\lambda) + 1 + 7\lambda = 0 \quad \text{...(ii)}$$

Its centre $[-(2 + 3\lambda), -(1 - 2\lambda)]$ lies on Eq. (i)

$\therefore \quad 6 \times -(2 + 3\lambda) - 4 \times -(1 - 2\lambda) + 7 = 0$

or $\quad -12 - 18\lambda + 4 - 8\lambda + 7 = 0$

or $\quad -26\lambda - 1 = 0$

$$\therefore \qquad \lambda = -\frac{1}{26}$$

Substituting the value of λ in Eq. (ii), the equation of circle is

$$x^2 + y^2 + 2x\left(2 - \frac{3}{26}\right) + 2y\left(1 + \frac{2}{26}\right) + 1 - \frac{7}{26} = 0$$

$$\Rightarrow \qquad 26(x^2 + y^2) + 98x + 56y + 9 = 0$$

Example 88. Prove that the tangents from any point of a fixed circle of co-axial system to two other fixed circles of the system are in a constant ratio.

Sol. Let the equations of the circles be $x^2 + y^2 + 2g_i x + c = 0$, $i = 1,2,3$. Since, all the three circles are fixed g_1, g_2 and g_3 are constants.

Let $P(h, k)$ be any point on the first circle, so that

$$h^2 + k^2 + 2g_1 h + c = 0 \qquad \ldots(i)$$

Let PQ and PR be the tangents from P on the other two circles

$$\therefore \qquad PQ = \sqrt{(h^2 + k^2 + 2g_2 h + c)}$$

and $$PR = \sqrt{(h^2 + k^2 + 2g_3 h + c)}$$

$$\therefore \qquad \frac{(PQ)^2}{(PR)^2} = \frac{h^2 + k^2 + 2g_2 h + c}{h^2 + k^2 + 2g_3 h + c}$$

$$= \frac{-2g_1 h + 2g_2 h}{-2g_1 h + 2g_3 h} \qquad \text{[from Eq. (i)]}$$

$$= \frac{g_2 - g_1}{g_3 - g_1} = \text{constant}$$

because g_1, g_2, g_3 are constants.

Example 89. If A, B, C be the centres of three co-axial circles and t_1, t_2, t_3 be the lengths of the tangents to them from any point, prove that

$$\overline{BC} \cdot t_1^2 + \overline{CA} \cdot t_2^2 + \overline{AB}\ t_3^2 = 0$$

Sol. Let the equations of three circles are $x^2 + y^2 + 2g_i x + c = 0$, $i = 1, 2, 3,$.

According to the question

$$A \equiv (-g_1, 0),\ B \equiv (-g_2, 0),\ C \equiv (-g_3, 0)$$

Let any point be $P(h, k)$

$$\therefore \qquad t_1 = \sqrt{h^2 + k^2 + 2g_1 h + c}$$

$$t_2 = \sqrt{h^2 + k^2 + 2g_2 h + c}$$

$$t_3 = \sqrt{h^2 + k^2 + 2g_3 h + c}$$

and $$\overline{AB} = (g_1 - g_2)$$

$$\overline{BC} = (g_2 - g_3)$$

and $$\overline{CA} = (g_3 - g_1)$$

Now, $\overline{BC} \cdot t_1^2 + \overline{CA} \cdot t_2^2 + \overline{AB}\ t_3^2$

$$= \Sigma (g_2 - g_3)(h^2 + k^2 + 2g_1 h + c)$$

$$= (h^2 + k^2 + c)\ \Sigma\ (g_2 - g_3) + 2h \Sigma g_1 (g_2 - g_3)$$

$$= (h^2 + k^2 + c)(g_2 - g_3 + g_3 - g_1 + g_1 - g_2)$$

$$+ 2h\ \{g_1(g_2 - g_3) + g_2(g_3 - g_1) + g_3(g_1 - g_2)\}$$

$$= (h^2 + k^2 + c)(0) + 2h(0) = 0$$

which proves the result.

Limiting Point

Limiting points of system of co-axial circles are the centres of the point circles belonging to the family (Circles whose radii are zero are called **point circles).**

1. Limiting points of the co-axial system

Let the circle is

$$x^2 + y^2 + 2gx + c = 0 \qquad \ldots(i)$$

where, g is variable and c is constant.

$\therefore$ Centre and the radius of Eq. (i) are $(-g, 0)$ and $\sqrt{(g^2 - c)}$, respectively. Let

$$\sqrt{g^2 - c} = 0$$

$$\therefore \qquad g = \pm\sqrt{c}$$

Thus, we get the two limiting points of the given co-axial system as

$$(\sqrt{c}, 0) \ \text{ and } \ (-\sqrt{c}, 0)$$

Clearly the above limiting points are real and distinct, real and coincident or imaginary according as $c >, =, < 0$

2. System of co-axial circles whose two limiting point are given :

Let (α, β) and (γ, δ) be the two given limiting points. Then, the corresponding point circles with zero radii are

$$(x - \alpha)^2 + (y - \beta)^2 = 0$$

and $$(x - \gamma)^2 + (y - \delta)^2 = 0$$

or $$x^2 + y^2 - 2\alpha x - 2\beta y + \alpha^2 + \beta^2 = 0$$

and $$x^2 + y^2 - 2\gamma x - 2\delta y + \gamma^2 + \delta^2 = 0$$

The equation of co-axial system is

$$(x^2 + y^2 - 2\alpha x - 2\beta y + \alpha^2 + \beta^2)$$

$$+\lambda(x^2 + y^2 - 2\gamma x - 2\delta y + \gamma^2 + \delta^2) = 0$$

where, $\lambda \neq -1$ is a variable parameter.

$$\Rightarrow x^2(1+\lambda)+y^2(1+\lambda)-2x(\alpha+\gamma\lambda)$$
$$-2y(\beta+\delta\lambda)+(\alpha^2+\beta^2)+\lambda(\gamma^2+\delta^2)=0$$

or $$x^2+y^2-\frac{2(\alpha+\gamma\lambda)}{(1+\lambda)}x-2\frac{(\beta+\delta\lambda)}{(1+\lambda)}y$$
$$+\frac{(\alpha^2+\beta^2)+\lambda(\gamma^2+\delta^2)}{(1+\lambda)}=0$$

Centre of this circle is $\left(\frac{(\alpha+\gamma\lambda)}{(1+\lambda)},\frac{(\beta+\delta\lambda)}{(1+\lambda)}\right)$ ...(i)

For limiting point,

Radius
$$=\sqrt{\frac{(\alpha+\gamma\lambda)^2}{(1+\lambda)^2}+\frac{(\beta+\delta\lambda)^2}{(1+\lambda)^2}-\frac{(\alpha^2+\beta^2)+\lambda(\gamma^2+\delta^2)}{(1+\lambda)}}=0$$

After solving, find λ. Substituting value of λ in Eq. (i), we get the limiting point of co-axial system.

Example 90. ***Find the coordinates of the limiting points of the system of circles determined by the two circles***

$x^2+y^2+5x+y+4=0$ and $x^2+y^2+10x-4y-1=0$

Sol. The given circles are

$$S_1\equiv x^2+y^2+5x+y+4=0$$

and $$S_2\equiv x^2+y^2+10x-4y-1=0$$

$\therefore$ Equation of the co-axial system of circles is $S_1+\lambda S_2=0$

or $$(x^2+y^2+5x+y+4)$$
$$+\lambda(x^2+y^2+10x-4y-1)=0$$

or $$x^2(1+\lambda)+y^2(1+\lambda)+5x(1+2\lambda)$$
$$+y(1-4\lambda)+(4-\lambda)=0$$

or $$x^2+y^2+\frac{5(1+2\lambda)}{(1+\lambda)}x+\frac{(1-4\lambda)}{(1+\lambda)}y+\frac{(4-\lambda)}{(1+\lambda)}=0$$

The centre of this circles is

$$\left(\frac{-5(1+2\lambda)}{2(1+\lambda)},-\frac{(1-4\lambda)}{2(1+\lambda)}\right)$$ ...(i)

Radius $=\sqrt{\frac{25(1+2\lambda)^2}{4(1+\lambda)^2}+\frac{(1-4\lambda)^2}{4(1+\lambda)^2}-\frac{(4-\lambda)}{(1+\lambda)}}=0$

or $25(1+2\lambda)^2+(1-4\lambda)^2-4(4-\lambda)(1+\lambda)=0$

or $25(4\lambda^2+4\lambda+1)+(16\lambda^2-8\lambda+1)-4(-\lambda^2+3\lambda+4)=0$

or $120\lambda^2+80\lambda+10=0$ or $12\lambda^2+8\lambda+1=0$

or $(6\lambda+1)(2\lambda+1)=0$

i.e. $$\lambda=-\frac{1}{6} \text{ and } -\frac{1}{2}$$

Substituting these values of λ in Eq. (i), we get the points $(-2,-1)$ and $(0,-3)$ which are the required limiting points.

Example 91. If the origin be one limiting point of a system of co-axial circles of which $x^2+y^2+3x+4y+25=0$ is a member, find the other limiting point.

Sol. Equation of circle with origin as limiting point is

$$(x-0)^2+(y-0)^2=0 \text{ or } x^2+y^2=0$$

belongs to the system of co-axial circles of which one member is

$$x^2+y^2+3x+4y+25=0$$

Hence, the equation of the whole system is

$$(x^2+y^2+3x+4y+25)+\lambda(x^2+y^2)=0$$

or $$x^2(1+\lambda)+y^2(1+\lambda)+3x+4y+25=0$$

or $$x^2+y^2+\frac{3}{(1+\lambda)}x+\frac{4}{(1+\lambda)}y+\frac{25}{(1+\lambda)}=0$$ ...(i)

$\therefore$ Its centre $=\left(-\frac{3}{2(1+\lambda)},-\frac{2}{(1+\lambda)}\right)$ ...(ii)

Radius of Eq. (i) can be zero for limiting point, then

$$\frac{9}{4(1+\lambda)^2}+\frac{4}{(1+\lambda)^2}-\frac{25}{(1+\lambda)}=0$$
$$9+16-100(1+\lambda)=0$$

$\Rightarrow$ $$1+\lambda=\frac{1}{4} \text{ or } \lambda=-\frac{3}{4}$$

From Eq. (ii), $$\left(\frac{-3}{2(1-3/4)},\frac{-2}{(1-3/4)}\right)$$

or $(-6,-8)$ is the other limiting point of the system.

Example 92. Prove that the limiting points of the system

$$x^2+y^2+2gx+c+\lambda(x^2+y^2+2fx+k)=0$$

subtend a right angle at the origin, if $\frac{c}{g^2}+\frac{k}{f^2}=2$.

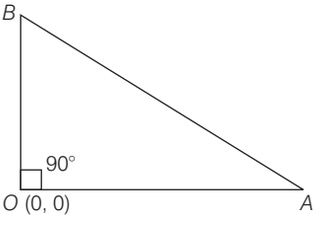
Sol. The given circle is

$$x^2+y^2+2gx+c+\lambda(x^2+y^2+2fy+k)=0$$

or $(1+\lambda)x^2+(1+\lambda)y^2+2gx+2fy\lambda+c+k\lambda=0$

or $$x^2+y^2+\frac{2g}{(1+\lambda)}x+\frac{2f\lambda}{(1+\lambda)}y+\frac{c+k\lambda}{(1+\lambda)}=0$$ ...(i)

Its centre is $$\left(\frac{-g}{1+\lambda},\frac{-f\lambda}{1+\lambda}\right)$$ ...(ii)



Radius of circle Eq. (i) is =0

$$\Rightarrow \quad \sqrt{\frac{g^2}{(1+\lambda)^2}+\frac{f^2\lambda^2}{(1+\lambda)^2}-\frac{(c+k\lambda)}{(1+\lambda)}}=0$$

or $\quad \lambda^2(f^2-k)-\lambda(k+c)+g^2-c=0$

which is a quadratic in λ. Let roots be λ_1 and λ_2.

$$\therefore \quad \lambda_1+\lambda_2=\frac{k+c}{f^2-k} \quad \text{and} \quad \lambda_1\lambda_2=\frac{g^2-c}{f^2-k}$$

then limiting points are [from Eq. (ii)]

$$A\left(\frac{-g}{1+\lambda_1},\frac{-f\lambda_1}{1+\lambda_1}\right) \quad \text{and} \quad B\left(\frac{-g}{1+\lambda_2},\frac{-f\lambda_2}{1+\lambda_2}\right)$$

But given that *AB* subtend a right angle at the origin.

$\therefore$ Slope of *OA* × Slope of *OB* = − 1

$$\Rightarrow \quad \left(\frac{\frac{-f\lambda_1}{1+\lambda_1}}{\frac{-g}{1+\lambda_1}}\right)\times\left(\frac{\frac{-f\lambda_2}{1+\lambda_2}}{\frac{-g}{1+\lambda_2}}\right)=-1$$

or $$\frac{f\lambda_1}{g}\times\frac{f\lambda_2}{g}=-1$$

or $$f^2\lambda_1\lambda_2+g^2=0$$

or $$f^2\frac{(g^2-c)}{(f^2-k)}+g^2=0$$

or $$2g^2f^2-cf^2-kg^2=0$$

or $$2=\frac{c}{g^2}+\frac{k}{f^2}$$

Example 93. Find the radical axis of co-axial system of circles whose limiting points are (–1,2) and (2, 3).

Sol. Equations of circles with limiting points are (–1, 2) and (2,3) are

$$(x+1)^2+(y-2)^2=0$$

or $$x^2+y^2+2x-4y+5=0 \quad \ldots(i)$$

and $$(x-2)^2+(y-3)^2=0$$

or $$x^2+y^2-4x-6y+13=0 \quad \ldots(ii)$$

respectively.

$\therefore$ Radical axis of circles Eqs. (i) and (ii) is

$$(x^2+y^2+2x-4y+5)$$
$$-(x^2+y^2-4x-6y+13)=0$$

or $$6x+2y-8=0$$

or $$3x+y-4=0$$

Example 94. Find the equation of the circle which passes through the origin and belongs to the co-axial of circles whose limiting points are (1,2) and (4,3).

Sol. Equations of circles whose limiting points are (1,2) and (4,3) are

$$(x-1)^2+(y-2)^2=0$$

or $$x^2+y^2-2x-4y+5=0 \quad \ldots(i)$$

and $$(x-4)^2+(y-3)^2=0$$

or $$x^2+y^2-8x-6y+25=0 \quad \ldots(ii)$$

Therefore, the corresponding system of co-axial circles is

$$(x^2+y^2-2x-4y+5)$$
$$+\lambda(x^2+y^2-8x-6y+25)=0 \quad \ldots(iii)$$

It passes through origin, then

$$5+25\lambda=0$$

$$\therefore \quad \lambda=-\frac{1}{5}$$

Substituting the value of λ in Eq. (iii), the required circle is

$$5(x^2+y^2-2x-4y+5)$$
$$-(x^2+y^2-8x-6y+25)=0$$

or $$4x^2+4y^2-2x-14y=0$$

or $$2x^2+2y^2-x-7y=0$$

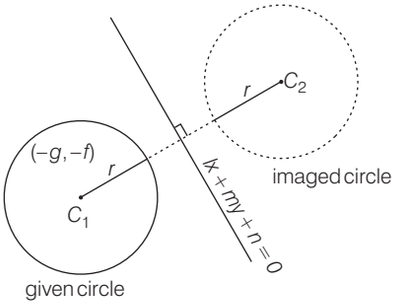
Image of the Circle by the Line Mirror

Let the circle be $x^2+y^2+2gx+2fy+c=0$ and line mirror is $lx+my+n=0$ in this condition, radius of circle remains unchanged but centres changes. Let the centre of imaged circle be (x_1, y_1).

Then, $$\frac{x_1-(-g)}{l}=\frac{y_1-(-f)}{m}=\frac{-2(-lg-mf+c)}{(l^2+m^2)}$$

we get, $$x_1=\frac{(l^2g-m^2g+2mlf-2nl)}{(l^2+m^2)}$$

and $$y_1=\frac{(m^2f-l^2f+2mlg-2mn)}{(l^2+m^2)}$$



$\therefore$ Required imaged circle is $(x-x_1)^2+(y-y_1)^2=r^2$

where, $r=\sqrt{(g^2+f^2-c)}$

Example 95. ***Find the equation of the image of the circle*** $x^2 + y^2 + 16x - 24y + 183 = 0$ ***by the line mirror*** $4x + 7y + 13 = 0$.

Sol. The given circle and line are

$$x^2 + y^2 + 16x - 24y + 183 = 0 \quad \ldots(i)$$

and $$4x + 7y + 13 = 0 \quad \ldots(ii)$$

Centre and radius of circle Eq. (i) are $(-8,12)$ and 5, respectively. Let the centre of the imaged circle be (x_1, y_1). Hence, (x_1, y_1) be the image of the point $(-8, 12)$ with respect to the line $4x + 7y + 13 = 0$, then

$$\frac{x_1 - (-8)}{4} = \frac{y_1 - 12}{7} = \frac{-2(4(-8) + 7(12) + 13)}{(4^2 + 7^2)}$$

$$\Rightarrow \quad \frac{x_1 + 8}{4} = \frac{y_1 - 12}{7} = -2$$

$\therefore \; x_1 = -16, y_1 = -2$

$\therefore$ Equation of the imaged circle is $(x + 16)^2 + (y + 2)^2 = 5^2$

or $$x^2 + y^2 + 32x + 4y + 235 = 0$$

Exercise for Session 7

1. The circles $x^2 + y^2 + x + y = 0$ and $x^2 + y^2 + x - y = 0$ intersect at an angle of

(a) $\pi / 6$ (b) $\pi / 4$ (c) $\pi / 3$ (d) $\pi / 2$

2. If the circles of same radius a and centres at (2, 3) and (5, 6) cut orthogonally, then a equals to

(a) 1 (b) 2 (c) 3 (d) 4

3. If the circles $x^2 + y^2 + 2x + 2ky + 6 = 0$ and $x^2 + y^2 + 2ky + k = 0$ intersect orthogonally, k is

(a) 2 or $-\frac{3}{2}$ (b) -2 or $-\frac{3}{2}$ (c) 2 or $\frac{3}{2}$ (d) -2 or $\frac{3}{2}$

4. If a circle passes through the point (a,b) and cuts the circle $x^2 + y^2 = 4$ orthogonally, then the locus of its centre is

(a) $2ax + 2by + (a^2 + b^2 + 4) = 0$ (b) $2ax + 2by - (a^2 + b^2 + 4) = 0$

(c) $2ax - 2by + (a^2 + b^2 + 4) = 0$ (d) $2ax - 2by - (a^2 + b^2 + 4) = 0$

5. The locus of the centre of the circle which cuts orthogonally the circle $x^2 + y^2 - 20x + 4 = 0$ and which touches $x = 2$ is

(a) $x^2 = 16y$ (b) $x^2 = 16y + 4$

(c) $y^2 = 16x$ (d) $y^2 = 16x + 4$

6. The equation of a circle which cuts the three circles $x^2 + y^2 - 3x - 6y + 14 = 0$, $x^2 + y^2 - x - 4y + 8 = 0$ and $x^2 + y^2 + 2x - 6y + 9 = 0$ orthogonally is

(a) $x^2 + y^2 - 2x - 4y + 1 = 0$ (b) $x^2 + y^2 + 2x + 4y + 1 = 0$

(c) $x^2 + y^2 - 2x + 4y + 1 = 0$ (d) $x^2 + y^2 - 2x - 4y - 1 = 0$

7. The equation of radical axis of the circles $x^2 + y^2 + x - y + 2 = 0$ and $3x^2 + 3y^2 - 4x - 12 = 0$ is

(a) $2x^2 + 2y^2 - 5x + y - 14 = 0$ (b) $7x - 3y + 18 = 0$

(c) $5x - y + 14 = 0$ (d) None of these

8. The radical centre of the circles $x^2 + y^2 = 1, x^2 + y^2 + 10y + 24 = 0$ and $x^2 + y^2 - 8x + 15 = 0$ is

(a) $(2, 5/2)$ (b) $(-2, 5/2)$

(c) $(-2, -5/2)$ (d) $(2, -5/2)$

9. If $(1,2)$ is a limiting point of the co-axial system of circles containing the circle $x^2 + y^2 + x - 5y + 9 = 0$, then the equation of the radical axis is

(a) $x - 9y + 4 = 0$ (b) $3x - y + 4 = 0$

(c) $x + 3y - 4 = 0$ (d) $9x + y - 4 = 0$

10. The limiting points of the system of circles represented by the equation $2(x^2+y^2)+\lambda x+\frac{9}{2}=0$ are

(a) $\left(\pm\frac{3}{2},0\right)$ (b) $(0,0)$ and $\left(\frac{9}{2},0\right)$

(c) $\left(\pm\frac{9}{2},0\right)$ (d) $(\pm3,\ 0)$

11. One of the limiting points of the co-axial system of circles containing the circles $x^2+y^2-4=0$ and $x^2+y^2-x-y=0$ is

(a) $(\sqrt{2},\sqrt{2})$ (b) $(-\sqrt{2},\sqrt{2})$

(c) $(-\sqrt{2},-\sqrt{2})$ (d) None of these

12. The point (2, 3) is a limiting point of a co-axial system of circles of which $x^2+y^2=9$ is a member. The coordinates of the other limiting point is given by

(a) $\left(\frac{18}{13},\frac{27}{13}\right)$ (b) $\left(\frac{9}{13},\frac{6}{13}\right)$

(c) $\left(\frac{18}{13},-\frac{27}{13}\right)$ (d) $\left(-\frac{18}{13},-\frac{9}{13}\right)$

13. Two circles are drawn through the points $(a,5a)$ and $(4a,a)$ to touch the *Y*-axis. Prove that they intersect at angle $\tan^{-1}\left(\frac{40}{9}\right)$.

14. Find the equation of the circle which cuts orthogonally the circle $x^2+y^2-6x+4y-3=0$, passes through (3,0) and touches the axis of *y*.

15. Tangents are drawn to the circles $x^2+y^2+4x+6y-19=0$, $x^2+y^2=9$ from any point on the line $2x+3y=5$. Prove that their lengths are equal.

16. Find the coordinates of the point from which the lengths of the tangents to the following three circles be equal $3x^2+3y^2+4x-6y-1=0$, $2x^2+2y^2-3x-2y-4=0$ and $2x^2+2y^2-x+y-1=0$

17. Find the equation of a circle which is co-axial with the circles $x^2+y^2+4x+2y+1=0$ and $x^2+y^2-x+3y-\frac{3}{2}=0$ and having its centre on the radical axis of these circles.

18. Find the radical axis of a co-axial system of circles whose limiting points are (1, 2) and (3 , 4).

Shortcuts and Important Results to Remember

1 If the lines $a_1x + b_1y + c_1 = 0$ and $a_2x + b_2y + c_2 = 0$ cut the X-axis and Y-axis in four concyclic points, then $a_1a_2 = b_1b_2$.

2 If two conic sections $a_1x^2 + 2h_1xy + b_1y^2 + 2g_1x + 2f_1y + c_1 = 0$ and $a_2x^2 + 2h_2xy + b_2y^2 + 2g_2x + 2f_2y + c_2 = 0$ will intersect each other in four concyclic points, if $\frac{a_1 - b_1}{a_2 - b_2} = \frac{h_1}{h_2}$.

3 If the circle $S_1 = 0$, bisects the circumference of the circle $S_2 = 0$, then their common chord will be the diameter of the circle $S_2 = 0$.

4 The radius of the director circle of a given circle is $\sqrt{2}$ times the radius of the given circle.

5 The point of intersection of the tangents at the points $P(a\cos\alpha, a\sin\alpha)$ and $Q(a\cos\beta, a\sin\beta)$ on the circle $x^2 + y^2 = a^2$ is

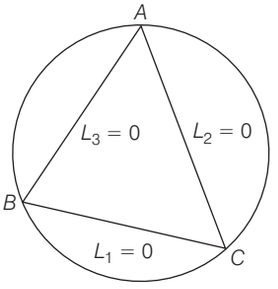
$$\left(\frac{a\cos\left(\frac{\alpha+\beta}{2}\right)}{\cos\left(\frac{\alpha-\beta}{2}\right)}, \frac{a\sin\left(\frac{\alpha+\beta}{2}\right)}{\cos\left(\frac{\alpha-\beta}{2}\right)}\right)$$

6 If the tangent to the circle $x^2 + y^2 = r^2$ at the point (a,b) meets the coordinates axes at the points A and B and O is the origin, then the area of the ΔOAB is $\frac{r^4}{2ab}$.

7 The length of the common chord of the circles $x^2 + y^2 + ax + by + c = 0$ and $x^2 + y^2 + bx + ay + c = 0$ is $\sqrt{\frac{1}{2}(a+b)^2 - 4c}$.

8 The length of the common chord of the circles $(x-a)^2 + y^2 = a^2$ and $x^2 + (y-b)^2 = b^2$ is $\frac{2ab}{\sqrt{a^2 + b^2}}$.

9 Family of circles circumscribing a triangle whose sides are given by $L_1 = 0, L_2 = 0$ and $L_3 = 0$ is given by $L_1L_2 + \lambda L_2L_3 + \mu L_3L_1 = 0$ provided coefficient of $xy = 0$ and coefficient of x^2 = coefficient of y^2.

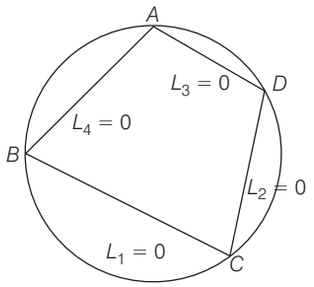


Remark

Equation of the circle circumscribing the triangle formed by the lines $a_rx + b_ry + c_r = 0$, where $r = 1, 2, 3$, is :

$$\begin{vmatrix} \frac{a_1^2 + b_1^2}{a_1x + b_1y + c_1} & a_1 & b_1 \\ \frac{a_2^2 + b_2^2}{a_2x + b_2y + c_2} & a_2 & b_2 \\ \frac{a_3^2 + b_3^2}{a_3x + b_3y + c_3} & a_3 & b_3 \end{vmatrix} = 0$$

10 Equation of circle circumscribing a quadrilateral whose sides in order are represented by the lines $L_1 = 0, L_2 = 0, L_3 = 0$ and $L_4 = 0$ is given by $L_1L_3 + \lambda L_2L_4 = 0$



provided coefficient of x^2 = coefficient of y^2 and coefficient of $xy = 0$.

11 The locus of the middle point of a chord of a circle subtending a right angle at a given point will be a circle.

12 The length of an equilateral triangle inscribed in the circle $x^2 + y^2 = a^2$ is $a\sqrt{3}$.

13 The distance between the chord of contact of tangents to $x^2 + y^2 + 2gx + 2fy + c = 0$ from the origin and the point (g,f) is $\frac{|g^2 + f^2 - c|}{2\sqrt{(g^2 + f^2)}}$.

14 The shortest chord of a circle passing through a point P inside the circle is the chord whose middle point is P.

15 The length of transverse common tangent $<$ the length of direct common tangent.

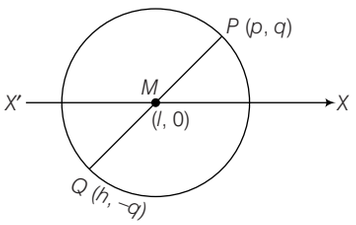
JEE Type Solved Examples :
Single Option Correct Type Questions

■ This section contains **10 multiple choice examples.** Each example has four choices (a), (b), (c) and (d) out of which **ONLY ONE** is correct.

● ***Ex. 1*** *Two distinct chords drawn from the point (p,q) on the circle $x^2+y^2=px+qy$, where $pq\neq 0$, are bisected by the X-axis. Then,*

(a) $|p|=|q|$ (b) $p^2=8q^2$ (c) $p^2<8q^2$ (d) $p^2>8q^2$

Sol. (d)



Suppose chord bisect at $M(\lambda,0)$, then other end point of chord is $(h,-q)$

where, $\lambda=\dfrac{p+h}{2}$

which lie on $x^2+y^2=px+qy$

or $h^2+q^2=ph-q^2$

$\Rightarrow$ $h^2-ph+2q^2=0$

for two distinct chords, $B^2-4AC>0$

or $p^2-4\cdot1\cdot2q^2>0$

or $p^2>8q^2$

● ***Ex. 2*** *The values of λ for which the circle $x^2+y^2+6x+5+\lambda(x^2+y^2-8x+7)=0$ dwindles into a point are*

(a) $1\pm\dfrac{\sqrt{2}}{3}$ (b) $2\pm\dfrac{2\sqrt{2}}{3}$ (c) $2\pm\dfrac{4\sqrt{2}}{3}$ (d) $1\pm\dfrac{4\sqrt{2}}{3}$

Sol. (c) The given circle is

$$x^2+y^2+6x+5+\lambda(x^2+y^2-8x+7)=0$$

or $x^2(1+\lambda)+y^2(1-\lambda)+(6-8\lambda)x+(5+7\lambda)=0$

$\Rightarrow$ $x^2+y^2+\left(\dfrac{6-8\lambda}{1+\lambda}\right)x+\left(\dfrac{5+7\lambda}{1+\lambda}\right)=0$

This will dwindle into a point circle, then radius of the circle = 0

$$\sqrt{\left(\frac{3-4\lambda}{1+\lambda}\right)^2+0-\left(\frac{5+7\lambda}{1+\lambda}\right)}=0$$

$\Rightarrow$ $(3-4\lambda)^2-(5+7\lambda)(1+\lambda)=0$

$\Rightarrow$ $9-16\lambda^2-24\lambda-5-5\lambda-7\lambda-7\lambda^2=0$

$\Rightarrow$ $9\lambda^2-36\lambda+4=0$

$$\lambda=\frac{36\pm\sqrt{(36)^2-4.9.4}}{2.9}$$

$\therefore$ $\lambda=2\pm\dfrac{4\sqrt{2}}{3}$

● ***Ex. 3*** *If $f(x+y)=f(x)\cdot f(y)$ for all x and y, $f(1)=2$ and $\alpha_n=f(n), n\in N$, then the equation of the circle having (α_1,α_2) and (α_3,α_4) as the ends of its one diameter is*

(a) $(x-2)(x-8)+(y-4)(y-16)=0$

(b) $(x-4)(x-8)+(y-2)(y-16)=0$

(c) $(x-2)(x-16)+(y-4)(y-8)=0$

(d) $(x-6)(x-8)+(y-5)(y-6)=0$

Sol. (a) $\because$ $f(x+y)=f(x).f(y)$ ...(i)

$\because$ $f(1)=2$

In Eq. (i), Put $x=y=1$,

then $f(2)=f(1).f(1)=2^2$

Now, in Eq. (i), $x=1, y=2$, then

$$f(3)=f(1)f(2)=2.2^2=2^3$$

Hence, $f(n)=2^n$

$\therefore$ $\alpha_n=f(n)=2^n\forall n\in N$

$(\alpha_1,\alpha_2)\equiv(2,4)$

and $(\alpha_3,\alpha_4)\equiv(8,16)$

Equation of circle in diametric form is

$(x-2)(x-8)+(y-4)(y-16)=0$

● ***Ex. 4*** *Two circles of radii a and b touching each other externally, are inscribed in the area bounded by $y=\sqrt{(1-x^2)}$ and the X-axis. If $b=\dfrac{1}{2}$, then a is equal to*

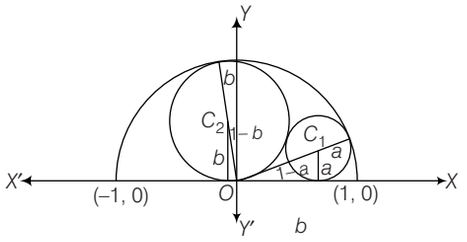
(a) $\dfrac{1}{4}$ (b) $\dfrac{1}{8}$

(c) $\dfrac{1}{2}$ (d) $\dfrac{1}{\sqrt{2}}$

Sol. (a) Let the centres of circles be C_1 and C_2, then

$C_1\equiv(\sqrt{(1-2a)},a)$

and $C_2\equiv(\sqrt{(1-2b)},b)$



Now, $C_1C_2 = a + b$

$$\Rightarrow \quad \left((\sqrt{(1-2a)})^2 + \left(a - \frac{1}{2}\right)^2\right) = \left(a + \frac{1}{2}\right)^2 \qquad \left[\because b = \frac{1}{2}\right]$$

or $$1 - 2a + \left(a - \frac{1}{2}\right)^2 = \left(a + \frac{1}{2}\right)^2$$

or $$1 - 2a + a^2 + \frac{1}{4} - a = a^2 + \frac{1}{4} + a$$

or $$a = \frac{1}{4}$$

● ***Ex. 5*** *There are two circles whose equations are* $x^2 + y^2 = 9$ *and* $x^2 + y^2 - 8x - 6y + n^2 = 0$, $n \in I$. *If the two circles having exactly two common tangents, then the number of possible values of n is*

(a) 2 (b) 7 (c) 8 (d) 9

Sol. (d) Given circles are $S_1 : x^2 + y^2 - 9 = 0$

Its centre C_1:(0,0) and radius $r_1 = 3$

and $S_2 : x^2 + y^2 - 8x - 6y + n^2 = 0$

Its centre C_2:(4,3) and radius $r_2 = \sqrt{(25 - n^2)}$

Here, $25 - n^2 > 0 \Rightarrow -5 < n < 5$ ...(i)

For exactly two common tangents,

$$r_1 + r_2 > C_1C_2$$

$$\Rightarrow \quad 3 + \sqrt{(25 - n^2)} > \sqrt{(4^2 + 3^2)}$$

$$\Rightarrow \quad \sqrt{(25 - n^2)} > 2$$

$$\Rightarrow \quad 25 - n^2 > 4$$

or $$n^2 < 21$$

or $$-\sqrt{21} < n < \sqrt{21} \qquad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$-\sqrt{21} < n < \sqrt{21}$$

But $n \in I$. So, $n = -4, -3, -2, -1, 0, 1, 2, 3, 4$

Hence, number of possible values of n is 9.

● ***Ex. 6*** *Suppose* $f(x, y) = 0$ *is the equation of a circle such that* $f(x, 1) = 0$ *has equal roots (each equal to 2) and* $f(1, x) = 0$ *also has equal roots (each equal to zero). The equation of circle is*

(a) $x^2 + y^2 + 4x + 3 = 0$ (b) $x^2 + y^2 + 4y + 3 = 0$

(c) $x^2 + y^2 + 4x - 3 = 0$ (d) $x^2 + y^2 - 4x + 3 = 0$

Sol. (d) Let $f(x, y) = x^2 + y^2 + 2gx + 2fy + c$

$$\Rightarrow \quad f(x, 1) = x^2 + 1 + 2gx + 2f + c \equiv (x - 2)^2 \qquad \text{(given)}$$

then, $$g = -2,\ 2f + c = 3 \qquad \text{...(i)}$$

Also, $$f(1, x) = 1 + x^2 + 2g + 2fx + c \equiv (x - 0)^2 \qquad \text{(given)}$$

then, $$f = 0, 2g + c = -1 \qquad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$g = -2, f = 0, c = 3$$

Thus, equation of circle is

$$x^2 + y^2 - 4x + 3 = 0$$

● ***Ex. 7*** *A variable circle C has the equation* $x^2 + y^2 - 2(t^2 - 3t + 1)x - 2(t^2 + 2t)y + t = 0$, *where t is a parameter. If the power of point* (a, b) *w.r.t. the circle C is constant, then the ordered pair* (a, b) *is*

(a) $\left(\frac{1}{10}, -\frac{1}{10}\right)$ (b) $\left(\frac{1}{10}, \frac{1}{10}\right)$

(c) $\left(-\frac{1}{10}, \frac{1}{10}\right)$ (d) $\left(-\frac{1}{10}, -\frac{1}{10}\right)$

Sol. (c) $\because C : x^2 + y^2 - 2(t^2 - 3t + 1)x - 2(t^2 + 2t)y + t = 0$

given power of circle = constant

$$\therefore \quad a^2 + b^2 - 2(t^2 - 3t + 1)a - 2(t^2 + 2t)b + t = \text{constant}$$

$$\Rightarrow \quad -2(a + b)t^2 + (6a - 4b + 1)t + (a^2 + b^2 - 2a) = \text{constant}$$

$\because$ Power of circle is constant, then

$$a + b = 0 \text{ and } 6a - 4b + 1 = 0$$

or $b = -a$, then $6a + 4a + 1 = 0$

$$\therefore \quad a = -\frac{1}{10},\ b = \frac{1}{10}$$

Hence, required ordered pair is $\left(-\frac{1}{10}, \frac{1}{10}\right)$

● ***Ex. 8*** *If the radii of the circles* $(x - 1)^2 + (y - 2)^2 = 1$ *and* $(x - 7)^2 + (y - 10)^2 = 4$ *are increasing uniformly w.r.t. time as* 0.3 unit/s *and* 0.4 unit/s *respectively, then they will touch each other at t equals to*

(a) 45 s (b) 90 s

(c) 11 s (d) 135 s

Sol. (b) Given circles are $S_1 : (x - 1)^2 + (y - 2)^2 = 1$

Its centre C_1:(1,2) and radius $r_1 = 1$

and $S_2 : (x - 7)^2 + (y - 10)^2 = 4$

Its centre C_2:(7,10) and radius $r_2 = 2$

$\because \quad C_1C_2 = 10 > r_1 + r_2$

Hence, the two circles are separated.

The radii of the two circles at time t are $(1 + 0.3t)$ and $(2 + 0.4t)$

For the two circles touch each other, then

$$C_1C_2 = |(1+0.3t) \pm (2+0.4t)|$$

$\Rightarrow$ $10 = |3+0.7t|$ or $10 = |-1-0.1t|$

$\Rightarrow$ $0.7t+3 = \pm 10$ or $-1-0.1t = \pm 10$

$\Rightarrow$ $t = 10$ or $t = 90$ $[\because t > 0]$

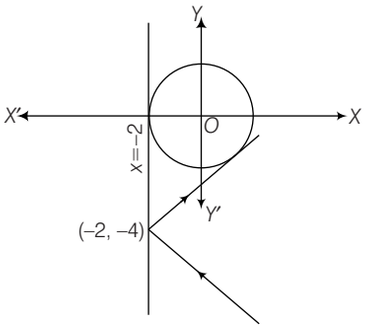
● ***Ex. 9*** *A light ray gets reflected from $x = -2$. If the reflected ray touches the circle $x^2 + y^2 = 4$ and the point of incident is $(-2,-4)$, then the equation of the incident ray is*

(a) $4y + 3x + 22 = 0$ (b) $3y + 4x + 20 = 0$

(c) $4y + 2x + 20 = 0$ (d) $y + x + 6 = 0$

Sol. (a) Any tangent of $x^2 + y^2 = 4$ is $y = mx \pm 2\sqrt{(1+m^2)}$.

If it passes through $(-2,-4)$, then $-4 = -2m \pm 2\sqrt{(1+m^2)}$



or $(m-2)^2 = 1 + m^2$

or $m = \infty,\ m = 3/4$

Hence, the slope of the reflected ray is 3/4.

Thus, the equation of the incident ray is

$$y + 4 = -\frac{3}{4}(x+2)$$

i.e. $4y + 3x + 22 = 0$

● ***Ex. 10*** *If a circle having centre at (α,β) radius r completely lies with in two lines $x + y = 2$ and $x + y = -2$, then, $\min.(|\alpha+\beta+2|, |\alpha+\beta-2|)$ is*

(a) greater than $\sqrt{2}r$

(b) less than $\sqrt{2}r$

(c) greater than $2r$

(d) less than $2r$

Sol. (a) Minimum distance of the centre from line > radius of circle i.e. $\min.\left\{\frac{|\alpha+\beta+2|}{\sqrt{2}}, \frac{|\alpha+\beta-2|}{\sqrt{2}}\right\} > r$

or $\min.\{|\alpha+\beta+2|, |\alpha+\beta-2|\} > \sqrt{2}r$

JEE Type Solved Examples :
More than One Correct Option Type Questions

■ This section contains **5 multiple choice examples.** Each example has four choices (a), (b), (c) and (d) out of which MORE THAN ONE may be correct.

● ***Ex. 11*** *If point $P(x,y)$ is called a lattice point, if $x, y \in I$. Then, the total number of lattice points in the interior of the circle $x^2 + y^2 = a^2, a \neq 0$ cannot be*

(a) 202 (b) 203 (c) 204 (d) 205

Sol. (a, b, c) Given circle is $x^2 + y^2 = a^2$ ...(i)

Clearly (0, 0) will belong the interior of circle Eq. (i). Also, other points interior to circle Eq. (i) will have the coordinates of the form

$$(\pm\lambda, 0), (0, \pm\lambda), \text{ where } \lambda^2 < a^2$$

and $(\pm\lambda, \pm\mu)$ and $(\pm\mu, \pm\lambda)$, where $\lambda^2 + \mu^2 < a^2$ and $\lambda, \mu \in I$

$\therefore$ Number of lattice points in the interior of the circle will be of the form $1 + 4r + 8t$, where $r, t = 0,1,2,\ldots$

$\therefore$ Number of such points must be of the form $4n + 1$, where $n = 0,1,2,\ldots$

● ***Ex. 12*** *Let x, y be real variable satisfying $x^2 + y^2 + 8x - 10y - 40 = 0$. Let $a = \max.\{\sqrt{(x+2)^2 + (y-3)^2}\}$ and $b = \min.\{\sqrt{(x+2)^2 + (y-3)^2}\}$, then*

(a) $a + b = 18$ (b) $a - b = 4\sqrt{2}$

(c) $a + b = 4\sqrt{2}$ (d) $a \cdot b = 73$

Sol. (a, b, d) Given circle is

$$x^2 + y^2 + 8x - 10y - 40 = 0$$

The centre and radius of the circle are $(-4,5)$ and 9, respectively.

Distance of the centre $(-4,5)$ from $(-2,3)$ is

$$\sqrt{(4+4)} = 2\sqrt{2}.$$

Therefore, $a = 2\sqrt{2} + 9$

and $b = -2\sqrt{2} + 9$

$\therefore$ $a + b = 18,\ a - b = 4\sqrt{2},\ ab = 73$

● ***Ex. 13*** *The equation of the tangents drawn from the origin to the circle* $x^2 + y^2 - 2rx - 2hy + h^2 = 0$, *are*

(a) $x = 0$

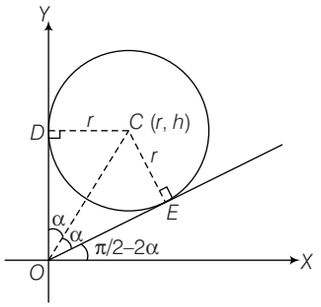
(b) $y = 0$

(c) $(h^2 - r^2)x - 2rhy = 0$

(d) $(h^2 - r^2)x + 2rhy = 0$

Sol. (a, c) The given equation is $(x - r)^2 + (y - h)^2 = r^2$

tangents are $x = 0$



and $y = x\tan\left(\frac{\pi}{2} - 2\alpha\right) = x\cot 2\alpha$

$$= \frac{x(1 - \tan^2\alpha)}{2\tan\alpha}$$

$$y = \frac{x\left(1 - \frac{r^2}{h^2}\right)}{2\left(\frac{r}{h}\right)} \qquad \left(\because \text{in } \Delta ODC, \tan\alpha = \frac{r}{h}\right)$$

or $(h^2 - r^2)x - 2rhy = 0$

● ***Ex. 14*** *Point M moved on the circle* $(x - 4)^2 + (y - 8)^2 = 20$. *Then it broke away from it and moving along a tangent to the circle cut the X-axis at point* $(-2, 0)$. *The coordinates of the point on the circle at which the moving point broke away is*

(a) $\left(\frac{42}{5}, \frac{36}{5}\right)$ (b) $\left(-\frac{2}{5}, \frac{44}{5}\right)$

(c) $(6, 4)$ (d) $(2, 4)$

Sol. (b, c) Given circle is

$$(x - 4)^2 + (y - 8)^2 = 20$$

or $x^2 + y^2 - 8x - 16y + 60 = 0$ ...(i)

Equation of chord of contact from $(-2, 0)$ is

$$-2 \cdot x + 0 \cdot y - 4(x - 2) - 8(y + 0) + 60 = 0$$

or $3x + 4y - 34 = 0$ ...(ii)

Solving Eqs. (i) and (ii), we get

$$x^2 + \left(\frac{34 - 3x}{4}\right)^2 - 8x - 16\left(\frac{34 - 3x}{4}\right) + 60 = 0$$

or $5x^2 - 28x - 12 = 0$

or $(x - 6)(5x + 2) = 0$

or $x = 6, -\frac{2}{5}$

Therefore, the points are $(6, 4)$ and $\left(-\frac{2}{5}, \frac{44}{5}\right)$.

● ***Ex. 15*** *The equations of four circles are* $(x \pm a)^2 + (y \pm a)^2 = a^2$. *The radius of a circle touching all the four circles is*

(a) $(\sqrt{2} - 1)a$ (b) $2\sqrt{2}\,a$

(c) $(\sqrt{2} + 1)a$ (d) $(2 + \sqrt{2})a$

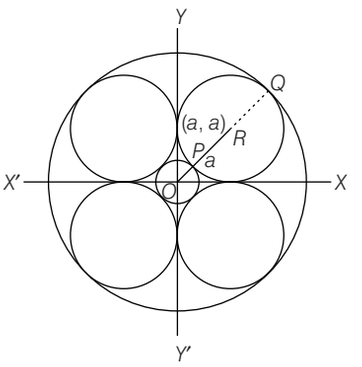
Sol. (a, c) Radius of inner circle $= OR - a$

$$= \sqrt{(a^2 + a^2)} - a$$

$$= a(\sqrt{2} - 1)$$

Radius of outer circle $= OR + RQ$

$$= a\sqrt{2} + a = a(\sqrt{2} + 1)$$



JEE Type Solved Examples :
Paragraph Based Questions

- This section contains **2 solved paragraphs** based upon each of the paragraph **3 multiple choice** questions have to be answered. Each of these questions has four choices (a), (b), (c) and (d) out of which **ONLY ONE** is correct.

Paragraph I

(Q. Nos. 16 to 18)

Consider the relation $4l^2 - 5m^2 + 6l + 1 = 0$, where $l, m \in R$.

16. The line $lx + my + 1 = 0$ touches a fixed circle whose equation is

(a) $x^2 + y^2 - 4x - 5 = 0$ (b) $x^2 + y^2 + 6x + 6 = 0$

(c) $x^2 + y^2 - 6x + 4 = 0$ (d) $x^2 + y^2 + 4x - 4 = 0$

17. Tangents PA and PB are drawn to the above fixed circle from the point P on the line $x + y - 1 = 0$. Then, the chord of contact AB passes through the fixed point

(a) $\left(\frac{1}{2}, -\frac{5}{2}\right)$ (b) $\left(\frac{1}{3}, \frac{4}{3}\right)$ (c) $\left(-\frac{1}{2}, \frac{3}{2}\right)$ (d) $\left(\frac{1}{2}, \frac{5}{2}\right)$

18. The number of tangents which can be drawn from the point $(2, -3)$ are

(a) 0 (b) 1 (c) 2 (d) 1 or 2

Sol.

16. (c) Let the equation of the circle be

$$x^2 + y^2 + 2gx + 2fy + c = 0 \quad \ldots(i)$$

The line $lx + my + 1 = 0$ touch circle Eq. (i), then

$$\frac{|-lg - mf + 1|}{\sqrt{(l^2 + m^2)}} = \sqrt{(g^2 + f^2 - c)}$$

$$\Rightarrow \quad (lg + mf - 1)^2 = (l^2 + m^2)(g^2 + f^2 - c)$$

or $(f^2 - c)l^2 + (g^2 - c)m^2 - 2gflm + 2gl + 2fm - 1 = 0 \quad \ldots(ii)$

But the given condition is

$$4l^2 - 5m^2 + 6l + 1 = 0 \quad \ldots(iii)$$

Comparing Eqs. (ii) and (iii), we get

$$\frac{f^2 - c}{4} = \frac{g^2 - c}{-5} = \frac{-2gf}{0} = \frac{g}{3} = \frac{2f}{0} = \frac{-1}{1}$$

Then, we get $g = -3$, $f = 0$, $c = 4$

Substituting these values in Eq. (i), the equation of the circle is

$$x^2 + y^2 - 6x + 4 = 0$$

17. (a) Let any point on the line $x + y - 1 = 0$ is

$$P(\lambda, 1 - \lambda), \lambda \in R.$$

Then, equation of AB is

$$\lambda x + (1 - \lambda)y - 3(x + \lambda) + 4 = 0$$

$$\Rightarrow \quad (-3x + y + 4) + \lambda(x - y - 3) = 0$$

for fixed point $-3x + y + 4 = 0$, $x - y - 3 = 0$

$$\therefore \quad x = \frac{1}{2}, y = -\frac{5}{2}$$

$\therefore$ Fixed point is $\left(\frac{1}{2}, \frac{-5}{2}\right)$

18. (c) Let $S \equiv x^2 + y^2 - 6x + 4 = 0$.

$$\therefore \quad S_1 = (2)^2 + (-3)^2 - 6(2) + 4$$

$$= 4 + 9 - 12 - 4$$

$$= 5 > 0$$

Therefore, point $(2, -3)$ lies outside the circle from which two tangents can be drawn.

Paragraph II

(Q. Nos. 19 to 21)

If α- chord of a circle be that chord which subtends an angle α at the centre of the circle.

19. If $x + y = 1$ is α-chord of $x^2 + y^2 = 1$, then α is equal to

(a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{2}$ (d) $\frac{3\pi}{4}$

20. If slope of a $\frac{\pi}{3}$-chord of $x^2 + y^2 = 4$ is 1, then its equation is

(a) $x - y + \sqrt{6} = 0$ (b) $x - y + \sqrt{3} = 0$

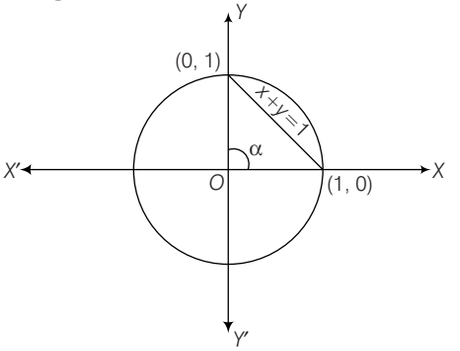
(c) $x - y - \sqrt{3} = 0$ (d) $x - y - 2\sqrt{3} = 0$

21. Distance of $\frac{2\pi}{3}$ — chord of $x^2 + y^2 + 2x + 4y + 1 = 0$ from the centre is

(a) $\frac{1}{\sqrt{2}}$ (b) 1 (c) $\sqrt{2}$ (d) 2

Sol.

19. (c) From figure

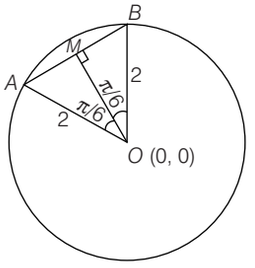


$$\alpha = \frac{\pi}{2}$$

20. (a) ∵ Slope of chord is 1.

Let the equation of chord be $x - y + \lambda = 0$.

∵ $$OM = 2\cos\left(\frac{\pi}{6}\right) = \sqrt{3}$$



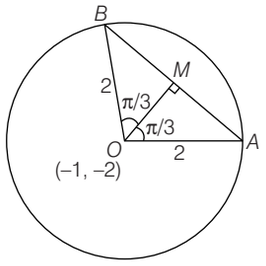
∴ $$\frac{|0 - 0 + \lambda|}{\sqrt{2}} = \sqrt{3}$$

⇒ $$\lambda = \pm\sqrt{6}$$

Hence, equation of chords are

$$x - y \pm \sqrt{6} = 0.$$

21. (b) From figure,



$$OM = 2\cos\left(\frac{\pi}{3}\right) = 1$$

JEE Type Solved Examples :
Single Integer Answer Type Questions

■ This section contains **2 examples.** The answer to each example is a **single digit integer,** ranging from 0 to 9 (both inclusive).

● ***Ex. 22*** *A circle with centre in the first quadrant is tangent to $y = x + 10$, $y = x - 6$ and the Y-axis. Let (p, q) be the centre of the circle. If the value of $(p + q) = a + b\sqrt{a}$, when $a, b \in Q$, then the value of $|a - b|$ is*

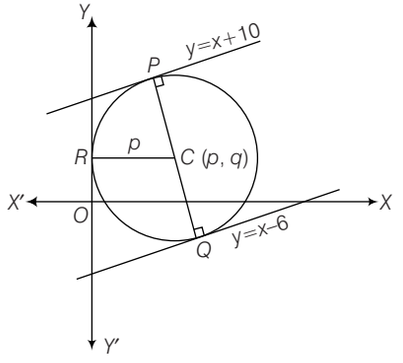
Sol. (6) ∵ $$CP = CR$$

⇒ $$\frac{|p - q + 10|}{\sqrt{2}} = p$$

or $$p - q + 10 = p\sqrt{2} \quad \ldots(i)$$

and $$CP = CQ$$

$$\frac{p - q + 10}{\sqrt{2}} = -\left(\frac{p - q - 6}{\sqrt{2}}\right) \text{ or } p - q = -2 \quad \ldots(ii)$$



From Eqs. (i) and (ii), we get

$$p = 4\sqrt{2} \text{ and } q = 4\sqrt{2} + 2$$

Now, $$p + q = 2 + 8\sqrt{2} = a + b\sqrt{2}$$ (given)

∴ $$a = 2, b = 8$$

Hence, $|a - b| = |2 - 8| = 6$

● ***Ex. 23*** *If the circles $x^2 + y^2 + (3 + \sin\theta)x + 2\cos\phi y = 0$ and $x^2 + y^2 + (2\cos\phi)x + 2\lambda y = 0$ touch each other, then the maximum value of λ is*

Sol. (1) Since, both the circles are passing through the origin (0, 0), the equation of tangent at (0,0) of first circle will be same as that of the tangent at (0, 0) of second circle.

Equation of tangent at (0, 0) of first circle is

$$(3 + \sin\theta)x + (2\cos\phi)y = 0 \quad \ldots(i)$$

Equaton of tangent at (0, 0) of second circle is

$$(2\cos\phi)x + 2\lambda y = 0 \quad \ldots(ii)$$

Therefore, Eqs. (i) and (ii) must be identical, then

$$\frac{3 + \sin\theta}{2\cos\phi} = \frac{2\cos\phi}{2\lambda}$$

or $$\lambda = \frac{2\cos^2\phi}{(3 + \sin\theta)}$$

or $$\lambda_{max} = 1 \qquad (\text{when } \sin\theta = -1 \text{ and } \cos\phi = 1)$$

JEE Type Solved Examples : Matching Type Questions

■ This section contains **2 examples.** Examples 24 and 25 have four statements (A, B, C and D) given in **Column I** and four statements (p, q, r and s) in **Column II**. Any given statement in **Column I** can have correct matching with one or more statement(s) given in **Column II.**

● ***Ex. 24.*** *Consider the circles C_1 of radius a and C_2 of radius b, $b > a$ both lying the first quadrant and touching the coordinate axes.*

	Column I		Column II
(A)	C_1 and C_2 touch each other and $\frac{b}{a} = \lambda + \sqrt{\mu}$, $\lambda \in$ prime number and $\mu \in$ whole number, then	(p)	$\lambda + \mu$ is a prime number
(B)	C_1 and C_2 cut orthogonally and $\frac{b}{a} = \lambda + \sqrt{\mu}$, $\lambda \in$ prime number and $\mu \in$ whole number, then	(q)	$\lambda + \mu$ is a composite number
(C)	C_1 and C_2 intersect so that the common chord is longest and $\frac{b}{a} = \lambda + \sqrt{\mu}$, $\lambda \in$ prime number and $\mu \in$ whole number, then	(r)	$2\lambda + \mu$ is a perfect number
(D)	C_2 passes through the centre of C_1 and $\frac{b}{a} = \lambda + \sqrt{\mu}$, $\lambda \in$ prime number and $\mu \in$ whole number, then	(s)	$\lvert\lambda - \mu\rvert$ is a prime number

Sol. (A)→ (p, s); (B) → (p); (C) → (p, r, s); (D) → (q, r)

$\because \quad C_1 : x^2 + y^2 - 2ax - 2ay + a^2 = 0$

Centre : (a,a) and radius : a

and $\quad C_2 : x^2 + y^2 - 2bx - 2by + b^2 = 0$

Centre : (b,b) and radius : b

(A) $\because$ C_1 and C_2 touch each other, then

$$\sqrt{2}(b-a) = b + a \Rightarrow \frac{b}{a} = (\sqrt{2}+1)^2 = 3 + \sqrt{8}$$

$$\Rightarrow \quad \lambda = 3, \mu = 8$$

(B) $\because$ C_1 and C_2 intersect orthogonally, then

$$2(b-a)^2 = b^2 + a^2$$

$$\Rightarrow \quad a^2 + b^2 - 4ab = 0$$

or $$\left(\frac{b}{a}\right)^2 - 4\left(\frac{b}{a}\right) + 1 = 0$$

$$\therefore \quad \frac{b}{a} = \frac{4 \pm \sqrt{(16-4)}}{2} = 2 + \sqrt{3}$$

$$\Rightarrow \quad \lambda = 2, \mu = 3]$$

(C) $\because$ C_1 and C_2 intersect, the common chord is

$$2(b-a)(x+y) = b^2 - a^2$$

given common chord is longest, then passes through (a,a)

$$\Rightarrow \quad 2(b-a)(2a) = b^2 - a^2$$

or $$(b-3a)(b-a) = 0$$

$$\because \quad b - a \neq 0 \qquad [b > a]$$

$$\therefore \quad b - 3a = 0$$

or $$\frac{b}{a} = 3 \Rightarrow \lambda = 3, \mu = 0$$

(D) $\because$ C_2 passes through (a,a), then $a^2 + a^2 - 2ab - 2ab + b^2 = 0$

or $b^2 - 4ab + 2a^2 = 0$

or $$\left(\frac{b}{a}\right)^2 - 4\left(\frac{b}{a}\right) + 2 = 0$$

or $$\frac{b}{a} = \frac{4 \pm \sqrt{(16-8)}}{2} = 2 + \sqrt{2}$$

$$\Rightarrow \quad \lambda = 2, \mu = 2$$

● ***Ex. 25.*** *Match the following*

	Column I		Column II
(A)	The circles $x^2 + y^2 + 2x + c = 0$ $(c > 0)$ and $x^2 + y^2 + 2y + c = 0$ touch each other, then the value of $2c$ is	(p)	1
(B)	The circles $x^2 + y^2 + 2x + 3y + c = 0$ $(c > 0)$ and $x^2 + y^2 - x + 2y + c = 0$ intersect orthogonally, then the value of $2c$ is	(q)	2
(C)	The circle $x^2 + y^2 = 9$ is contains the circle $x^2 + y^2 - 2x + 1 - c^2 = 0$ $(c > 0)$, then $2c$ can be	(r)	3
(D)	The circle $x^2 + y^2 = 9$ is contains in the circle $x^2 + y^2 - 2x + 1 - \frac{c^2}{4} = 0$ $(c > 0)$, then $(c-6)$ can be	(s)	4

Sol. (A) → (p); (B) → (q); (C) → (p, q, r); (D) → (r, s)

(A) The circles

$$S_1 : (x+1)^2 + y^2 = (\sqrt{(1-c)})^2$$

Centre $C_1 : (-1, 0)$, radius $r_1 : \sqrt{(1-c)}$

and $$S_2 : x^2 + (y+1)^2 = (\sqrt{(1-c)})^2$$

Centre $C_2 : (0, -1)$, radius : $r_2 = \sqrt{(1-c)}$

Now, $\quad C_1C_2 = \sqrt{2}$ and $r_1 = r_2$

$\therefore$ The circles will touch externally only and $C_1C_2 = r_1 + r_2$

$$\Rightarrow \quad \sqrt{2} = 2\sqrt{(1-c)} \text{ or } 2c = 1$$

(B) The circles $S_1:(x+1)^2+\left(y+\frac{3}{2}\right)^2=\left(\sqrt{\left(\frac{13}{4}-c\right)}\right)^2$

Centre $C_1:\left(-1,-\frac{3}{2}\right)$, radius $r_1:\sqrt{\left(\frac{13}{4}-c\right)}$

and $S_2:\left(x-\frac{1}{2}\right)^2+(y+1)^2=\left(\sqrt{\left(\frac{5}{4}-c\right)}\right)^2$

Centre $C_2:\left(\frac{1}{2},-1\right)$, radius $r_2:\sqrt{\left(\frac{5}{4}-c\right)}$

For intersect orthogonally

$$(C_1C_2)^2=r_1^2+r_2^2$$

$$\Rightarrow \quad \left(\frac{3}{2}\right)^2+\left(\frac{1}{2}\right)^2=\frac{13}{4}-c+\frac{5}{4}-c$$

or $$2c=2$$

(C) The circles

$$S_1:x^2+y^2=3^2$$

Centre $C_1:(0,0)$, radius $r_1:3$

and $$S_2:(x-1)^2+y^2=c^2$$

Centre $C_2:(1,0)$, radius $r_2:c$

Now, S_2 will be contained in S_1, then

$$C_1C_2<r_1-r_2$$

or $$1<3-c \text{ or } c<2\Rightarrow 2c<4$$

(D) The circles

$$S_1:x^2+y^2=9$$

Centre $C_1:(0,0)$, radius $r_1:3$ and

$$S_2:(x-1)^2+y^2=\left(\frac{c}{2}\right)^2$$

Centre $C_2:(1,0)$, radius $r_2:\frac{c}{2}$

Now, S_1 will be contained in S_2,

then, $$r_2-r_1>C_1C_2$$

$$\Rightarrow \quad \frac{c}{2}-3>1 \text{ or } c>8$$

$$\therefore \quad (c-6)>2$$

JEE Type Solved Examples :
Statement I and II Type Questions

- **Directions** (Ex. Nos. 26 and 27) are Assertion-Reason Type examples. Each of these examples contains two statements :
  Statement I (Assertion) and **Statement II** (Reason)

  Each of these examples also has four alternative choices only one of which is the correct answer. You have to select the correct choice as given below :
  (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
  (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
  (c) Statement I is true, Statement II is false
  (d) Statement I is false, Statement II is true

- ***Ex. 26*** *C_1 is a circle of radius 2 touching X-axis and Y-axis. C_2 is another circle of radius greater than 2 and touching the axes as well as the circle C_1.*

Statement I *Radius of Circle $C_2=\sqrt{2}(\sqrt{2}+1)(\sqrt{2}+2)$*

Statement II *Centres of both circles always lie on the line $y=x$.*

Sol. (c) $C_1:(x-2)^2+(y-2)^2=2^2$

$$C_2:(x-r)^2+(y-r)^2=r^2 \qquad (r>2)$$

According to question,

$$\sqrt{(r-2)^2+(r-2)^2}=r+2$$

$$(r-2)^2+(r-2)^2=(r+2)^2$$

$$r^2-12r+4=0$$

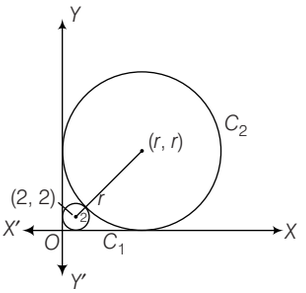
$$r=\frac{12\pm\sqrt{(144-16)}}{2}$$

$$=6\pm 4\sqrt{2}$$

$$\therefore \quad r=6+4\sqrt{2} \qquad [\because r>2]$$

$$=2(\sqrt{2}+1)^2$$

$$=\sqrt{2}(\sqrt{2}+1)(2+\sqrt{2})$$



∴Statement I is true and Statement II is always not true (where circles in II or IV quadrants)

- ***Ex. 27*** *From the point $P(\sqrt{2},\sqrt{6})$ tangents PA and PB are drawn to the circle $x^2+y^2=4$*

Statement I *Area of the quadrilateral OAPB (O being origin) is 4.*

Statement II *Tangents PA and PB are perpendicular to each other and therefore quadrilateral OAPB is a square.*

Sol. (a) Clearly, $P(\sqrt{2},\sqrt{6})$ lies on $x^2+y^2=8$, which is the director circle of $x^2+y^2=4$.

Therefore, tangents *PA* and *PB* are perpendicular to each other. So, *OAPB* is a square.

Hence, area of $OAPB=(\sqrt{S_1})^2=S_1$

$$=(\sqrt{2})^2+(\sqrt{6})^2-4=4$$

∴Both statements are true and statement II is correct explanation of statement I.

Subjective Type Examples

■ In this section, there are **16 subjective solved examples.**

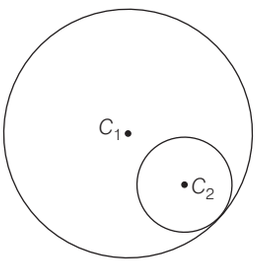
● ***Ex. 28*** *Find the equation of a circle having the lines* $x^2 + 2xy + 3x + 6y = 0$ *as its normals and having size just sufficient to contain the circle*

$$x(x-4) + y(y-3) = 0.$$

Sol. Given pair of normals is $x^2 + 2xy + 3x + 6y = 0$

or $(x + 2y)(x + 3) = 0$

$\therefore$ Normals are $x + 2y = 0$ and $x + 3 = 0$ the point of intersection of normals $x + 2y = 0$ and $x + 3 = 0$ is the centre of required circle, we get centre $C_1 \equiv (-3, 3/2)$ and other circle is



$$x(x-4) + y(y-3) = 0$$

or $x^2 + y^2 - 4x - 3y = 0$ ...(i)

its centre $C_2 \equiv (2, 3/2)$ and radius $r = \sqrt{4 + \frac{9}{4}} = \frac{5}{2}$

Since, the required circle just contains the given circle(i), the given circle should touch the required circle internally from inside.

$\Rightarrow$ radius of the required circle $= |C_1 - C_2| + r$

$$= \sqrt{(-3-2)^2 + \left(\frac{3}{2} - \frac{3}{2}\right)^2} + \frac{5}{2}$$

$$= 5 + \frac{5}{2} = \frac{15}{2}$$

Hence, equation of required circle is

$$(x+3)^2 + (y - 3/2)^2 = \left(\frac{15}{2}\right)^2$$

or $x^2 + y^2 + 6x - 3y - 54 = 0$

● ***Ex. 29*** *Let a circle be given by*

$$2x(x-a) + y(2y-b) = 0 \qquad (a \neq 0,\ b \neq 0)$$

Find the condition on a and b if two chords, each bisected by the X-axis, can be drawn to the circle from $(a, b/2)$.

Sol. The given circle is $2x(x-a) + y(2y-b) = 0$

or $x^2 + y^2 - ax - by/2 = 0$

Let AB be the chord which is bisected by X-axis at a point M. Let its coordinates be $M(h, 0)$

and let $S \equiv x^2 + y^2 - ax - by/2 = 0$

$\therefore$ Equation of chord AB is $T = S_1$

$$hx + 0 - \frac{a}{2}(x+h) - \frac{b}{4}(y+0) = h^2 + 0 - ah - 0$$

Since, its passes through $(a, b/2)$ we have

$$ah - \frac{a}{2}(a+h) - \frac{b^2}{8} = h^2 - ah$$

$$\Rightarrow \quad h^2 - \frac{3ah}{2} + \frac{a^2}{2} + \frac{b^2}{8} = 0$$

Now, there are two chords bisected by the X-axis, so there must be two distinct real roots of h.

$\therefore$ $B^2 - 4AC > 0$

$$\Rightarrow \quad \left(\frac{-3a}{2}\right)^2 - 4 \cdot 1 \cdot \left(\frac{a^2}{2} + \frac{b^2}{8}\right) > 0$$

$$\Rightarrow \quad a^2 > 2b^2.$$

Aliter : Given circle is

$$2x(x-a) + y(2y-b) = 0$$

or $x^2 + y^2 - ax - \frac{by}{2} = 0$ ...(i)

Let chords bisected at $M(h, 0)$ but given chords can be drawn $A\left(a, \frac{b}{2}\right)$ then chord cut the circle at $B(\lambda, -b/2)$

$\because$ Mid-point of ordinates of A and B is origin.

$\therefore$ $B(\lambda, b/2)$ lies on Eq. (i)

$\therefore$ $\lambda^2 + \frac{b^2}{4} - a\lambda + \frac{b^2}{4} = 0$

or $\lambda^2 - a\lambda + \frac{b^2}{2} = 0$

$\because$ λ is real

$\therefore$ $B^2 - 4AC > 0$ or $a^2 - 4 \cdot \frac{b^2}{2} > 0$ or $a^2 > 2b^2$

● ***Ex. 30*** *Let* C_1 *and* C_2 *be two circles with* C_2 *lying inside* C_1. *A circle* C *lying inside* C_1 *touches* C_1 *internally and* C_2 *externally. Identify the locus of the centre of* C.

Sol. Let the given circles $C_1$and C_2 have centres O_1 and O_2 with radii r_1 and r_2, respectively. Let centre of circle C is at O radius is r.

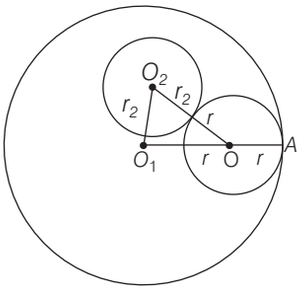
$\because$ $OO_2 = r + r_2$

$OO_1 = r_1 - r$

$\Rightarrow$ $OO_1 + OO_2 = r_1 + r_2$

which is greater than O_1O_2 as $O_1O_2 < r_1 + r_2$.

$\therefore$ Locus of O is an ellipse with foci O_1 and O_2.



Aliter :

Let $O_1 \equiv (0, 0)$, $O_2 \equiv (a, b)$ and $O \equiv (h, k)$

$\therefore$ $C_1 : x^2 + y^2 = r_1^2$

$C_2 : (x - a)^2 + (y - b)^2 = r_2^2$

$C : (x - h)^2 + (y - k)^2 = r^2$

$\Rightarrow$ $OO_2 = r + r_2$

$\Rightarrow$ $\sqrt{(h - a)^2 + (k - b)^2} = r + r_2$ ...(i)

and $OO_1 = r_1 - r$

$\Rightarrow$ $\sqrt{(h^2 + k^2)} = r_1 - r$ ...(ii)

On adding Eqs. (i) and (ii) we get

$$\sqrt{(h - a)^2 + (k - b)^2} + \sqrt{(h^2 + k^2)} = r_1 + r_2$$

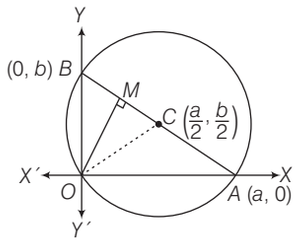
$\therefore$ Locus of O is $\sqrt{(x - a)^2 + (y - b)^2} + \sqrt{(x^2 + y^2)} = r_1 + r_2$

which represents an ellipse with foci are at (a,b) and $(0, 0)$.

● ***Ex. 31*** *A circle of constant radius r passes through the origin O, and cuts the axes at A and B. Show that the locus of the foot of the perpendicular from O to AB is*

$$(x^2 + y^2)^2 (x^{-2} + y^{-2}) = 4r^2$$

Sol. Let the coordinates of A and B are $(a, 0)$ and $(0, b)$.



$\therefore$ Equation of AB is $\frac{x}{a} + \frac{y}{b} = 1$ ...(i)

Centre of circle lie on line AB, since AB is diameter of the circle ($\because \angle AOB = \pi / 2$)

$\therefore$ Coordinate of centre C is $C \equiv \left(\frac{a}{2}, \frac{b}{2}\right)$

Since, the radius of circle = r

$\therefore$ $r = AC = CB = OC$

$$= \sqrt{\left(0 - \frac{a}{2}\right)^2 + \left(0 - \frac{b}{2}\right)^2} = \sqrt{\frac{a^2 + b^2}{4}}$$

$\therefore$ $a^2 + b^2 = 4r^2$ ...(ii)

Equation of OM which is $\perp$ to AB is

$$ax - by = \lambda$$

It passes through (0, 0)

$\therefore$ $0 = \lambda$

$\therefore$ Equation of OM is

$$ax - by = 0$$ ...(iii)

On solving Eq. (i) and Eq. (iii), we get

$$a = \frac{x^2 + y^2}{x} \text{ and } b = \frac{x^2 + y^2}{y}$$

Substituting the values of a and b in Eq. (ii), we get

$$(x^2 + y^2)^2 \left(\frac{1}{x^2} + \frac{1}{y^2}\right) = 4r^2$$

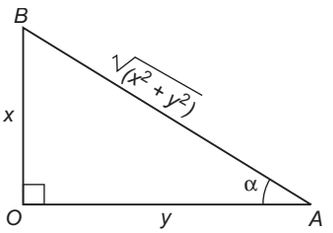
or $(x^2 + y^2)^2 (x^{-2} + y^{-2}) = 4r^2$

which is the required locus.

Aliter :

$\because$ AB is the diameter of circle. If $\angle OAB = \alpha$, then

$$OA = 2r \cos \alpha, OB = 2r \sin \alpha$$



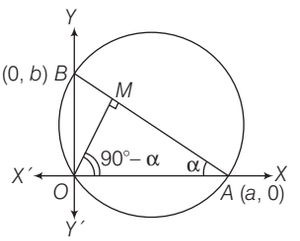
Equation of AB is

$$\frac{x}{2r \cos \alpha} + \frac{y}{2r \sin \alpha} = 1$$

$\Rightarrow$ $\frac{x}{\cos \alpha} + \frac{y}{\sin \alpha} = 2r$ ...(i)

and equation of OM is $y = x \tan (90° - \alpha)$

$\Rightarrow$ $\cot \alpha = \frac{y}{x}$



$\therefore$ $\sin \alpha = \frac{x}{\sqrt{(x^2 + y^2)}}$

and $\cos \alpha = \frac{y}{\sqrt{(x^2 + y^2)}}$

Then, from Eq. (i),

$$\frac{x}{y}\sqrt{(x^2+y^2)}+\frac{y}{x}\sqrt{(x^2+y^2)}=2r$$

$$\Rightarrow \quad \frac{(x^2+y^2)\sqrt{(x^2+y^2)}}{xy}=2r$$

On squaring, we have $(x^2+y^2)^2\,\frac{(x^2+y^2)}{x^2\,y^2}=4r^2$

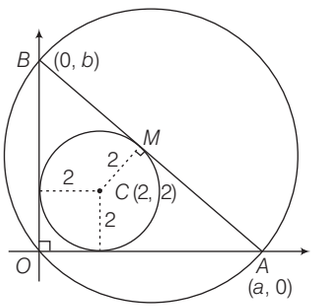
$$\Rightarrow \quad (x^2+y^2)^2\,(x^{-2}+y^{-2})=4r^2$$

● ***Ex. 32*** *The circle $x^2+y^2-4x-4y+4=0$ is inscribed in a triangle which has two of its sides along the coordinate axes. The locus of the circumcentre of the triangle is $x+y-xy+k\,(x^2+y^2)^{1/2}=0$. Find k.*

Sol. The given circle is $x^2+y^2-4x-4y+4=0$. This can be re-written as $(x-2)^2+(y-2)^2=4$ which has centre $C\,(2,2)$ and radius 2.

Let the equation of third side is

$$\frac{x}{a}+\frac{y}{b}=1 \qquad \text{(equation of } AB\text{)}$$



Length of perpendicular from (2, 2) on AB = radius = CM

$$\therefore \quad \frac{\left|\frac{2}{a}+\frac{2}{b}-1\right|}{\sqrt{\left(\frac{1}{a^2}+\frac{1}{b^2}\right)}}=2$$

Since, origin and (2, 2) lie on the same side of AB

$$\therefore \quad -\frac{\left(\frac{2}{a}+\frac{2}{b}-1\right)}{\sqrt{\left(\frac{1}{a^2}+\frac{1}{b^2}\right)}}=2$$

$$\text{or} \quad \frac{2}{a}+\frac{2}{b}-1=-2\sqrt{\left(\frac{1}{a^2}+\frac{1}{b^2}\right)} \qquad \ldots(i)$$

Since, $\quad \angle AOB=\frac{\pi}{2}$

Hence, AB is the diameter of the circle passing through ΔOAB, mid-point of AB is the centre of the circle i.e. $\left(\frac{a}{2},\frac{b}{2}\right)$.

Let centre be $(h,k)\equiv\left(\frac{a}{2},\frac{b}{2}\right)$ then $a=2h$ and $b=2k$.

Substituting the values of a and b in Eq. (i), then

$$\frac{2}{2h}+\frac{2}{2k}-1=-2\sqrt{\left(\frac{1}{4h^2}+\frac{1}{4k^2}\right)}$$

$$\Rightarrow \quad \frac{1}{h}+\frac{1}{k}-1=-\sqrt{\left(\frac{1}{h^2}+\frac{1}{k^2}\right)}$$

$$\text{or} \quad h+k-hk+\sqrt{(h^2+k^2)}=0$$

$\therefore$ Locus of $M\,(h,k)$ is

$$x+y-xy+\sqrt{(x^2+y^2)}=0$$

Hence, the required value of k is 1.

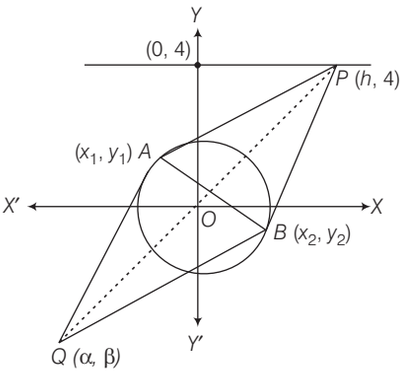
● ***Ex. 33*** *P is a variable on the line $y=4$. Tangents are drawn to the circle $x^2+y^2=4$ from P to touch it at A and B. The parallelogram PAQB is completed . Find the equation of the locus of Q.*

Sol. Let $P\,(h,4)$ be a variable point. Given circle is

$$x^2+y^2=4 \qquad \ldots(i)$$

Draw tangents from $P\,(h,4)$ and complete parallelogram $PAQB$.

Equation of the diagonal AB which is chord of contact of $x^2+y^2=4$ is $hx+4y=4$ $\ldots(ii)$



Let coordinates of A and B are (x_1,y_1) and (x_2,y_2), respectively.

Since, $A\,(x_1,y_1)$ and $B\,(x_2,y_2)$ lies on Eq. (ii)

$\therefore \quad hx_1+4y_1=4 \quad$ and $\quad hx_2+4y_2=4$

$\therefore \quad h\,(x_1+x_2)+4\,(y_1+y_2)=8 \qquad \ldots(iii)$

Since, $PAQB$ is parallelogram

$\therefore$ Mid-point of AB = Mid-point of PQ

$$\Rightarrow \quad \frac{x_1+x_2}{2}=\frac{\alpha+h}{2}$$

$$\text{and} \quad \frac{y_1+y_2}{2}=\frac{\beta+4}{2} \qquad \ldots(iv)$$

Eliminating x from Eqs. (i) and (ii), then

$$\left(\frac{4-4y}{h}\right)^2 + y^2 = 4$$

$$\Rightarrow \quad 16 + 16y^2 - 32y + h^2y^2 = 4h^2$$

$$\Rightarrow \quad (16 + h^2)\, y^2 - 32y + 16 - 4h^2 = 0$$

$$\therefore \quad y_1 + y_2 = \frac{32}{16 + h^2} \qquad \ldots(v)$$

From Eqs. (iii) and (v), we get

$$x_1 + x_2 = \frac{8h}{16 + h^2} \qquad \ldots(vi)$$

From Eqs. (iv) and (vi)

$$\beta + 4 = \frac{32}{16 + h^2}$$

or $$(16 + h^2)(\beta + 4) = 32 \qquad \ldots(vii)$$

From Eqs. (iv) and (vi)

$$\alpha + h = \frac{8h}{16 + h^2}$$

or $$(16 + h^2)(\alpha + h) = 8h \qquad \ldots(viii)$$

Dividing Eq. (viii) by Eq. (vii), then

$$\frac{\alpha + h}{\beta + 4} = \frac{h}{4} \quad \text{or} \quad h = \frac{4\alpha}{\beta}$$

Substituting the value of h in Eq. (vii) then

$$\left(16 + \frac{16\alpha^2}{\beta^2}\right)(\beta + 4) = 32$$

$$\Rightarrow \quad (\alpha^2 + \beta^2)(\beta + 4) = 2\beta^2$$

Hence, locus of $Q(\alpha, \beta)$ is $(x^2 + y^2)(y + 4) = 2y^2$

● ***Ex. 34*** *Show that the circumcircle of the triangle formed by the lines $ax + by + c = 0$; $bx + cy + a = 0$ and $cx + ay + b = 0$ passes through the origin if $(b^2 + c^2)(c^2 + a^2)(a^2 + b^2) = abc(b + c)(c + a)(a + b)$.*

Sol. Equation of conic is

$$(bx + cy + a)(cx + ay + b) + \lambda\,(cx + ay + b)(ax + by + c) + \mu\,(ax + by + c)(bx + cy + a) = 0 \qquad \ldots(i)$$

where, λ and μ are constants.

Eq. (i) represents a circle if the coefficient of x^2 and y^2 are equal and the coefficient of xy is zero such that

$$bc + \lambda ca + \mu ab = ca + \lambda ab + \mu bc$$

or $$(a - b)\, c + \lambda\,(b - c)\, a + \mu\,(c - a)\, b = 0 \qquad \ldots(ii)$$

and $$(c^2 + ab) + \lambda\,(a^2 + bc) + \mu\,(b^2 + ac) = 0 \qquad \ldots(iii)$$

on solving Eq. (ii) and Eq. (iii) by cross multiplication rule, we get

$$\frac{1}{(c^2 - ab)(a^2 + b^2)} = \frac{\lambda}{(a^2 - bc)(b^2 + c^2)} = \frac{\mu}{(b^2 - ac)(c^2 + a^2)}$$

$$\therefore \quad \lambda = \frac{(a^2 - bc)(b^2 + c^2)}{(c^2 - ab)(a^2 + b^2)}$$

and $$\mu = \frac{(b^2 - ac)(c^2 + a^2)}{(c^2 - ab)(a^2 + b^2)} \qquad \ldots(iv)$$

and given, Eq. (i) passes through the origin then

$$ab + bc\lambda + ca\,\mu = 0 \qquad \ldots(v)$$

From Eqs. (iv) and (v), we get

$$ab + \frac{bc\,(a^2 - bc)(b^2 + c^2)}{(c^2 - ab)(a^2 + b^2)} + \frac{ca\,(b^2 - ac)(c^2 + a^2)}{(c^2 - ab)(a^2 + b^2)} = 0$$

$$\Rightarrow \quad (c^2 - ab)(a^2 + b^2)\, ab + (a^2 - bc)(b^2 + c^2)bc + (b^2 - ca)(c^2 + a^2)\, ca = 0$$

$$\Rightarrow \quad abc^2\,(a^2 + b^2) + a^2bc\,(b^2 + c^2) + b^2ca\,(c^2 + a^2) = a^2b^2\,(a^2 + b^2) + b^2c^2\,(b^2 + c^2) + c^2a^2\,(c^2 + a^2)$$

$$\Rightarrow \quad abc\,\{c\,(a^2 + b^2) + a\,(b^2 + c^2) + b\,(c^2 + a^2)\} = a^2b^2\,(a^2 + b^2) + b^2c^2\,(b^2 + c^2) + c^2a^2\,(c^2 + a^2)$$

$$\Rightarrow \quad abc\,\{(a + b)(b + c)(c + a) - 2abc\} = a^2b^2\,(a^2 + b^2) + b^2c^2\,(b^2 + c^2) + c^2a^2\,(c^2 + a^2)$$

$$\Rightarrow \quad abc\,(a + b)(b + c)(c + a) = 2a^2b^2c^2 + a^2b^2\,(a^2 + b^2) + b^2c^2\,(b^2 + c^2) + c^2a^2\,(c^2 + a^2)$$

$$\Rightarrow \quad abc\,(a + b)(b + c)(c + a) = (a^2 + b^2)(b^2 + c^2)(c^2 + a^2)$$

Hence, $$(a^2 + b^2)(b^2 + c^2)(c^2 + a^2) = abc\,(a + b)(b + c)(c + a)$$

● ***Ex. 35*** *If four points P, Q, R, S in the plane be taken and the square of the length of the tangents from P to the circle on QR as diameter be denoted by $\{P, QR\}$, show that*

$$\{P, RS\} - \{P, QS\} + \{Q, PR\} - \{Q, RS\} = 0$$

Sol. Let $P \equiv (x_1, y_1)$, $Q \equiv (x_2, y_2)$, $R \equiv (x_3, y_3)$ and $S \equiv (x_4, y_4)$.

Equation of circle with RS as diameter is

$$(x - x_3)(x - x_4) + (y - y_3)(y - y_4) = 0$$

$$\therefore \quad \{P, RS\} = (x_1 - x_3)(x_1 - x_4) + (y_1 - y_3)(y_1 - y_4)$$

Now, equation of circle with QS as diameter is

$$(x - x_2)(x - x_4) + (y - y_2)(y - y_4) = 0$$

$$\therefore \quad \{P, QS\} = (x_1 - x_2)(x_1 - x_4) + (y_1 - y_2)(y_1 - y_4)$$

Equation of circle with PR as diameter is

$$(x - x_1)(x - x_3) + (y - y_1)(y - y_3) = 0$$

$\therefore$ $\{Q, PR\} = (x_2 - x_1)(x_2 - x_3) + (y_2 - y_1)(y_2 - y_3)$

Equation of circle with RS as diameter is

$$(x - x_3)(x - x_4) + (y - y_3)(y - y_4) = 0$$

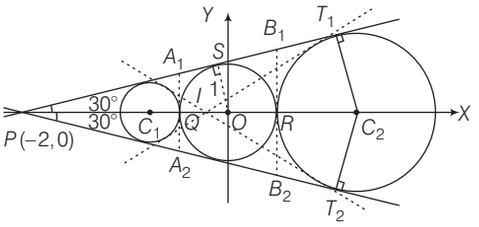
$\therefore$ $\{Q, RS\} = (x_2 - x_3)(x_2 - x_4) + (y_2 - y_3)(y_2 - y_4)$

Hence, $\{P, RS\} - \{P, QS\} + \{Q, PR\} - \{Q, RS\} = 0$

● ***Ex. 36*** *Let T_1, T_2 be two tangents drawn from $(-2, 0)$ on the circle $C : x^2 + y^2 = 1$. Determine the circles touching C and having T_1, T_2 as their pair of tangents. Further, find the equations of all possible common tangents to these circles when taken two at a time.*

Sol. In figure $OS = 1$, $OP = 2$

$\therefore$ $\sin \angle SPO = \dfrac{1}{2} = \sin 30°$



$\therefore$ $\angle SPO = 30°$

$\because$ $PA_1 = PA_2 \Rightarrow \angle PA_1A_2 = \angle PA_2A_1$

$\Rightarrow$ ΔPA_1A_2 is an equilateral triangle.

Therefore, centre C_1 is centroid of ΔPA_1A_2, C_1 divides PQ in the ratio 2 : 1.

$\therefore$ $C_1 \equiv \left(-\dfrac{4}{3}, 0\right)$ and its radius $= C_1Q = \dfrac{1}{3}$

$\Rightarrow$ $C_1 : (x + 4/3)^2 + y^2 = \left(\dfrac{1}{3}\right)^2$ ...(i)

The other circle C_2 touches the equilateral triangle PB_1B_2 externally.

its radius is given by $= \dfrac{\Delta}{s - a}$, where $B_1B_2 = a$

$$= \frac{\frac{\sqrt{3}}{4}a^2}{\frac{3a}{2} - a} = \frac{\sqrt{3}}{2}a$$

but $\tan 30° = \dfrac{a/2}{3} \Rightarrow a = \dfrac{6}{\sqrt{3}}$

$\therefore$ Radius $= \dfrac{\sqrt{3}}{2} \cdot \dfrac{6}{\sqrt{3}} = 3$

$\Rightarrow$ coordinates of C_2 are (4, 0)

$\therefore$ Equation of $C_2 : (x - 4)^2 + y^2 = 3^2$ ...(ii)

Equations of common tangents to circle (i) and circle C are

$$x = -1, y = \pm \frac{1}{\sqrt{3}}(x + 2), \{T_1 \text{ and } T_2\}$$

and equations of common tangents to circle (ii) and circle C are

$$x = 1, y = \pm \frac{1}{\sqrt{3}}(x + 2) (\{T_1 \text{ and } T_2\}$$

To find the remaining two transverse common tangents to Eqs. (i) and (ii). If I divides C_1 and C_2 in the ratio $r_1 : r_2 = 1/3 : 3 = 1 : 9$.

Therefore coordinates of I are $(-4/5, 0)$.

Equation of any line through I is $y - 0 = m(x + 4/5)$. If it will touch Eq. (ii)

then $\dfrac{|m(4 + 4/5) - 0|}{\sqrt{(1 + m^2)}} = 3$

$\Rightarrow$ $\left(\dfrac{24}{5}\right)^2 m^2 = 9(1 + m^2)$

$\Rightarrow$ $64m^2 = 25 + 25m^2$

$\Rightarrow$ $39m^2 = 25 \Rightarrow m = \pm \dfrac{5}{\sqrt{39}}$

Therefore, equations of transverse common tangents are

$$y = \pm \frac{5}{\sqrt{39}}(x + 4/5)$$

● ***Ex. 37*** *Find the equation of the circle of minimum radius which contains the three circles*

$$x^2 - y^2 - 4y - 5 = 0$$

$$x^2 + y^2 + 12x + 4y + 31 = 0$$

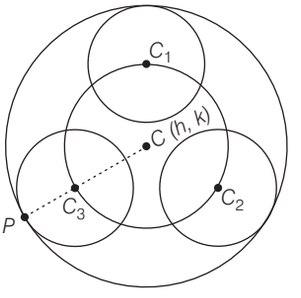
and $$x^2 + y^2 + 6x + 12y + 36 = 0$$

Sol. The coordinates of the centres and radii of three given circles are as given below :

$C_1 \equiv (0, 2)$; $r_1 = 3$

$C_2 \equiv (-6, -2)$; $r_2 = 3$

and $C_3 \equiv (-3, -6)$; $r_3 = 3$



Let $C \equiv (h, k)$ be the centre of the circle passing through the centres C_1 (0, 2), C_2 (−6, −2) and C_3 (−3, −6).

Then, $CC_1 = CC_2 = CC_3$

$\Rightarrow$ $(CC_1)^2 = (CC_2)^2 = (CC_3)^2$

$$\Rightarrow \quad (h-0)^2+(k-2)^2=(h+6)^2+(k+2)^2$$
$$=(h+3)^2+(k+6)^2$$
$$\Rightarrow \quad -4k+4=12h+4k+40=6h+12k+45$$
$$\Rightarrow \quad 12h+8k+36=0$$
or $$3h+2k+9=0 \qquad ...(i)$$
and $$6h-8k-5=0 \qquad ...(ii)$$

On solving Eqs. (i) and (ii), we get $h=-\frac{31}{18}, k=-\frac{23}{12}$

Now, $CP=CC_3+C_3P=CC_3+3$

$$=\sqrt{\left(-3+\frac{31}{18}\right)^2+\left(-6+\frac{23}{12}\right)^2}+3=\left(\frac{5}{36}\sqrt{(949)}+3\right)$$

Hence, equation of required circle is

$$\left(x+\frac{31}{18}\right)^2+\left(y+\frac{23}{12}\right)^2=\left(3+\frac{5}{\sqrt{36}}\sqrt{949}\right)^2$$

Remark

If radii of three given circles are distinct say $r_1 < r_2 < r_3$ then the radius of the required circle will be equal to (CC_1 or CC_2 or CC_3) + r_3 ($\because CC_1 = CC_2 = CC_3$)

● ***Ex. 38*** *Find the point P on the circle* $x^2+y^2-4x-6y+9=0$ *such that*

(i) $\angle POX$ is minimum,

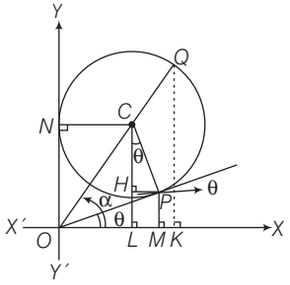
(ii) *OP is maximum, when O is the origin and OX is the X-axis.*

Sol. Given circle is

$$x^2+y^2-4x-6y+9=0$$
or $$(x-2)^2+(y-3)^2=2^2 \qquad .... (i)$$

Its centre is $C\equiv(2,3)$ and radius $r=2$

Eq. (i) Let OP and ON be the two tangents from O to the circle Eq. (i), then $OP=ON=3$



then $\angle POX$ is minimum when OP is tangent to the circle Eq. (i) at P

Let $\angle POX=\theta$

$$\therefore \quad P\equiv(OP\cos\theta, OP\sin\theta)$$
i.e. $$P\equiv(3\cos\theta, 3\sin\theta) \qquad ...(ii)$$

From figure, $OM=OL+LM=NC+HP=NC+CP\sin\theta$

$$\Rightarrow \quad OP\cos\theta=NC+CP\sin\theta$$
$$\Rightarrow \quad 3\cos\theta=2+2\sin\theta$$
$$\Rightarrow \quad 9(1-\sin^2\theta)=4(1+\sin\theta)^2$$
$$\Rightarrow \quad 9(1-\sin\theta)=4(1+\sin\theta) \qquad (\because \sin\theta\neq -1)$$
$$\therefore \quad \sin\theta=\frac{5}{13} \quad \text{and} \quad \cos\theta=\frac{12}{13}$$

From Eq. (ii), $P\equiv\left(3\times\frac{12}{13}, 3\times\frac{5}{13}\right)$ i.e. $P\equiv\left(\frac{36}{13}, \frac{15}{13}\right)$

Eq. (ii) OP will be maximum, if P becomes the point extended part of OC cuts the circle. Let this point be Q

then maximum value of $OP=OQ=OC+CQ=(\sqrt{13}+2)$

Let $\angle COX=\alpha$

then, $Q\equiv(OQ\cos\alpha, OQ\sin\alpha)$

$$\equiv((2+\sqrt{13})\cos\alpha, (2+\sqrt{13})\sin\alpha) \qquad ... (iii)$$

Now, in ΔCOL, $\cos\alpha=\frac{OL}{OC}=\frac{NC}{OC}=\frac{2}{\sqrt{13}}$

$$\therefore \quad \sin\alpha=\frac{3}{\sqrt{13}}$$

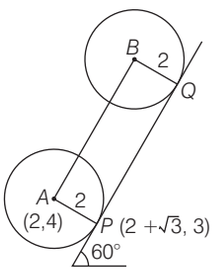
Now, from Eq. (iii), $Q\equiv\left(2+\frac{4}{\sqrt{13}}, 3+\frac{6}{\sqrt{13}}\right)$

● ***Ex. 39*** *The circle* $x^2+y^2-4x-8y+16=0$ *rolls up the tangent to it at* $(2+\sqrt{3}, 3)$ *by* 2 *units, assuming the X-axis as horizontal, find the equation of the circle in the new position.*

Sol. Given circle is

$$x^2+y^2-4x-8y+16=0 \qquad ...(i)$$

Let $P\equiv(2+\sqrt{3}, 3)$



Equation of tangent to the circle Eq. (i) at $P(2+\sqrt{3}, 3)$ is

$$(2+\sqrt{3})x+3y-2(x+2+\sqrt{3})-4(y+3)+16=0$$
or $$\sqrt{3}x-y-2\sqrt{3}=0 \qquad ...(ii)$$

Let A and B be the centres of the circles in old and new positions, then

$$B\equiv(2+2\cos 60^\circ, 4+2\sin 60^\circ)$$
($\because AB$ makes an angle 60° with X-axis)
or $$B\equiv(3, 4+\sqrt{3})$$

and radius $= \sqrt{2^2 + 4^2 - 16} = 2$

$\therefore$ Equation of the required circle is

$$(x-3)^2 + (y-4-\sqrt{3})^2 = 2^2$$

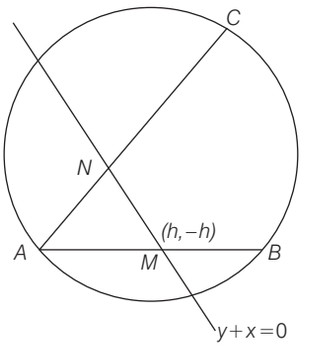
or $$x^2 + y^2 - 6x - 2(4+\sqrt{3})y + 24 + 8\sqrt{3} = 0$$

● ***Ex. 40*** *Find the intervals of the values of 'a' for which the line $y + x = 0$ bisects two chords drawn from a point $\left(\frac{1+\sqrt{2}a}{2}, \frac{1-\sqrt{2}a}{2}\right)$ to the circle*

$2x^2 + 2y^2 - (1+\sqrt{2}\,a)x - (1-\sqrt{2}a)y = 0.$

Sol. The point $A\left(\frac{1+\sqrt{2}a}{2}, \frac{1-\sqrt{2}a}{2}\right)$ lies on the given circle as its coordinate satisfy the equation of the circle. Let AB and AC are two chords drawn from A. Let M and N are the mid-points of AB and AC.

Let coordinate of M be $(h, -h)$ and coordinate of B is (α, β), then



$$h = \frac{\alpha + \frac{1+\sqrt{2}a}{2}}{2}$$

and $$-h = \frac{\beta + \frac{1-\sqrt{2}a}{2}}{2}$$

$\therefore$ $$\alpha = 2h - \frac{1-\sqrt{2}a}{2}$$

and $$\beta = -2h - \frac{1-\sqrt{2}a}{2}$$

Since, $B(\alpha, \beta)$ lies on the given circle, we have

$\Rightarrow$ $$2\left[2h - \frac{1+\sqrt{2}a}{2}\right]^2 + 2\left[-2h - \frac{1-\sqrt{2}a}{2}\right]^2 - (1+\sqrt{2}a)\left[2h - \frac{1+\sqrt{2}a}{2}\right] - (1-\sqrt{2}a)\left[-2h - \frac{1-\sqrt{2}a}{2}\right] = 0$$

$\Rightarrow$ $$16h^2 - 4h(1+\sqrt{2}a) + 4h(1-\sqrt{2}a) + \frac{(1+\sqrt{2}a)^2}{2} + \frac{(1-\sqrt{2}a)^2}{2} - 2h(1+\sqrt{2}a) + \frac{(1+\sqrt{2}a)^2}{2} + 2h(1-\sqrt{2}a) + \frac{(1-\sqrt{2}a)^2}{2} = 0$$

$\Rightarrow$ $$16h^2 - 12\sqrt{2}\,ah + (1+\sqrt{2}a)^2 + (1-\sqrt{2}a)^2 = 0$$

$\Rightarrow$ $$16h^2 - 12\sqrt{2}\,ah + 2 + 4a^2 = 0$$

or $$8h^2 - 6\sqrt{2}\,ah + 1 + 2a^2 = 0$$

Hence, for two real and different values of h, we must have

$$(-6\sqrt{2}a)^2 - 4 \cdot 8(1+2a^2) > 0$$

or $$72a^2 - 32(1+2a^2) > 0$$

$\Rightarrow$ $$8a^2 - 32 > 0$$

$\Rightarrow$ $$a^2 - 4 > 0$$

$$(a+2)(a-2) > 0$$

Hence, the required value of a (from wavy curve)

$$a \in (-\infty, -2) \cup (2, \infty)$$

Aliter : Equation of chord AB whose mid-point is $(h, -h)$ is

$$T = S_1$$

$$2xh - 2yh - (1+\sqrt{2}a)\left(\frac{x+h}{2}\right) - (1-\sqrt{2}a)\left(\frac{y-h}{2}\right) = 2h^2 + 2h^2 - (1+\sqrt{2}a)h + (1-\sqrt{2}a)h$$

$\Rightarrow$ $$4xh - 4yh - (1+\sqrt{2}a)(x+h) - (1-\sqrt{2}a)(y-h) = 8h^2 - 2(1+\sqrt{2}a)h + 2(1-\sqrt{2}a)h$$

$\Rightarrow$ $$x[4h - (1+\sqrt{2}a)] - y[4h + (1-\sqrt{2}a)] - h(1+\sqrt{2}a) + h(1-\sqrt{2}a) = 8h^2 - 2(1+\sqrt{2}a)h + 2(1-\sqrt{2}a)h$$

or $$8h^2 - (1+\sqrt{2}a)h + (1-\sqrt{2}a)h - x[4h - (1+\sqrt{2}a)] + y[4h + (1-\sqrt{2}a)] = 0$$

It passes through $A\left(\frac{1+\sqrt{2}a}{2}, \frac{1-\sqrt{2}a}{2}\right)$, then

$$8h^2 - 2\sqrt{2}ah - \left(\frac{1+\sqrt{2}a}{2}\right)[4h - (1+\sqrt{2}a)] + \left(\frac{1-\sqrt{2}a}{2}\right)[4h + (1-\sqrt{2}a)] = 0$$

or $$8h^2 - 2\sqrt{2}ah - 2h(1+\sqrt{2}a) + \frac{(1+\sqrt{2}a)^2}{2} + 2h(1-\sqrt{2}a) + \frac{(1-\sqrt{2}a)^2}{2} = 0$$

or $$8h^2 - 6\sqrt{2}ah + 1 + 2a^2 = 0$$

Hence, for two real and different values of h, we must have

$$(-6\sqrt{2}a)^2 - 4\cdot 8\cdot(1+2a^2) > 0$$

or $$a^2 - 4 > 0$$

$$\therefore \quad (a+2)(a-2) > 0$$

$$\therefore \quad a \in (-\infty, -2) \cup (2, \infty)$$

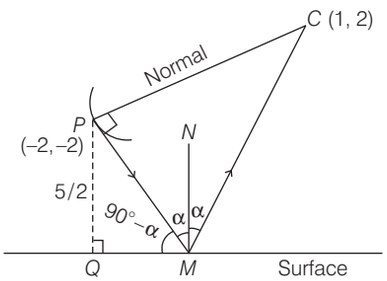
● ***Ex. 41*** *A ball moving around the circle $x^2 + y^2 - 2x - 4y - 20 = 0$ in anti-clockwise direction leaves it tangentially at the point $P(-2, -2)$. After getting reflected from a straight line, it passes through the centre of the circle. Find the equation of the straight line if its perpendicular distance from P is 5/2. You can assume that the angle of incidence is equal to the angle of reflection.*

Sol. Radius of the circle $= CP = \sqrt{9+16} = 5$

Let the equation is of surface is $y = mx + c$

given $$PQ = \frac{5}{2}$$

$$\therefore \quad \frac{-2m + 2 + c}{\sqrt{(1+m^2)}} = \pm\frac{5}{2} \qquad \ldots(i)$$



Tangent at P strikes it at the point M and after reflection passes through the centre $C(1, 2)$.

Let MN be the normal at M.

$$\angle PMN = \angle NMC = \alpha$$

In ΔPCM, $$\tan 2\alpha = \frac{PC}{PM}$$

$$\Rightarrow \quad \tan 2\alpha = \frac{5}{PM}$$

$$\Rightarrow \quad PM = 5\cot 2\alpha \qquad \ldots(ii)$$

and in ΔPQM

$$\sin(90°-\alpha) = \frac{5/2}{PM}$$

$$\therefore \quad PM = \frac{5}{2\cos\alpha} \qquad \ldots(iii)$$

From Eqs. (ii) and (iii), $5\cot 2\alpha = \dfrac{5}{2\cos\alpha}$

$$\Rightarrow \quad 2\cot 2\alpha\cos\alpha = 1$$

$$\Rightarrow \quad \frac{2\cos 2\alpha}{\sin 2\alpha}.\cos\alpha = 1$$

$$\Rightarrow \quad \frac{2(1-2\sin^2\alpha)\cos\alpha}{2\sin\alpha\cos\alpha} = 1$$

$$\Rightarrow \quad 1 - 2\sin^2\alpha = \sin\alpha$$

$$\Rightarrow \quad 2\sin^2\alpha + \sin\alpha - 1 = 0$$

$$\Rightarrow \quad (2\sin\alpha - 1)(\sin\alpha + 1) = 0$$

$$\Rightarrow \quad \sin\alpha \neq -1$$

$$\therefore \quad \sin\alpha = \frac{1}{2}$$

$$\therefore \quad \alpha = 30°$$

Tangent at $P(-2,-2)$ is

$$-2x - 2y - (x-2) - 2(y-2) - 20 = 0$$

$$\Rightarrow \quad 3x + 4y + 14 = 0$$

Slope of $PM = -3/4$

$\because$ $\angle PMQ = 90° - \alpha = 90° - 30° = 60°$

$$\therefore \quad \tan 60° = \left|\frac{m + 3/4}{1 - 3m/4}\right|, \quad \sqrt{3} = \frac{4m+3}{4-3m}$$

$$\therefore \quad m = \frac{4\sqrt{3}-3}{4+3\sqrt{3}}$$

From Eq. (i) $\pm\dfrac{5}{2} = \dfrac{2(1-m)+c}{\sqrt{1+m^2}}$

we get $$c = \frac{11+2\sqrt{3}}{4+3\sqrt{3}} \quad \text{or} \quad \frac{-39+2\sqrt{3}}{4+3\sqrt{3}}$$

c being intercept on Y-axis made by surface is clearly –ve. Hence, the required line is

$$y = \left(\frac{4\sqrt{3}-3}{4+3\sqrt{3}}\right)x + \left(\frac{-39+2\sqrt{3}}{4+3\sqrt{3}}\right)$$

$$\Rightarrow \quad (4\sqrt{3}-3)x - (4+3\sqrt{3})y - (39-2\sqrt{3}) = 0.$$

● ***Ex. 42*** *Find the limiting points of the circles $(x^2 + y^2 + 2gx + c) + \lambda(x^2 + y^2 + 2fy + d) = 0$ and show that the square of the distance between them is*

$$\frac{(c-d)^2 - 4f^2g^2 + 4cf^2 + 4dg^2}{f^2 + g^2}$$

Sol. The given circles are

$$(x^2 + y^2 + 2gx + c) + \lambda(x^2 + y^2 + 2fy + d) = 0$$

$$\Rightarrow \quad x^2 + y^2 + \frac{2g}{1+\lambda}x + \frac{2f\lambda}{1+\lambda}y + \frac{(c+\lambda d)}{1+\lambda} = 0$$

Centre of the circle $\left(\dfrac{-g}{1+\lambda}, \dfrac{-f\lambda}{1+\lambda}\right)$

Equating the radius of this circle to zero, we get

$$\frac{g^2}{(1+\lambda)^2} + \frac{f^2\lambda^2}{(1+\lambda)^2} - \frac{(c+\lambda d)}{(1+\lambda)} = 0$$

$$\Rightarrow \quad g^2 + f^2\lambda^2 - (c + \lambda d)(1 + \lambda) = 0$$

$$\Rightarrow \quad (f^2 - d)\lambda^2 - (c + d)\lambda + g^2 - c = 0$$

Let the roots be λ_1 and λ_2

then $\lambda_1 + \lambda_2 = \dfrac{(c+d)}{(f^2-d)}, \lambda_1\lambda_2 = \dfrac{g^2-c}{f^2-d}$

$$\therefore \quad (\lambda_1 - \lambda_2) = \sqrt{(\lambda_1 + \lambda_2)^2 - 4\lambda_1\lambda_2}$$

$$= \sqrt{\frac{(c+d)^2}{(f^2-d)^2} - \frac{4(g^2-c)}{(f^2-d)}}$$

$$= \frac{\sqrt{(c+d)^2 - 4f^2g^2 + 4cf^2 + 4dg^2}}{(f^2-d)} \quad ...(i)$$

$$\therefore \quad \lambda_1 = \frac{(c+d) + \sqrt{(c-d)^2 - 4f^2g^2 + 4cf^2 + 4dg^2}}{2(f^2-d)} \quad ...(ii)$$

and $\lambda_2 = \dfrac{(c+d) - \sqrt{\{(c-d)^2 - 4f^2g^2 + 4cf^2 + 4dg^2\}}}{2(f^2-d)}$ ...(iii)

Hence, limiting points are

$$\left(\frac{-g}{1+\lambda_1}, \frac{-f\lambda_1}{1+\lambda_1}\right) \quad \text{and} \quad \left(\frac{-g}{1+\lambda_2}, \frac{-f\lambda_2}{1+\lambda_2}\right)$$

Substituting the values of λ_1 and λ_2 from Eqs. (ii) and (iii) square of the distance between limiting points

$$= \left(\frac{-g}{1+\lambda_1} + \frac{g}{1+\lambda_2}\right)^2 + \left(\frac{-f\lambda_1}{1+\lambda_1} + \frac{f\lambda_2}{1+\lambda_2}\right)^2$$

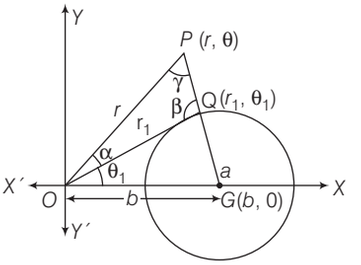
$$= \frac{(g^2+f^2)(\lambda_1-\lambda_2)^2}{[1+(\lambda_1+\lambda_2)+\lambda_1\lambda_2]^2}$$

$$= \frac{(g^2+f^2)\dfrac{\{(c-d)^2 - 4f^2g^2 + 4cf^2 + 4dg^2\}}{(f^2-d)^2}}{\left(\dfrac{g^2+f^2}{f^2-d}\right)^2}$$

$$\Rightarrow \quad \frac{[(c-d)^2 - 4f^2g^2 + 4cf^2 + 4dg^2]}{(g^2+f^2)}$$

● ***Ex. 43*** *One vertex of a triangle of given species is fixed and another moves along circumference of a fixed circle. Prove that the locus of the remaining vertex is a circle and find its radius.*

Sol. Let OPQ be a triangle of given species. Then the angles α, β, γ will be fixed.



Let the polar coordinates of Q be (r_1, θ_1), we have to find the locus of $P(r, \theta)$. In $\angle OCQ$

$$\cos\theta_1 = \frac{r_1^2 + b^2 - a^2}{2r_1 b} \quad ...(i)$$

$$\because \quad \theta = \alpha + \theta_1, \quad \therefore \ \theta_1 = \theta - \alpha \quad ...(ii)$$

using sine rule in ΔOPQ

$$\frac{r}{\sin\beta} = \frac{r_1}{\sin\gamma}$$

$$\therefore \quad r_1 = \frac{r\sin\gamma}{\sin\beta} \quad ...(iii)$$

Substituting the values of θ_1 and r_1 from Eqs. (ii)and (iii) in Eq. (i)

$$2b\frac{r\sin\gamma}{\sin\beta}\cos(\theta-\alpha) = \frac{r^2\sin^2\gamma}{\sin^2\beta} + b^2 - a^2$$

$$\Rightarrow \quad \frac{a^2\sin^2\beta}{\sin^2\gamma} = r^2 + \frac{b^2\sin^2\beta}{\sin^2\gamma} - 2b\frac{r\sin\beta}{\sin\gamma}\cos(\theta-\alpha)$$

This is an equation of circle in polar form with radius $\dfrac{\sin\beta}{\sin\gamma}$.

Circle Exercise 1 :
Single Option Correct Type Questions

■ This section contains **30 multiple choice questions.** Each question has four choices (a), (b), (c) and (d) out of which **ONLY ONE** is correct

1. The sum of the square of the length of the chord intercepted by the line $x+y=n, n\in N$ on the circle $x^2+y^2=4$ is

(a) 11 (b) 22
(c) 33 (d) None of these

2. Tangents are drawn to the circle $x^2+y^2=50$ from a point 'P' lying on the X-axis. These tangents meet the Y-axis at points 'P_1' and 'P_2'. Possible coordinates of 'P' so that area of triangle PP_1P_2 is minimum, is

(a) $(10,0)$ (b) $(10\sqrt{2},0)$ (c) $(-10\sqrt{2},0)$ (d) $(10\sqrt{3},0)$

3. Equation of chord AB of circle $x^2+y^2=2$ passing through $P(2,2)$ such that $\frac{PB}{PA}=3$, is given by

(a) $x=3y$ (b) $x=y$
(c) $y-2=\sqrt{3}(x-2)$ (d) $y-3=\sqrt{3}(x-1)$

4. If r_1 and r_2 are the radii of smallest and largest circles which passes through (5, 6) and touches the circle $(x-2)^2+y^2=4$, then r_1r_2 is

(a) $\frac{4}{41}$ (b) $\frac{41}{4}$ (c) $\frac{5}{41}$ (d) $\frac{41}{5}$

5. Equation of circle $S(x,y)=0, (S(2,3)=16)$ which touches the line $3x+4y-7=0$ at $(1,1)$ is given by

(a) $x^2+y^2+x+2y-5=0$
(b) $x^2+y^2+2x+2y-7=0$
(c) $x^2+y^2+4x-6y+13=0$
(d) $x^2+y^2-4x+6y-7=0$

6. If $P(2,8)$ is an interior point of a circle $x^2+y^2-2x+4y-\lambda=0$ which neither touches nor intersects the axes, then set for λ is

(a) $(-\infty,-1)$ (b) $(-\infty,-4)$
(c) $(96,\infty)$ (d) ϕ

7. The difference between the radii of the largest and smallest circles which have their centre on the circumference of the circle $x^2+y^2+2x+4y-4=0$ and pass through the point (a,b) lying outside the given circle is

(a) 6 (b) $\sqrt{(a+1)^2+(b+2)^2}$
(c) 3 (d) $\sqrt{(a+1)^2+(b+2)^2}-3$

8. The number of rational point(s) (a point (a,b) is rational, if a and b both are rational numbers) on the circumference of a circle having centre (π, e) is

(a) atmost one (b) atleast two
(c) exactly two (d) infinite

9. Three sides of a triangle have the equations $L_r\equiv y-m_rx-c_r=0; r=1,2,3$. Then $\lambda L_2L_3+\mu L_3L_1+\nu L_1L_2=0$, where $\lambda\neq 0,\mu\neq 0,\nu\neq 0$ is the equation of circumcircle of triangle, if

(a) $\lambda(m_2+m_3)+\mu(m_3+m_1)+\nu(m_1+m_2)=0$
(b) $\lambda(m_2m_3-1)+\mu(m_3m_1-1)+\nu(m_1m_2-1)=0$
(c) Both (a) and (b)
(d) None of the above

10. $f(x,y)\equiv x^2+y^2+2ax+2by+c=0$ represent a circle. If $f(x,0)=0$ has equal roots, each being 2 and $f(0,y)=0$ has 2 and 3 as its roots, then the centre of the circle is

(a) $\left(2,\frac{5}{2}\right)$ (b) Data are not consistent
(c) $\left(-2,-\frac{5}{2}\right)$ (d) Data are inconsistent

11. If $(1+\alpha x)^n=1+8x+24x^2+\ldots$ and a line through $P(\alpha,n)$ cuts the circle $x^2+y^2=4$ in A and B, then $PA.PB$ is equal to

(a) 4 (b) 8 (c) 16 (d) 32

12. A region in the xy-plane is bounded by the curve $y=\sqrt{(25-x^2)}$ and the line $y=0$. If the point $(a,a+1)$ lies in the interior of the region, then

(a) $a\in(-4,3)$ (b) $a\in(-\infty,-1)\cup(3,\infty)$
(c) $a\in(-1,3)$ (d) None of these

13. $S(x,y)=0$ represents a circle. The equation $S(x,2)=0$ gives two identical solutions $x=1$ and the equation $S(1,y)=0$ gives two distinct solutions $y=0,2$, then the equation of the circle is

(a) $x^2+y^2+2x-2y+1=0$ (b) $x^2+y^2-2x+2y+1=0$
(c) $x^2+y^2-2x-2y-1=0$ (d) $x^2+y^2-2x-2y+1=0$

14. Let $0<\alpha<\frac{\pi}{2}$ be a fixed angle. If $P=(\cos\theta,\sin\theta)$ and $Q=(\cos(\alpha-\theta),\sin(\alpha-\theta))$, then Q is obtained from P by

(a) clockwise rotation around origin through an angle α
(b) anti-clockwise rotation around origin through an angle α
(c) reflection in the line through origin with slope $\tan\alpha$
(d) reflection in the line through origin with slope $\tan\left(\frac{\alpha}{2}\right)$

15. The number of points (x, y) having integral coordinates satisfying the condition $x^2 + y^2 < 25$ is
(a) 69 (b) 80 (c) 81 (d) 77

16. The point $([P+1], [P])$, (where $[.]$ denotes the greatest integer function) lying inside the region bounded by the circle $x^2 + y^2 - 2x - 15 = 0$ and $x^2 + y^2 - 2x - 7 = 0$, then
(a) $P \in [-1, 0) \cup [0, 1) \cup [1, 2)$ (b) $P \in [-1, 2) - \{0, 1\}$
(c) $P \in (-1, 2)$ (d) None of these

17. A point P lies inside the circles $x^2 + y^2 - 4 = 0$ and $x^2 + y^2 - 8x + 7 = 0$. The point P starts moving under the conditions that its path encloses greatest possible area and it is at a fixed distance from any arbitrarily chosen fixed point in its region. The locus of P is
(a) $4x^2 + 4y^2 - 12x + 1 = 0$ (b) $4x^2 + 4y^2 + 12x - 1 = 0$
(c) $x^2 + y^2 - 3x - 2 = 0$ (d) $x^2 + y^2 - 3x + 2 = 0$

18. The set of values of 'c' so that the equations $y = |x| + c$ and $x^2 + y^2 - 8|x| - 9 = 0$ have no solution is
(a) $(-\infty, -3) \cup (3, \infty)$ (b) $(-3, 3)$
(c) $(-\infty, -5\sqrt{2}) \cup (5\sqrt{2}, \infty)$ (d) $(5\sqrt{2} - 4, \infty)$

19. If a line segment $AM = a$ moves in the plane XOY remaining parallel to OX so that the left end point A slides along the circle $x^2 + y^2 = a^2$, the locus of M is
(a) $x^2 + y^2 = 4a^2$ (b) $x^2 + y^2 = 2ax$
(c) $x^2 + y^2 = 2ay$ (d) $x^2 + y^2 - 2ax - 2ay = 0$

20. The four points of intersection of the lines $(2x - y + 1)(x - 2y + 3) = 0$ with the axes lie on a circle whose centre is at the point
(a) $\left(-\frac{7}{4}, \frac{5}{4}\right)$ (b) $\left(\frac{3}{4}, \frac{5}{4}\right)$ (c) $\left(\frac{9}{4}, \frac{5}{4}\right)$ (d) $\left(0, \frac{5}{4}\right)$

21. The number of integral values of λ for which $x^2 + y^2 + \lambda x + (1 - \lambda)y + 5 = 0$ is the equation of a circle whose radius cannot exceed 5, is
(a) 14 (b) 18 (c) 16 (d) None of these

22. Let $\phi(x, y) = 0$ be the equation of a circle. If $\phi(0, \lambda) = 0$ has equal roots $\lambda = 2, 2$ and $\phi(\lambda, 0) = 0$ has roots $\lambda = \frac{4}{5}, 5$, then the centre of the circle is
(a) $\left(2, \frac{29}{10}\right)$ (b) $\left(\frac{29}{10}, 2\right)$ (c) $\left(-2, \frac{29}{10}\right)$ (d) None of these

23. The locus of the point of intersection of the tangents to the circle $x = r\cos\theta, y = r\sin\theta$ at points whose parametric angles differ by $\frac{\pi}{3}$ is
(a) $x^2 + y^2 = 4(2 - \sqrt{3})r^2$ (b) $3(x^2 + y^2) = 1$
(c) $x^2 + y^2 = (2 - \sqrt{3})r^2$ (d) $3(x^2 + y^2) = 4r^2$

24. One of the diameter of the circle circumscribing the rectangle $ABCD$ is $4y = x + 7$. If A and B are the points $(-3, 4)$ and $(5, 4)$ respectively, then the area of the rectangle is
(a) 16 sq units (b) 24 sq units
(c) 32 sq units (d) None of these

25. A, B, C and D are the points of intersection with the coordinate axes of the lines $ax + by = ab$ and $bx + ay = ab$, then
(a) A, B, C, D are concyclic
(b) A, B, C, D form a parallelogram
(c) A, B, C, D form a rhombus
(d) None of the above

26. α, β and γ are parametric angles of three points P, Q and R respectively, on the circle $x^2 + y^2 = 1$ and A is the point $(-1, 0)$. If the lengths of the chords AP, AQ and AR are in GP, then $\cos\left(\frac{\alpha}{2}\right), \cos\left(\frac{\beta}{2}\right)$ and $\cos\left(\frac{\gamma}{2}\right)$ are in
(a) AP (b) GP
(c) HP (d) None of these

27. The equation of the circle passing through (2, 0) and (0, 4) and having the minimum radius is
(a) $x^2 + y^2 = 20$
(b) $x^2 + y^2 - 2x - 4y = 0$
(c) $(x^2 + y^2 - 4) + \lambda(x^2 + y^2 - 16) = 0$
(d) None of the above

28. A circle of radius unity is centred at the origin. Two particles start moving at the same time from the point (1, 0) and move around the circle in opposite direction. One of the particle moves anticlockwise with constant speed v and the other moves clockwise with constant speed $3v$. After leaving (1, 0), the two particles meet first at a point P and continue until they meet next at point Q. The coordinates of the point Q are
(a) (1, 0) (b) (0, 1) (c) (−1, 0) (d) (0, −1)

29. The circle $x^2 + y^2 = 4$ cuts the line joining the points $A(1, 0)$ and $B(3, 4)$ in two points P and Q. Let $\frac{BP}{PA} = \alpha$ and $\frac{BQ}{QA} = \beta$, then α and β are roots of the quadratic equation
(a) $x^2 + 2x + 7 = 0$ (b) $3x^2 + 2x - 21 = 0$
(c) $2x^2 + 3x - 27 = 0$ (d) None of these

30. The locus of the mid-points of the chords of the circle $x^2 + y^2 + 4x - 6y - 12 = 0$ which subtend an angle of $\frac{\pi}{3}$ radians at its circumference is
(a) $(x + 2)^2 + (y - 3)^2 = 6.25$ (b) $(x - 2)^2 + (y + 3)^2 = 6.25$
(c) $(x + 2)^2 + (y - 3)^2 = 18.75$ (d) $(x + 2)^2 + (y + 3)^2 = 18.75$

Circle Exercise 2 :
More than One Correct Option Type Questions

This section contains **15 multiple choice questions**. Each question has four choices (a), (b), (c) and (d) out of which **MORE THAN ONE** may be correct.

31. If OA and OB are two perpendicular chords of the circle $r = a\cos\theta + b\sin\theta$ passing through origin, then the locus of the mid-point of AB is

(a) $x^2 + y^2 = a + b$ (b) $x = \frac{a}{2}$

(c) $x^2 - y^2 = a^2 - b^2$ (d) $y = \frac{b}{2}$

32. If A and B are two points on the circle $x^2 + y^2 - 4x + 6y - 3 = 0$ which are farthest and nearest respectively, from the point (7, 2), then

(a) $A \equiv (2 - 2\sqrt{2}, -3 - 2\sqrt{2})$

(b) $A \equiv (2 + 2\sqrt{2}, -3 + 2\sqrt{2})$

(c) $B \equiv (2 + 2\sqrt{2}, -3 + 2\sqrt{2})$

(d) $B \equiv (2 - 2\sqrt{2}, -3 - 2\sqrt{2})$

33. If the circle $x^2 + y^2 + 2gx + 2fy + c = 0$ cuts each of the circles $x^2 + y^2 - 4 = 0$, $x^2 + y^2 - 6x - 8y + 10 = 0$ and $x^2 + y^2 + 2x - 4y - 2 = 0$ at the extremities of a diameter, then

(a) $c = -4$ (b) $g + f = c - 1$

(c) $g^2 + f^2 - c = 17$ (d) $gf = 6$

34. The possible value of $\lambda(\lambda > 0)$ such that the angle between the pair of tangents from point $(\lambda, 0)$ to the circle $x^2 + y^2 = 4$ lies in interval $\left(\frac{\pi}{2}, \frac{2\pi}{3}\right)$ is

(a) $\left(\frac{4}{\sqrt{3}}, 2\sqrt{2}\right)$ (b) $(0, \sqrt{2})$

(c) (1,2) (d) $\left(\frac{4}{\sqrt{3}}, \frac{4}{\sqrt{3}}\right)$

35. If a chord of the circle $x^2 + y^2 - 4x - 2y - c = 0$ is trisected at the points $\left(\frac{1}{3}, \frac{1}{3}\right)$ and $\left(\frac{8}{3}, \frac{8}{3}\right)$, then

(a) $c = 10$ (b) $c = 20$

(c) $c = 15$ (d) $c^2 - 40c + 400 = 0$

36. From the point $A(0,3)$ on $x^2 + 4x + (y-3)^2 = 0$, a chord AB is drawn and extended to a point M, such that $AM = 2AB$. An equation of the locus of M is

(a) $x^2 + 6x + (y-2)^2 = 0$

(b) $x^2 + 8x + (y-3)^2 = 0$

(c) $x^2 + y^2 + 8x - 6y + 9 = 0$

(d) $x^2 + y^2 + 6x - 4y + 4 = 0$

37. An equation of a circle touching the axes of coordinates and the line $x\cos\alpha + y\sin\alpha = 2$ can be

(a) $x^2 + y^2 - 2gx - 2gy + g^2 = 0$, where $g = \frac{2}{(\cos\alpha + \sin\alpha + 1)}$

(b) $x^2 + y^2 - 2gx - 2gy + g^2 = 0$, where $g = \frac{2}{(\cos\alpha + \sin\alpha - 1)}$

(c) $x^2 + y^2 - 2gx + 2gy + g^2 = 0$, where $g = \frac{2}{(\cos\alpha - \sin\alpha + 1)}$

(d) $x^2 + y^2 - 2gx + 2gy + g^2 = 0$, where $g = \frac{2}{(\cos\alpha - \sin\alpha - 1)}$

38. If α is the angle subtended at $P(x_1, y_1)$ by the circle $S \equiv x^2 + y^2 + 2gx + 2fy + c = 0$, then

(a) $\cot\alpha = \frac{\sqrt{S_1}}{\sqrt{(g^2 + f^2 - c)}}$ (b) $\cot\frac{\alpha}{2} = \frac{\sqrt{S_1}}{\sqrt{(g^2 + f^2 - c)}}$

(c) $\tan\alpha = \frac{2\sqrt{(g^2 + f^2 - c)}}{\sqrt{S_1}}$ (d) $\alpha = 2\tan^{-1}\left(\frac{\sqrt{(g^2 + f^2 - c)}}{\sqrt{S_1}}\right)$

39. The equation of the circle which touches the axis of coordinates and the line $\frac{x}{3} + \frac{y}{4} = 1$ and whose centre lies in the first quadrant is $x^2 + y^2 - 2\lambda x - 2\lambda y + \lambda^2 = 0$, then λ is equal to

(a) 1 (b) 2

(c) 3 (d) 6

40. If P is a point on the circle $x^2 + y^2 = 9$, Q is a point on the line $7x + y + 3 = 0$, and the line $x - y + 1 = 0$, is the perpendicular bisector of PQ, then the coordinates of P are

(a) (3, 0) (b) $\left(\frac{72}{25}, -\frac{21}{25}\right)$

(c) (0, 3) (d) $\left(-\frac{72}{25}, \frac{21}{25}\right)$

41. If a circle passes through the point $\left(3, \sqrt{\frac{7}{2}}\right)$ and touches $x + y = 1$ and $x - y = 1$, then the centre of the circle is

(a) (4,0) (b) (4, 2) (c) (6, 0) (d) (7, 9)

42. The equation of a circle C_1 is $x^2 + y^2 = 4$. The locus of the intersection of orthogonal tangents to the circle is the curve C_2 and the locus of the intersection of perpendicular tangents to the curve C_2 is the curve C_3. Then,

(a) C_3 is a circle

(b) the area enclosed by the curve C_3 is 8π

(c) C_2 and C_3 are circles with the same centre

(d) None of the above

43. The equation of a tangent to the circle $x^2+y^2=25$ passing through $(-2,11)$ is
(a) $4x+3y=25$ (b) $3x+4y=38$
(c) $24x-7y+125=0$ (d) $7x+24y=230$

44. Consider the circles
$C_1 \equiv x^2+y^2-2x-4y-4=0$ and
$C_2 \equiv x^2+y^2+2x+4y+4=0$
and the line $L \equiv x+2y+2=0$, then
(a) L is the radical axis of C_1 and C_2
(b) L is the common tangent of C_1 and C_2
(c) L is the common chord of C_1 and C_2
(d) L is perpendicular to the line joining centres of C_1 and C_2

45. A square is inscribed in the circle $x^2+y^2-10x-6y+30=0$. One side of the square is parallel to $y=x+3$, then one vertex of the square is
(a) (3, 3) (b) (7,3)
(c) $(6,3-\sqrt{3})$ (d) $(6,3+\sqrt{3})$

Circle Exercise 3 : Paragraph Based Questions

This section contains **7 paragraphs** based upon each of the paragraph **3 multiple choice questions** have to be answered. Each of these questions has four choices (a), (b), (c) and (d) out of which **ONLY ONE** is correct.

Paragraph I

(Q. Nos. 46 to 48)

Consider the circle $S: x^2+y^2-4x-1=0$ and the line $L: y=3x-1$. If the line L cuts the circle at A and B.

46. Length of the chord AB is
(a) $\sqrt{5}$ (b) $\sqrt{10}$ (c) $2\sqrt{5}$ (d) $5\sqrt{2}$

47. The angle subtended by the chord AB is the minor arc of S is
(a) $\frac{\pi}{4}$ (b) $\frac{2\pi}{3}$ (c) $\frac{3\pi}{4}$ (d) $\frac{5\pi}{6}$

48. Acute angle between the line L and the circle S is
(a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{2}$

Paragraph II

(Q. Nos. 49 to 51)

P is a variable point on the line $L=0$. Tangents are drawn to the circle $x^2+y^2=4$ from P to touch it at Q and R. The parallelogram $PQSR$ is completed.

49. If $L \equiv 2x+y-6=0$, then the locus of the circumcenter of ΔPQR is
(a) $2x-y=4$ (b) $2x+y=3$
(c) $x-2y=4$ (d) $x+2y=3$

50. If $P \equiv (6,8)$, then area of ΔQRS is $\frac{192}{25}\sqrt{\lambda}$ sq units. The value of λ is
(a) 2 (b) 3 (c) 5 (d) 6

51. If $P \equiv (3,4)$, then the coordinates of S are
(a) $\left(-\frac{46}{25},\frac{63}{25}\right)$ (b) $\left(-\frac{51}{25},-\frac{68}{25}\right)$
(c) $\left(-\frac{46}{25},\frac{68}{25}\right)$ (d) $\left(-\frac{68}{25},\frac{51}{25}\right)$

Paragraph III

(Q. Nos. 52 to 54)

Equation of the circumcircle of a triangle formed by the lines $L_1=0$, $L_2=0$ and $L_3=0$ can be written as $L_1L_2+\lambda L_2L_3+\mu L_3L_1=0$, where λ and μ are such that coefficient of x^2 = coefficient of y^2 and coefficient of $xy=0$.

52. $L_1{L_2}^2+\lambda L_2L_3^2+\mu L_3L_1^2=0$ represents
(a) a curve passing through point of intersection of $L_1=0$, $L_2=0$ and $L_3=0$
(b) a circle is coefficient of $x^2=$ coefficient of y^2 and coefficient of $xy=0$
(c) a parabola
(d) pair of straight lines

53. $L_1=0$, $L_2=0$ be the distinct parallel lines, $L_3=0$, $L_4=0$ be two other distinct parallel lines which are not parallel to $L_1=0$. The equation of a circle passing through the vertices of the parallelogram formed must be of the form
(a) $\lambda L_1L_4+\mu L_2L_3=0$ (b) $\lambda L_1L_3+\mu L_2L_4=0$
(c) $\lambda L_1L_2+\mu L_3L_4=0$ (d) $\lambda L_1^2L_3+\mu L_2^2L_4=0$

54. If $L_1{L_2}+\lambda L_2L_3+\mu L_3L_1=0$ is such that $\mu=0$ and λ is non-zero, then it represents
(a) a parabola
(b) a pair of straight lines
(c) a circle
(d) an ellipse

Paragraph IV

(Q. Nos. 55 to 57)

Given two circles intersecting orthogonally having the length of common chord $\frac{24}{5}$ unit. The radius of one of the circles is 3 units.

55. If radius of other circle is λ units, then λ is
(a) 2 (b) 4 (c) 5 (d) 6

56. If angle between direct common tangents is 2θ, then $\sin 2\theta$ is
(a) $\frac{4}{5}$ (b) $\frac{4\sqrt{6}}{25}$ (c) $\frac{12}{25}$ (d) $\frac{24}{25}$

57. If length of direct common tangent is λ units, then λ^2 is
(a) 12 (b) 24 (c) 36 (d) 48

Paragraph V

(Q. Nos. 58 to 60)

Consider the two circles $C_1 : x^2 + y^2 = a^2$ and $C_2 : x^2 + y^2 = b^2$ $(a > b)$. Let A be a fixed point on the circle C_1, say $A(a, 0)$ and B be a variable point on the circle C_2. The line BA meets the circle C_2 again at C. 'O' being the origin.

58. If $(OA)^2 + (OB)^2 + (BC)^2 = \lambda$, then $\lambda \in$
(a) $[5b^2 - 3a^2, 5b^2 + a^2]$ (b) $[4b^2, 4b^2 + a^2]$
(c) $[4a^2, 4b^2]$ (d) $[5b^2 - 3a^2, 5b^2 + 3a^2]$

59. The locus of the mid-point of AB is
(a) $\left(x - \frac{a}{2}\right)^2 + y^2 = \frac{b^2}{4}$ (b) $\left(x - \frac{a}{2}\right)^2 + y^2 = \frac{a^2}{4}$
(c) $\left(x - \frac{b}{2}\right)^2 + y^2 = \frac{a^2}{4}$ (d) $\left(x - \frac{b}{2}\right)^2 + y^2 = \frac{b^2}{4}$

60. If $(BC)^2$ is maximum, then the locus of the mid-point of AB is
(a) $x^2 + y^2 = b^2$ (b) $x^2 + y^2 = (a + b)^2$
(c) $x^2 + y^2 = (a - b)^2$ (d) None of these

Paragraph VI

(Q. Nos. 61 to 63)

Two variable chords AB and BC of a circle $x^2 + y^2 = a^2$ are such that $AB = BC = a$, M and N are the mid-points of AB and BC respectively such that line joining MN intersect the circle at P and Q, where P is closer to AB and O is the centre of the circle.

61. $\angle OAB$ is
(a) 15° (b) 30°
(c) 45° (d) 60°

62. Angle between tangents at A and C is
(a) 60° (b) 90°
(c) 120° (d) 150°

63. Locus of point of intersection of tangents at A and C is
(a) $x^2 + y^2 = a^2$ (b) $x^2 + y^2 = 2a^2$
(c) $x^2 + y^2 = 4a^2$ (d) $x^2 + y^2 = 8a^2$

Paragraph VII

(Q. Nos. 64 to 66)

t_1, t_2, t_3 are lengths of tangents drawn from a point (h, k) to the circles $x^2 + y^2 = 4$, $x^2 + y^2 - 4x = 0$ and $x^2 + y^2 - 4y = 0$ respectively further, $t_1^4 = t_2^2\, t_3^2 + 16$. Locus of the point (h, k) consist of a straight line L_1 and a circle C_1 passing through origin. A circle C_2, which is equal to circle C_1 is drawn touching the line L_1 and the circle C_1 externally.

64. Equation of L_1 is
(a) $x + y = 0$ (b) $x - y = 0$
(c) $2x + y = 0$ (d) $x + 2y = 0$

65. Equation of C_1 is
(a) $x^2 + y^2 - x - y = 0$ (b) $x^2 + y^2 - 2x + y = 0$
(c) $x^2 + y^2 - x + 2y = 0$ (d) $x^2 + y^2 - 2x - 2y = 0$

66. The distance between the centres of C_1 and C_2 is
(a) $\sqrt{2}$ (b) 2
(c) $2\sqrt{2}$ (d) 4

Circle Exercise 4 : Single Integer Answer Type Questions

- This section contains **10 questions**. The answer to each question is a **single digit integer**, ranging from 0 to 9 (both inclusive).

67. The point (1, 4) lies inside the circle $x^2 + y^2 - 6x - 10y + \lambda = 0$. If the circle neither touches nor cuts the axes, then the difference between the maximum and the minimum possible values of λ is

68. Consider the family of circles $x^2 + y^2 - 2x - 2\lambda y - 8 = 0$ passing through two fixed points A and B. Then the distance between the points A and B is

69. If $C_1 : x^2 + y^2 = (3+2\sqrt{2})^2$ be a circle and PA and PB are pair of tangents on C_1, where P is any point on the director circle of C_1, then the radius of the smallest circle which touches C_1 externally and also the two tangents PA and PB, is

70. If a circle $S(x, y) = 0$ touches the point $(2,3)$ of the line $x + y = 5$ and $S(1,2) = 0$, then radius of such circle is $\frac{1}{\sqrt{\lambda}}$ units, then the value of λ^2 is.

71. If real numbers x and y satisfy $(x+5)^2 + (y-12)^2 = 196$, then the maximum value of $(x^2 + y^2)^{\frac{1}{3}}$ is

72. If the equation of circle circumscribing the quadrilateral formed by the lines in order are $2x + 3y = 2$, $3x - 2y = 3$, $x + 2y = 3$ and $2x - y = 1$ is given by $x^2 + y^2 + \lambda x + \mu y + \nu = 0$. Then the value of $|\lambda + 2\mu + \nu|$ is

73. A circle $x^2 + y^2 + 4x - 2\sqrt{2}y + c = 0$ is the director circle of the circle C_1 and C_1 is the director circle of circle C_2 and so on. If the sum of radii of all these circles is 2 and if $c = \lambda\sqrt{2}$, then the value of λ is

74. If the area bounded by the circles $x^2 + y^2 = r^2$, $r = 1, 2$ and the rays given by $2x^2 - 3xy - 2y^2 = 0$, $y > 0$ is $\frac{\lambda\pi}{4}$ sq units, then the value of λ is

75. The length of a common internal tangent of two circles is 5 and that of a common external tangent is 13. If the product of the radii of two circles is λ, then the value of $\frac{\lambda}{4}$ is

76. Consider a circles S with centre at the origin and radius 4. Four circles A, B, C and D each with radius unity and centres $(-3,0)$, $(-1,0)$, $(1,0)$ and $(3,0)$ respectively are drawn. A chord PQ of the circle S touches the circle B and passes through the centre of the circle C. If the length of this chord can be expressed as $\sqrt{\lambda}$, then the value of $\frac{\lambda}{9}$ is

Circle Exercise 5 : Matching Type Questions

- This section contains **4 questions**. Questions 77 and 78 have four statements (A, B, C and D) given in **Column I** and four statements (p, q, r and s) in **Column II**, and questions 79 and 80 have three statements (A, B and C) given in **Column I** and five statements (p, q, r, s and t) in **Column II**. Any given statement in **Column I** can have correct matching with one or more statement(s) given in **Column II**.

77. Consider the circles $S_1 : x^2 + y^2 - 4x - 6y + 12 = 0$ and $S_2 : (x-5)^2 + (y-6)^2 = r^2 > 1$

	Column I		Column II
(A)	S_1 and S_2 touch internally, then $(r-1)^2$ is divisible by	(p)	3
(B)	S_1 and S_2 touch externally, then $r^2 + 2r + 3$ is divisible by	(q)	4
(C)	S_1 and S_2 intersect orthogonally, then $r^2 - 1$ is divisible by	(r)	5
(D)	S_1 and S_2 intersect so that the common chord is longest, then $r^2 + 5$ is divisible by	(s)	6

78. Match the following

	Column I		Column II
(A)	If $ax + by - 5 = 0$ is the equation of the chord of the circle $(x-3)^2 + (y-4)^2 = 4$, which passes through $(2,3)$ and at the greatest distance from the centre of the circle, then	(p)	$a + b = 1$
(B)	Let O be the origin and P be a variable point on the circle $x^2 + y^2 + 2x + 2y = 0$. If the locus of mid-point of OP is $x^2 + y^2 + 2ax + 2by = 0$, then	(q)	$a + b = 2$
(C)	If (a, b) be coordinates of the centre of the smallest circle which cuts the circle $x^2 + y^2 - 2x - 4y - 4 = 0$ and $x^2 + y^2 - 10x + 12y + 52 = 0$ orthogonally, then	(r)	$a^2 + b^2 = 2$
(D)	If a and b are the slope of tangents which are drawn to the circle $x^2 + y^2 - 6\sqrt{3}x - 6y + 27 = 0$ from the origin, then	(s)	$a^2 + b^2 = 3$

79. Match the following

	Column I		Column I
(A)	If the shortest and largest distance from the point (10,7) to the circle $x^2 + y^2 - 4x - 2y - 20 = 0$ are L and M respectively, then	(p)	$M + L = 10$
(B)	If the shortest and largest distance from the point (3, −6) to the circle $x^2 + y^2 - 16x - 12y - 125 = 0$ are L and M respectively, then	(q)	$M + L = 20$
(C)	If the shortest and largest distance from the point (6, −6) to the circle $x^2 + y^2 - 4x + 6y - 12 = 0$ are L and M respectively, then	(r)	$M + L = 30$
		(s)	$M - L = 10$
		(t)	$M - L = 26$

80. Match the following

	Column I		Column II
(A)	If the straight lines $y = a_1x + b$ and $y = a_2x + b$ $(a_1 \neq a_2)$ and $b \in R$ meet the coordinate axes in concyclic points, then	(p)	$a_1^2 + a_2^2 = 4$
(B)	If the chord of contact of the tangents drawn to $x^2 + y^2 = b^2$ and $b \in R$ from any point on $x^2 + y^2 = a_1^2$, touches the circle $x^2 + y^2 = a_2^2$ $(a_1 \neq a_2)$, then	(q)	$a_1 + a_2 = 3$
(C)	If the circle $x^2 + y^2 + 2a_1x + b = 0$ and $x^2 + y^2 + 2a_2x + b = 0 (a_1 \neq a_2)$ and $b \in R$ cuts orthogonally, then	(r)	$a_1a_2 = b$
		(s)	$a_1a_2 = 1$
		(t)	$a_1a_2 = b^2$

Circle Exercise 6 : Statement I and II Type Questions

■ **Directions** (Q. Nos. 81 to 88) are Assertion-Reason type questions. Each of these questions contains two statements:
Statement I (Assertion) and **Statement II** (Reason) Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select the correct choice as given below :

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(c) Statement I is true, Statement II is false
(d) Statement I is false, Statement II is true

81. **Statement I** Only one tangent can be drawn from the point (1, 3) to the circle $x^2 + y^2 = 1$

Statement II Solving $\frac{|3 - m|}{\sqrt{(1 + m^2)}} = 1$, we get only one real value of m

82. **Statement I** Tangents cannot be drawn from the point $(1, \lambda)$ to the circle $x^2 + y^2 + 2x - 4y = 0$

Statement II $(1+1)^2 + (\lambda + 2)^2 < 1^2 + 2^2$

83. **Statement I** Number of circles passing through (1, 4), (2, 3), (−1, 6) is one

Statement II Every triangle has one circumcircle

84. **Statement I** Two tangents are drawn from a point on the circle $x^2 + y^2 = 50$ to the circle $x^2 + y^2 = 25$, then angle between tangents is $\frac{\pi}{3}$

Statement II $x^2 + y^2 = 50$ is the director circle of $x^2 + y^2 = 25$.

85. **Statement I** Circles $x^2 + y^2 = 4$ and $x^2 + y^2 - 6x + 5 = 0$ intersect each other at two distinct points

Statement II Circles with centres C_1, C_2 and radii r_1, r_2 intersect at two distinct points if $|C_1C_2| < r_1 + r_2$

86. **Statement I** The line $3x - 4y = 7$ is a diameter of the circle $x^2 + y^2 - 2x + 2y - 47 = 0$

Statement II Normal of a circle always pass through centre of circle

87. **Statement I** A ray of light incident at the point (−3, −1) gets reflected from the tangent at $(0, -1)$ to the circle $x^2 + y^2 = 1$. If the reflected ray touches the circle, then equation of the reflected ray is $4y - 3x = 5$

Statement I The angle of incidence = angle of reflection i.e. $\angle i = \angle r$

88. **Statement I** The chord of contact of the circle $x^2 + y^2 = 1$ w.r.t. the points (2,3), (3,5) and (1,1) are concurrent.

Statement II Points (1, 1), (2, 3) and (3,5) are collinear.

Circle Exercise 7 :
Subjective Type Questions

- In this section, there are **16 subjective questions**.

89. Find the equation of the circle passing through $(1, 0)$ and $(0, 1)$ and having the smallest possible radius.

90. Find the equation of the circle which touches the circle $x^2 + y^2 - 6x + 6y + 17 = 0$ externally and to which the lines $x^2 - 3xy - 3x + 9y = 0$ are normals.

91. A line meets the coordinate axes at A and B. A circle is circumscribed about the triangle OAB. If the distance of the points A and B from the tangent at O, the origin, to the circle are m and n respectively, find the equation of the circle.

92. Find the equation of a circle which passes through the point $(2\ ,\ 0)$ and whose centre is the limit of the point of intersection of the lines $3x + 5y = 1$ and $(2 + c)\ x + 5c^2 y = 1$ as $c \to 1$.

93. Tangents are drawn from $P(6, 8)$ to the circle $x^2 + y^2 = r^2$. Find the radius of the circle such that the area of the Δ formed by tangents and chord of contact is maximum.

94. $2x - y + 4 = 0$ is a diameter of the circle which circumscribed a rectangle $ABCD$. If the coordinates of A and B are $A(4, 6)$ and $B(1, 9)$, find the area of rectangle $ABCD$.

95. Find the radius of smaller circle which touches the straight line $3x - y = 6$ at $(1, -3)$ and also touches the line $y = x$.

96. If the circle C_1, $x^2 + y^2 = 16$ intersects another circle C_2 of radius 5 in such a manner that the common chord is of maximum length and has a slope equal to (3/4), find the coordinates of centre C_2.

97. Let $2x^2 + y^2 - 3xy = 0$ be the equation of a pair of tangents drawn from the origin O to a circle of radius 3 with centre in the first quadrant. If A is one of the points of contact, find the length of OA.

98. The circle $x^2 + y^2 = 1$ cuts the X-axis at P and Q. another circle with centre at Q and variable radius intersects the first circle at R above the X-axis and the line segment PQ at S. Find the maximum area of the ΔQSR.

99. If the two lines $a_1x + b_1y + c_1 = 0$ and $a_2x + b_2y + c_2 = 0$ cut the coordinate axes in concyclic points, prove that $a_1a_2 = b_1b_2$ and find the equation of the circle.

100. The centre of the circle $S = 0$ lie on the line $2x - 2y + 9 = 0$ and $S = 0$ cuts orthogonally the circle $x^2 + y^2 = 4$. Show that circle $S = 0$ passes through two fixed points and find their coordinates.

101. Find the condition on a, b, c such that two chords of the circle $x^2 + y^2 - 2ax - 2by + a^2 + b^2 - c^2 = 0$ passing through the point $(a, b + c)$ are bisected by the line $y = x$.

102. Two straight lines rotate about two fixed points. If they start from their position of coincidence such that one rotates at the rate double that of the other. Prove that the locus of their point of intersection is a circle.

103. The base AB of a triangle is fixed and its vertex C moves such that $\sin A = k \sin B\ (k \neq 1)$. Show that the locus of C is a circle whose centre lies on the line AB and whose radius is equal to $\dfrac{ak}{(1 - k^2)}$, a being the length of the base AB.

104. Consider a curve $ax^2 + 2hxy + by^2 = 1$ and a point P not on the curve. A line drawn from the point P intersects the curve at points Q and R. If the product $PQ \cdot PR$ is independent of the slope of the line, then show that the curve is a circle.

Circle Exercise 8 :
Questions Asked in Previous 13 Year's Exams

■ This section contains questions asked in **IIT-JEE, AIEEE, JEE Main & JEE Advanced** from year **2005** to **2017**.

105. A circle is given by $x^2+(y-1)^2=1$, another circle C touches it externally and also the X-axis, then the locus of its centre is **[IIT-JEE 2005, 3M]**

(a) $\{(x,y):x^2=4y\}\cup\{(x,y):y\le 0\}$

(b) $\{(x,y):x^2+(y-1)^2=4\}\cup\{(x,y):y\le 0\}$

(c) $\{(x,y):x^2=y\}\cup\{(0,y):y\le 0\}$

(d) $\{(x,y):x^2=4y\}\cup\{(0,y):y\le 0\}$

106. If the circles $x^2+y^2+2ax+cy+a=0$ and $x^2+y^2-3ax+dy-1=0$ intersect in two distinct points P and Q, then the line $5x+by-a=0$ passes through P and Q for **[AIEEE 2005, 6M]**

(a) exactly one value of a (b) no value of a

(c) infinitely many values of a (d) exactly two values of a

107. A circle touches the X-axis and also touches the circle with centre at (0, 3) and radius 2. The locus of the centre of the circle is **[AIEEE 2005, 3M]**

(a) an ellipse (b) a circle

(c) a hyperbola (d) a parabola

108. If a circle passes through the point (a,b) and cuts the circle $x^2+y^2=p^2$ orthogonally, then the equation of the locus of its centre is **[AIEEE 2005, 3M]**

(a) $x^2+y^2-3ax-4by+(a^2+b^2-p^2)=0$

(b) $2ax+2by-(a^2-b^2+p^2)=0$

(c) $x^2+y^2-2ax-3by+(a^2-b^2-p^2)=0$

(d) $2ax+2by-(a^2+b^2+p^2)=0$

Paragraph
(Q. Nos. 109 to 111)

ABCD is a square of side length 2 units. C_1 is the circle touching all the sides of the square ABCD and C_2 is the circumcircle of square ABCD. L is a fixed line in the same plane and R is a fixed point.

109. If P is any point of C_1 and Q is another point on C_2, then $\dfrac{PA^2+PB^2+PC^2+PD^2}{QA^2+QB^2+QC^2+QD^2}$ is equal to

(a) 0.75 (b) 1.25 (c) 1 (d) 0.5

110. If a circle is such that it touches the line L and the circle C_1 externally, such that both the circles are on the same side of the line, then the locus of centre of the circle is

(a) ellipse (b) hyperbola

(c) parabola (d) pair of straight line

111. A line L' through A is drawn parallel to BD. Point S moves such that its distances from the line BD and the vertex A are equal. If locus of S cuts L' at T_2 and T_3 and AC at T_1, then area of $\Delta T_1T_2T_3$ is **[IIT-JEE 2006, 5+5+5 M]**

(a) $\frac{1}{2}$ sq units (b) $\frac{2}{3}$ sq units

(c) 1 sq units (d) 2 sq units

112. If the lines $3x-4y-7=0$ and $2x-3y-5=0$ are two diameters of a circle of area 49π square units, the equation of the circle is **[AIEEE 2006, 6M]**

(a) $x^2+y^2+2x-2y-47=0$

(b) $x^2+y^2+2x-2y-62=0$

(c) $x^2+y^2-2x+2y-62=0$

(d) $x^2+y^2-2x+2y-47=0$

113. Let C be the circle with centre (0, 0) and radius 3 units. The equation of the locus of the mid-points of the chords of the circle C that subtend an angle of $\frac{2\pi}{3}$ at its centre is **[AIEEE 2006, 6M]**

(a) $x^2+y^2=\frac{3}{2}$ (b) $x^2+y^2=1$

(c) $x^2+y^2=\frac{27}{4}$ (d) $x^2+y^2=\frac{9}{4}$

114. Tangents are drawn from the point (17, 7) to the circle $x^2+y^2=169$.

Statement I The tangents are mutually perpendicular. because

Statement II The locus of the points from which mutually perpendicular tangents can be drawn to the given circle is $x^2+y^2=338$. **[IIT-JEE 2007, 3M]**

(a) Statement I is True, statement II is True; statement II is a correct explanation for statement I

(b) Statement I is True, statement II is True; statement II is not a correct explanation for statement I

(c) Statement I is True, statement II is False

(d) Statement I is False, statement II is True

115. Consider a family of circles which are passing through the point $(-1,1)$ and are tangent to X-axis. If (h,k) are the coordinate of the centre of the circles, then the set of values of k is given by the interval **[AIEEE 2007, 3M]**

(a) $-\frac{1}{2}\le k\le\frac{1}{2}$ (b) $k\le\frac{1}{2}$

(c) $0\le k\le\frac{1}{2}$ (d) $k\ge\frac{1}{2}$

Paragraph

(Q. Nos. 116 to 118)

A circle C of radius 1 is inscribed in an equilateral triangle PQR. The points of contact of C with the sides PQ, QR, RP are D, E, F, respectively. The line PQ is given by the equation $\sqrt{3}x + y - 6 = 0$ *and the point D is* $\left(\frac{3\sqrt{3}}{2}, \frac{3}{2}\right)$. *Further, it is given that the origin and the centre of C are on the same side of the line PQ.*

116. The equation of circle C is

(a) $(x-2\sqrt{3})^2 + (y-1)^2 = 1$ (b) $(x-2\sqrt{3})^2 + \left(y+\frac{1}{2}\right)^2 = 1$

(c) $(x-\sqrt{3})^2 + (y+1)^2 = 1$ (d) $(x-\sqrt{3})^2 + (y-1)^2 = 1$

117. Points E and F are given by

(a) $\left(\frac{\sqrt{3}}{2}, \frac{3}{2}\right), (\sqrt{3}, 0)$ (b) $\left(\frac{\sqrt{3}}{2}, \frac{1}{2}\right), (\sqrt{3}, 0)$

(c) $\left(\frac{\sqrt{3}}{2}, \frac{3}{2}\right), \left(\frac{\sqrt{3}}{2}, \frac{1}{2}\right)$ (d) $\left(\frac{3}{2}, \frac{\sqrt{3}}{2}\right), \left(\frac{\sqrt{3}}{2}, \frac{1}{2}\right)$

118. Equations of the sides QR, RP are **[IIT-JEE 2008, (4 + 4 + 4) M]**

(a) $y = \frac{2}{\sqrt{3}}x + 1,\ y = -\frac{2}{\sqrt{3}}x - 1$ (b) $y = \frac{1}{\sqrt{3}}x,\ y = 0$

(c) $y = \frac{\sqrt{3}}{2}x + 1,\ y = -\frac{\sqrt{3}}{2}x - 1$ (d) $y = \sqrt{3}x,\ y = 0$

119. Consider $L_1 : 2x + 3y + p - 3 = 0$; $L_2 : 2x + 3y + p + 3 = 0$ where, p is a real number, and $C : x^2 + y^2 + 6x - 10y + 30 = 0$

Statement I If line L_1 is a chord of circle C, then line L_2 is not always a diameter of circle C and

Statement II If line L_1 is a diameter of circle C, then line L_2 is not a chord of circle C. **[IIT-JEE 2008, 3M]**

(a) Statement I is True, statement II is True; statement II is a correct explanation for statement I

(b) Statement I is True, statement II is True; statement II is not a correct explanation for statement I

(c) Statement I is True, statement II is False

(d) Statement I is False, statement II is True

120. The point diametrically opposite to the point $P(1, 0)$ on the circle $x^2 + y^2 + 2x + 4y - 3 = 0$ is **[AIEEE 2008, 3M]**

(a) $(3, -4)$ (b) $(-3, 4)$ (c) $(-3, -4)$ (d) $(3, 4)$

121. Tangents drawn from the point $P(1, 8)$ to the circle $x^2 + y^2 - 6x - 4y - 11 = 0$ touch the circle at the points A and B. The equation of the circumcircle of the triangle PAB is **[IIT-JEE 2009, 3M]**

(a) $x^2 + y^2 + 4x - 6y + 19 = 0$ (b) $x^2 + y^2 - 4x - 10y + 19 = 0$

(c) $x^2 + y^2 - 2x + 6y - 29 = 0$ (d) $x^2 + y^2 - 6x - 4y + 19 = 0$

122. The centres of two circles C_1 and C_2 each of unit radius are at a distance of 6 units from each other. Let P be the mid point of the line segment joining the centres of C_1 and C_2 and C be a circle touching circles C_1 and C_2 externally. If a common tangent to C_1 and C passing through P is also a common tangent to C_2 and C, then the radius of the circle C is **[IIT-JEE 2009, 4M]**

123. If P and Q are the points of intersection of the circles $x^2 + y^2 + 3x + 7y + 2p - 5 = 0$ and $x^2 + y^2 + 2x + 2y - p^2 = 0$ then there is a circle passing through P, Q and (1, 1) for : **[AIEEE 2009, 4M]**

(a) all except one value of p

(b) all except two values of p

(c) exactly one value of p

(d) all values of p

124. The circle $x^2 + y^{2d} = 4x + 8y + 5$ intersects the line $3x - 4y = m$ at two distinct points if **[AIEEE 2010, 4M]**

(a) $-35 < m < 15$ (b) $15 < m < 65$

(c) $35 < m < 85$ (d) $-85 < m < -35$

125. The circle passing through the point $(-1, 0)$ and touching the Y-axis at (0, 2) also passes through the point. **[IIT-JEE 2011, 3M]**

(a) $\left(-\frac{3}{2}, 0\right)$ (b) $\left(-\frac{5}{2}, 2\right)$

(c) $\left(-\frac{3}{2}, \frac{5}{2}\right)$ (d) $(-4, 0)$

126. The straight line $2x - 3y = 1$ divides the circular region $x^2 + y^2 \le 6$ into two parts.

If $S = \left\{\left(2, \frac{3}{4}\right), \left(\frac{5}{2}, \frac{3}{4}\right), \left(\frac{1}{4}, -\frac{1}{4}\right), \left(\frac{1}{8}, \frac{1}{4}\right)\right\}$ then the number of point(s) in S lying inside the smaller part is **[IIT-JEE 2011, 4M]**

127. The two circles $x^2 + y^2 = ax$ and $x^2 + y^2 = c^2 (c > 0)$ touch each other if **[AIEEE 2011, 4M]**

(a) $|a| = c$ (b) $a = 2c$

(c) $|a| = 2c$ (d) $2|a| = c$

128. The locus of the mid-point of the chord of contact of tangents drawn from points lying on the straight line $4x - 5y = 20$ to the circle $x^2 + y^2 = 9$ is **[IIT-JEE 2012, 3M]**

(a) $20(x^2 + y^2) - 36x + 45y = 0$

(b) $20(x^2 + y^2) + 36x - 45y = 0$

(c) $36(x^2 + y^2) - 20x + 45y = 0$

(d) $36(x^2 + y^2) + 20x - 45y = 0$

Paragraph

(Q. Nos. 129 and 130)

A tangent PT is drawn to the circle $x^2 + y^2 = 4$ at the point $P(\sqrt{3}, 1)$. A straight line L, perpendicular to PT is a tangent to the circle $(x-3)^2 + y^2 = 1$.

129. A possible equation of L is

(a) $x - \sqrt{3}y = 1$ (b) $x + \sqrt{3}y = 1$

(c) $x - \sqrt{3}y = -1$ (d) $x + \sqrt{3}y = 5$

130. A common tangent of the two circles is **[IIT-JEE 2012, (3 + 3) M]**

(a) $x = 4$ (b) $y = 2$

(c) $x + \sqrt{3}y = 4$ (d) $x + 2\sqrt{2}y = 6$

131. The length of the diameter of the circle which touches the X -axis at the point (1, 0) and passes through the point (2, 3) is **[AIEEE 2012, 4M]**

(a) $\frac{10}{3}$ (b) $\frac{3}{5}$

(c) $\frac{6}{5}$ (d) $\frac{5}{3}$

132. The circle passing through $(1, -2)$ and touching the axis of x at (3, 0) also passes through the point **[JEE Main 2013, 4M]**

(a) $(-5, 2)$ (b) $(2, -5)$

(c) $(5, -2)$ (d) $(-2, 5)$

133. Circle(s) touching X-axis at a distance 3 from the origin and having an intercept of length $2\sqrt{7}$ on Y-axis is (are) **[JEE Advanced 2013, 3M]**

(a) $x^2 + y^2 - 6x + 8y + 9 = 0$

(b) $x^2 + y^2 - 6x + 7y + 9 = 0$

(c) $x^2 + y^2 - 6x - 8y + 9 = 0$

(d) $x^2 + y^2 - 6x - 7y + 9 = 0$

134. Let C be the circle with centre at $(1, 1)$ and radius = 1. If T is the circle centred at $(0, y)$, passing through origin and touching the circle C externally, then the radius of T is equal to **[JEE Main 2014, 4M]**

(a) $\frac{1}{2}$ (b) $\frac{1}{4}$

(c) $\frac{\sqrt{3}}{\sqrt{2}}$ (d) $\frac{\sqrt{3}}{2}$

135. A circle S passes through the point (0, 1) and is orthogonal to the circles $(x-1)^2 + y^2 = 16$ and $x^2 + y^2 = 1$. Then **[JEE Advanced 2014, 3M]**

(a) radius of S is 8 (b) radius of S is 7

(c) centre of S is $(-7, 1)$ (d) centre of S is $(-8, 1)$

136. Locus of the image of the point (2, 3) in the line $(2x - 3y + 4) + k(x - 2y + 3) = 0, k \in R$, is a **[JEE Main 2015, 4M]**

(a) circle of radius $\sqrt{2}$

(b) circle of radius $\sqrt{3}$

(c) straight line parallel to X-axis

(d) straight line parallel to Y-axis

137. The number of common tangents to the circles $x^2 + y^2 - 4x - 6x - 12 = 0$ and $x^2 + y^2 + 6x + 18y + 26 = 0$, is **[JEE Main 2015, 4M]**

(a) 3 (b) 4

(c) 1 (d) 2

138. The centres of those circles which touch the circle, $x^2 + y^2 - 8x - 8y - 4 = 0$, externally and also touch the X-axis, lie on **[JEE Main 2016, 4M]**

(a) a hyperbola

(b) a parabola

(c) a circle

(d) an ellipse which is not a circle

139. If one of the diameters of the circle, given by the equation, $x^2 + y^2 - 4x + 6y - 12 = 0$, is a chord of a circle S, whose centre is at $(-3, 2)$, then the radius of S is **[JEE Main 2016, 4M]**

(a) 5 (b) 10

(c) $5\sqrt{2}$ (d) $5\sqrt{3}$

140. Let RS be the diameter of the circle $x^2 + y^2 = 1$, where S is the point (1, 0). Let P be a variable point (other than R and S) on the circle and tangents to the circle at S and P meet at the point Q. The normal to the circle at P intersects a line drawn through Q parallel to RS at point E. Then the locus of E passes through the point(s) **[JEE Advanced 2016, 4M]**

(a) $\left(\frac{1}{3}, \frac{1}{\sqrt{3}}\right)$ (b) $\left(\frac{1}{4}, \frac{1}{2}\right)$

(c) $\left(\frac{1}{3}, -\frac{1}{\sqrt{3}}\right)$ (d) $\left(\frac{1}{4}, -\frac{1}{2}\right)$

141. For how many values of p, the circle $x^2 + y^2 + 2x + 4y - p = 0$ and the co-ordinate axes have exactly three common points? **[JEE Advanced 2017, 3M]**

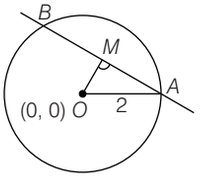
Solutions

1. $AB^2 = 4AM^2 = 4\left(4 - \frac{n^2}{2}\right) = 2(8 - n^2)$

Hence, required sum $= 2(8 - 1^2 + 8 - 2^2) = 22$



2. Tangent at $(5\sqrt{2}\cos\theta, 5\sqrt{2}\sin\theta)$ is

$$x\cos\theta + y\sin\theta = 5\sqrt{2}$$

$\therefore$ $OP = 5\sqrt{2}\sec\theta$, $OP, = 5\sqrt{2}\,\text{cosec}\,\theta$

$\therefore$ Area $(\Delta PP_1P_2) = 2 \times$ area of ΔOPP_1

$$= 2 \times \frac{1}{2} \times 5\sqrt{2}\sec\theta \times 5\sqrt{2}\ \text{cosec}\,\theta$$

$$= \frac{100}{\sin 2\theta},$$

Area $(\Delta PP_1P_2)_{\min} = 100$

$\Rightarrow$ $\theta = \frac{\pi}{4} \Rightarrow OP = 10$

$\Rightarrow$ $P \equiv (10, 0), (-10, 0)$

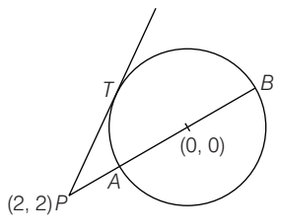
3. Let $S \equiv x^2 + y^2 - 2 = 0$, $P \equiv (2,2)$

$\therefore$ $S_1 = 2^2 + 2^2 - 2 = 6 > 0$

$\Rightarrow P$ lies outside the circle

$$PA.PB = (PT)^2 = S_1 = 6 \quad \ldots(i)$$

given $$\frac{PB}{PA} = 3 \quad \ldots(ii)$$



From Eqs. (i) and (ii), we get

$$PA = \sqrt{2},\ PB = 3\sqrt{2}$$

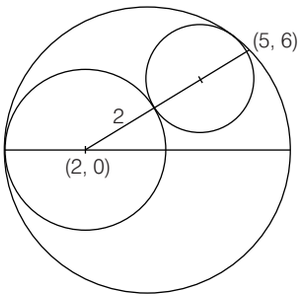
$\Rightarrow$ $AB = PB - PA = 2\sqrt{2} =$ Diameter of circle

Hence, chord AB passes through the centre $(0,0)$, $y = x$

4. Let $S \equiv (x-2)^2 + y^2 - 4 = 0$

Its centre $C \equiv (2, 0)$ and radius $r = 2$

Distance between $C \equiv (2,0)$ and $(5, 6)$ is $\sqrt{(2-5)^2 + (0-6)^2}$



i.e. $3\sqrt{5}$

$\therefore$ $r_1 r_2 = \left(\frac{3\sqrt{5} - 2}{2}\right).\left(\frac{3\sqrt{5} + 2}{2}\right)$

$$= \frac{41}{4}$$

5. Any circle which touches $3x + 4y - 7 = 0$ at $(1, 1)$ will be of the form

$$S(x,y) \equiv (x-1)^2 + (y-1)^2 + \lambda(3x + 4y - 7) = 0$$

Since, $S(2,3) = 16 \Rightarrow 1 + 4 + \lambda(11) = 16$

$\therefore$ $\lambda = 1$

So, required circle will be $x^2 + y^2 + x + 2y - 5 = 0$

6. Let $S \equiv x^2 + y^2 - 2x + 4y - \lambda = 0$

for interval point $P(2,8)$,

$$4 + 64 - 4 + 32 - \lambda < 0$$

$\Rightarrow$ $\lambda > 96$ $\quad \ldots(i)$

and x-intercept $= 2\sqrt{(1+\lambda)}$ and y-intercept $= 2\sqrt{(4+\lambda)}$

given $2\sqrt{(1+\lambda)} < 0 \Rightarrow \lambda < -1$ $\quad \ldots(ii)$

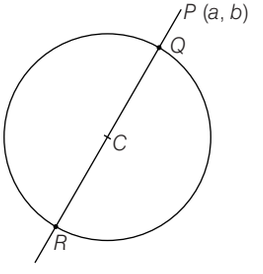
and $2\sqrt{(4+\lambda)} < 0 \Rightarrow \lambda < -4$ $\quad \ldots(iii)$

from Eqs. (i), (ii) and (iii), we get

$\lambda \in \phi$

7. Let $S \equiv x^2 + y^2 + 2x + 4y - 4 = 0$

Its centre $C \equiv (-1, -2)$ and radius $r = 3$. The points on the circle which are nearest and farthest to the point $P(a,b)$ are Q and R respectively. Thus, the circle centred at Q having radius PQ will be the smallest circle while the circle centred at R having radius PR will be the largest required circle.



Hence, the difference between their radii is

$$PR - PQ = QR = 2 \times 3 = 6$$

8. Radius $= \sqrt{(a-\pi)^2 + (b-e)^2}$

$$= \text{irrational} = k$$

$\therefore$ Circle $(x-\pi)^2 + (y-e)^2 = k^2$

9. Given $\lambda L_2L_3 + \mu L_3L_1 + \nu L_1L_2 = 0$

$\Rightarrow \lambda(y - m_2x - c_2)(y - m_3x - c_3) + \mu(y - m_3x - c_3)(y - m_1x - c_1)$
$+ \nu(y - m_1x - c_1)(y - m_2x - c_2) = 0$

for circle coefficient of x^2 = coefficient of y^2 and coefficient of $xy = 0$,

then, $\lambda(m_2m_3 - 1) + \mu(m_3m_1 - 1) + \nu(m_1m_2 - 1) = 0$

and $(m_2 + m_3)\lambda + (m_3 + m_1)\mu + (m_1 + m_2)\nu = 0$

10. $\because f(x,y) \equiv x^2 + y^2 + 2ax + 2by + c = 0$

$\Rightarrow$ $f(x,0) = 0 \Rightarrow x^2 + 2ax + c = (x-2)^2$

$\therefore$ $a = -2, c = 4$

and $f(0,y) = 0 \Rightarrow y^2 + 2by + c = (y-2)(y-3)$

$\therefore$ $2b = -5, c = 6$

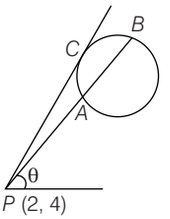
or $b = -\frac{5}{2}, c = 6$

Clearly, that data are not consistent.

11. Given, $(1 + \alpha x)^n = 1 + 8x + 24x^2 + \ldots$

$\Rightarrow$ $1 + n(\alpha x) + \frac{n(n-1)}{1.2}(\alpha x)^2 + \ldots$

$= 1 + 8x + 24x^2 + \ldots$



Equating the coefficients of x and x^2, we get

$n\alpha = 8, \frac{n\alpha(n\alpha - \alpha)}{1.2} = 24$

or $\frac{8(8-\alpha)}{2} = 24 \Rightarrow 8 - \alpha = 6$

$\therefore$ $\alpha = 2$ and $n = 4$

Equation of line is $\frac{x-2}{\cos\theta} = \frac{y-4}{\sin\theta} = r$, then point $(2 + r\cos\theta, 4 + r\sin\theta)$ lies on the circle $x^2 + y^2 = 4$,

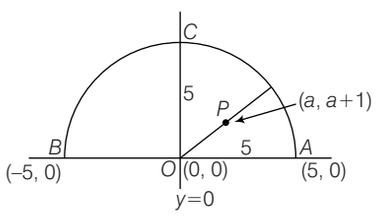
then, $(2 + r\cos\theta)^2 + (4 + r\sin\theta)^2 = 4$

or $r^2 + 4r(\cos\theta + 2\sin\theta) + 16 = 0$

$\therefore$ $PA \cdot PB = r_1r_2 = \frac{16}{1} = 16$

Aliter : $PA \cdot PB = (PC)^2 = 2^2 + 4^2 - 4 = 16$

12. For interior point $OP < 5$



$\Rightarrow$ $\sqrt{a^2 + (a+1)^2} < 5$

$\Rightarrow$ $2a^2 + 2a - 24 < 0$

$\therefore$ $a^2 + a - 12 < 0$

$(a+4)(a-3) < 0$

$\Rightarrow -4 < a < 3$ and for I and II quadrant

$a + 1 > 0$

$\therefore$ $a > -1$

Hence, $-1 < a < 3$

13. Let $S(x,y) \equiv x^2 + y^2 + 2gx + 2fy + c = 0$

$\Rightarrow$ $S(x,2) = 0$

$\Rightarrow$ $x^2 + 4 + 2gx + 4f + c = (x-1)^2$

$\therefore$ $g = -1, 3 + 4f + c = 0$ ...(i)

and $S(1,y) = 0 \Rightarrow 1 + y^2 + 2g + 2fy + c = (y-0)(y-2)$

$\therefore$ $f = -1, 1 + 2g + c = 0$ ...(ii)

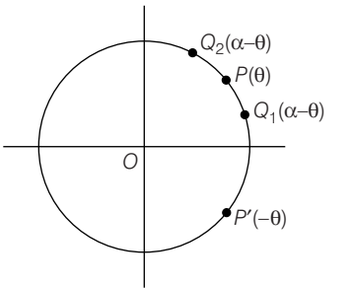
From Eqs. (i) and (ii), we get

$g = -1, f = -1, c = 1$

$\therefore$ Equation of required circle is

$x^2 + y^2 - 2x - 2y + 1 = 0$

14. See the diagram. Since, there is no condition on θ, Q can be placed either at Q_1 or Q_2 for a particular position of P. So option (a) and (b) cannot be definitely true.



Consider a line through origin $y = mx$. If Q and P are reflection of each other with line mirror $y = mx$

(Slope of PQ) $\times m = -1$

or $m\left(\frac{\sin\theta - \sin(\alpha - \theta)}{\cos\theta - \cos(\alpha - \theta)}\right) = -1$

$$m\left(\frac{2\cos\left(\frac{\alpha}{2}\right).\sin\left(\frac{2\theta - \alpha}{2}\right)}{2\sin\left(\frac{\alpha}{2}\right).\sin\left(\frac{\alpha - 2\theta}{2}\right)}\right) = -1$$

or $m\left(-\cot\frac{\alpha}{2}\right) = -1$

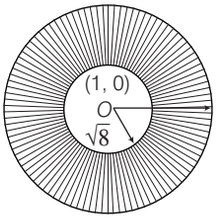
or $m = \tan\left(\frac{\alpha}{2}\right)$

15. Since, $x^2 + y^2 < 25$ and x and y are integers, the possible values of x and $y \in (0, \pm 1, \pm 2, \pm 3, \pm 4)$. Thus, x and y can be chosen in $9 \times 9 = 81$ ways. However, we have to exclude cases (3, 4), (4,3) and (4, 4) i.e. $3 \times 4 = 12$ cases. Hence, the number of permissible values

$= 81 - 12 = 69$

16. ∵ The point $([P+1],[P])$ lies inside the circle $x^2+y^2-2x-15=0$, then

$$[P+1]^2+[P]^2-2[P+1]-15<0$$



$$\Rightarrow \quad ([P]+1)^2+[P]^2-2([P]+1)-15<0$$

$$\Rightarrow \quad 2[P]^2-16<0 \Rightarrow [P]^2<8 \qquad \ldots(i)$$

∵ Circles are concentric

∴ point $([P+1],[P])$ out side the circle

$$x^2+y^2-2x-7=0$$

$$\therefore \quad ([P]+1)^2+[P]^2-2([P+1])-7>0$$

$$\Rightarrow \quad ([P]+1)^2+[P]^2-2([P]+1)-7>0$$

$$\Rightarrow \quad 2[P]^2-8>0$$

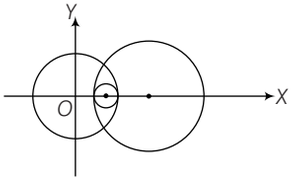
$$\therefore \quad [P]^2>4 \qquad \ldots(ii)$$

From Eqs. (i) and (ii), we get

$4<[P]^2<8$ which is impossible

∴ For no value of 'P' the point will be within the region.

17. The circles are $x^2+y^2=2^2$ and $(x-4)^2+(y-0)^2=3^2$



For the point P to enclose greatest area, the arbitrarily chosen point should be $\left(\frac{3}{2},0\right)$ and P should move in a circle of radius $\frac{1}{2}$

The locus of P is $\left(x-\frac{3}{2}\right)^2+(y-0)^2=\left(\frac{1}{2}\right)^2$

$$\Rightarrow \quad x^2+y^2-3x+2=0.$$

18. Since, $y=|x|+c$ and $x^2+y^2-8|x|-9=0$ both are symmetrical about Y-axis for $x>0$, $y=x+c$.

Equation of tangent to circle $x^2+y^2-8x-9=0$

Parallel to $y=x+c$ is $y=(x-4)+5\sqrt{(1+1)}$

$$\Rightarrow \quad y=x+(5\sqrt{2}-4)$$

for no solution $c>5\sqrt{2}-4$,

$$\therefore \quad c\in(5\sqrt{2}-4,\infty)$$

19. Let $\angle AOL=\theta$

$$\therefore \quad A\equiv(a\cos\theta,a\sin\theta)$$

$$\therefore \quad M\equiv(a+a\cos\theta,a\sin\theta)$$

$$x=a+a\cos\theta$$

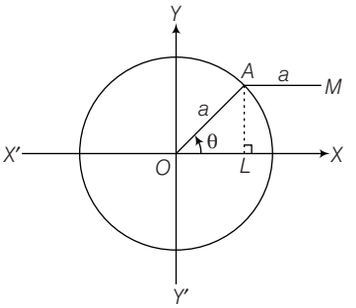
$$\Rightarrow \quad (x-a)=a\cos\theta \qquad \ldots(i)$$

and $\quad y=a\sin\theta$

From Eqs. (i) and (ii), we get

$$(x-a)^2+y^2=a^2$$

$$\Rightarrow \quad x^2+y^2-2ax=0$$



$$\Rightarrow \quad x^2+y^2=2ax$$

20. Equation of circle is $(2x-y+1)(x-2y+3)+\lambda xy=0$

for circle coefficient of $xy=0$

i.e. $\quad -5+\lambda=0,$

$$\therefore \quad \lambda=5$$

∴ Circle is $2x^2+2y^2+7x-5y+3=0$

$$\Rightarrow \quad x^2+y^2+\frac{7}{2}x-\frac{5}{2}y+\frac{3}{2}=0$$

∴ Centre is $\left(-\frac{7}{4},\frac{5}{4}\right)$

21. $\sqrt{\left\{\frac{\lambda^2}{4}+\frac{(1-\lambda)^2}{4}-5\right\}}\le 5$

$$\Rightarrow \quad \lambda^2+(1-\lambda)^2-20\le 100$$

$$\Rightarrow \quad 2\lambda^2-2\lambda-119\le 0$$

$$\therefore \quad \frac{1-\sqrt{239}}{2}\le\lambda\le\frac{1+\sqrt{239}}{2}$$

$$\Rightarrow \quad -7.2\le\lambda\le 8.2 \qquad \text{(approx.)}$$

$$\therefore \quad \lambda=-7,-6,-5,\ldots,7,8$$

22. Let $\phi(x,y)\equiv x^2+y^2+2gx+2fy+c=0$

$$\therefore \quad \phi(0,\lambda)=0+\lambda^2+0+2f\lambda+c=0$$

have equal roots,

Then, $2+2=-\frac{2f}{1}$ and $2.2=\frac{c}{1}$

$$\therefore \quad f=-2 \text{ and } c=4$$

and $\phi(\lambda,0)\equiv\lambda^2+0+2g\lambda+0+c=0$

$$\therefore \quad \lambda^2+2g\lambda+c=0$$

Here, $c=4$

$$\therefore \quad \lambda^2+2g\lambda+4=0$$

have roots 4/5, 5

$$\therefore \quad \frac{4}{5}+5=-2g$$

$$\Rightarrow \quad g=-\frac{29}{10}$$

$$\therefore \quad \text{Centre}\equiv(-g,-f)=\left(\frac{29}{10},2\right)$$

23. Circle is $x^2+y^2=r^2\cos^2\theta+r^2\sin^2\theta$

$$x^2+y^2=r^2$$

Equation of tangent at θ is

$$x\cos\theta+y\sin\theta=r \qquad \ldots(i)$$

and at $\left(\theta+\frac{\pi}{3}\right)$ is $x\cos\left(\theta+\frac{\pi}{3}\right)+y\sin\left(\theta+\frac{\pi}{3}\right)=r$

$$\Rightarrow\ x\left(\frac{1}{2}\cos\theta-\frac{\sqrt{3}}{2}\sin\theta\right)+y\left(\frac{1}{2}\sin\theta+\frac{\sqrt{3}}{2}\cos\theta\right)=r$$

$$\Rightarrow\quad x\cos\theta+y\sin\theta-x\sqrt{3}\sin\theta+y\sqrt{3}\cos\theta=2r$$

$$\Rightarrow\quad r-\sqrt{3}(x\sin\theta-y\cos\theta)=2r$$

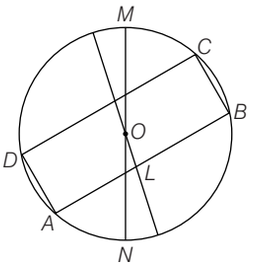
or $$x\sin\theta-y\cos\theta=-\frac{r}{\sqrt{3}} \qquad \ldots(ii)$$

Squaring and adding Eqs. (i) and (ii), then we get

$$x^2+y^2=\frac{4r^2}{3}\Rightarrow 3(x^2+y^2)=4r^2$$

24. Let MN be the diameter of the circle whose equation is

$$4y=x+7 \qquad \ldots(i)$$



and coordinates of A and B are $(-3,4)$ and $(5,4)$ respectively.

Equation of $\perp$ bisector of AB is $[L\equiv(1,4)]$

$$y-4=-\frac{1}{0}(x-1) \qquad (\because \text{slope of } AB=0)$$

$$\therefore\quad x=1 \qquad \ldots(ii)$$

Solving Eqs. (i) and (ii), we get the coordinates of the centre of the circle as (1, 2)

$$\therefore\quad OL=\sqrt{(1-1)^2+(4-2)^2}=2$$

$$\therefore\quad BC=2OL=4 \text{ unit}$$

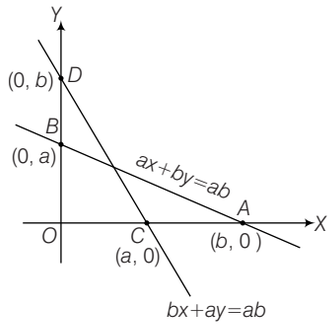
$$AB=8 \text{ unit}$$

$\therefore$ Area of rectangle $ABCD=4\times 8$

$=32$ sq units.

25. $\because OC\cdot OA=ab=OB\cdot OD$

$\therefore A, B, C, D$ are concyclic.



26. Coordinates of P, Q, R are $(\cos\alpha,\sin\alpha),(\cos\beta,\sin\beta)$ and $(\cos\gamma,\sin\gamma)$ respectively.

and $\quad A\equiv(-1,0)$

$$\therefore\quad AP=\sqrt{((1+\cos\alpha)^2+\sin^2\alpha)}=2\cos\left(\frac{\alpha}{2}\right)$$

$$AQ=\sqrt{((1+\cos\beta)^2+\sin^2\beta)}=2\cos\left(\frac{\beta}{2}\right)$$

$$AR=\sqrt{((1+\cos\gamma)^2+\sin^2\gamma)}=2\cos\left(\frac{\gamma}{2}\right)$$

$\because AP, AQ, AR$ are in GP, then

$$\cos\left(\frac{\alpha}{2}\right),\cos\left(\frac{\beta}{2}\right),\cos\left(\frac{\gamma}{2}\right) \text{ are also in GP.}$$

27. Let equation of circle be

$$x^2+y^2+2gx+2fy+c=0$$

It pass through (2, 0) and (0, 4), then $4+0+4g+0+c=0$

$$\Rightarrow\quad g=-\frac{(c+4)}{4} \text{ and } 0+16+0+8f+c=0$$

$$\Rightarrow\quad f=-\frac{(c+16)}{8}$$

$$\because\quad \text{Radius } r=\sqrt{(g^2+f^2-c)}$$

$$=\sqrt{\left\{\frac{(c+4)^2}{16}+\frac{(c+16)^2}{64}-c\right\}}$$

$$=\sqrt{\left\{\frac{4\{c^2+8c+16\}+\{c^2+32c+256\}-64c}{64}\right\}}$$

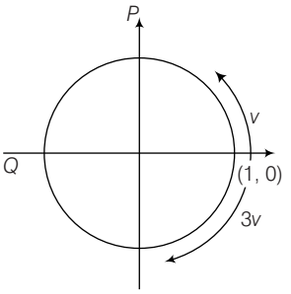
$$=\sqrt{\left(\frac{5c^2+320}{64}\right)}$$

For minimum radius $c=0$

$$\therefore\quad g=-1,\ f=-2$$

Required circle is $x^2+y^2-2x-4y=0$

28. The particle which moves clockwise is moving three times as fast as the particle moving anticlockwise ($\because$ speed in clockwise $3v$ and in anticlockwise v).



This mean the clockwise particle travels $\left(\frac{3}{4}\right)$th of the way around the circle, the anticlockwise particle will travel $\left(\frac{1}{4}\right)$th of the way around the circle. So, the second particle will meet at $P(0,1)$.

Using the same logic, they will meet at $Q(-1,0)$, when they meet the second time.

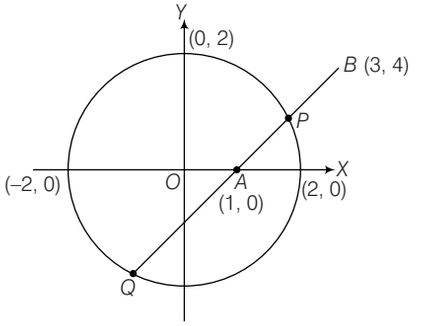
29. $\because \quad \frac{BP}{PA} = \alpha$

$BP : PA = \alpha : 1$

$\therefore$ Coordinates of P is $\left(\frac{3+\alpha}{1+\alpha}, \frac{4}{\alpha+1}\right)$, P lie on $x^2 + y^2 = 4$

$\Rightarrow \quad (\alpha+3)^2 + 16 = 4(\alpha+1)^2$

$\Rightarrow \quad 3\alpha^2 + 2\alpha - 21 = 0 \quad \ldots(i)$



and $\frac{BQ}{QA} = \frac{\beta}{1}$

$BQ : QA = \beta : 1$ or $\frac{BQ}{QA} - 1 = \beta - 1$

$\frac{AB}{QA} = \frac{(\beta-1)}{1}$

$AB : QA = (\beta-1) : 1$

$\therefore$ Coordinates of Q is $\left(\frac{\beta-3}{\beta-1}, \frac{-4}{\beta-1}\right)$

Q lie on $x^2 + y^2 = 4$

$\therefore \quad (\beta-3)^2 + 16 = 4(\beta-1)^2$

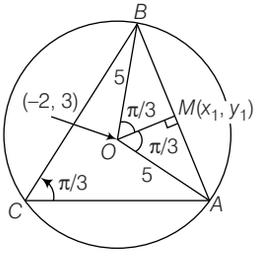
$\Rightarrow \quad 3\beta^2 - 21\beta - 21 = 0$

Hence, α is a root of $3x^2 + 2x - 21 = 0$

and β is a root of $3x^2 - 2x - 21 = 0$

30. $\because \angle ACB = \frac{\pi}{3}$ (given)

$\therefore \angle AOB = \frac{2\pi}{3}$



$\Rightarrow \quad \angle AOM = \angle BOM = \frac{\pi}{3}$

Let mid-point of chord AB is (x_1, y_1)

$\therefore$ In ΔAOM,

$$\cos\frac{\pi}{3} = \frac{OM}{OA} = \frac{\sqrt{(x_1+2)^2 + (y_1-3)^2}}{5}$$

or $\left(\frac{5}{2}\right)^2 = (x_1+2)^2 + (y_1-3)^2$

$\Rightarrow \quad \frac{25}{4} = x_1^2 + y_1^2 + 4x_1 - 6y_1 + 13$

$4x_1^2 + 4y_1^2 + 16x_1 - 24y_1 + 27 = 0$

$\therefore$ Locus of mid-point is

$x^2 + y^2 + 4x - 6y + \frac{27}{4} = 0$

$\Rightarrow \quad (x+2)^2 + (y-3)^2 = 6.25$

31. $\because \quad r = a\cos\theta + b\sin\theta$

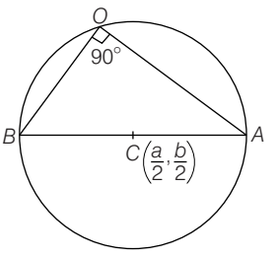
$\Rightarrow \quad r^2 = a(r\cos\theta) + b(r\sin\theta)$

or $x^2 + y^2 = ax + by \quad (\because x = r\cos\theta, y = r\sin\theta)$

or $x^2 + y^2 - ax - by = 0 \quad \ldots(i)$

Circle pass through O (origin)

given $\angle AOB = 90°$



$\therefore AB$ is Diameter of circle Eq. (i), Centre is $\left(\frac{a}{2}, \frac{b}{2}\right)$

$\therefore$ Locus of mid point AB ($\because$ mid-point of AB is C)

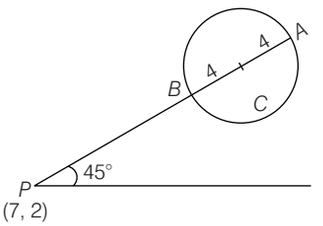
$x = \frac{a}{2}, y = \frac{b}{2}$

32. Slope of $PC = \frac{-3-2}{2-7} = 1$

If $\tan\theta = 1$

$\therefore \quad \theta = 45°$

Equation of PA is $\frac{x-7}{\frac{1}{\sqrt{2}}} = \frac{y-2}{\frac{1}{\sqrt{2}}} = r$



$\therefore \quad \left(7 + \frac{r}{\sqrt{2}}, 2 + \frac{r}{\sqrt{2}}\right)$ lie on circle,

then, $\left(7 + \frac{r}{\sqrt{2}}\right)^2 + \left(2 + \frac{r}{\sqrt{2}}\right)^2 - 4\left(7 + \frac{r}{\sqrt{2}}\right) + 6\left(2 + \frac{r}{\sqrt{2}}\right) - 3 = 0$

$\therefore \quad r^2 = -5\sqrt{2} \pm 4$

$\therefore \quad r = -5\sqrt{2} \pm 4$

$\therefore$ Points $\left(7+\frac{-5\sqrt{2}\pm 4}{\sqrt{2}}, 2+\frac{-5\sqrt{2}\pm 4}{\sqrt{2}}\right)$

$\Rightarrow (2\pm 2\sqrt{2}, -3\pm 2\sqrt{2})$

Taking + ve sign for A, –ve sign for B.

33. Let $S \equiv x^2+y^2+2gx+2fy+c=0$

$S_1 \equiv x^2+y^2-4=0$

$S_2 \equiv x^2+y^2-6x-8y+10=0$

$S_3 \equiv x^2+y^2+2x-4y-2=0$

$\therefore$Common chords are

$S-S_1 \equiv 2gx+2fy+c+4=0$ ...(i)

$S-S_2 \equiv (2g+6)x+(2f+8)y+c-10=0$ ...(ii)

$S-S_3 \equiv (2g-2)x+(2f+4)y+c+2=0$ ...(iii)

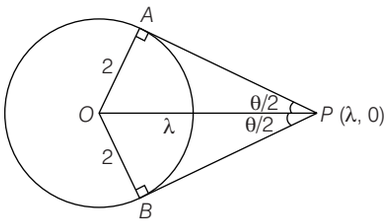
For cutting the extremities of diameter, chords Eqs. (i), (ii) and (iii) pass through the centres of S_1, S_2 and S_3 respectively, then

$\therefore \quad c+4=0, (2g+6)3+(2f+8)4+c-10=0$

and $(2g-2)(-1)+(2f+4)(2)+c+2=0$

after solving $c=-4$, $g=-2$, $f=-3$

34.



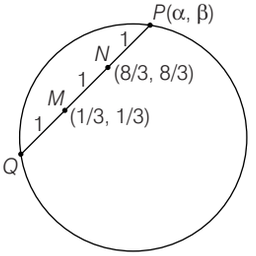
$\because \quad \frac{\pi}{2}<\theta<\frac{2\pi}{3} \Rightarrow \frac{\pi}{4}<\frac{\theta}{2}<\frac{\pi}{3}$

$\Rightarrow \quad \frac{1}{\sqrt{2}}<\sin\left(\frac{\theta}{2}\right)<\frac{\sqrt{3}}{2}$

$\Rightarrow \quad \frac{1}{\sqrt{2}}<\frac{2}{\lambda}<\frac{\sqrt{3}}{2}$ or $\sqrt{2}>\frac{\lambda}{2}>\frac{2}{\sqrt{3}}$

or $\quad 2\sqrt{2}>\lambda>\frac{4}{\sqrt{3}}$ or $\frac{4}{\sqrt{3}}<\lambda<2\sqrt{2}$

35. It is clear that N is the mid-point of M and P



$\therefore \quad \alpha=\frac{16}{3}-\frac{1}{3}=5$ and $\beta=\frac{16}{3}-\frac{1}{3}=5$

$(\alpha,\beta)\equiv(5,5)$ lie on the circle

$\therefore \quad 5^2+5^2-4\times 5-2\times 5-c=0$

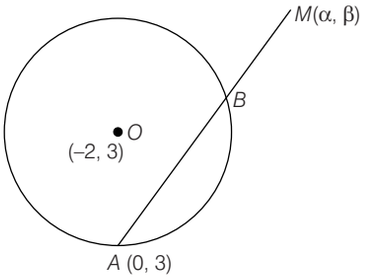
$c=20$

or $\quad c^2-40c+400=0$

36. Let $M(\alpha,\beta)$

$\because \quad AM=2AB \Rightarrow AB+BM=2AB$

$\therefore \quad AB=BM$



$\therefore B$ is the mid point of AM.

$\therefore$Coordinates of B are $\left(\frac{\alpha}{2}, \frac{3+\beta}{2}\right)$ which lie on

$x^2+4x+(y-3)^2=0$

$\frac{\alpha^2}{4}+4\times\frac{\alpha}{2}+\left(\frac{3+\beta}{2}-3\right)^2=0$

$\alpha^2+8\alpha+(\beta-3)^2=0$

$\therefore$Requires locus is

$x^2+8x+(y-3)^2=0$

or $\quad x^2+y^2+8x-6y+9=0$

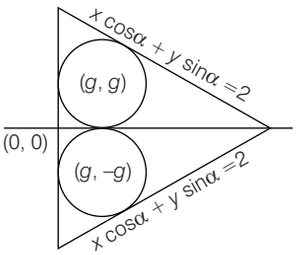
37. $x\cos\alpha+y\sin\alpha=2$ or $\frac{x}{2\sec\alpha}+\frac{y}{2\,\mathrm{cosec}\,\alpha}=1$

$2\sec\alpha =$ + ve in IV

and $\quad 2\,\mathrm{cosec}\,\alpha =$ –ve in IV

value of g in I quadrant

$g=\left(\frac{g\cos\alpha+g\sin\alpha-2}{\sqrt{1}}\right)$



$\therefore \quad g=\frac{2}{\cos\alpha+\sin\alpha\pm 1}$

and value g of in IV quadrant

$g=\left|\frac{g\cos\alpha-g\sin\alpha-2}{1}\right|$

$\Rightarrow \quad \pm g=g(\cos\alpha-\sin\alpha)-2$

$g=\frac{2}{\cos\alpha-\sin\alpha\pm 1}$

Equation of circles in I quadrant

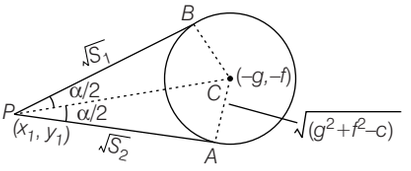
$(x-g)^2+(y-g)^2=g^2$

And in IV quadrant is $(x-g)^2+(y-g)^2=g^2$

38. $\therefore \quad \cot\left(\frac{\alpha}{2}\right) = \frac{\sqrt{S_1}}{\sqrt{(g^2+f^2-c)}}$

$\therefore \quad \tan\left(\frac{\alpha}{2}\right) = \frac{\sqrt{(g^2+f^2-c)}}{\sqrt{S_1}}$

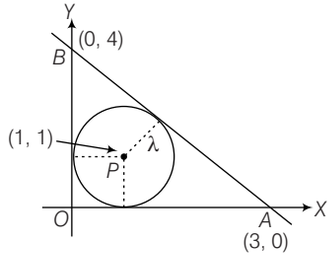
$\therefore \quad \alpha = 2\tan^{-1}\left(\frac{\sqrt{(g^2+f^2-c)}}{\sqrt{S_1}}\right)$



39. For condition of tangency

$$\frac{|4\lambda+3\lambda-12|}{5} = \lambda \Rightarrow \quad 7\lambda-12 = \pm 5\lambda$$

$\therefore \quad \lambda = 1, 6$



40. Let coordinates of $P \equiv (3\cos\alpha, 3\sin\alpha)$

Let x-coordinate of Q is x_1, then

y-coordinate of Q is $-7x_1 - 3$

$\therefore \quad Q \equiv (x_1, -7x_1 - 3)$

$\because x - y + 1 = 0$ is the perpendicular bisector of PQ, then mid-point of PQ lie on $x - y + 1 = 0$

$$\Rightarrow \quad \frac{3\cos\alpha + x_1}{2} - \frac{3\sin\alpha - 7x_1 - 3}{2} + 1 = 0$$

$$\Rightarrow \quad 8x_1 + 3\cos\alpha - 3\sin\alpha + 5 = 0$$

$$\Rightarrow \quad 24x_1 + 9\cos\alpha - 9\sin\alpha + 15 = 0 \qquad \ldots(i)$$

and slope of $(x - y + 1 = 0) \times$ slope of $PQ = -1$

$$\Rightarrow \quad 1 \times \frac{3\sin\alpha + 7x_1 + 3}{3\cos\alpha - x_1} = -1$$

$$\Rightarrow \quad 3\sin\alpha + 7x_1 + 3 = -3\cos\alpha + x_1$$

$$\Rightarrow \quad 6x_1 + 3\sin\alpha + 3\cos\alpha + 3 = 0$$

$$\Rightarrow \quad 24x_1 + 12\sin\alpha + 12\cos\alpha + 12 = 0 \qquad \ldots(ii)$$

Subtracting Eqs. (i) and (ii), we obtain

$$-3\cos\alpha - 21\sin\alpha + 3 = 0$$

$$\Rightarrow \quad (1 - \cos\alpha) = 7\sin\alpha$$

$$\Rightarrow \quad (1-\cos\alpha)^2 = 49(1 - \cos^2\alpha)$$

$$\Rightarrow \quad (1-\cos\alpha)^2 = 49(1+\cos\alpha)(1-\cos\alpha)$$

$$\Rightarrow \quad (1-\cos\alpha)(1 - \cos\alpha - 49 - 49\cos\alpha) = 0$$

$\therefore \quad \cos\alpha = 1$ and $\cos\alpha = -\frac{24}{25}$

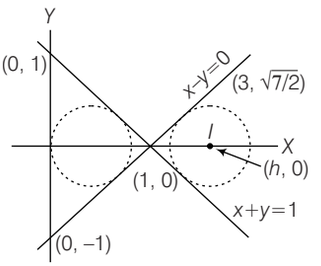
$\therefore$ Coordinates of P are (3, 0) and $\left(-\frac{72}{25}, \frac{21}{25}\right)$.

41. Circle possible in I region and centre of circle on X-axis.

If centre is $(h, 0)$, then

$$\frac{|h-0-1|}{\sqrt{2}} = \sqrt{(h-3)^3 + \frac{7}{2}}$$

$\therefore \quad h = 6, 4$



Then, centres are (6, 0) and (4, 0)

42. $\because C_2$ is the director circle of C_1

$\therefore$ Equation of C_2 is

$$x^2 + y^2 = 2(2)^2 = 8$$

Again C_3 is the director circle of C_2. Hence, the equation of C_3 is

$$x^2 + y^2 = 2(8) = 16$$

43. The equation of tangent in terms of slope of $x^2 + y^2 = 25$ is

$$y = mx \pm 5\sqrt{(1+m^2)} \qquad \ldots(i)$$

Given Eq. (i), pass through $(-2, 11)$, then

$$11 = -2m \pm 5\sqrt{(1+m^2)}$$

squaring both sides, then we get

$$21m^2 - 44m - 96 = 0$$

$$\Rightarrow \quad (7m - 24)(3m + 4) = 0$$

$\therefore \quad m = -\frac{4}{3}, \frac{24}{7}$

There from Eq. (i) we get required tangents are

$$24x - 7y \pm 125 = 0 \text{ and } 4x + 3y = \pm 25$$

Hence, tangents are $24x - 7y + 125 = 0$ and $4x + 3y = 25$

44. $C_1 \equiv x^2 + y^2 - 2x - 4y - 4 = 0 \qquad \ldots(i)$

and $C_2 \equiv x^2 + y^2 + 2x + 4y + 4 = 0 \qquad \ldots(ii)$

$\therefore$ Radical axis is $C_1 - C_2 = 0$

$$\Rightarrow \quad -4x - 8y - 8 = 0$$

or $x + 2y + 2 = 0$ which is $L = 0$

(a) Option is correct.

Centre and radius of $C_1 = 0$ are (1, 2) and 3.

$\because$ Length of $\perp$ from (1, 2) on $L = 0$

is $\frac{|1+4+2|}{\sqrt{1+4}} = \frac{7}{\sqrt{5}} \neq$ radius

$\therefore$(b) Option is wrong.

L is also the common chord of C_1 and C_2.

$\therefore$(c) Option is correct.

$\because$ Centres of $C_1 = 0$ and $C_2 = 0$ are (1, 2) and $(-1, -2)$

$\therefore$ Slope of Line joining centres of circles $C_1 = 0$ and $C_2 = 0$ is

$$\frac{-2-2}{-1-1} = \frac{4}{2} = 2 = m_1 \qquad \text{(say)}$$

and slope of $L=0$ is $-\frac{1}{2}=m_2$ (say)

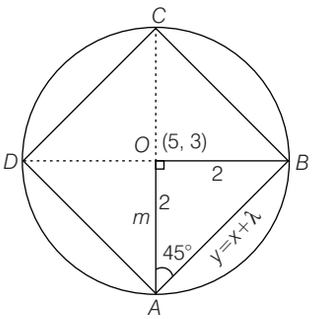
$\therefore \quad m_1m_2=-1$

Hence, L is perpendicular to the line joining centres of C_1 and C_2.

$\therefore$ **(d) Option is correct.**

45. Let slope of OA is m,

Then, $\left|\frac{m-1}{1+m}\right|=\tan 45°$



$\Rightarrow \quad \frac{m-1}{1+m}=\pm 1 \quad$ or $\quad \frac{m-1}{m+1}=-1$

$\Rightarrow \quad m-1=-m-1$

$\therefore \quad m=0$

$\therefore$Equation of OA is $y=3$

Solving $y=3$ and $x^2+y^2-10x-6y+30=0$

$\Rightarrow \quad x^2+9-10x-18+30=0$

$\Rightarrow \quad x^2-10x+21=0$

$\Rightarrow \quad (x-7)(x-3)=0$

or $\quad x=3,7$

$\therefore$Two vertices are (3, 3) and (7, 3) and other diagonal is $\perp$ to $y=3$ and through centre (5, 3) is $x=5$.

Now, solving $x=5$ and $x^2+y^2-10x-6y+30=0$

$\Rightarrow \quad 25+y^2-50-6y+30=0$

$\Rightarrow \quad y^2-6y+5=0$

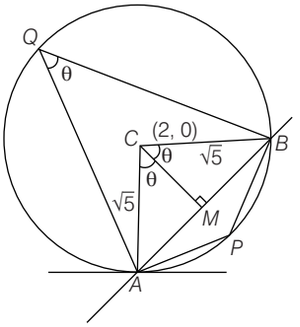
$\Rightarrow \quad (y-1)(y-5)=0$ or $y=1,5$

$\therefore$Other two vertices are (5, 1) and (5, 5).

Sol. (Q. Nos. 46 to 48)

$S: x^2+y^2-4x-1=0$ ...(i)

$L: y=3x-1$ ...(ii)



From Eqs. (i) and (ii), we get $x^2+(3x-1)^2-4x-1=0$

or $\quad 10x^2-10x=0$

$\therefore \quad x=0$ and $x=1$

From Eq. (ii), $y=-1$ and $y=2$

$\therefore \quad A\equiv(0,-1)$ and $B\equiv(1,2)$

46. $AB=\sqrt{(0-1)^2+(-1-2)^2}=\sqrt{10}$

47. Let $\angle ACB=2\theta$

$\therefore \quad CM=\frac{5}{\sqrt{10}}=\sqrt{\frac{5}{2}}$

$\Rightarrow \quad \cos\theta=\frac{CM}{\sqrt{5}}=\frac{1}{\sqrt{2}}$

$\therefore \quad \theta=\frac{\pi}{4}$

Required angle $=\angle APB=\pi-\theta=\pi-\frac{\pi}{4}=\frac{3\pi}{4}$

48. Equation of tangent at $A(0,-1)$ to the circle S is

$0.x+(-1).y-2(x+0)-1=0$

or $\quad 2x+y+1=0$

$\therefore$ Slope $(m_1)=-2$

and slope of line L is $m_2=3$

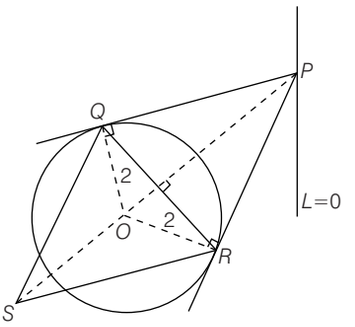
If θ be the angle between L and S, then $\tan\theta=\left|\frac{-2-3}{1+(-2)(3)}\right|=1$

$\therefore \quad \theta=\frac{\pi}{4}$

Sol. (Q. Nos. 49 to 51)

$\because \quad PQ=PR$,

parallelogram $PQRS$ is a rhombus.



$\therefore$Mid-point of QR = mid point of PS and $QR\perp PS$

Therefore, S in the mirror image of P w.r.t. QR.

49. Let $P(\lambda,6-2\lambda)$ be any point on $L=0$

$\because$ Circumcircle of ΔPQR always pass through O

$\therefore OP$ is diameter of circle.

Then, centre is $\left(\frac{\lambda}{2},3-\lambda\right)$ So,

$x=\frac{\lambda}{2}$ and $y=3-\lambda$

or $2x+y=3$ is the locus of the circumcenter of ΔPQR.

50. Area of ΔQRS = Area of $\Delta PQR = \dfrac{RL^3}{R^2+L^2}$ ...(i)

Here, $R = 2,\ L = \sqrt{S_1} = \sqrt{(6^2+8^2-4)} = \sqrt{96}$

From Eq. (i),

Area of $\Delta QRS = \dfrac{2\times 96\times\sqrt{96}}{4+96} = \dfrac{192\sqrt{6}}{25} = \dfrac{192\sqrt{\lambda}}{25}$ (given)

$\therefore \quad \lambda = 6$

51. Let $S \equiv (\alpha, \beta)$

$\because$ S is the mirror image of P w.r.t. QR.

Eq. (i) of QR is $3x + 4y = 4$, then

$$\frac{\alpha-3}{3} = \frac{\beta-4}{4} = \frac{-2(3.3+4.4-4)}{3^2+4^2}$$

$$= -\frac{42}{25}$$

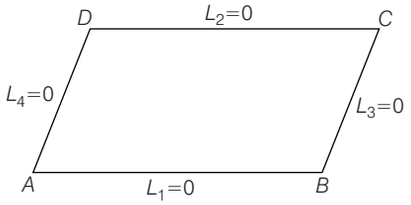
$\therefore \quad \alpha = -\dfrac{51}{25}$ and $\beta = -\dfrac{68}{25}$

Hence, $S \equiv \left(-\dfrac{51}{25}, -\dfrac{68}{25}\right)$

Sol. (Q. Nos. 52 to 54)

52. This is third degree equation which satisfy the point of intersection of $L_1 = 0$, $L_2 = 0$ and $L_3 = 0$.

53. $\lambda L_1L_2 + \mu L_3L_4 = 0$ will always pass through the vertices of the parallelogram for all $\lambda, \mu \in R \sim \{0\}$



54. Since, $\mu = 0$

So, $\quad L_1L_2 + \lambda L_2L_3 = 0$

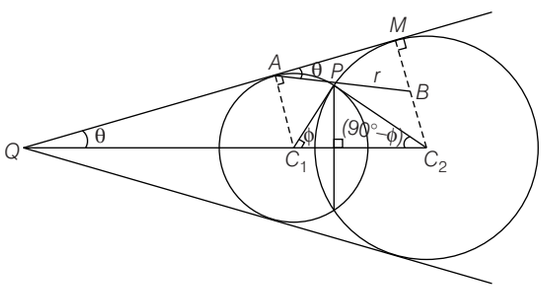
$\Rightarrow \quad L_2(L_1 + \lambda L_3) = 0$

This is the equation of pair of straight lines.

Sol. (Q. Nos. 55 to 57)

Let $2d$ = length of common chord and $\angle PC_1C_2 = \phi$, then

$\sin\phi = \dfrac{d}{3}$



and $\quad \sin(90°-\phi) = \dfrac{d}{r}$ or $\cos\phi = \dfrac{d}{r}$

$$1 = \frac{d^2}{9} + \frac{d^2}{r^2}$$

$\Rightarrow \quad d = \dfrac{3r}{\sqrt{9+r^2}} = \dfrac{1}{2}\left(\dfrac{24}{5}\right)$ (given)

$\Rightarrow \quad \dfrac{r}{\sqrt{(9-r^2)}} = \dfrac{4}{5}$

$\therefore \quad r = 4$

55. $\lambda = r = 4$

56. $\because (C_1C_2)^2 = r^2 + 3^2 = 16 + 9 = 25$

$\therefore \quad C_1C_2 = 5$

In ΔABM, $\quad \sin\theta = \dfrac{BM}{AB} = \dfrac{4-3}{C_1C_2} = \dfrac{1}{5}$

$\therefore \quad \sin 2\theta = 2\sin\theta\cos\theta = 2\times\dfrac{1}{5}\times\sqrt{1-\left(\dfrac{1}{5}\right)^2} = \dfrac{4\sqrt{6}}{25}$

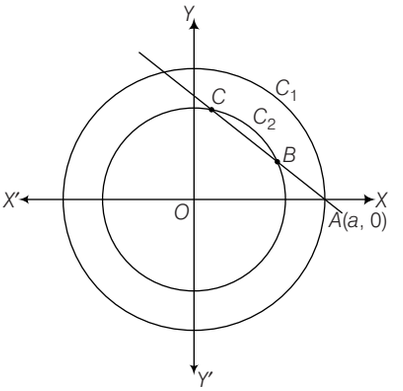
57. Length of direct common tangent $= \sqrt{(C_1C_2)^2 - (r-3)^2}$

$$= \sqrt{(5)^2 - (1)^2}$$

$$= \sqrt{24} = \lambda$$ (given)

$\therefore \quad \lambda^2 = 24$

Sol. (Q. Nos. 58 to 60)



Let equation of line AB be

$$\frac{x-a}{\cos\theta} = \frac{y-0}{\sin\theta} = r$$

Coordinates of any point on the line AB is $(a + r\cos\theta, r\sin\theta)$, then

$$B \equiv (a + r_1\cos\theta, r_1\sin\theta)$$

and $\quad C \equiv (a + r_2\cos\theta, r_2\sin\theta)$

58. $\lambda = (OA)^2 + (OB)^2 + (BC)^2$

$$= a^2 + b^2 + (r_1 - r_2)^2\cos^2\theta + (r_1 - r_2)^2\sin^2\theta$$

$$= (a^2 + b^2) + (r_1 - r_2)^2$$

$$= (a^2 + b^2) + 4a^2\cos^2\theta - 4(a^2 - b^2)$$

($\because$ B and C lie on $x^2 + y^2 = b^2$

$\therefore \quad (a + r\cos\theta)^2 + (r\sin\theta)^2 = b^2$

or $\quad r^2 + 2ar\cos\theta + a^2 - b^2 = 0$

$\therefore \quad r_1 - r_2 = \sqrt{4a^2\cos^2\theta - 4(a^2 - b^2)}$

$\Rightarrow \quad \lambda = 5b^2 - 3a^2 + 4a^2\cos^2\theta$

$\because \quad 0 \le \cos^2\theta \le 1$

$\therefore \quad \lambda \in [5b^2 - 3a^2, 5b^2 + a^2]$

59. Let (h,k) be the mid-point of AB and let (α,β) be the coordinates of B, then

$$\frac{a+\alpha}{2}=h \text{ and } \frac{0+\beta}{2}=k$$

$$\Rightarrow \quad \alpha=2h-a \text{ and } \beta=2k$$

Since, (α,β) lies on $x^2+y^2=b^2$

$$\Rightarrow \quad (2h-a)^2+(2k)^2=b^2$$

or $$\left(h-\frac{a}{2}\right)^2+k^2=\frac{b^2}{4}$$

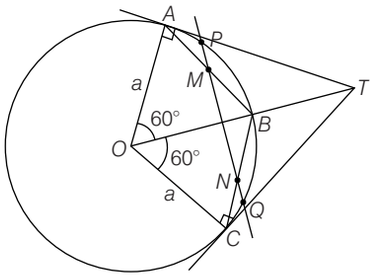
Hence, locus of (h,k) is

$$\left(x-\frac{a}{2}\right)^2+y^2=\frac{b^2}{4}$$

60. The locus of mid-point of AB, when BC is maximum is a fixed point M on X-axis.

Sol. (Q. Nos. 61 to 63)

61. From the figure $OA=OB=AB=a$



$$\therefore \quad \angle OAB=60^\circ$$

62. Let T be the point of intersection of tangents.

$$\because \quad \angle AOC=120^\circ$$

$$\therefore \quad \angle ATC=180^\circ-120^\circ=60^\circ$$

63. Locus of point of intersection of tangents at A and C is

$$x^2+y^2=\frac{a^2}{\sin^2\left(\frac{\alpha}{2}\right)}$$

$$=\frac{a^2}{\sin^2(30^\circ)}=4a^2 \qquad (\text{Here, } \alpha=60^\circ)$$

Hence, $x^2+y^2=4a^2$

Sol. (Q. Nos. 64 to 66)

Here, $$t_1^2=h^2+k^2-4,$$

$$t_2^2=h^2+k^2-4h,$$

$$t_3^2=h^2+k^2-4k$$

given $$t_1^4=t_2^2t_3^2+16$$

or $$(h^2+k^2-4)^2=(h^2+k^2-4h)(h^2+k^2-4k)+16$$

or $$(h^2+k^2)^2-8(h^2+k^2)+16=(h^2+k^2)^2-4(h^2+k^2)(h+k)+16hk+16$$

or $$(h^2+k^2)(h+k)-2(h^2+k^2)-4hk=0$$

or $$(h^2+k^2)(h+k)-2(h+k)^2=0$$

or $$(h+k)(h^2+k^2-2(h+k))=0$$

or $$h+k=0 \qquad \ldots(i)$$

and $$h^2+k^2-2h-2k=0 \qquad \ldots(ii)$$

64. Locus of (h,k) is [From Eq. (i)]

$$L_1: x+y=0$$

65. Locus of (h,k) is [From Eq. (ii)]

$$C_1: x^2+y^2-2x-2y=0$$

66. $\because$ Circle C_2 is equal to circle C_1

$\therefore$ Radius of circle C_2 = radius of circle $C_1=\sqrt{2}$

$\therefore$ Distance between the centres of C_1 and C_2

$$=\sqrt{2}+\sqrt{2}$$

$$=2\sqrt{2} \qquad (\because \text{ circles } C_1 \text{ and } C_2 \text{ touch externally})$$

67. The given circle is

$$S:(x-3)^2+(y-5)^2=(\sqrt{(34-\lambda)})^2$$

Since, point $P(1,4)$ lies inside the circle

$$\therefore \quad S_1<0$$

$$\Rightarrow \quad 1+16-6-40+\lambda<0$$

or $$\lambda<29 \qquad \ldots(i)$$

Also, circle neither touches nor cuts the axes, then

$$3>\sqrt{(34-\lambda)} \text{ or } \lambda>25 \qquad \ldots(ii)$$

and $$5>\sqrt{(34-\lambda)} \text{ or } \lambda>9 \qquad \ldots(iii)$$

From Eqs. (i), (ii) and (iii), we get

$$25<\lambda<29$$

Hence, difference $=29-25=4$

68. $x^2+y^2-2x-2\lambda y-8=0$

or $(x^2+y^2-2x-8)-2\lambda y=0$

which is of the form $S+\lambda L=0$

All the circles pass through the point of intersection of the circle $x^2+y^2-2x-8=0$ and $y=0$

Solving, we get

$$x^2-2x-8=0$$

or $$(x-4)(x+2)=0$$

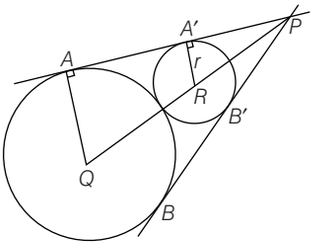
$$\therefore \quad A\equiv(-2,0)$$

and $$B\equiv(4,0)$$

Hence, $|AB|=6$

69. $\because AQ=BQ=3+2\sqrt{2}$

and PQ = radius of director circle of C_1



$$=\sqrt{2}(3+2\sqrt{2})=3\sqrt{2}+4$$

Let 'r' be required radius

$$\therefore \quad 3\sqrt{2}+4=3+2\sqrt{2}+r+r\sqrt{2} \qquad \left(\because \frac{PR}{PQ}=\frac{A'R}{AQ}\right)$$

$$\Rightarrow \quad r=\frac{(\sqrt{2}+1)}{(\sqrt{2}+1)}=1$$

70. Since, **A.** $x+y-5=0$ is a tangent to the circle at $P(2,3)$, so the centre of the circle lies on $x-y+1=0$. Now $Q(1,2)$ lies on the circle.

Equation of right bisector of PQ is $x+y-4=0$

$\therefore$ Centre of circle is point of intersection of $x-y+1=0$ and $x+y-4=0$ which is $\left(\frac{3}{2},\frac{5}{2}\right)$

$\therefore$ Radius $\frac{1}{\sqrt{\lambda}}=\frac{\left|\frac{3}{2}+\frac{5}{2}-5\right|}{\sqrt{2}}=\frac{1}{\sqrt{2}}$

$\therefore \quad \lambda=2$

Hence, $\lambda^2=4$

71. Since, given circle is $(x+5)^2+(y-12)^2=(14)^2$

or $\left(\frac{x+5}{14}\right)^2+\left(\frac{y-12}{14}\right)^2=1$

Let, $\frac{x+5}{14}=\cos\theta$ and $\frac{y-12}{14}=\sin\theta$

or $x=14\cos\theta-5$ and $y=14\sin\theta+12$

$\therefore \quad x^2+y^2=(14\cos\theta-5)^2+(14\sin\theta+12)^2$

$=196+25+144+28(12\sin\theta-5\cos\theta)$

$=365+28(12\sin\theta-5\cos\theta)$

Maximum value of $(x^2+y^2)=365+28\times13=729$

$(\because -13\le 12\sin\theta-5\cos\theta\le 13)$

or maximum value of $(x^2+y^2)^{\frac{1}{3}}=9$

72. Let the given lines are represented by L_1, L_2, L_3 and L_4, then

$L_1\equiv 2x+3y-2=0 \qquad L_2\equiv 3x-2y-3=0$

$L_3\equiv x+2y-3=0 \qquad L_4\equiv 2x-y-1=0$

Equation of second degree conic circumscribing a quadrilateral whose sides are $L_1=0$, $L_2=0$, $L_3=0$ and $L_4=0$ is

$L_1L_3+kL_2L_4=0$

or $(2x+3y-2)(x+2y-3)+k(3x-2y-3)(2x-y-1)=0$ ...(i)

For circle, coefficient of $x^2=$ coefficient of y^2

or $2+6k=6+2k$

$\therefore \quad k=1$

From, Eq. (i), required circle is

$8x^2+8y^2-17x-8y+9=0$

or $x^2+y^2-\left(\frac{17}{8}\right)x-y+\left(\frac{9}{8}\right)=0$

Here, $\lambda=-\frac{17}{8},\mu=-1,\nu=\frac{9}{8}$

then, $|\lambda+2\mu+\nu|=3$

73. Let radius of given circle is a

$\therefore \quad a=\sqrt{(4+2-c)}=\sqrt{(6-c)}$ ...(i)

Now, radius of circle $C_1=\frac{a}{\sqrt{2}}$ and radius of circle $C_2=\frac{a}{(\sqrt{2})^2}$

and so on.

Also, $a+\frac{a}{\sqrt{2}}+\frac{a}{(\sqrt{2})^2}+\ldots\infty=2$ (gjven)

Then, $\frac{a}{1-\frac{1}{\sqrt{2}}}=2$

or $a=2-\sqrt{2}=\sqrt{6-c}$ [From Eq. (i)]

or $4+2-4\sqrt{2}=6-c$

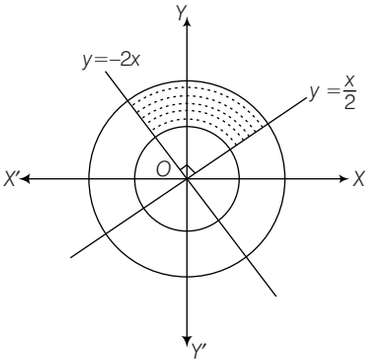
$\therefore \quad c=4\sqrt{2}$

Hence, $\lambda=4$

74. The rays are given as $2x^2-3xy-2y^2=0$ i.e. $(2x+y)(x-2y)=0$

$\Rightarrow \; y=\frac{x}{2}$ or $y=-2x$ which are perpendicular.

$\therefore$ Required area



$=\frac{1}{4}(\pi(2)^2-\pi(1)^2)$

$=\frac{3\pi}{4}=\frac{\lambda\pi}{4}$ (given)

$\therefore \quad \lambda=3$

75. Let radii of circles be r_1 and r_2 and distance between centres is d, then

$\sqrt{d^2-(r_1+r_2)^2}=5$ ...(i)

and $\sqrt{d^2-(r_1-r_2)^2}=13$ ...(ii)

From Eqs. (i) and (ii), we get

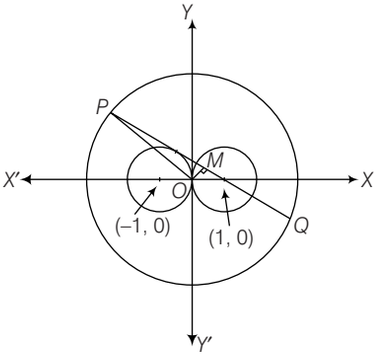
$(r_1+r_2)^2-(r_1-r_2)^2=(13)^2-(5)^2$

$\Rightarrow \quad 4r_1r_2=144$ or $\lambda=36$ $(\because r_1r_2=\lambda)$

$\therefore \quad \frac{\lambda}{4}=9$

76. Let $ax+by=1$ ...(i)

be a chord PQ.



which pass through (1, 0), then $a + 0 = 1$

$\therefore \quad a = 1$

and touch circle B with centre $(-1, 0)$ and radius 1, then

$$\frac{|-a + 0 - 1|}{\sqrt{a^2 + b^2}} = 1$$

or $\quad a^2 + b^2 = (a+1)^2$

or $\quad b^2 = 2a + 1 = 3$

$\therefore \quad b = \sqrt{3}$

From Eq. (i), Equation of chord is $x + \sqrt{3}\, y = 4$

$\therefore \quad OM = \frac{1}{2}$ and $OP = 4$

$\therefore \quad PQ = 2PM = 2\sqrt{(OP)^2 - (OM)^2}$

$$= 2\sqrt{\left(16 - \frac{1}{4}\right)} = \sqrt{63} = \sqrt{\lambda}$$

$\therefore \quad \lambda = 63$

Hence, $\quad \frac{\lambda}{9} = 7$

77. $\because \quad S_1 : (x-2)^2 + (y-3)^2 = 1$

Centre C_1:(2,3) and radius r_1:1 and $S_2 : (x-5)^2 + (y-6)^2 = r^2$

Centre C_2:(5,6) and radius r_2:r

$\Rightarrow \quad C_1C_2 = 3\sqrt{2}$

(A) $\because S_1$ and S_2 touch internally, then

$C_1C_2 = r_2 - r_1$

or $\quad 3\sqrt{2} = r - 1$

or $\quad (r-1)^2 = 18$

(B) $\because S_1$ and S_2 touch externally, then

$C_1C_2 = r_2 + r_1$

or $\quad 3\sqrt{2} = r + 1$

or $\quad r^2 + 2r + 3 = (r+1)^2 + 2 = 18 + 2 = 20$

(C) $\because S_1$ and S_2 intersect orthogonally, then

$(C_1C_2)^2 = r_1^2 + r_2^2$

$\Rightarrow \quad 18 = r^2 + 1$

or $\quad r^2 - 1 = 16$

(D) $\because S_1$ and S_2 intersect, the common chord is $S_1 - S_2 = 0$

i.e. $\quad 6x + 6y + r^2 - 49 = 0$

Given, common chord is longest, then passes through (2, 3)

$\Rightarrow \quad 12 + 18 + r^2 - 49 = 0$

or $\quad r^2 = 19$

$\therefore \quad r^2 + 5 = 24$

78. **(A)** Since (2, 3) lies on $ax + by - 5 = 0$

$\therefore \quad 2a + 3b - 5 = 0 \quad \ldots$(i)

Since, line is at greatest distance from centre

$\Rightarrow \quad \left(\frac{4-3}{3-2}\right)\left(-\frac{a}{b}\right) = -1$ i.e. $a = b$

From Eq. (i), $a = b = 1$

$\therefore \quad a + b = 2$ and $a^2 + b^2 = 2$

(B) Let P be the point (h,k), then $h^2 + k^2 + 2h + 2k = 0$ ...(i)

mid-point of OP is $\left(\frac{h}{2}, \frac{k}{2}\right)$

Let $\quad x = \frac{h}{2}, y = \frac{k}{2}$

or $\quad h = 2x, k = 2y$

From Eq. (i), $4x^2 + 4y^2 + 4x + 4y = 0$

or $\quad x^2 + y^2 + x + y = 0$

On comparing, we get

$2a = 1, 2b = 1$

or $\quad a = b = \frac{1}{2}$

$\therefore \quad a + b = 1$

(C) Centre of circles are C_1:(1,2) and C_2:(5,−6)

Equation of C_1C_2 is $y - 2 = \frac{-6-2}{5-1}(x-1)$

or $\quad 2x + y - 4 = 0 \quad \ldots$(i)

Equation of radical axis is $8x - 16y - 56 = 0$

or $\quad x - 2y - 7 = 0 \quad \ldots$(ii)

Point of intersection of Eqs. (i) and (ii) are (3, −2)

$\therefore \quad a = 3, b = -2$

or $\quad a + b = 1$

(D) Let $S \equiv x^2 + y^2 - 6\sqrt{3}x - 6y + 27 = 0$

$S_1 = 0^2 + 0^2 - 0 - 0 + 27 = 27$

$T = 0.x + 0.y - 3\sqrt{3}(x+0) - 3(y+0) + 27$

$= -3\sqrt{3}x - 3y + 27$

Eq. of the pair of tangents is given by

$SS_1 = T^2$

$\Rightarrow \quad 27(x^2 + y^2 - 6\sqrt{3}x - 6y + 27) = (-3\sqrt{3}x - 3y + 27)^2$

or $\quad 3(x^2 + y^2 - 6\sqrt{3}x - 6y + 27) = (\sqrt{3}x + y - 9)^2$

or $\quad 18y^2 - 18\sqrt{3}xy = 0$

or $\quad 18y(y - \sqrt{3}x) = 0$

the tangents are $y = 0, y = \sqrt{3}x$

$\therefore \quad a = 0, b = \sqrt{3}$

then, $\quad a^2 + b^2 = 3$

79. **(A)** $\because \quad P \equiv (10,7)$

and $\quad S = x^2 + y^2 - 4x - 2y - 20$

$\therefore \quad S_1 = 100 + 49 - 40 - 14 - 20 > 0$

$\therefore P$ outside the circle, radius $r = \sqrt{4 + 1 + 20} = 5$

centre $C \equiv (2,1)$

$\therefore$ Shortest distance $L = CP - r$

$= \sqrt{(10-2)^2 + (7-1)^2} - 5$

$= \sqrt{(64+36)} - 5 = 10 - 5 = 5$

And largest distance $M = CP + r$

$= 10 + 5 = 15$

$M + L = 20, M - L = 10$

(B) $\because \quad P \equiv (3,-6)$

and $\quad S \equiv x^2+y^2-16x-12y-125$

$\therefore \quad S_1 = 9+36-48+72-125<0$

$\therefore$ P inside the circle radius $r=\sqrt{(64+36+125)}=15$

centre $C \equiv (8,6)$

$\therefore$ Shortest distance $L = r-CP$

$$= 15-\sqrt{(8-3)^2+(6+6)^2}$$

$$= 15-13=2$$

And largest distance $M = r+CP$

$$= 15+13=28$$

$$M+L=30,$$

$$M-L=26$$

(C) $P \equiv (6,-6)$

and $\quad S \equiv x^2+y^2-4x+6y-12$

$\therefore \quad S_1 = (6)^2+(-6)^2-24-36-12=0$

P on the circle

$\therefore$ radius $r=\sqrt{(4+9+12)}=5$

$\therefore$ Shortest distance $L=0$

and largest distance $M=2r=10$

$$M+L=10,\ M-L=10$$

80. **(A)** Equation of conic $(y-a_1x-b)(y-a_2x-b)+\lambda xy=0$ represent a circle. If coefficient of x^2 = coefficient of y^2

$\therefore \quad a_1a_2=1$

$\because \quad AM>GM$

$\therefore \quad \dfrac{a_1+a_2}{2} > \sqrt{a_1a_2} = 1$

$\Rightarrow \quad a_1+a_2>2$

and $\quad \dfrac{a_1^2+a_2^2}{2} > \sqrt{a_1^2.a_2^2} = |a_1a_2| = 1$

$\therefore \quad a_1^2+a_2^2>2$

(B) Let $(a_1\cos\theta, a_1\sin\theta)$ be any point on $x^2+y^2=a_1^2$, then chord of contact is

$$x(a_1\cos\theta)+y(a_1\sin\theta)=b^2$$

which is tangent of $x^2+y^2=a_2^2$

$\therefore \quad \dfrac{|0+0-b^2|}{\sqrt{\{(a_1\cos\theta)^2+(a_1\sin\theta)^2\}}} = a_2$ or $b^2=a_1a_2$

for $\quad b=1,\ a_1a_2=1$

$$AM>GM$$

$\Rightarrow \quad \dfrac{a_1+a_2}{2} > \sqrt{a_1a_2} = |b|$

$\therefore \quad a_1+a_2>2|b|,$

for $\quad b=1,\ a_1+a_2>2$

and then, $a_1^2+a_2^2>2$

(C) $2gg_1+2ff_1=c+c_1$

$\Rightarrow \quad 2\times a_1\times a_2+0=b+b$

$\therefore \quad a_1a_2=b$ for $b=1, a_1a_2=1$

and then, $\quad a_1+a_2>2$

Also, $\quad a_1^2+a_2^2>2$

81. Let $S \equiv x^2+y^2-1=0$

$\therefore \quad S(1,3)=1^2+3^2-1=9>0$

$\Rightarrow$ Point (1, 3) outside the circle $x^2+y^2=1$

$\therefore$ Two tangents can be drawn from (1, 3) to circle $x^2+y^2=1$

$\Rightarrow$ Statement I is false

Also, $\quad \dfrac{|3-m|}{\sqrt{(1+m^2)}}=1$

Squaring both sides, we get

$$9+m^2-6m=1+m^2$$

or $\quad 6m=8 \Rightarrow m=\dfrac{4}{3}$

$\Rightarrow$ Statement II is true.

82. $\because x^2+y^2+2x-4y=0$

$\Rightarrow \quad (x+1)^2+(y-2)^2=1^2+2^2$

Let $S \equiv (x+1)^2+(y-2)^2-1^2-2^2$

Value of $S(1,\lambda)=(1+1)^2+(\lambda-2)^2-1^2-2^2<0$

or $\quad (1+1)^2+(\lambda-2)^2<1^2+2^2$

$\therefore$ Points (1, λ) inside the circle.

$\Rightarrow$ No tangents can be drawn from the point (1, λ) to the circle

$$x^2+y^2+2x-4y=0$$

and $\quad (1+1)^2+(\lambda-2)^2<1^2+2^2$

$\Rightarrow \quad (\lambda-2)^2<1$

or $\quad -1<\lambda-2<1$

or $\quad 1<\lambda<3$

$\therefore$ Statement II and Statement II are both true and statement II is correct explanation for statement I.

83. Let $A \equiv (1,4),\ B \equiv (2,3)$ and $C \equiv (-1,6)$

$$\therefore \text{Area of } \Delta ABC = \frac{1}{2}\begin{vmatrix} 1 & 4 & 1 \\ 2 & 3 & 1 \\ -1 & 6 & 1 \end{vmatrix} = 0$$

$\Rightarrow A, B, C$ are collinear

i.e. no circle is drawn.

Hence, Statement I is false and through three non-collinear points in a plane only one circle can be drawn.

$\therefore$ Statement II is true.

84. $\because$ Locus of point of intersection of perpendicular tangents is director circle.

$\because x^2+y^2=50$ is director circle of $x^2+y^2=25$

$\Rightarrow$ Statement I is false and statement II is true.

85. Here, $C_1 \equiv (0,0),\ r_1=2$

and $\quad C_2 \equiv (3,0),\ r_2=2$

$\therefore \quad |C_1C_2|=3$ and $r_1+r_2=4$

and $\quad |r_1-r_2|=0$

$\Rightarrow \quad |r_1-r_2|<|C_1C_2|<r_1+r_2$

Hence, circles $x^2+y^2=4$ and $x^2+y^2-6x+5=0$ intersect each other at two distinct points.

$\Rightarrow$ Statement I is true and Statement II is false.

86. $\because$ Centre of circle $(1, -1)$ lies on $3x - 4y = 7$

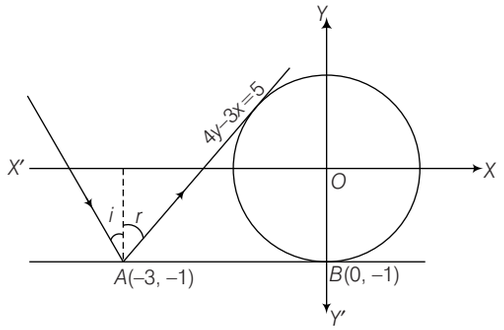
$\therefore$ $3x - 4y = 7$ is a diameter of circle

$$x^2 + y^2 - 2x + 2y - 47 = 0$$

$\therefore$Statement I is true.

Statement II is always true but Statement I is not a correct explanation of Statement I.

87. Statement I is true, line $4y - 3x - 5 = 0$ passes through $A(-3, -1)$ and its distance from $O(0, 0)$ is 1 unit = radius of circle



The tangent at $B(0, -1)$ is $y = -1$ and normal at A to line AB is $x = -3$

$\therefore$Equation of incident ray is $y + 1 = \left(-\frac{4}{3}\right)(x + 3)$

$\Rightarrow$ $4x + 3y + 15 = 0$

Statement II is obviously true.

Hence, both statements are true and but Statement II is not correct explanation of Statement I.

88. The given points are $A(1,1)$, $B(2,3)$ and $C(3,5)$ which are collinear as

Slope of AB = Slope of $BC = 2$

Hence, Statement II is true

The chords of contact are concurrent, then,

$$\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

Hence, points (x_1, y_1), (x_2, y_2) and (x_3, y_3) are collinear.

Therefore, Both statements are true and statement II is correct explanation of statement I.

89. Let the equation of circle be

$$x^2 + y^2 + 2gx + 2fy + c = 0 \quad \ldots(i)$$

Since, circle Eq. (i) passes through (1,0) and (0,1) then

$$1 + 2g + c = 0 \quad \Rightarrow \quad g = -\frac{(1 + c)}{2} \quad \ldots(ii)$$

and $$1 + 2f + c = 0 \quad \Rightarrow \quad f = -\frac{(1 + c)}{2} \quad \ldots(iii)$$

Radius of the circle Eq. (ii) $= \sqrt{(g^2 + f^2 - c)}$

$$= \sqrt{\frac{(1 + c)^2}{4} + \frac{(1 + c)^2}{4} - c} = \sqrt{\left(\frac{1 + c^2}{2}\right)}$$

For minimum radius, c must be equal to zero, then from Eqs. (ii) and (iii),

$$g = -\frac{1}{2} \quad \text{and} \quad f = -\frac{1}{2}$$

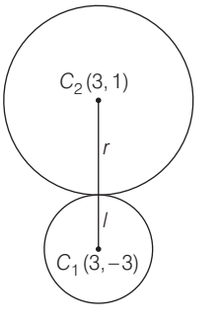
Equation of required circle, from Eq. (i), is

$$x^2 + y^2 - x - y = 0$$

90. The given circle is

$$x^2 + y^2 - 6x + 6y + 17 = 0$$

Centre and radius of this circle are $(3, -3)$ and $\sqrt{9 + 9 - 17} = 1$ respectively. But given the required circle has normals



$$x^2 - 3xy - 3x + 9y = 0$$

or $$(x - 3)(x - 3y) = 0$$

or $$x = 3 \quad \text{and} \quad x - 3y = 0 \quad \ldots(i)$$

but point of intersection of normals is the centre of the circle. Point of intersection of normals represented by Eq. (i) is (3, 1) which is centre of the required circle. Since, given circle and required circle touch each other externally, then (if radius of required circles is r)

Sum of radii = Distance between the centres

$$r + 1 = \sqrt{(3 - 3)^2 + (-3 - 1)^2} = 4$$

$\therefore$ $$r = 3$$

$\therefore$Equation of required circle is

$$(x - 3)^2 + (y - 1)^2 = 3^2$$

or $$x^2 + y^2 - 6x - 2y + 1 = 0$$

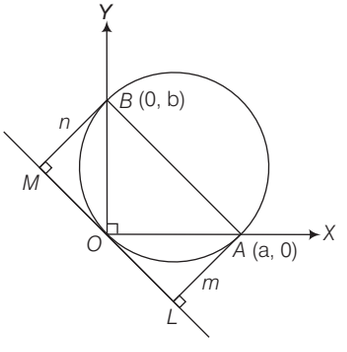
91. Let $OA = a$ and $OB = b$ then the coordinates of A and B are $(a, 0)$ and $(0, b)$ respectively.

Since, $\angle AOB = \pi / 2$

Hence, AB is the diameter of the required circle whose equation is

$$(x - a)(x - 0) + (y - 0)(y - b) = 0$$

or $$x^2 + y^2 - ax - by = 0 \quad \ldots(i)$$



Equation of tangent at (0,0) of Eq. (i) is

$$0 \cdot x + 0 \cdot y - \frac{a}{2}(x + 0) - \frac{b}{2}(0 + y) = 0$$

or $$ax + by = 0$$

$$\therefore \quad m = AL = \frac{a \cdot a + 0}{\sqrt{a^2 + b^2}}$$

or $$m = \frac{a^2}{\sqrt{a^2 + b^2}} \quad \text{...(ii)}$$

and $$n = BM = \frac{a \cdot 0 + b \cdot b}{\sqrt{a^2 + b^2}}$$

$$\therefore \quad n = \frac{b^2}{\sqrt{a^2 + b^2}} \quad \text{...(iii)}$$

Adding Eqs. (ii) and (iii), we get

$$m + n = \sqrt{(a^2 + b^2)}$$

From Eqs. (ii) and (iii), we get

$$a = \pm\sqrt{m\,(m + n)} \quad \text{and} \quad b = \pm\sqrt{n\,(m + n)}$$

From Eq. (i), equation of required circle is

$$x^2 + y^2 \pm \sqrt{m\,(m + n)}\,x \pm \sqrt{n(m + n)}\,y = 0$$

92. Solving the equations

$$(2 + c)\,x + 5c^2 y = 1 \quad \text{and} \quad 3x + 5y = 1$$

then $$(2 + c)\,x + 5c^2\left(\frac{1 - 3x}{5}\right) = 1$$

or $$(2 + c)\,x + c^2\,(1 - 3x) = 1$$

$$\therefore \quad x = \frac{1 - c^2}{2 + c - 3c^2}$$

or $$x = \frac{(1 + c)\,(1 - c)}{(3\,c + 2)\,(1 - c)} = \frac{1 + c}{3c + 2}$$

$$\therefore \quad x = \lim_{c \to 1} \frac{1 + c}{3c + 2}$$

$$x = \frac{2}{5}$$

$$\therefore \quad y = \frac{1 - 3x}{5} = \frac{1 - \frac{6}{5}}{5} = -\frac{1}{25}$$

Therefore, the centre of the required circle is $\left(\frac{2}{5}, -\frac{1}{25}\right)$ but circle passes through (2, 0)

$$\therefore \text{ Radius of the required circle} = \sqrt{\left(\frac{2}{5} - 2\right)^2 + \left(-\frac{1}{25} - 0\right)^2}$$

$$= \sqrt{\frac{64}{25} + \frac{1}{625}} = \sqrt{\frac{1601}{625}}$$

Hence, the required equation of the circle is

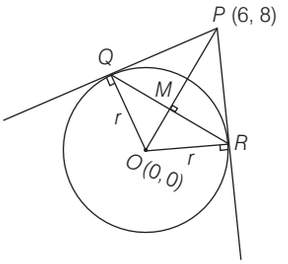
$$\left(x - \frac{2}{5}\right)^2 + \left(y + \frac{1}{25}\right)^2 = \frac{1601}{625}$$

or $$25x^2 + 25y^2 - 20x + 2y - 60 = 0$$

93. Equation of chord of contact (QR) is $6x + 8y - r^2 = 0$

$$\therefore \quad PM = \frac{|\,6 \cdot 6 + 8 \cdot 8 - r^2\,|}{\sqrt{(6^2 + 8^2)}} = \frac{|\,100 - r^2\,|}{10}$$

and $$OM = \frac{|\,0 + 0 - r^2\,|}{\sqrt{(6^2 + 8^2)}} = \frac{r^2}{10}$$



then $$QR = 2 \cdot QM = 2\sqrt{\{(OQ)^2 - (OM)^2\}}$$

$$= 2\sqrt{\left(r^2 - \frac{r^4}{100}\right)}$$

$\therefore$ Area of $\Delta QPR = \frac{1}{2} \cdot QR \cdot PM$

$$\Delta\,(\text{say}) = \frac{1}{2} \cdot 2\sqrt{\left(r^2 - \frac{r^4}{100}\right)} \cdot \frac{|\,100 - r^2\,|}{10}$$

$$\therefore \quad \Delta^2 = \frac{r^2\,(100 - r^2)^3}{1000} = z \quad \text{(say)}$$

$$\therefore \quad \frac{dz}{dr} = \frac{1}{1000}\{r^2 \,.\, 3\,(100 - r^2)^2 \,.\, (-2r) + (100 - r^2)^3 \cdot 2r\}$$

$$= \frac{2r\,(100 - r^2)^2}{1000}\{100 - r^2 - 3r^2\}$$

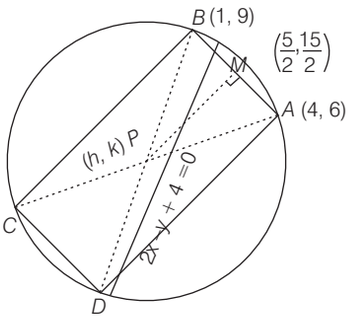
For maximum or minimum $\frac{dz}{dr} = 0$, then we get $r = 5$, ($r \neq 10$ as P is outside the circle)

and $$\left.\frac{d^2 z}{dr^2}\right|_{r=5} = -\text{ve}$$

$\therefore \Delta$ is also maximum at $r = 5$.

94. Since, A (4, 6) and B (1, 9) do not lie on $2x - y + 4 = 0$.

Let M be the mid-point of AB, then coordinates of M is $\left(\frac{5}{2}, \frac{15}{2}\right)$



Slope of $AB = \dfrac{9-6}{1-4} = -1$

$\therefore$ Slope of $PM = 1$

Equation of PM is, $\quad y - \dfrac{15}{2} = 1 \cdot \left(x - \dfrac{5}{2}\right)$

which passes through $P(h, k)$, then

$$k - \frac{15}{2} = h - \frac{5}{2} \quad \text{or} \quad k - h = 5 \qquad \ldots(i)$$

and (h, k) lie on $2x - y + 4 = 0$

$$\therefore \quad 2h - k + 4 = 0 \qquad \ldots(ii)$$

Solving Eqs. (i) and (ii), we get

$$h = 1 \quad \text{and} \quad k = 6$$

Now, $\quad AD = 2PM = 2\sqrt{\left(1 - \dfrac{5}{2}\right)^2 + \left(6 - \dfrac{15}{2}\right)^2}$

$$= 2\sqrt{\frac{9}{4} + \frac{9}{4}} = 3\sqrt{2}$$

and $\quad AB = \sqrt{(4-1)^2 + (6-9)^2} = 3\sqrt{2}$

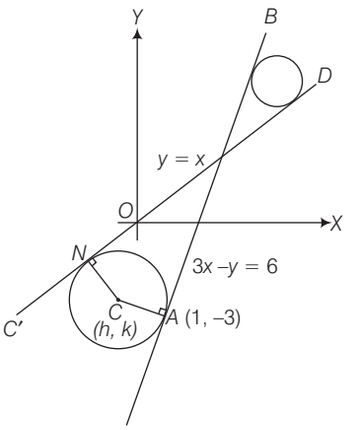
$\therefore$ Area of rectangle

$$ABCD = AB \times AD = 3\sqrt{2} \times 3\sqrt{2} = 18 \text{ sq units.}$$

95. Let $C(h, k)$ be the centre of the circle. Let AB and $C'D$ be the lines represented by

$3x - y = 6$ and $y = x$ respectively.

Clearly, the circle touches AB at $A(1, -3)$.



Equation of line $\perp$ to $3x - y = 6$ is $x + 3y = \lambda$ which passes through $(1, -3)$.

then $\quad 1 - 9 = \lambda$

$$\therefore \quad \lambda = -8$$

$\therefore \perp$ line is $\quad x + 3y + 8 = 0$

which passes through $C(h, k)$

then $\quad h + 3k + 8 = 0 \qquad \ldots(i)$

Now, centre $\quad C(h, k) \equiv C(-3k - 8, k)$

Radius $\quad CN = \dfrac{|-3k - 8 - k|}{\sqrt{1+1}} = CA$

$$= \sqrt{(-3k - 8 - 1)^2 + (k + 3)^2}$$

$$\Rightarrow \quad \frac{4|k+2|}{\sqrt{2}} = |k+3|\sqrt{10} \qquad \ldots(ii)$$

$$\Rightarrow \quad 4|k+2| = 2\sqrt{5}\,|k+3|$$

$$\Rightarrow \quad 2|k+2| = \sqrt{5}\,|k+3|$$

$$\therefore \quad k + 2 = \pm\frac{\sqrt{5}}{2}(k+3)$$

$$\therefore \quad k = -7 - 2\sqrt{5} \quad \text{or} \quad k = -7 + 2\sqrt{5}$$

Since, radius from Eq. (ii),

$$r = \frac{4|k+2|}{\sqrt{2}}$$

$$(\text{radius})_{\text{at } k = -7 - 2\sqrt{5}} = \frac{4|-7 - 2\sqrt{5} + 2|}{\sqrt{2}}$$

$$= 10\sqrt{2} + 4\sqrt{10} = 26.79$$

$$(\text{radius})_{\text{at } k = -7 + 2\sqrt{5}} = \frac{4|-7 + 2\sqrt{5} + 2|}{\sqrt{2}}$$

$$= 10\sqrt{2} - 4\sqrt{10} = 1.5$$

Hence, radius of smaller circle is 1.5 units.

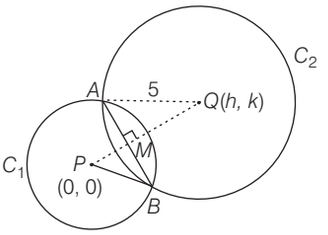
96. Let the centre of the circle C_2 is $Q(h, k)$, equation of the circle C_2 is

$$(x - h)^2 + (y - k)^2 = 5^2$$

or $\quad x^2 + y^2 - 2xh - 2yk + h^2 + k^2 - 25 = 0$

$$C_2 \equiv x^2 + y^2 - 2xh - 2yk + h^2 + k^2 - 25 = 0$$

and equation of circle $C_1 \equiv x^2 + y^2 - 16 = 0$



$\therefore$ Equation of common chord is

$$C_1 - C_2 = 0$$

$$\Rightarrow \quad -2xh - 2yk + h^2 + k^2 - 9 = 0$$

or $\quad 2hx + 2ky - (h^2 + k^2 - 9) = 0 \qquad \ldots(i)$

Slope of this line $= -h/k$

But, it is given that its slope $= 3/4$

$$\therefore \quad -\frac{h}{k} = \frac{3}{4}$$

or $\quad 3k + 4h = 0 \qquad \ldots(ii)$

Let p be the length perpendicular from $P(0, 0)$ on chord (1), then

$$p = \frac{h^2 + k^2 - 9}{\sqrt{(4h^2 + 4k^2)}}$$

or $\quad p = \dfrac{(h^2 + k^2 - 9)}{2\sqrt{(h^2 + k^2)}} \qquad \ldots(iii)$

Length of this chord $AB = 2AM$

$$= 2\sqrt{(16 - p^2)}$$

This chord has maximum length, then $p = 0$, then from Eq. (iii),

$$h^2 + k^2 - 9 = 0 \qquad \ldots(iv)$$

On solving Eqs. (ii) and (iv) we get

$$h = \mp\frac{9}{5}, k = \pm\frac{12}{5}$$

$\therefore$ Centre of C_2 is $\left(\frac{9}{5}, -\frac{12}{5}\right)$ or $\left(-\frac{9}{5}, \frac{12}{5}\right)$

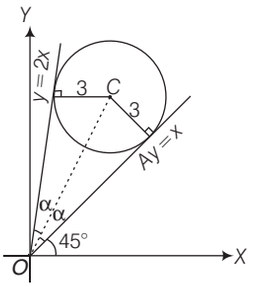
97. $\because\ 2x^2 + y^2 - 3xy = 0$

$\Rightarrow \quad (2x - y)(x - y) = 0$

$\Rightarrow \quad y = 2x, y = x$

are the equations of straight lines passing through origin.

Now, let the angle between tangents is 2α,



then, $\tan(45° + 2\alpha) = 2$

$\Rightarrow \quad \frac{\tan 45° + \tan 2\alpha}{1 - \tan 45° \tan 2\alpha} = 2$

$\Rightarrow \quad \frac{1 + \tan 2\alpha}{1 - \tan 2\alpha} = \frac{2}{1} \Rightarrow \frac{2\tan 2\alpha}{2} = \frac{1}{3}$

(By componendo and dividendo rule)

$\Rightarrow \quad \frac{2\tan\alpha}{1 - \tan^2\alpha} = \frac{1}{3}$

$\Rightarrow \quad \tan^2\alpha + 6\tan\alpha - 1 = 0$

$\therefore \quad \tan\alpha = \frac{-6 \pm \sqrt{(36 + 4)}}{2} = -3 \pm \sqrt{10}$

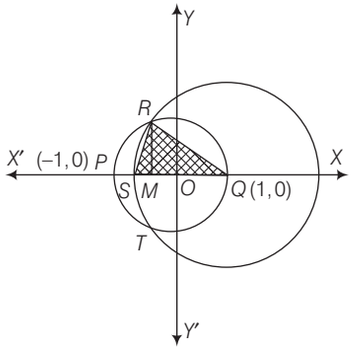
$= -3 + \sqrt{10} \qquad \left(\because 0 < \alpha < \frac{\pi}{4}\right)$

Now, in ΔOAC, $\tan\alpha = \frac{3}{OA} = (\sqrt{10} - 3)$

$\therefore \quad OA = \frac{3}{(\sqrt{10} - 3)} \frac{(\sqrt{10} + 3)}{(\sqrt{10} + 3)} = 3(3 + \sqrt{10})$

98. The given circle is $x^2 + y^2 = 1$ ...(i)

with centre at $O(0,0)$ and radius 1. It cuts X-axis at the points when $y = 0$ then $x = \pm 1$ i.e., *at* $P(-1, 0)$ and $Q(1, 0)$.



Equation of circle with centre at $Q(1, 0)$ and radius r is

$$(x - 1)^2 + (y - 0)^2 = r^2 \qquad \text{...(ii)}$$

$(0 < r < 2)$

Solving Eqs. (i) and (ii), we get

$$x = \frac{2 - r^2}{2} \quad \text{and} \quad y = \pm\frac{r\sqrt{4 - r^2}}{2}$$

but R above the X-axis.

$\therefore \quad R \equiv \left(\frac{2 - r^2}{2}, \frac{r\sqrt{4 - r^2}}{2}\right)$

So, $SQ = r$ and $MR = \frac{r\sqrt{4 - r^2}}{2}$

$\therefore$ Area of $\Delta QSR = \frac{1}{2} \cdot QS \cdot MR$

$$\Delta = \frac{1}{2} \cdot r \cdot \frac{r\sqrt{4 - r^2}}{2}$$

$$\Delta\,(\text{say}) = \frac{r^2\sqrt{(4 - r^2)}}{4}$$

$$\Delta^2 = \frac{r^4}{16}(4 - r^2) = A \qquad \text{(say)}$$

$\therefore \quad A = \frac{1}{16}(4r^4 - r^6)$

$\therefore \quad \frac{dA}{dr} = \frac{1}{16}(16r^3 - 6r^5)$ and $\frac{d^2A}{dr^2} = \frac{1}{16}(48r^2 - 30r^4)$

For maximum and minimum area, $\frac{dA}{dr} = 0$

$$r^2 = \frac{8}{3}$$

$\therefore \quad \left(\frac{d^2A}{dr^2}\right)_{r = \sqrt{\frac{8}{3}}} = \frac{1}{16}\left(48 \times \frac{8}{3} - 30 \times \frac{64}{9}\right) < 0$

$\therefore$ A is maximum. Hence, Δ is also maximum.

$\therefore$ Maximum value of $\Delta = \frac{1}{2} \times \frac{8}{3} \times \frac{1}{2}\sqrt{\left(4 - \frac{8}{3}\right)}$

$$= \frac{2}{3} \times \frac{2}{\sqrt{3}}$$

$$= \frac{4\sqrt{3}}{9} \text{ sq units.}$$

99. The equation of any curve passing through

$$a_1x + b_1y + c_1 = 0$$

$$a_2x + b_2y + c_2 = 0$$

$y = 0$ and $x = 0$ is

$$(a_1x + b_1y + c_1)(a_2x + b_2y + c_2) + \lambda xy = 0 \qquad \text{...(i)}$$

where, λ is a parameter.

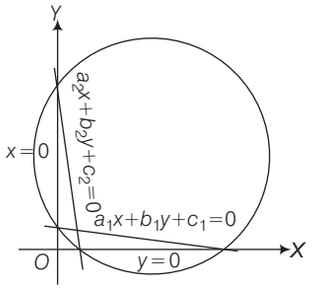
This curve will represent a circle. If the coefficient of x^2 = coefficient of y^2,

i.e. $a_1a_2 = b_1b_2$ ...(ii)

and if the coefficient of $xy = 0$

then $a_1b_2 + a_2b_1 + \lambda = 0$

$\therefore \quad \lambda = -(a_1b_2 + a_2b_1)$



Substituting the value of λ in Eq. (i) then

$$(a_1x + b_1y + c_1)(a_2x + b_2y + c_2) - (a_1b_2 + a_2b_1)\, xy = 0$$

$$\Rightarrow\ a_1a_2x^2 + b_1b_2y^2 + (a_1c_2 + a_2c_1)\, x + (b_1c_2 + b_2c_1)\, y = 0$$

From Eq. (ii), $b_1b_2 = a_1a_2$

$\therefore$ Equation of required circle is

$$a_1a_2(x^2 + y^2) + (a_1c_2 + a_2c_1)\, x + (b_1c_2 + b_2c_1)\, y = 0$$

100. Let circle be

$$S \equiv x^2 + y^2 + 2gx + 2fy + c = 0 \qquad \ldots(i)$$

Since, centre of this circle $(-g, -f)$ lie on $2x - 2y + 9 = 0$

$$\therefore \qquad -2g + 2f + 9 = 0 \qquad \ldots(ii)$$

and the circle $S = 0$ and $x^2 + y^2 - 4 = 0$ cuts orthogonally.

$$\therefore \qquad 2g \times 0 + 2f \times 0 = c - 4$$

$$\therefore \qquad c = 4 \qquad \ldots(iii)$$

Substituting the values of g and c from Eqs. (ii) and (iii) in Eq. (i), then

$$x^2 + y^2 + (2f + 9)\, x + 2fy + 4 = 0$$

or $$(x^2 + y^2 + 9x + 4) + 2f\,(x + y) = 0$$

Hence, the circle $S = 0$ passes through fixed point

$(\because$ form $S' + \lambda P = 0)$

$\therefore\ \ x^2 + y^2 + 9x + 4 = 0$ and $x + y = 0$

After solving we get $(-4, 4)$ or $\left(-\frac{1}{2}, \frac{1}{2}\right)$.

101. Chords are bisected on the line $y = x$. Let (x_1, x_1) be the mid-point of the chord, then equation of the chord is $T = S_1$

$$\therefore\ \ xx_1 + yx_1 - a\,(x + x_1) - b\,(y + x_1) + a^2 + b^2 - c^2$$

$$= x_1^2 + x_1^2 - 2ax_1 - 2bx_1 + a^2 + b^2 - c^2$$

$$\Rightarrow\ (x_1 - a)\, x\ + (x_1 - b)\, y + ax_1 + bx_1 - 2x_1^2 = 0$$

This chord passes through $(a, b + c)$

$$\Rightarrow\ (x_1 - a)\, a\ + (x_1 - b)\,(b + c) + ax_1 + bx_1 - 2x_1^2 = 0$$

$$\Rightarrow \qquad 2x_1^2 - (2a + 2b + c)\, x_1 + a^2 + b^2 + bc = 0$$

which is quadratic in x_1. Since, it is given that two chords are bisected on the line $y = x$, then x_1 must have two real roots,

$$B^2 - 4AC > 0$$

$$\Rightarrow\ (2a + 2b + c)^2 - 4 \cdot 2\,(a^2 + b^2 + bc) > 0$$

$$\Rightarrow\ 4a^2 + 4b^2 + c^2 + 8ab + 4bc + 4ac - 8a^2 - 8b^2 - 8b^2 - 8bc > 0$$

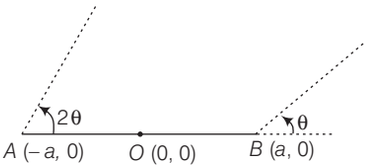
$$\Rightarrow\ 4a^2 + 4b^2 - 8ab + 4bc - 4ac - c^2 < 0$$

Hence, the condition on a, b, c is

$$4a^2 + 4b^2 - c^2 - 8ab + 4bc - 4ca < 0$$

102. Let $A \equiv (-a, 0)$ and $B \equiv (a, 0)$ be two fixed points.

Let one line which rotates about B an angle θ with the X-axis at any time t and at that time the second line which rotates about A make an angle 2θ with X-axis.



Now, equation of lines through B and A are respectively

$$y - 0 = \tan\theta\,(x - a) \qquad \ldots(i)$$

and $$y - 0 = \tan 2\theta\,(x + a) \qquad \ldots(ii)$$

From Eq. (ii), $y = \dfrac{2\tan\theta}{1 - \tan^2\theta}(x + a)$

$$= \left\{\frac{\frac{2y}{(x-a)}}{1 - \frac{y^2}{(x-a)^2}}\right\}(x + a) \qquad \text{[from Eq. (i)]}$$

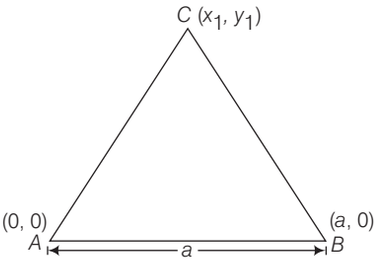
$$\Rightarrow \qquad y = \frac{2y\,(x - a)\,(x + a)}{(x - a)^2 - y^2}$$

$$\Rightarrow\ (x - a)^2 - y^2 = 2\,(x^2 - a^2)$$

or $x^2 + y^2 + 2ax - 3a^2 = 0$ which is the required locus.

103. Let the coordinate of C is (x_1, y_1)

and let the coordinates of A and B are $(0, 0)$ and $(a, 0)$



given $$k = \frac{\sin A}{\sin B} = \frac{BC}{AC}$$

$$\Rightarrow \qquad (BC)^2 = k^2\,(AC)^2$$

$$\Rightarrow\ \ (x_1 - a)^2 + y_1^2 = k^2\,(x_1^2 + y_1^2)$$

$$\Rightarrow (1 - k^2)\, x_1^2 + (1 - k^2)\, y_1^2 - 2ax_1 + a^2 = 0 \qquad (\because k \neq 1)$$

$$\Rightarrow \qquad x_1^2 + y_1^2 - \frac{2ax_1}{1 - k^2} + \frac{a^2}{1 - k^2} = 0$$

Hence, locus of C is

$$x^2 + y^2 - \frac{2ax}{1 - k^2} + \frac{a^2}{1 - k^2} = 0$$

This is a circle whose centre is

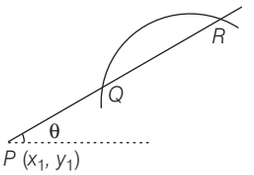
$$\left(\frac{a}{1 - k^2}, 0\right)$$

and $$\text{radius} = \sqrt{\frac{a^2}{(1 - k^2)^2} - \frac{a^2}{(1 - k^2)}} = \frac{ak}{(1 - k^2)}$$

104. Let P be (x_1, y_1) and line through $P(x_1, y_1)$ makes an angle θ with X-axis, then

$$\frac{x - x_1}{\cos\theta} = \frac{y - y_1}{\sin\theta} = r$$

Coordinates of any point on the curve is $(x_1 + r\cos\theta, y_1 + r\sin\theta)$. This point must lie on $ax^2 + 2hxy + by^2 = 1$



$$\therefore\ a(x_1 + r\cos\theta)^2 + 2h(x_1 + r\cos\theta)(y_1 + r\sin\theta) + b(y_1 + r\sin\theta)^2 = 1$$

$$\therefore\ (a\cos^2\theta + h\sin 2\theta + b\sin^2\theta)r^2 + 2(ax_1\cos\theta + hx_1\sin\theta + hy_1\cos\theta)r + ax_1^2 + 2hx_1y_1 + by_1^2 = 0$$

It is quadratic equation in r. Let roots of this equation are r_1 and r_2 then

$$r_1r_2 = \frac{ax_1^2 + 2hx_1y_1 + by_1^2}{(a\cos^2\theta + h\sin 2\theta + b\sin^2\theta)}$$

$$\therefore\quad PQ \cdot PR = \frac{ax_1^2 + 2hx_1y_1 + by_1^2}{a\cos^2\theta + h\sin 2\theta + b\sin^2\theta} \text{ for } a = b, h = 0$$

$$\therefore\quad PQ \cdot PR = \frac{ax_1^2 + 0 + ay_1^2}{a\cos^2\theta + 0 + a\sin^2\theta} = x_1^2 + y_1^2$$

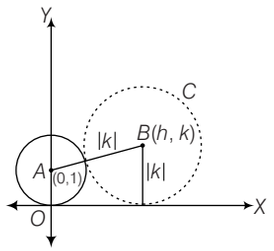
which is independent of θ.

Then curve $ax^2 + 2hxy + by^2 = 1$ becomes $ax^2 + 0 + ay^2 = 1$

$$\Rightarrow\quad x^2 + y^2 = \frac{1}{a}$$

is a circle with centre $(0, 0)$ and radius $\frac{1}{\sqrt{a}}$.

105. Let the centre of circle C be (h,k). Then as this circle touches axis of x, its radius $=|k|$



Also, it touches the given circle $x^2 + (y-1)^2 = 1$, centre $(0, 1)$ radius 1, externally

Therefore, the distance between centres = sum of radii

$$\Rightarrow\quad \sqrt{(h-0)^2 + (k-1)^2} = 1 + |k|$$

$$\Rightarrow\quad h^2 + k^2 - 2k + 1 = (1 + |k|)^2$$

$$\Rightarrow\quad h^2 + k^2 - 2k + 1 = 1 + 2|k| + k^2$$

$$\Rightarrow\quad h^2 = 2k + 2|k|$$

$\therefore$ Locus of (h,k) is, $x^2 = 2y + 2|y|$

Now if $y > 0$, it becomes $x^2 = 4y$

and if $y \le 0$, it becomes $x = 0$

$\therefore$Combining the two, the required locus is

$$\{(x,y) : x^2 = 4y\} \cup \{(0,y) : y \le 0\}$$

106. $s_1 = x^2 + y^2 + 2ax + cy + a = 0$

$$s_2 = x^2 + y^2 - 3ax + dy - 1 = 0$$

Equation of common chord of circles s_1 and s_2 is given by $s_1 - s_2 = 0$

$$\Rightarrow\quad 5ax + (c-d)y + a + 1 = 0$$

Given, that $5x + by - a = 0$ passes through P and Q

$\therefore$ The two equations should represent the same line

$$\Rightarrow\quad \frac{a}{1} = \frac{c-d}{b} = \frac{a+1}{-a}$$

$$\Rightarrow\quad a + 1 = -a^2$$

$$a^2 + a + 1 = 0$$

No real value of a.

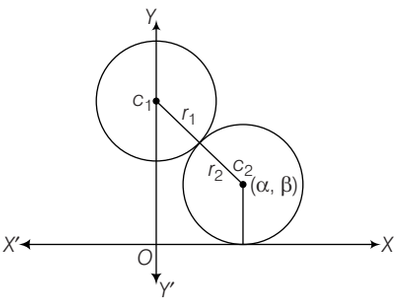
107. Equation of circle with centre $(0, 3)$ and radius 2 is

$$x^2 + (y-3)^2 = 4$$

Let centre of the variable circle is (α,β)

$\because$ It touches X-axis.

$\therefore$It's equation is $(x-\alpha)^2 + (y-\beta)^2 = \beta^2$



Circle touch externally

$$\Rightarrow\quad c_1c_2 = r_1 + r_2$$

$$\therefore\quad \sqrt{\alpha^2 + (\beta-3)^2} = 2 + \beta$$

$$\alpha^2 + (\beta-3)^2 = \beta^2 + 4 + 4\beta$$

$$\Rightarrow\quad \alpha^2 = 10(\beta - 1/2)$$

$\therefore$Locus is $x^2 = 10\left(y - \frac{1}{2}\right)$ which is a parabola.

108. Let the centre be (α,β)

$\because$ It cuts the circle $x^2 + y^2 = p^2$ orthogonally

$\therefore$Using $2g_1g_2 + 2f_1f_2 = c_1 + c_2$, we get

$$2(-\alpha)\times 0 + 2(-\beta)\times 0 = c_1 - p^2$$

$$\Rightarrow\quad c_1 = p^2$$

Let equation of circle is

$$x^2 + y^2 - 2\alpha x - 2\beta y + p^2 = 0$$

It passes through

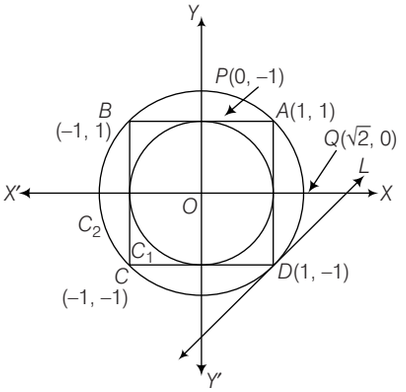
$$(a,b) \Rightarrow a^2 + b^2 - 2\alpha a - 2\beta b + p^2 = 0$$

$\therefore$ Locus of (α,β) is

$\therefore$ $\quad 2ax + 2by - (a^2 + b^2 + p^2) = 0$

109. Without loss of generally it we can assume the square $ABCD$ with its vertices $A(1,1)$, $B(-1,1)$, $C(-1,-1)$, $D(1,-1)$

P to be the point $(0,1)$ and Q as $(\sqrt{2},0)$.



Then, $\dfrac{PA^2 + PB^2 + PC^2 + PD^2}{QA^2 + QB^2 + QC^2 + QD^2}$

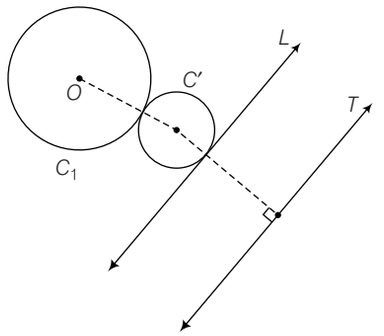
$$= \frac{1+1+5+5}{2[(\sqrt{2}-1)^2+1] + 2((\sqrt{2}+1)^2+1)}$$

$$= \frac{12}{16} = 0.75$$

110. Let C' be the circle touching circle C_1 and L, so that C_1 and C' are on the same side of L. Let us draw a line T parallel to L at a distance equal to the radius of circle C_1, on opposite side of L.

Then, the centre of C' is equidistant from the centre of C_1 and from line T.

$\Rightarrow$ locus of centre of C' is a parabola.

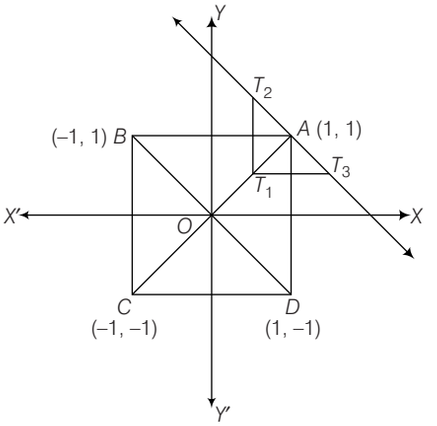


111. Since, S is equidistant from A and line BD, it traces a parabola.

Clearly, AC is the axis, $A(1,1)$ is the focus and $T_1\left(\frac{1}{2},\frac{1}{2}\right)$ is the vertex of parabola.

$$AT_1 = \frac{1}{\sqrt{2}}.$$

T_2T_3 = latusrectum of parabola



$$= 4 \times \frac{1}{\sqrt{2}} = 2\sqrt{2}$$

$\therefore$ $\quad$ Area $(\Delta T_1T_2T_3) = \dfrac{1}{2} \times \dfrac{1}{\sqrt{2}} \times 2\sqrt{2} = \dfrac{1}{2} = 1$ sq units.

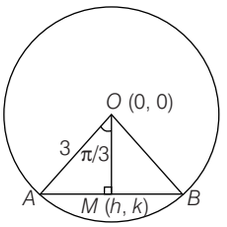
112. Point of intersection of $3x - 47 - 7 = 0$ and $2x - 3y - 5 = 0$ is $(1,-1)$ which is the centre of the circle and radius $= 7$

$\therefore$Equation is $(x-1)^2 + (y+1)^2 = 49$

$\Rightarrow$ $\quad x^2 + y^2 - 2x + 2y - 47 = 0$

113. Let $M(h,k)$ be the mid-point of chord AB where

$$\angle AOB = \frac{2\pi}{3}$$



$\therefore$ $\quad \angle AOM = \dfrac{\pi}{3}.$

Also, $\quad OM = 3\cos\dfrac{\pi}{3} = \dfrac{3}{2}$

$\Rightarrow$ $\quad \sqrt{h^2 + k^2} = \dfrac{3}{2}$

$\Rightarrow$ $\quad h^2 + k^2 = \dfrac{9}{4}$

$\therefore$ Locus of (h,k) is $x^2 + y^2 = \dfrac{9}{4}$

114. Equation of director circle of the given circle $x^2 + y^2 = 169$ is $x^2 + y^2 = 2 \times 169 = 338$.

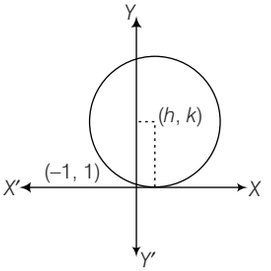
We know from every point on director circle, the tangents drawn to given circle are perpendicular to each other.

Here, (17, 7) lies on director circle.

$\therefore$ The tangent from (17, 7) to given circle are mutually perpendicular.

115. Equation of circle whose centre is (h,k)

$$(x-h)^2+(y-k)^2=k^2$$



(radius of circle = k because circle is tangent to x-axis)

Equation of circle passing through $(-1,+1)$

$\therefore \quad (-1-h)^2+(1-k)^2=k^2$

$\Rightarrow \quad 1+h^2+2h+1+k^2-2k=k^2$

$\Rightarrow \quad h^2+2h-2k+2=0 \quad D\geq 0$

$\therefore \quad (2)^2-4\times 1.(-2K+2)\geq 0$

$\Rightarrow \quad 4-4(-2k+2)\geq 0$

$\Rightarrow \quad 1+2k-2\geq 0 \quad \Rightarrow \quad k\geq \frac{1}{2}$

116. Slope of $CD=\frac{1}{\sqrt{3}}$

$\therefore$ Parametric equation of CD is

$$\frac{x-\frac{3\sqrt{3}}{2}}{\frac{\sqrt{3}}{2}}=\frac{y-\frac{3}{2}}{\frac{1}{2}}=\pm 1$$

$\therefore$ Two possible coordinates of C are

$$\left(\frac{\sqrt{3}}{2}+\frac{3\sqrt{3}}{2},\frac{1}{2}+\frac{3}{2}\right) \text{ or } \left(\frac{-\sqrt{3}}{2}+\frac{3\sqrt{3}}{2},-\frac{1}{2}+\frac{3}{2}\right)$$

i.e. $(2\sqrt{3},2)$ or $(\sqrt{3},1)$

As (0, 0) and C lie on the same side of PQ

$\therefore(\sqrt{3},1)$ should be the coordinates of C.

Remark : Remember (x_1,y_1) and (x_2,y_2) lie on the same or opposite side of a line $ax+by+c=0$ according as $\frac{ax_1+by_1+c}{ax_2+by_2+c}>0$ or <0. $\therefore$ Equation of the circle is $(x-\sqrt{3})^2+(y-1)^2=1$

117. ΔPQR is an equilateral triangle, the incentre C must coincide with centroid of ΔPQR and D, E, F must coincide with the mid points of sides PQ, QR and RP respectively.

Also, $\angle CPD=30^\circ \Rightarrow PD=\sqrt{3}$

Writing the equation of side PQ in symmetric form we get,

$$\frac{x-\frac{3\sqrt{3}}{2}}{-\frac{1}{2}}=\frac{y-\frac{3}{2}}{\frac{\sqrt{3}}{2}}=\mp\sqrt{3}$$

$\therefore$ Coordinates of $P=\left(\frac{\sqrt{3}}{2}+\frac{3\sqrt{3}}{2},\frac{-3}{2}+\frac{3}{2}\right)=(2\sqrt{3},0)$

and coordinates of $Q=\left(\frac{-\sqrt{3}}{2}+\frac{3\sqrt{3}}{2},\frac{3}{2}+\frac{3}{2}\right)=(\sqrt{3},3)$

Let coordinates of R be (α,β), then using the formula for centriod of Δ we get

$$\frac{\sqrt{3}+2\sqrt{3}+\alpha}{3}=\sqrt{3} \text{ and } \frac{3+0+\beta}{3}=1$$

$\Rightarrow \quad \alpha=0$ and $\beta=0$

$\therefore$ Coordinates of $R=(0,0)$

Now, coordinates of $E=$ mid point of $QR=\left(\frac{\sqrt{3}}{2},\frac{3}{2}\right)$ and coordinates of $F=$ mid-point of $PR=(\sqrt{3},0)$

118. Equation of side QR is $y=\sqrt{3}x$ and equation of side RP is $y=0$

119. The given circle is $x^2+y^2+6x-10y+30=0$ Centre $(-3,5)$, radius = 2

$$L_1: 2x+3y+(p-3)=0;$$
$$L_2: 2x+3y+p+3=0$$

Clearly, $L_1 || L_2$

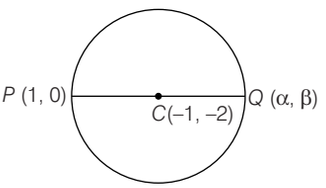
Distance between L_1 and L_2

$$=\left|\frac{p+3-p+3}{\sqrt{2^2+3^2}}\right|=\frac{6}{\sqrt{13}}<2$$

$\Rightarrow$ If one line is a chord of the given circle, other line may or may not the diameter of the circle.

Statement I is true and statement II is false.

120. The given circle is $x^2+y^2+2x+4y-3=0$



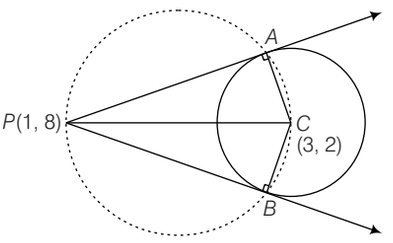
Centre $(-1,-2)$

Let $Q(\alpha,\beta)$ be the point diametrically opposite to the point $P(1,0)$,

then, $\frac{1+\alpha}{2}=-1$ and $\frac{0+\beta}{2}=-2$

$\Rightarrow \quad \alpha=-3, \beta=-4$, So, Q is $(-3,-4)$

121. Tangents PA and PB are drawn from the point $P(1,3)$ to circle $x^2+y^2-6x-4y-11=0$ with centre $C(3,2)$



Clearly the circumcircle of ΔPAB will pass through C and as $\angle A=90^\circ$, PC must be a diameter of the circle.

$\therefore$ Equation of required circle is

$$(x-1)(x-3)+(y-2)=0$$

$\Rightarrow \quad x^2+y^2-4x-10y+19=0$

122. Let r be the radius of required circle.

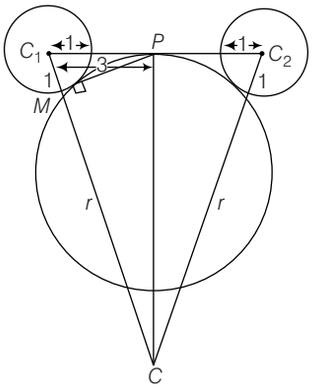
Clearly, in $\Delta C_1CC_2, C_1C = C_2C = r+1$ and P is mid-point of C_1C_2

$\therefore$ $CP \perp C_1C_2$

Also, $PM \perp CC_1$

Now, $\Delta PMC_1 \sim \Delta CPC_1$ (by AA similarity)

$\therefore$ $\dfrac{MC_1}{PC_1} = \dfrac{PC_1}{CC_1}$



$\Rightarrow$ $\dfrac{1}{3} = \dfrac{3}{r+1} \Rightarrow r+1 = 9 \Rightarrow r = 8.$

123. The given circles are

$S_1 \equiv x^2 + y^2 + 3x + 7y + 2p - 5 = 0$ ...(i)

$S_2 \equiv x^2 + y^2 + 2x + 2y - p^2 = 0$ ...(ii)

$\therefore$ Equation of common chord PQ is $S_1 - S_2 = 0$

$\Rightarrow$ $L \equiv x + 5y + p^2 + 2p - 5 = 0$

$\Rightarrow$ Equation of circle passing through P and Q is $S_1 + \lambda L = 0$

$\Rightarrow$ $(x^2 + y^2 + 3x + 7y + 2p - 5) + \lambda(x + 5y + p^2 + 2p - 5) = 0$

As it passes through (1, 1), therefore

$\Rightarrow$ $(7 + 2p) + \lambda(2p + p^2 + 1) = 0$

$\Rightarrow$ $\lambda = -\dfrac{2p+7}{(p+1)^2}$

which does not exist for $p = -1$

124. Circle $x^2 + y^2 - 4x - 8y - 5 = 0$

Centre $= (2, 4)$

Radius $= \sqrt{4 + 16 + 5} = 5$

If circle is intersecting line $3x - 4y = m$, at two distinct points.

$\Rightarrow$ length of perpendicular from centre to the line < radius

$\Rightarrow$ $\dfrac{|6 - 16 - m|}{5} < 5$

$\Rightarrow$ $|10 + m| < 25$

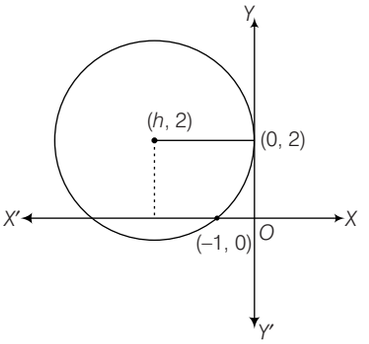
$\Rightarrow$ $-25 < m + 10 < 25$

$\Rightarrow$ $-35 < m < 15$

125. Let centre of the circle be $(h, 2)$ then radius $= |h|$

$\therefore$ Equation of circle becomes $(x-h)^2 + (y-2)^2 = h^2$

As it passes through $(-1, 0)$



$\Rightarrow$ $(-1-h)^2 + 4 = h^2 \Rightarrow h = \dfrac{-5}{2}$

$\therefore$ Centre $\left(\dfrac{-5}{2}, 2\right)$ and $r = \dfrac{5}{2}$

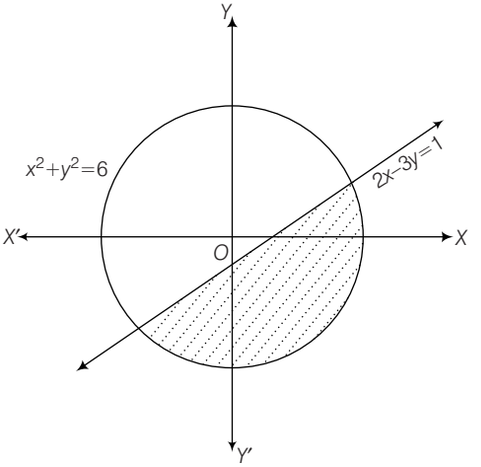
Distance of centre from $(-4, 0)$ is $\dfrac{5}{2}$

$\therefore$ It lies on the circle.

126. The smaller region of circle is the region given by

$x^2 + y^2 \le 6$ ...(i)

and $2x - 3y \ge 1$ ...(ii)



We observe that only two points $\left(2, \dfrac{3}{4}\right)$ and $\left(\dfrac{1}{4}, -\dfrac{1}{4}\right)$ satisfy both the inequations Eqs. (i) and (ii), we get

$\therefore$ 2 points in S lie inside the smaller part.

127. As centre of one circle is (0, 0) and other circle passes through (0, 0), therefore

Aslo, $C_1\left(\dfrac{a}{2}, 0\right) C_2(0, 0)$

$r_1 = \dfrac{|a|}{2}\ r_2 = C$

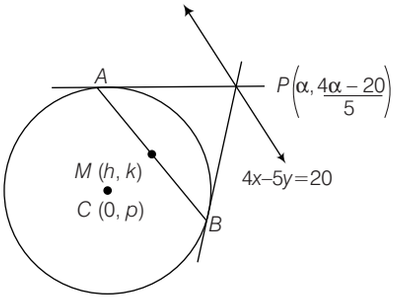
$C_1C_2 = r_1 - r_2 = \dfrac{|a|}{2}$

$\Rightarrow$ $c - \dfrac{|a|}{2} = \dfrac{|a|}{2} \Rightarrow c = |a|$

If the two circles touch each other, then they must touch each other internally.

128. Any point P on line $4x-5y=20$ is $\left(\alpha, \frac{4\alpha-20}{5}\right)$.

Equation of chord of contact AB to the circle $x^2+y^2=9$



drawn from point $P\left(\alpha, \frac{4\alpha-20}{5}\right)$ is

$$x.\alpha + y.\left(\frac{4\alpha-20}{5}\right)=9 \qquad \ldots(i)$$

Also, the equation of chord AB whose mid-point is (h,k) is

$$hx+ky=h^2+k^2 \qquad \ldots(ii)$$

$\because$ Eqs. (i) and (ii) represent the same line, therefore

$$\frac{h}{\alpha}=\frac{k}{\frac{4\alpha-20}{5}}=\frac{h^2+k^2}{9}$$

$\Rightarrow \quad 5k\alpha=4h\alpha-20h$

and $\quad 9h=\alpha(h^2+k^2)$

$\Rightarrow \quad \alpha=\frac{20h}{4h-5k}$ and $\alpha=\frac{9h}{h^2+k^2}$

$\Rightarrow \quad \frac{20h}{4h-5k}=\frac{9h}{h^2+k^2}$

$\Rightarrow \quad 20(h^2+k^2)=9(4h-5k)$

$\therefore$ Locus of (h,k) is $20(x^2+y^2)-36x+45y=0$

Sol. (Q. Nos. 129 to 130)

Equation of tangent PT to the circle $x^2+y^2=4$ at the point $P(\sqrt{3},1)$ is $x\sqrt{3}+y=4$

Let the line L, perpendicular to tangent PT be

$$x-y\sqrt{3}+\lambda=0 \qquad \ldots(i)$$

As it is tangent to the circle $(x-3)^2+y^2=1$

$\therefore$ length of perpendicular from centre of circle to the tangent = radius of circle.

$\Rightarrow \quad \left|\frac{3+\lambda}{2}\right|=1 \Rightarrow \lambda=-1 \text{ or } -5$

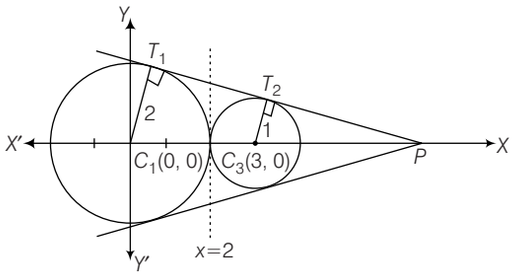
129. From Eq. (i)

Equation of L can be

$$x-\sqrt{3}y=1$$

or $\quad x-\sqrt{3}y=5$

130.



From the figure it is clear that the intersection point of two direct common tangents lies on X-axis.

Aslo $\quad \Delta PT_1C_1 \sim \Delta PT_2C_2$

$\Rightarrow \quad PC_1 : PC_2 = 2:1$

or P divides C_1C_2 in the ratio 2:1 externally

$\therefore$Coordinates of P are $(6,0)$

Let the equation of tangent through P be

$$y=m(x-6)$$

As it touches $x^2+y^2=4$

$\therefore \quad \left|\frac{6m}{\sqrt{m^2+1}}\right|=2$

$\Rightarrow \quad 36m^2=4(m^2+1)$

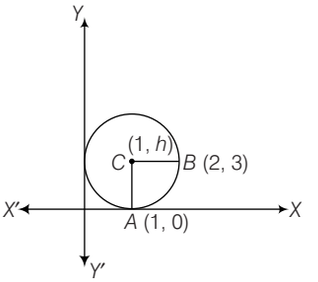
$\Rightarrow \quad m=\pm\frac{1}{2\sqrt{2}}$

$\therefore$Equations of common tangents are $y=\pm\frac{1}{2\sqrt{2}}(x-6)$

Also $x=2$ is the common tangent to the two circles.

131. Let centre of the circle ne $(1,4)$

[$\because$ circle touches x-axis at (1, 0)]



Let the circle passes through the point $B(2,3)$

$\therefore \quad CA=CB$ (radius)

$\Rightarrow \quad CA^2=CB^2$

$\Rightarrow \quad (1-1)^2+(h-0)^2=(1-2)^2+(h-3)^2$

$\Rightarrow \quad h^2=1+h^2+9-6h$

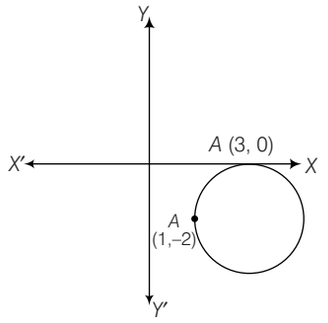
$\Rightarrow \quad h=\frac{10}{6}=\frac{5}{3}$

Thus, diameter is $2h=\frac{10}{3}$.

132. Since, circle touches X-axis at (3, 0)

$\therefore$ The equation of circle be

$$(x-3)^2+(y-0)^2+\lambda y=0$$



As it passes through (1, –2)

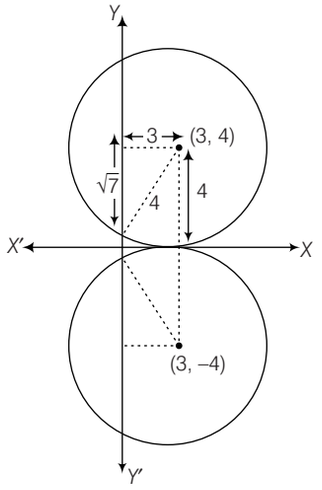
$\therefore$ Put $x=1, y=-2$

$\Rightarrow \quad (1-3)^2+(-2)^2+\lambda(-2)=0 \Rightarrow \lambda=4$

$\therefore$Equation of circle is $(x-3)^2+y^2-8=0$

Now, from the options (5, –2) satisfies equation of circle.

133. There can be two possibilities for the given circle as shown in the figure



$\therefore$ The equations of circle can be

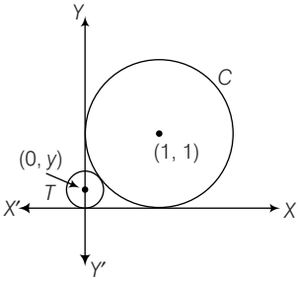
$$(x-3)^2+(y-4)^2=4^2$$

or $\quad (x-3)^2+(y+4)^2=4^2$

i.e. $\quad x^2+y^2-6x+8y+9=0$

or $\quad x^2+y^2-6x+8y+9=0$

134.



Equation of circle $C \equiv (x-1)^2+(y-1)^2=1$

Radius of $T=|y|$

T touches C externally

therefore,

Distance between the centres = sum of their radii

$\Rightarrow \quad \sqrt{(0-1)^2+(y-1)^2}=1+|y|$

$\Rightarrow \quad (0-1)^2+(y-1)^2=(1+|y|)^2$

$\Rightarrow \quad 1+y^2+1-2y=1+y^2+2|y|$

$$2|y|=1-2y$$

If $y>0$ then, $2y=1-2y \Rightarrow y=\frac{1}{4}$

If $y<0$ then, $-2y=1-2y \Rightarrow 0=1$ (not possible)

$\therefore \quad y=\frac{1}{4}$

135. Let the equation of circle be

$$x^2+y^2+2gx+2fy+c=0$$

It passes through (0, 1)

$\therefore \quad 1+2f+c=0$ ...(i)

This circle is orthogonal to $(x-1)^2+y^2=16$

i.e. $\quad x^2+y^2-2x-15=0$

and $\quad x^2+y^2-1=0$

$\therefore$We should have

$$2g(-1)+2f(0)=c-15$$

or $\quad 2g+c-15=0$ ...(ii)

and $\quad 2g(0)+2f(0)=c-1$ or $c=1$

Solving Eqs. (i), (ii) and (iii), we get

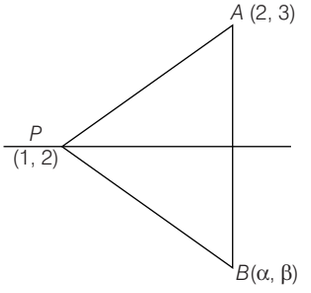
$$c=1, g=7, f=-1$$

$\therefore$ Required circle is

$$x^2+y^2+14x-2y+1=0$$

With centre (–7,1) and radius = 7

136. Intersection point of $2x-3y+4=0$ and $x-2y+3=0$ is (1, 2)



Since, P is the fixed point for given family of lines

So, $PB = PA$

$$(\alpha-1)^2+(\beta-2)^2=(2-1)^2+(3-2)^2$$

$$(\alpha-1)^2+(\beta-2)^2=1+1=2$$

$$(x-1)^2+(y-2)^2=(\sqrt{2})^2$$

$(x-a)^2+(y-b)^2=r^2$

Therefore, given locus is a circle with centre (1,2) and radius $\sqrt{2}$.

137. $x^2+y^2-4x-6y-12=0$ ...(i)

Centre $C_1=(2,3)$ and Radius, $r_1=5$ units

$$x^2+y^2+6x+18y+26=0 \quad \text{...(ii)}$$

Centre, $C_2=(-3,-9)$

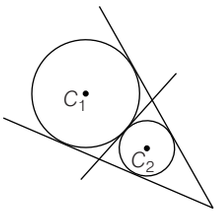
and radius, $r_2=8$ units

$|C_1C_2|=\sqrt{(2+3)^2+(3+9)^2}=13$ units

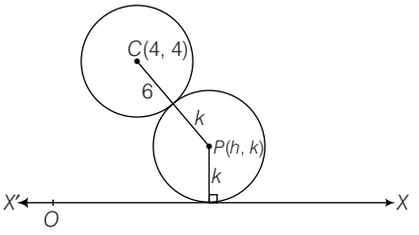
$r_1+r_2=5+8=13$

$\therefore \quad |C_1C_2|=r_1+r_2$

Therefore, there are three common tangents.



138. For the given circle, centre : (4, 4), radius =6

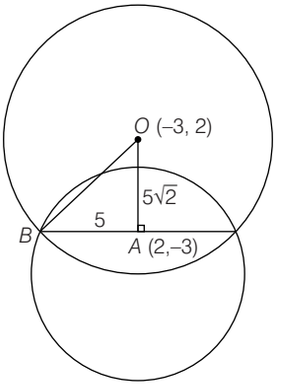


$$6+k=\sqrt{(h-4)^2+(k-4)^2}$$

$$(h-4)^2=20k+20$$

$\therefore$ locus of (h, k) is $(x-4)^2=20(y+1)$, which is parabola.

139. Centre of $S:O(-3,2)$ and centre of given circle is $A(2,-3)$



$\Rightarrow \quad OA=5\sqrt{2}$

Also, $AB=5$ ($\because AB=$ radius of the given circle)

Now, in ΔOAB,

$$(OB)^2=(AB)^2+(OA)^2=25+50=75$$

$\therefore \quad OB=5\sqrt{3}$

140. Circle : $x^2+y^2=1$

Equation of tangent at $P(\cos\theta,\sin\theta)$

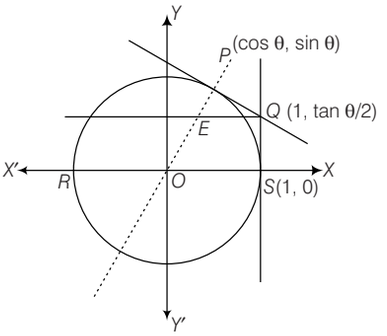
$$x\cos\theta+y\sin\theta=1 \quad \text{...(i)}$$

Equation of normal at P

$$y=x\tan\theta \quad \text{...(ii)}$$

Equation of tangent at S is $x=1$

$$\therefore \quad Q\left(1,\frac{1-\cos\theta}{\sin\theta}\right)=Q\left(1,\tan\frac{\theta}{2}\right)$$



$\therefore$ Equation of line through Q and parallel to RS is $y=\tan\frac{\theta}{2}$

$\therefore$ Intersection point E of normal and $y=\tan\frac{\theta}{2}$

$$\tan\frac{\theta}{2}=x\tan\theta$$

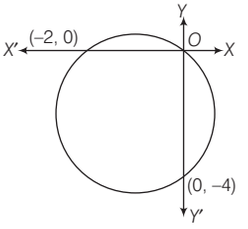
$$\Rightarrow \quad x=\frac{1-\tan^2\frac{\theta}{2}}{2}$$

$$\therefore \quad \text{Locus of } E: x=\frac{1-y^2}{2} \text{ or } y^2=1-2x$$

It is satisfied by the points $\left(\frac{1}{3},\frac{1}{\sqrt{3}}\right)$ and $\left(\frac{1}{3},\frac{-1}{\sqrt{3}}\right)$.

141. (2) Equation of circle can be written as

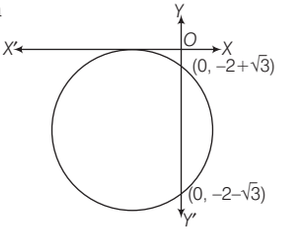
$(x+1)^2+(y+2)^2=p+5$ ...(i)



Case I. For $p=0$, circle passes through origin and cuts x-axis and y-axis at $(-2, 0)$ and $(0, -4)$ respectively.

Case II. If circle touch X-axis, then

$$(1)^2=-p \Rightarrow p=-1$$



From Eq. (i), we get

$(x+1)^2+(y+2)^2=2^2$

Cut off Y-axis at (put $x=0$)

$(y+2)^2=3$

$\Rightarrow \quad y=-2\pm\sqrt{3}$

or $(0, -2\pm\sqrt{3})$

Case III. If circle touch Y-axis, then

$$(2)^2=-p$$

$\Rightarrow \quad p=-4$

From Eq. (i), we get

$(x+1)^2+(y+2)^2=1$

Cut off X-axis at (put $y=0$)

$(x+1)^2=-3$ (impossible)

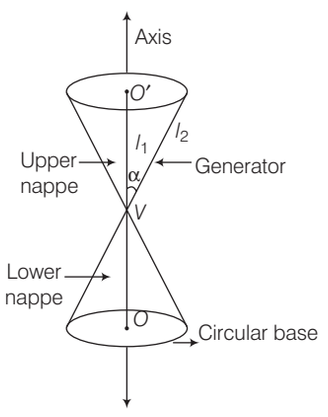
Introduction, Conic Section, Section of a Right Circular Cone by Different Planes, Conic Section : Definition, Equation of Conic Section, Recognisation of Conics, How to Find the Centre of Conics, Parabola : Definition, Other forms of Parabola with Latusrectum 4a, General Equation of a Parabola, The Generalised form $(y-k)^2 = 4a(x-h)$, Parabolic Curve

Introduction

The famous Greek mathematician Euclid, the father of creative Geometry, near about 300 BC considering various plane sections of a right circular cone found many curves, which are called conics or conic sections.

Conic Section

Let l_1 be a fixed vertical line and l_2 be another line intersecting it at a fixed point V and inclined to it at an angle α.

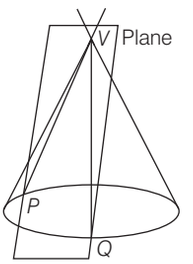


Suppose we rotate the line l_2 around the line l_1 in such a way the angle remains constant then, the surface generated is a double-napped right circular hollow cone.

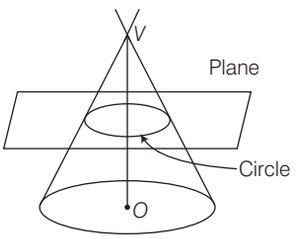
The point V is called the vertex, the line l_1 is the axis of the cone. The rotating line l_2 is called a generator of the cone. The vertex separates the cone into two parts called nappes. The constant angle α is called the semi-vertical angle of the cone.

Section of a Right Circular Cone by Different Planes

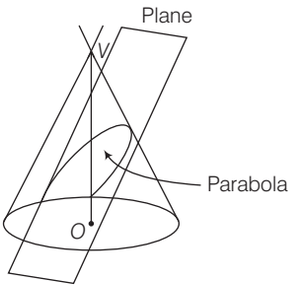
1. Section of a right circular cone by a plane which is passing through its vertex is a pair of straight lines, lines always passes through the vertex of the cone.



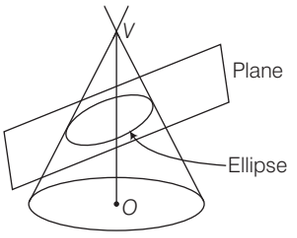
2. Section of a right circular cone by a plane which parallel to its base is a circle.



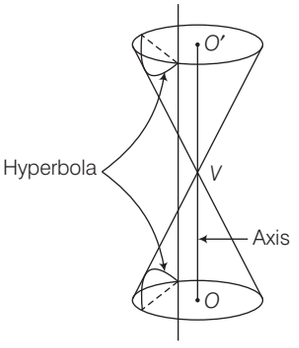
3. Section of a right circular cone by a plane which is parallel to a generator of the cone is a parabola.



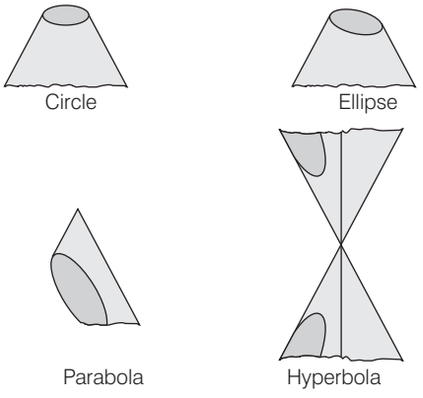
4. Section of a right circular cone by a plane which is not parallel to any generator and not parallel or perpendicular to the axis of the cone is an ellipse.



5. Section of a right circular cone by a plane which is parallel to the axis of the cone is a hyperbola.

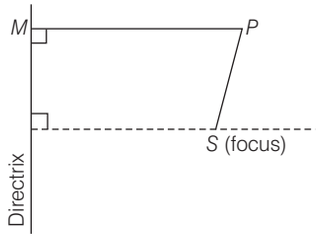


3D View



Conic Section : Definition

The locus of a point which moves in a plane such that the ratio of its distance from a fixed point to its perpendicular distance from a fixed straight line is always constant, is known as a **conic section** or **a conic.**



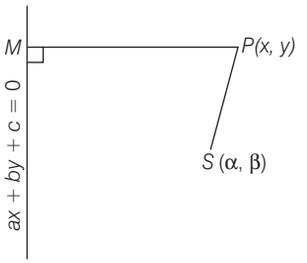
The fixed point is called the **focus** of the conic and this fixed line is called the **directrix** of the conic. Also, this constant ratio is called the **eccentricity** of the conic and is denoted by e.

In the figure, $\frac{SP}{PM} = \text{constant} = e$

$\Rightarrow \quad SP = e\,PM$

Equation of Conic Section

If the focus is (α,β) and the directrix is $ax + by + c = 0$, then the equation of the conic section whose eccentricity $= e$ is $SP = e\,PM$



$$\Rightarrow \sqrt{(x-\alpha)^2 + (y-\beta)^2} = e \cdot \frac{|ax + by + c|}{\sqrt{(a^2 + b^2)}}$$

$$\Rightarrow \quad (x-\alpha)^2 + (y-\beta)^2 = e^2 \cdot \frac{(ax + by + c)^2}{(a^2 + b^2)}.$$

Important Terms

Axis The straight line passing through the focus and perpendicular to the directrix is called the axis of the conic section.

Vertex The points of intersection of the conic section and the axis is (are) called vertex (vertices) of the conic section.

Focal Chord Any chord passing through the focus is called focal chord of the conic section.

Double Ordinate A straight line drawn perpendicular to the axis and terminated at both end of the curve is a double ordinate of the conic section.

Latusrectum The double ordinate passing through the focus is called the latusrectum of the conic section.

Centre The point which bisects every chord of the conic passing through it, is called the centre of the conic section.

Remark

Parabola has no centre but circle, ellipse and hyperbola have centre.

Example 1 Find the locus of a point, which moves such that its distance from the point (0, –1) is twice its distance from the line $3x + 4y + 1 = 0$.

Sol. Let $P(x_1, y_1)$ be the point, whose locus is required.

Its distance from $(0, -1) = 2\times$ its distance from the line $3x + 4y + 1 = 0$.

$$\Rightarrow \quad \sqrt{(x_1 - 0)^2 + (y_1 + 1)^2} = 2 \times \frac{|3x_1 + 4y_1 + 1|}{\sqrt{(3^2 + 4^2)}}$$

$$\Rightarrow \quad 5\sqrt{x_1^2 + (y_1 + 1)^2} = 2\,|3x_1 + 4y_1 + 1|$$

Squaring and simplifying, we have

$$25(x_1^2 + y_1^2 + 2y_1 + 1) = 4(9x_1^2 + 16y_1^2 + 24x_1y_1 + 6x_1 + 8y_1 + 1)$$

or $11x_1^2 + 39y_1^2 + 96x_1y_1 + 24x_1 - 18y_1 - 21 = 0$

Hence, the locus of (x_1, y_1) is

$$11x^2 + 39y^2 + 96xy + 24x - 18y - 21 = 0$$

Example 2 What conic does the equation $25(x^2 + y^2 - 2x + 1) = (4x - 3y + 1)^2$ represent ?

Sol. Given equation is

$$25(x^2 + y^2 - 2x + 1) = (4x - 3y + 1)^2 \qquad \ldots(i)$$

Write the right hand side of this equation, so that it appears in perpendicular distance form, then

$$(4x - 3y + 1)^2 = 25\left(\frac{4x - 3y + 1}{\sqrt{(4^2 + 3^2)}}\right)^2$$

then, Eq. (i) can be re-written as

$$25[(x - 1)^2 + (y - 0)^2] = 25\left[\frac{4x - 3y + 1}{\sqrt{(4^2 + 3^2)}}\right]^2$$

or $$\sqrt{(x - 1)^2 + (y - 0)^2} = \frac{|4x - 3y + 1|}{\sqrt{(4^2 + 3^2)}}$$

Here, $e = 1$

Thus, the given equation represents a parabola. It may noted that (1,0) is the focus and $4x - 3y + 1 = 0$ is the directrix of the parabola.

Recognisation of Conics

The equation of conics represented by the general equation of second degree

$$ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0 \qquad \ldots(i)$$

can be recognised easily by the condition given in the tabular form. For this, first we have to find discriminant of the equation. We know that the discriminant of above equation is represented by Δ, where

$$\Delta = abc + 2fgh - af^2 - bg^2 - ch^2$$

The nature of the conic section depends upon the position of the focus S with respect to the directrix and also upon the value of the eccentricity e. Two different cases arise.

***Case* I (When the focus lies on the directrix)**

In this case Eq. (i) represents the **Degenerate conic** whose nature is given in the following table :

Condition	Nature of Conic
$e > 1$; $\Delta = 0$, $h^2 > ab$	The lines will be real and distinct intersecting at S.
$e = 1$; $\Delta = 0$, $h^2 = ab$	The lines will coincident
$e < 1$; $\Delta = 0$, $h^2 < ab$	The lines will be imaginary.

***Case* II (When the focus does not lie on the directrix)**

In this case Eq. (i) represents the **Non-degenerate conic** whose nature is given in the following table :

Condition	Nature of Conic
$e = 1$; $\Delta \neq 0$, $h^2 = ab$	a parabola
$0 < e < 1$; $\Delta \neq 0$, $h^2 < ab$	an ellipse
$e > 1$; $\Delta \neq 0$, $h^2 > ab$	a hyperbola
$e > 1$; $\Delta \neq 0$, $h^2 > ab$; $a + b = 0$	rectangular hyperbola

Remark

1. If conic represents an empty set, then $\Delta \neq 0$, $h^2 < ab$.
2. If conic represents a single point, the $\Delta = 0$, $h^2 < ab$.

Example 3 What conic does $13x^2 - 18xy + 37y^2 + 2x + 14y - 2 = 0$ represent?

Sol. Compare the given equation with

$$ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$$

$\therefore \quad a = 13, h = -9, b = 37, g = 1, f = 7, c = -2$,

then, $\Delta = abc + 2fgh - af^2 - bg^2 - ch^2$

$$= (13)(37)(-2) + 2(7)(1)(-9) - 13(7)^2 - 37(1)^2 + 2(-9)^2$$

$$= -962 - 126 - 637 - 37 + 162 = -1600 \neq 0$$

and also $h^2 = (-9)^2 = 81$ and $ab = 13 \times 37 = 481$

Here, $h^2 < ab$

So, we have $h^2 < ab$ and $\Delta \neq 0$.

Hence, the given equation represents an ellipse.

Example 4 What conic is represented by the equation $\sqrt{ax} + \sqrt{by} = 1$?

Sol. Given conic is $\sqrt{ax} + \sqrt{by} = 1$

On squaring both sides, we get

$$ax + by + 2\sqrt{abxy} = 1$$

$$\Rightarrow \quad ax + by - 1 = -2\sqrt{abxy}$$

Again, on squaring both sides, then

$$(ax + by - 1)^2 = 4abxy$$

$$\Rightarrow \quad a^2x^2 + b^2y^2 + 1 + 2abxy - 2by - 2ax = 4abxy$$

$$\Rightarrow \quad a^2x^2 + b^2y^2 - 2abxy - 2ax - 2by + 1 = 0$$

$$\Rightarrow \quad a^2x^2 - 2abxy + b^2y^2 - 2ax - 2by + 1 = 0 \quad ...(i)$$

Comparing the Eq. (i) with the equation

$$Ax^2 + 2Hxy + By^2 + 2Gx + 2Fy + C = 0$$

$\therefore \quad A = a^2, H = -ab, B = b^2, G = -a, F = -b, C = 1$

then, $\Delta = ABC + 2FGH - AF^2 - BG^2 - CH^2$

$= a^2b^2 - 2a^2b^2 - a^2b^2 - a^2b^2 - a^2b^2$

$= -4a^2b^2 \neq 0$ and $H^2 = a^2b^2 = AB$

So, we have $\Delta \neq 0$ and $H^2 = AB$.

Hence, the given equation represents a parabola.

Example 5 If the equation $x^2 - y^2 - 2x + 2y + \lambda = 0$ represents a degenerate conic, find the value of λ.

Sol. For degenerate conic $\Delta = 0$

Comparing the given equation of conic with

$$ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$$

$\therefore \quad a = 1, b = -1, h = 0, g = -1, f = 1, c = \lambda$

$\therefore \quad \Delta = abc + 2fgh - af^2 - bg^2 - ch^2 = 0$

$\Rightarrow (1)(-1)(\lambda) + 0 - 1 \times (1)^2 + 1 \times (-1)^2 - \lambda(0)^2 = 0$

$\Rightarrow \quad -\lambda - 1 + 1 = 0 \Rightarrow \lambda = 0$

Example 6 If the equation $x^2 + y^2 - 2x - 2y + c = 0$ represents an empty set, then find the value of c.

Sol. For empty set $\Delta \neq 0$ and $h^2 < ab$.

Now, comparing the given equation of conic with

$$ax^2 + 2hxy + by^2 + 2gx + 2fy + c' = 0$$

then $a = 1, h = 0, b = 1, g = -1, f = -1, c' = c$

$\because \quad h^2 < ab$

$\therefore \quad 0 < 1$ which is true

and $\Delta = abc' + 2fgh - af^2 - bg^2 - c'h^2 \neq 0$

$\Rightarrow \quad (1)(1)(c) + 0 - 1 \times (-1)^2 - 1 \times (-1)^2 - 0 \neq 0$

$\Rightarrow \quad c - 2 \neq 0$

$\therefore \quad c \neq 2$

Hence, $c \in R \sim (2)$

Example 7 If the equation of conic

$$2x^2 + xy + 3y^2 - 3x + 5y + \lambda = 0$$

represent a single point, then find the value of λ.

Sol. For single point,

$$h^2 < ab \quad \text{and} \quad \Delta = 0$$

Comparing the given equation with

$$ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$$

then, $a = 2, h = \frac{1}{2}, b = 3, g = -\frac{3}{2}, f = \frac{5}{2}, c = \lambda$.

$\because \quad h^2 = \frac{1}{4}, \; ab = 6$

$\therefore \quad h^2 < ab$

and $\Delta = abc + 2fgh - af^2 - bg^2 - ch^2$

$= (2)(3)(\lambda) + 2 \times \frac{5}{2} \times -\frac{3}{2} \times \frac{1}{2}$

$\quad - 2 \times \frac{25}{4} - 3 \times \frac{9}{4} - \lambda \times \frac{1}{4}$

$= 6\lambda - \frac{15}{4} - \frac{25}{2} - \frac{27}{4} - \frac{\lambda}{4}$

$= \frac{23\lambda}{4} - 23 = 0$

$\therefore \quad \lambda = 4$

Example 8 For what value of λ the equation of conic $2xy + 4x - 6y + \lambda = 0$ represents two intersecting straight lines, if $\lambda = 17$, then this equation represents?

Sol. Comparing the given equation of conic with

$$ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$$

$\therefore \quad a = 0, b = 0, h = 1, g = 2, f = -3, c = \lambda$

For two intersecting lines,

$h^2 > ab, \Delta = 0$

$\because \quad ab = 0, h = 1$

$\therefore \quad h^2 > ab$

and $\Delta = abc + 2fgh - af^2 - bg^2 - ch^2$

$= 0 + 2 \times -3 \times 2 \times 1 - 0 - 0 - \lambda(1)^2$

$= -12 - \lambda = 0$

$\therefore \quad \lambda = -12$

For $\lambda = 17$, then the given equation of conic $2xy + 4x - 6y + 17 = 0$ according to the first system but here $c = 17$.

$\therefore \quad a = 0, b = 0, h = 1, g = 2, f = -3, c = 17,$

$\therefore \quad \Delta = abc + 2f\ gh - af^2 - bg^2 - ch^2$

$= 0 + 2 \times -3 \times 2 \times 1 - 0 - 0 - 17 \times (1)^2$

$= -12 - 17 = -29 \neq 0$

$\therefore \quad \Delta \neq 0$ and $h^2 > ab$

So, we have $\Delta \neq 0$ and $h^2 > ab$.

Hence, the given equation represents a hyperbola.

How to Find the Centre of Conics

If $S \equiv ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$.

Partially differentiating w.r.t. x and y, we get

$$\frac{\partial S}{\partial x} = 2ax + 2hy + 2g; \quad \frac{\partial S}{\partial y} = 2hx + 2by + 2f$$

(Treating y as constant) (Treating x as constant)

For centre, $\frac{\partial S}{\partial x}=0$ and $\frac{\partial S}{\partial y}=0$

$\therefore \quad 2ax+2hy+2g=0 \quad$ and $\quad 2hx+2by+2f=0$

$\Rightarrow \quad ax+hy+g=0 \quad$ and $\quad hx+by+f=0$

Solving these equations we get the centre

$$(x,y)=\left(\frac{hf-bg}{ab-h^2},\frac{gh-af}{ab-h^2}\right).$$

Remembering Method

Since, $\Delta=\begin{vmatrix} a & h & g \\ h & b & f \\ g & f & c \end{vmatrix}$

Write first two rows,

i.e. $\begin{matrix} a & h & g & a \\ h & b & f & h \end{matrix}$ (Repeat Ist member)

$\therefore \quad ab-h^2,\ hf-bg,\ gh-af$

or points $\left(\frac{hf-bg}{ab-h^2},\frac{gh-af}{ab-h^2}\right)$ or $\left(\frac{C_{13}}{C_{33}},\frac{C_{23}}{C_{33}}\right)$.

OR

According to first two rows,

$$ax+hy+g=0 \quad \text{and} \quad hx+by+f=0.$$

After solving we get find the centre of conic.

Example 9 *Find the centre of the conic*

$14x^2-4xy+11y^2-44x-58y+71=0$

Sol. Let $f(x,y)\equiv 14x^2-4xy+11y^2-44x-58y+71=0$

Differentiating partially w.r.t. x and y, then

$\frac{\partial f}{\partial x}=28x-4y-44$ and $\frac{\partial f}{\partial y}=-4x+22y-58$

For centre, $\frac{\partial f}{\partial x}=0$ and $\frac{\partial f}{\partial y}=0$,

$\therefore \quad 28x-4y-44=0$

or $\quad 7x-y-11=0 \quad \ldots$(i)

and $\quad -4x+22y-58=0$

or $\quad -2x+11y=29 \quad \ldots$ (ii)

On solving Eqs. (i) and (ii) we get,

$$x=2 \text{ and } y=3$$

$\therefore$ Centre is (2, 3).

Aliter : Comparing the given conic with

$$ax^2+2hxy+by^2+2gx+2fy+c=0$$

$\therefore \quad a=14, h=-2, b=11, g=-22, f=-29, c=71$

$\therefore \quad$ Centre $\left(\frac{hf-bg}{ab-h^2},\frac{gh-af}{ab-h^2}\right)$

or $\quad =\left(\frac{(-2)(-29)-(11)(-22)}{(14)(11)-(-2)^2},\frac{(-22)(-2)-(14)(-29)}{(14)(11)-(-2)^2}\right)$

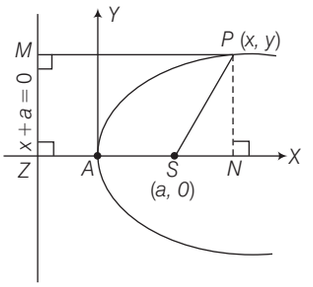
or $\quad =(2,3)$

Parabola : Definition

A parabola is the locus of a point which moves in a plane such that its distance from a fixed point (i.e. focus) is always equal to its distance from a fixed straight line (i.e., directrix).

Standard Equation of Parabola

Let S be the focus and ZM be the directrix of the parabola. Draw SZ perpendicular to ZM, let A be the mid point of SZ, then as $AS=AZ$



So, A lies on the parabola. Take A as the origin and a line AY through A perpendicular to AX as Y-axis.

Let $\quad AS=AZ=a>0$

then, coordinate of S is $(a,0)$ and the equation of ZM is

$$x=-a \text{ or } x+a=0$$

Now, take $P(x,y)$ be any point on the parabola. Join SP and from P draw PM perpendicular to the directrix ZM.

Then, $\quad SP=\sqrt{(x-a)^2+(y-0)^2}=\sqrt{(x-a)^2+y^2}$

and $\quad PM=ZN=AZ+AN=a+x$

Now, for the parabola $\quad SP=PM$

$\Rightarrow \quad (SP)^2=(PM)^2 \Rightarrow (x-a)^2+y^2=(a+x)^2$

$\Rightarrow \quad y^2=(a+x)^2-(x-a)^2=4ax$

$\therefore \quad y^2=4ax,$

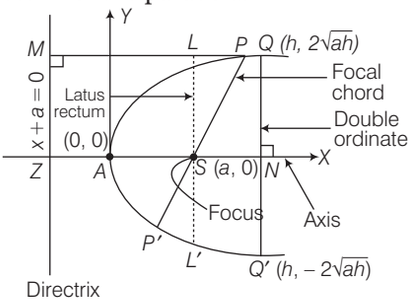
which is required equation of the parabola.

Remark

A parabola has two real foci situated on its axis one of which is the focus S and the other lies at infinity. the corresponding directrix is also at infinity.

Some Terms Related to Parabola

1. **Axis** The axis of the parabola is the straight line which is passes through focus and perpendicular to the directrix of the parabola.



For the parabola $y^2 = 4ax$, X-axis is the **axis**.

Here, all powers of y are even in $y^2 = 4ax$ then, parabola $y^2 = 4ax$ is symmetrical about its axis (i.e. X-axis).

or

If the point (x, y) lie on the parabola $y^2 = 4ax$, then the point $(x, -y)$ also lies on it. Hence, the parabola is symmetrical about X-axis (i.e. axis of parabola).

2. **Vertex** The point of intersection of the parabola and its axis is called the vertex of the parabola. For the parabola $y^2 = 4ax$.

$A(0, 0)$ i.e. the origin is the vertex.

3. **Double ordinate** If Q be the point on the parabola, draw QN perpendicular to the axis of parabola and produced to meet the curve again at Q', then QQ' is called a double ordinate.

If abscissa of Q is h, then ordinate of Q,

$$y^2 = 4ah \quad \text{or } y = 2\sqrt{ah} \qquad \text{(for first quadrant)}$$

and ordinate of Q' is $y = -2\sqrt{ah}$ (for fourth quadrant)

Hence, coordinates of Q and Q' are $(h, 2\sqrt{ah})$ and $(h, -2\sqrt{ah})$, respectively.

4. **Latusrectum** The double ordinate LL' passes through the focus is called the latusrectum of the parabola.

Since focus $S(a, 0)$ the equation of the latusrectum of the parabola is $x = a$, then solving

$$x = a \quad \text{and} \quad y^2 = 4ax$$

then, we get $y = \pm 2a$

Hence, the coordinates of the extremities of the latusrectum are $L(a, 2a)$ and $L'(a, -2a)$, respectively.

Since, $LS = L'S = 2a$

$\therefore$ Length of latusrectum $LL' = 2(LS) = 2(L'S) = 4a$.

5. **Focal chord** A chord of a parabola which is passing through the focus is called a focal chord of the parabola. In the given figure, PP' and LL' are the focal chords.

Remarks

1. In objective questions use LL' as focal chord and in subjective questions use PP' as focal chord.
2. Length of smallest focal chord of the parabola $4a$. Hence, the latusrectum of a parabola is the smallest focal chord.

6. **Focal distance** The focal distance of any point P on the parabola is its distance from the focus S i.e. SP

Also, $SP = PM$ = Distance of P from the directrix.

If $P \equiv (x, y)$

then, $SP = PM = x + a$

7. **Parametric equations** From the equation of the parabola $y^2 = 4ax$, we can write $\frac{y}{2a} = \frac{2x}{y} = t$

where 't' is a parameter.

Then, $y = 2at$ and $x = at^2$

The equations $x = at^2$ and $y = 2at$ are called parametric equations. The point $(at^2, 2at)$ is also referred to as the point 't'.

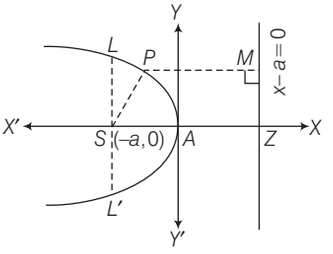
Remarks

1. Coordinates of any point on the parabola $y^2 = 4ax$, may be taken as $(at^2, 2at)$.
2. Equation of chord joining t_1 and t_2 is $2x - (t_1 + t_2)y + 2at_1t_2 = 0$.
3. If the chord joining t_1, t_2 and t_3, t_4 pass through a point $(c, 0)$ on the axis, then $t_1t_2 = t_3t_4 = -\frac{c}{a}$.

Other forms of Parabola with Latusrectum $4a$

(1) Parabola opening to left (i.e. $y^2 = -4ax$) : ($a > 0$)

(i) Vertex is $A(0, 0)$.
(ii) Focus is $S(-a, 0)$.
(iii) Equation of the directrix MZ is $x - a = 0$.
(iv) Equation of the axis is $y = 0$ i.e. X-axis.
(v) Equation of the tangent at the vertex is $x = 0$ i.e. Y-axis.

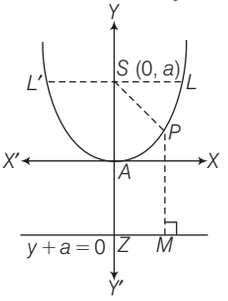


(vi) Length of latusrectum = $LL' = 4a$.

(vii) Ends of latusrectum are $L(-a, 2a)$ and $L'(-a, -2a)$.
(viii) Equation of latusrectum is $x = -a$ i.e. $x + a = 0$.
(ix) Parametric coordinates is $(-at^2, 2at)$.

(2) Parabola opening upwards (i.e. $x^2 = 4ay$) : $(a > 0)$

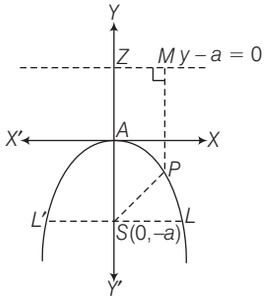
(i) Vertex is $A(0, 0)$.
(ii) Focus is $S(0, a)$.
(iii) Equation of the directrix MZ is $y + a = 0$.



(iv) Equations of the axis is $x = 0$ i.e. Y-axis.
(v) Equation of the tangent at the vertex is $y = 0$ i.e. X-axis.
(vi) Ends of latusrectum are $L(2a, a)$ and $L'(-2a, a)$.
(vii) Length of latusrectum $= LL' = 4a$.
(viii) Equation of latusrectum is $y = a$ i.e. $y - a = 0$.
(ix) Parametric coordinates is $(2at, at^2)$.

(3) Parabola opening downwards (i.e. $x^2 = -4ay$) : $(a > 0)$

(i) Vertex is $A(0, 0)$. (ii) Focus is $S(0, -a)$.
(iii) Equation of the directrix MZ is $y - a = 0$.
(iv) Equation of the axis is $x = 0$ i.e. Y-axis.
(v) Equation of the tangent at the vertex is $y = 0$ i.e. X-axis.



(vi) Length of latusrectum $= LL' = 4a$
(vii) Ends of latusrectum are $L(2a, -a)$ and $L'(-2a, -a)$
(viii) Equation of latusrectum is $y = -a$ i.e. $y + a = 0$.
(ix) Parametric coordinates are $(2at, -at^2)$.

Smart Table : The Study of Standard Parabolas

Equation and Graph of the parabola	$y^2 = 4ax, a > 0$	$y^2 = -4ax, a > 0$	$x^2 = 4ay, a > 0$	$x^2 = -4ay, a > 0$
				Vertex	$(0, 0)$	$(0, 0)$	$(0, 0)$	$(0, 0)$

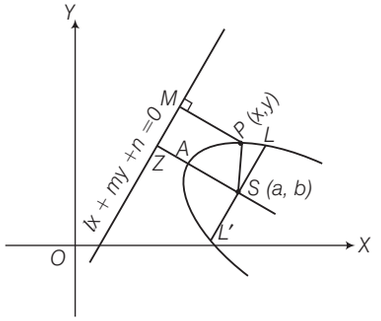
General Equation of a Parabola

Let $S(a,b)$ be the focus, and $lx+my+n=0$ is the equation of the directrix. Let $P(x,y)$ be any point on the parabola. Then by definition $SP = PM$



$$\Rightarrow \sqrt{(x-a)^2+(y-b)^2} = \frac{|lx+my+n|}{\sqrt{(l^2+m^2)}}$$

$$\Rightarrow (x-a)^2+(y-b)^2 = \frac{(lx+my+n)^2}{(l^2+m^2)}$$

$$\Rightarrow m^2x^2+l^2y^2-2lmxy+x \text{ term}+y \text{ term}+\text{constant}=0$$

This is of the form $(mx-ly)^2+2gx+2fy+c=0$.

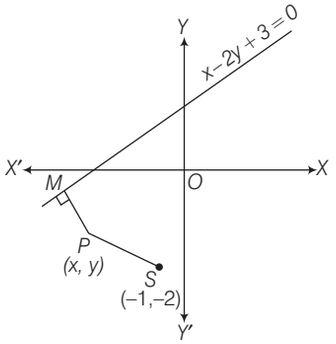
This equation is the general equation of parabola.

Remark

Second degree terms in the general equation of a parabola forms a perfect square.

Example 10 Find the equation of the parabola whose focus is at $(-1,-2)$ and the directrix is the straight line $x-2y+3=0$.

Sol. Let $P(x,y)$ be any point on the parabola whose focus is $S(-1,-2)$ and the directrix $x-2y+3=0$. Draw PM perpendicular from $P(x,y)$ on the directrix $x-2y+3=0$.



Then, by definition

$$SP = PM$$

$$\Rightarrow (SP)^2 = (PM)^2$$

$$\Rightarrow (x+1)^2+(y+2)^2 = \left(\frac{|x-2y+3|}{\sqrt{(1)^2+(-2)^2}}\right)^2$$

$$\Rightarrow 5(x^2+y^2+2x+4y+5) = (x^2+4y^2-4xy+6x-12y+9)$$

$$\therefore 4x^2+y^2+4xy+4x+32y+16=0$$

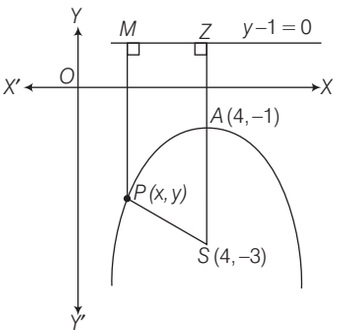
Example 11 Find the equation of the parabola whose focus is $(4,-3)$ and vertex is $(4,-1)$.

Sol. Let $A(4,-1)$ be the vertex and $S(4,-3)$ be the focus.

$$\therefore \text{Slope of } AS = \frac{-3+1}{4-4} = \infty$$

which is parallel to Y-axis.

$\therefore$ Directrix parallel to X-axis.



Let $Z(x_1,y_1)$ be any point on the directrix, then A is the mid-point of SZ.

$$\therefore 4 = \frac{x_1+4}{2} \Rightarrow x_1 = 4$$

and $$-1 = \frac{y_1-3}{2} \Rightarrow y_1 = 1$$

$$\therefore Z = (4,1)$$

Also, directrix is parallel to X-axis and passes through $Z(4,1)$, so equation of directrix is

$$y=1 \quad \text{or} \quad y-1=0$$

Now, let $P(x,y)$ be any point on the parabola. Join SP and draw PM perpendicular to the directrix. Then, by definition

$$SP = PM$$

$$\Rightarrow (SP)^2 = (PM)^2$$

$$\Rightarrow (x-4)^2+(y+3)^2 = \left(\frac{|y-1|}{\sqrt{1^2}}\right)^2$$

$$\Rightarrow (x-4)^2+(y+3)^2 = (y-1)^2$$

$$\therefore x^2-8x+8y+24=0$$

Aliter :

Here $a = AS = 2$

$\therefore$ Length of latusrectum $= 4a = 8$

Equation of parabola with vertex $(0,0)$ and open downward is $x^2 = -8y$.

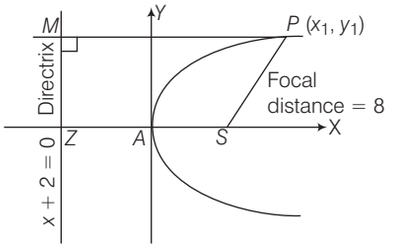
Shifting $(4,-1)$ on $(0,0)$, we get required parabola

$$(x-4)^2 = -8(y+1)$$

$$\therefore x^2-8x+8y+24=0$$

Example 12 The focal distance of a point on a parabola $y^2 = 8x$ is 8. Find it.

Sol. Comparing $y^2 = 8x$ with $y^2 = 4ax$



$\therefore \quad 4a = 8 \implies a = 2$

$\therefore$ Equation of directrix is $x + 2 = 0$.

Let $P(x_1, y_1)$ on the parabola

$$y^2 = 8x$$

$\therefore \quad y_1^2 = 8x_1$ ...(i)

$\because \quad SP = 8$

$\Rightarrow \quad PM = 8 \quad [\because SP = PM]$

$\Rightarrow \quad x_1 + 2 = 8$

or $\quad x_1 = 6$

From Eq. (i), $\quad y_1^2 = 8 \times 6$

$\therefore \quad y_1 = \pm 4\sqrt{3}$

$\therefore$ The required points are $(6, 4\sqrt{3})$ and $(6, -4\sqrt{3})$.

Example 13 QQ' is a double ordinate of a parabola $y^2 = 4ax$. Find the locus of its point of trisection.

Sol. Let the double ordinate QQ' meet the axis of the parabola

$$y^2 = 4ax \quad \text{...(i)}$$

Let coordinates of Q be (x_1, y_1), then coordinates of Q' be $(x_1 - y_1)$ since, Q and Q' lies on Eq. (i), then

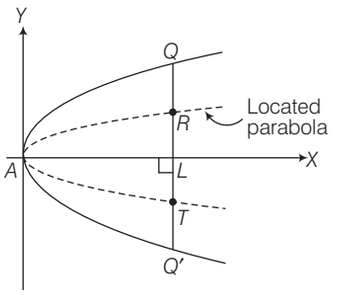
$$y_1^2 = 4ax_1 \quad \text{...(ii)}$$

Let R and T be the points of trisection of QQ'. Then, the coordinates of R and T are

$$\left(\frac{1\cdot x_1 + 2\cdot x_1}{1+2}, \frac{1\cdot(-y_1) + 2\cdot y_1}{1+2}\right) \text{ or } \left(x_1, \frac{y_1}{3}\right)$$

and $\left(\frac{2\cdot x_1 + 1\cdot x_1}{2+1}, \frac{2\cdot(-y_1) + 1\cdot y_1}{2+1}\right)$ or $\left(x_1, -\frac{y_1}{3}\right)$

respectively.



Since, R divide QQ' in 1 : 2 (internally)

and T divide QQ' in 2 : 1 (internally).

For locus, let $R(h,k)$, then

$$x_1 = h \quad \text{and} \quad \frac{y_1}{3} = k \quad \text{or} \quad y_1 = 3k$$

On substituting the values of x_1 and $y_1$in Eq. (ii), then

$$(3k)^2 = 4a(h) \quad \text{or} \quad 9k^2 = 4ah$$

$\therefore$ The required locus is $9y^2 = 4ax$ similarly, let $T(h',k')$

then, $\quad x_1 = h' \quad \text{and} \quad -\frac{y_1}{3} = k'$

or $\quad y_1 = -3k'$

On substituting the values of x_1 and y_1 in Eq. (ii), then

$$(-3k')^2 = 4a(h')$$

or $\quad 9k'^2 = 4ah'$

$\therefore$ The required locus is $9y^2 = 4ax$.

Hence, the locus of point of trisection is

$$9y^2 = 4ax.$$

Aliter : Let R and T be the points of trisection of double ordinates QQ'. Let (h,k) be the coordinates of R,

then, $\quad AL = h \quad \text{and} \quad RL = k$

$$RT = RL + LT = k + k = 2k.$$

Since, $\quad RQ = TR = Q'T = 2k$

$\therefore \quad LQ = LR + RQ = k + 2k = 3k$

Thus, the coordinates of Q are $(h, 3k)$.

Since, $(h, 3k)$ lies on $y^2 = 4ax$

$\Rightarrow \quad 9k^2 = 4ah$

Hence, the locus of (h, k) is $9y^2 = 4ax$.

Example 14 Prove that the area of the triangle inscribed in the parabola $y^2 = 4ax$ is $\frac{1}{8a}(y_1 \sim y_2)(y_2 \sim y_3)(y_3 \sim y_1)$, where y_1, y_2, y_3 are the ordinates of the vertices.

Sol. Let the vertices of the triangle be $(x_1, y_1), (x_2, y_2)$ and (x_3, y_3).

$\because \quad (x_1, y_1)$ is a point on the parabola $y^2 = 4ax$.

$\therefore \quad y_1^2 = 4ax_1$

$\therefore \quad x_1 = \frac{y_1^2}{4a}$

Similarly, $\quad x_2 = \frac{y_2^2}{4a}$

and $\quad x_3 = \frac{y_3^2}{4a}$

Now , vertices of triangle are

$$\left(\frac{y_1^2}{4a}, y_1\right), \left(\frac{y_2^2}{4a}, y_2\right) \text{and} \left(\frac{y_3^2}{4a}, y_3\right).$$

$\therefore$ Required area of the triangle $= \frac{1}{2}\left|\begin{vmatrix} \frac{y_1^2}{4a} & y_1 & 1 \\ \frac{y_2^2}{4a} & y_2 & 1 \\ \frac{y_3^2}{4a} & y_3 & 1 \end{vmatrix}\right|$

$$= \frac{1}{8a}\left|\begin{vmatrix} y_1^2 & y_1 & 1 \\ y_2^2 & y_2 & 1 \\ y_3^2 & y_3 & 1 \end{vmatrix}\right| = \frac{1}{8a}(y_1 \sim y_2)(y_2 \sim y_3)(y_3 \sim y_1)$$

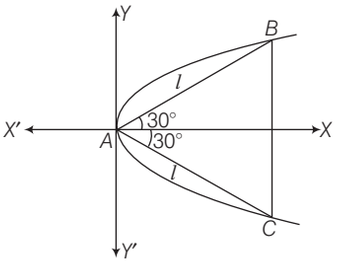
Example 15 Find the length of the side of an equilateral triangle inscribed in the parabola $y^2 = 4ax$, so that one angular point is at the vertex.

Sol. Let ABC be the inscribed equilateral triangle, with one angular point at the vertex A of the parabola

$$y^2 = 4ax \quad \ldots(i)$$

Let the length of the side of equilateral triangle $= l$

$\therefore$ $AB = BC = CA = l$



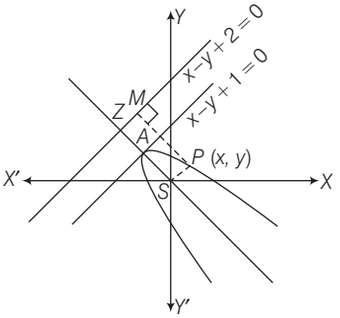
$\therefore$ The coordinates of B is $(l\cos 30°, l\sin 30°)$

i.e., $\left(\frac{l\sqrt{3}}{2}, \frac{l}{2}\right)$.

Since, B lies on Eq. (i), then $\left(\frac{l}{2}\right)^2 = 4a\left(\frac{l\sqrt{3}}{2}\right)$ or $l = 8a\sqrt{3}$

Example 16 Prove that the equation of the parabola whose focus is (0,0) and tangent at the vertex is $x - y + 1 = 0$ is $x^2 + y^2 + 2xy - 4x + 4y - 4 = 0$.

Sol. Let focus is $S(0, 0)$ and A is the vertex of the parabola take any point Z such that $AS = AZ$ given tangent at vertex is $x - y + 1 = 0$, since directrix is parallel to the tangent at the vertex.



$\therefore$ Equation of directrix is $x - y + \lambda = 0$

where, λ is constant.

$\because$ A is the mid-point of SZ.

$\therefore$ $SZ = 2SA$

$\Rightarrow$ $\frac{|0 - 0 + \lambda|}{\sqrt{(1^2 + (-1)^2)}} = 2 \times \frac{|0 - 0 + 1|}{\sqrt{(1^2 + (-1)^2)}}$

$\Rightarrow$ $\frac{|\lambda|}{\sqrt{2}} = \frac{2}{\sqrt{2}}$

$\therefore$ $\lambda = \pm 2$

$\Rightarrow$ $\lambda = 2$

[$\because$ λ is positive since directrix in this case always lies in II quadrant]

$\therefore$ Equation of directrix is $x - y + 2 = 0$.

Now, take $P(x, y)$ be any point on the parabola, draw $PM \perp ZM$, then from definition,

$$SP = PM$$

$\Rightarrow$ $(SP)^2 = (PM)^2$

$\Rightarrow$ $(x - 0)^2 + (y - 0)^2 = \left(\frac{|x - y + 2|}{\sqrt{2}}\right)^2$

$\Rightarrow$ $2(x^2 + y^2) = (x - y + 2)^2$

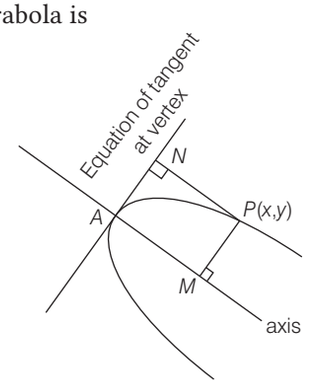
$\Rightarrow$ $2x^2 + 2y^2 = x^2 + y^2 - 2xy + 4x - 4y + 4$

$\therefore$ $x^2 + y^2 + 2xy - 4x + 4y - 4 = 0$

Equation of Parabola if Equation of axis, Tangent at Vertex and Latusrectum are given

Let equation of axis is $ax + by + c = 0$ and equation of tangent at vertex is $bx - ay + d = 0$.

Equation of parabola is

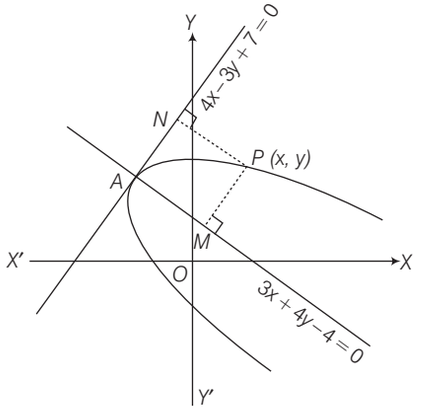


$$(PM)^2 = (\text{Latusrectum})\ (PN)$$

$$\Rightarrow \left(\frac{ax + by + c}{\sqrt{(a^2 + b^2)}}\right)^2 = (\text{Latusrectum})\left(\frac{bx - ay + d}{\sqrt{(b^2 + a^2)}}\right)$$

Example 17 Find the equation of the parabola whose latusrectum is 4 units, axis is the line $3x+4y-4=0$ and the tangent at the vertex is the line $4x-3y+7=0$.

Sol. Let $P(x, y)$ be any point on the parabola and let PM and PN are perpendiculars from P on the axis and tangent at the vertex respectively, then



$$(PM)^2 = (\text{latusrectum})\,(PN)$$

$$\Rightarrow \quad \left(\frac{3x+4y-4}{\sqrt{3^2+4^2}}\right)^2 = 4\left(\frac{4x-3y+7}{\sqrt{4^2+(-3)^2}}\right)$$

$$\therefore \quad (3x+4y-4)^2 = 20\,(4x-3y+7)$$

which is required parabola.

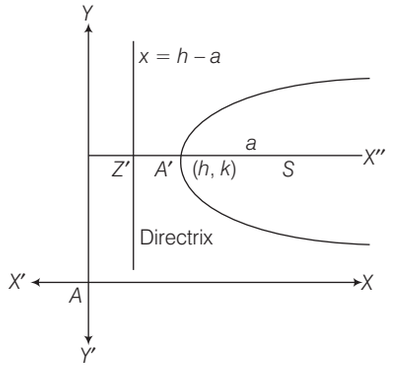
The Generalised form $(y-k)^2 = 4a(x-h)$

The parabola

$$y^2 = 4ax \qquad \ldots(i)$$

can be written as $(y-0)^2 = 4a\,(x-0)$.

The vertex of this parabola is $A(0,0)$



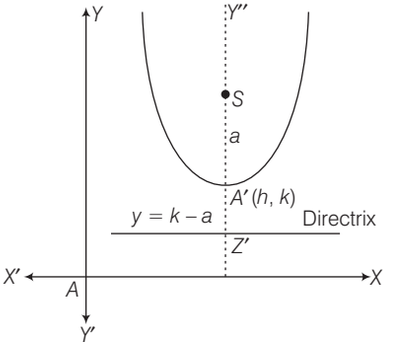
Now, when origin is shifted at $A'(h, k)$ without changing the direction of axes, its equation becomes

$$(y-k)^2 = 4a\,(x-h) \qquad \ldots(ii)$$

This is called generalised form of the parabola Eq. (i) and axis $A'X'' \| AX$ with its vertex at $A'(h, k)$. Its focus is at $(a+h, k)$ and length of latusrectum = $4a$, the equation of the directrix is

$$x = h-a \;\Rightarrow\; x+a-h=0$$

Another form is $(x-h)^2 = 4a(y-k)$ axis parallel to



Y-axis with its vertex (h,k) its focus is at $(h,a+k)$ and length of latusrectum = $4a$, the equation of the directrix is

$$y = k-a \;\Rightarrow\; y+a-k=0.$$

Remark

The parametric equation of $(y-k)^2 = 4a(x-h)$ are $x = h + at^2$ and $y = k + 2at$.

Parabolic Curve

The equations $y = Ax^2 + Bx + C$ and $x = Ay^2 + By + C$ are always represents parabolas generally called parabolic curve.

Now, $\quad y = Ax^2 + Bx + C$

$$= A\left\{x^2 + \frac{B}{A}x + \frac{C}{A}\right\}$$

$$= A\left\{\left(x+\frac{B}{2A}\right)^2 - \frac{B^2}{4A^2} + \frac{C}{A}\right\}$$

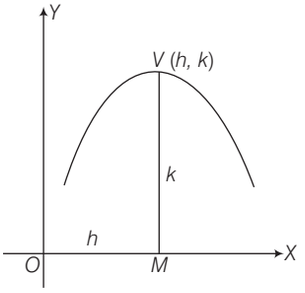
$$= A\left\{\left(x+\frac{B}{2A}\right)^2 - \frac{(B^2-4AC)}{4A^2}\right\}$$

or $\quad \left(x+\frac{B}{2A}\right)^2 = \frac{1}{A}\left(y+\frac{B^2-4AC}{4A}\right)$

Comparing it with $(x-h)^2 = 4a(y-k)$ it represent a parabola with vertex at $(h,k) = \left(-\frac{B}{2A}, -\frac{B^2-4AC}{4A}\right)$

and axis parallel to Y-axis and latusrectum $= \frac{1}{|A|}$

and the curve opening upwards and downwards depending upon the sign of A and B.



The optimum distance of its vertex V from OX is

$$\left| -\frac{B^2 - 4AC}{4A} \right|$$

and $$x = Ay^2 + By + C$$

$$= A\left\{ y^2 + \frac{B}{A}y + \frac{C}{A} \right\}$$

$$= A\left\{ \left(y + \frac{B}{2A} \right)^2 - \frac{B^2}{4A^2} + \frac{C}{A} \right\}$$

$$= A\left\{ \left(y + \frac{B}{2A} \right)^2 - \frac{B^2 - 4AC}{4A^2} \right\}$$

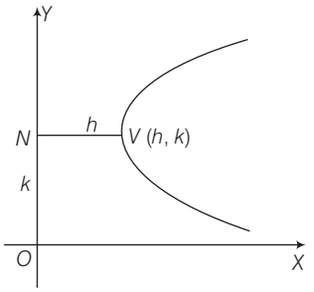
$$\Rightarrow \left(y + \frac{B}{2A} \right)^2 = \frac{1}{A}\left(x + \frac{B^2 - 4AC}{4A} \right)$$

Comparing it with $(y-k)^2 = 4a(x-h)$, it represent a parabola with vertex at

$$(h, k) = \left(-\frac{B^2 - 4AC}{4A}, -\frac{B}{2A} \right)$$

and axis parallel to X-axis and latusrectum $= \frac{1}{|A|}$

and the curve opening left and right depending upon the sign of A and B.



The optimum distance of its vertex V from OY is

$$\left| -\frac{B^2 - 4AC}{4A} \right|.$$

Remarks

1. The optimum distance of vertex from OX or OY can be easily obtained using calculus Method.
2. Equation of the parabola with axis parallel to the X-axis is of the form $x = Ay^2 + By + C$.
3. Equation of the parabola with axis parallel to the Y-axis is of the form $y = Ax^2 + Bx + C$.

Method to Make Perfect Square

If $$x = \alpha y^2 \pm \beta y + \gamma$$

first make the coefficient of y^2 is unity

i.e., $$x = \alpha\left\{ y^2 \pm \frac{\beta}{\alpha}y + \frac{\gamma}{\alpha} \right\}$$

Now, in braces write y and put the sign after y which between y^2 and y i.e. $\pm$ and after this sign write the half the coefficient of y i.e. $\frac{\beta}{2\alpha}$.

Now, write in braces $\left(y \pm \frac{\beta}{2\alpha} \right)^2$

and always subtract $\left(\frac{\beta}{2\alpha} \right)^2 = \frac{\beta^2}{4\alpha^2}$

$$\therefore \quad x = \alpha\left\{ \left(y \pm \frac{\beta}{2\alpha} \right)^2 - \frac{\beta^2}{4\alpha^2} + \frac{\gamma}{\alpha} \right\}$$

$$= \alpha\left\{ \left(y \pm \frac{\beta}{2\alpha} \right)^2 - \frac{(\beta^2 - 4\gamma\alpha)}{4\alpha^2} \right\}$$

Example 18 Find the vertex, focus, latusrectum, axis and the directrix of the parabola $x^2 + 8x + 12y + 4 = 0$.

Sol. The equation of parabola is

$$x^2 + 8x + 12y + 4 = 0 \quad \ldots(i)$$

$$\Rightarrow (x+4)^2 - 16 + 12y + 4 = 0$$

$$\Rightarrow (x+4)^2 - 12 + 12y = 0$$

$$\Rightarrow (x+4)^2 = -12y + 12$$

$$\Rightarrow (x+4)^2 = -12(y-1)$$

Let $$x + 4 = X,\ y - 1 = Y \quad \ldots(ii)$$

$$\therefore \quad X^2 = -12Y \quad \ldots(iii)$$

Comparing it with $X^2 = -4aY$

$$\therefore \quad a = 3$$

$\therefore$ Vertex of Eq. (iii) is (0, 0)

i.e. $$X = 0, Y = 0$$

From Eq. (ii),

$$x + 4 = 0\,,\ y - 1 = 0$$

$\therefore$ $x = -4,\ y = 1$

$\therefore$ Vertex of Eq. (i) is $(-4, 1)$.

Foucs of Eq. (iii) is $(0, -3)$

i.e. $X = 0, Y = -3$

From Eq. (ii),

$$x + 4 = 0,\ y - 1 = -3$$

$\therefore$ $x = -4\,,\ y = -2$

$\therefore$ Focus of Eq. (i) is $(-4, -2)$.

and latusrectum $= 4a = 12$.

Equation of axis of Eq. (iii) is $X = 0$

$\therefore$ Equation of axis of Eq. (i) is $x + 4 = 0$

Equation of directrix of Eq. (iii) is

$$Y = 3 \text{ or } y - 1 = 3$$

$\therefore$ $y - 4 = 0$

$\therefore$ Equation of directrix of Eq. (i) is

$$y - 4 = 0.$$

Example 19 Prove that the equation $y^2 + 2ax + 2by + c = 0$ represents a parabola whose axis is parallel to the axis of x. Find its vertex.

Sol. The equation of parabola is

$$y^2 + 2ax + 2by + c = 0$$

$$(y + b)^2 - b^2 + 2ax + c = 0$$

$$\Rightarrow \quad (y + b)^2 = -2ax + b^2 - c$$

$$\Rightarrow \quad (y + b)^2 = -2a\left(x - \frac{b^2 - c}{2a}\right) \qquad \ldots(i)$$

Let $y + b = Y,\ x - \dfrac{b^2 - c}{2a} = X$

From Eq. (i) ,

$$Y^2 = -2aX \qquad \ldots(ii)$$

axis of its parabola is $Y = 0$

or $y + b = 0,$

which is parallel to X-axis

and vertex of Eq. (ii) is $X = 0, Y = 0$

$$\Rightarrow \quad x - \frac{b^2 - c}{2a} = 0, \quad y + b = 0$$

$$\Rightarrow \quad x = \frac{b^2 - c}{2a}, \quad y = -b$$

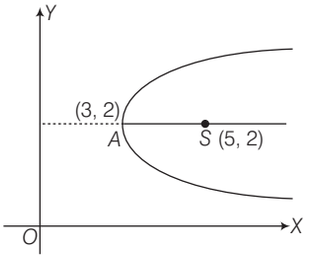
$\therefore$ Vertex of given parabola is $\left(\dfrac{b^2 - c}{2a}, -b\right)$.

Example 20 Find the equation of the parabola with its vertex at (3, 2) and its focus at (5, 2).

Sol. Let Vertex $A(3,2)$ and focus is $S(5,2)$

Slope of $AS = \dfrac{2-2}{5-3} = 0$, which is parallel to X-axis.

Hence, axis of parabola parallel to X-axis.



The equation is of the form

$$(y - k)^2 = 4a\,(x - h)$$

or $(y - 2)^2 = 4a\,(x - 3)$

as (h,k) is the vertex (3,2)

$a =$ distance between the focus and the vertex

$$= \sqrt{(5-3)^2 + (2-2)^2} = 2$$

Hence, the required equation is

$$(y - 2)^2 = 8(x - 3)$$

or $y^2 - 8x - 4y - 28 = 0.$

Example 21 Find the equation of the parabola with latusrectum joining the points (3, 6) and (3, −2).

Sol. Slope of (3,6) and (3, −2) is $\dfrac{-2-6}{3-3} = \infty$, since latusrectum is perpendicular to axis. Hence, axis parallel to X-axis. The equation of the two possible parabolas will be of the form

$$(y - k)^2 = \pm\, 4a\,(x - h) \qquad \ldots(i)$$

Since, latusrectum $= \sqrt{(3-3)^2 + (6+2)^2} = 8$

$\therefore$ $4a = 8$

$\Rightarrow$ $a = 2$

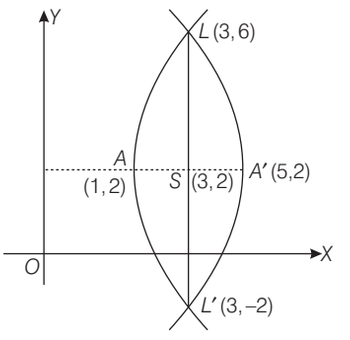
$\therefore$ From Eq. (i),

$$(y - k)^2 = \pm\, 8\,(x - h)$$

Since, (3,6) and (3, −2) lie on the parabola, then

$$(6 - k)^2 = \pm\, 8\,(3 - h) \qquad \ldots(ii)$$

and $(-2 - k)^2 = \pm\, 8\,(3 - h) \qquad \ldots(iii)$



On solving Eqs. (ii) and (iii), we get

$$k = 2$$

From Eq. (ii),

$$16 = \pm 8(3-h),$$

$$\therefore \quad h = 3 \pm 2$$

$$\therefore \quad h = 5,1$$

Hence, values of (h, k) are (5,2) and (1, 2).

The required parabolas are

$$(y-2)^2 = 8(x-5)$$

and $\quad (y-2)^2 = -8(x-1).$

Example 22 Find the equation to the parabola whose axis parallel to the Y-axis and which passes through the points (0, 4) (1, 9) and (4, 5) and determine its latusrectum .

Sol. The equation of parabola parallel to Y-axis is

$$y = Ax^2 + Bx + C \qquad \ldots(i)$$

The points (0,4) , (1,9) and (4,5) lie on Eq. (i), then

$$4 = 0 + 0 + C \quad \Rightarrow \quad C = 4 \qquad \ldots(ii)$$

$$\Rightarrow \qquad 9 = A + B + C$$

$$\Rightarrow \qquad 9 = A + B + 4 \qquad [\because C = 4]$$

$$\therefore \qquad A + B = 5 \qquad \ldots(iii)$$

and $\qquad 5 = 16A + 4B + C \qquad [\because C = 4]$

$$\Rightarrow \qquad 5 = 16A + 4B + 4$$

$$\therefore \qquad 16A + 4B = 1$$

$$\Rightarrow \qquad 4A + B = \frac{1}{4} \qquad \ldots(iv)$$

On solving Eqs. (iii) and (iv), we get

$$A = -\frac{19}{12}, B = \frac{79}{12} \qquad \ldots(v)$$

On substituting the values of A, B and C from Eqs. (ii) and Eq. (v) in Eq. (i), then equation of parabola is

$$y = -\frac{19}{12}x^2 + \frac{79}{12}x + 4$$

Hence, length of latusrectum $= \dfrac{1}{\left|-\dfrac{19}{12}\right|} = \dfrac{12}{19}.$

Exercise for Session 1

1. The vertex of the parabola $y^2 + 6x - 2y + 13 = 0$ is

(a) (–2, 1) (b) (2, – 1)

(c) (1, 1) (d) (1 , –1)

2. If the parabola $y^2 = 4ax$ passes through (3, 2), then the length of latusrectum is

(a) $\frac{1}{3}$ (b) $\frac{2}{3}$

(c) 1 (d) $\frac{4}{3}$

3. The value of p such that the vertex of $y = x^2 + 2px + 13$ is 4 units above the X-axis is

(a) ± 2 (b) 4

(c) ± 3 (d) 5

4. The length of the latusrectum of the parabola whose focus is (3,3) and directrix is $3x - 4y - 2 = 0$, is

(a) 1 (b) 2

(c) 4 (d) 8

5. If the vertex and focus of a parabola are (3,3) and (–3, 3) respectively , then its equation is

(a) $x^2 - 6x + 24y - 63 = 0$ (b) $x^2 - 6x + 24y + 81 = 0$

(c) $y^2 - 6y + 24x - 63 = 0$ (d) $y^2 - 6y - 24x + 81 = 0$

6. If the vertex of the parabola $y = x^2 - 8x + c$ lies on X-axis, then the value of c is

(a) 4 (b) – 4

(c) 16 (d) –16

7. The parabola having its focus at (3,2) and directrix along the Y-axis has its vertex at

(a) $\left(\frac{3}{2}, 1\right)$ (b) $\left(\frac{3}{2}, 2\right)$

(c) $\left(\frac{3}{2}, \frac{1}{2}\right)$ (d) $\left(\frac{3}{2}, -\frac{1}{2}\right)$

8. The directrix of the parabola $x^2 - 4x - 8y + 12 = 0$ is

(a) $y = 0$ (b) $x = 1$

(c) $y = -1$ (d) $x = -1$

9. The equation of the latusrectum of the parabola $x^2 + 4x + 2y = 0$ is

(a) $3y - 2 = 0$ (b) $3y + 2 = 0$

(c) $2y - 3 = 0$ (d) $2y + 3 = 0$

10. The focus of the parabola $x^2 - 8x + 2y + 7 = 0$ is

(a) $\left(0, -\frac{1}{2}\right)$ (b) (4,4)

(c) $\left(4, \frac{9}{2}\right)$ (d) $\left(-4, -\frac{9}{2}\right)$

11. The equation of the parabola with the focus (3,0) and directrix $x + 3 = 0$ is

(a) $y^2 = 2x$ (b) $y^2 = 3x$

(c) $y^2 = 6x$ (d) $y^2 = 12x$

12. Equation of the parabola whose axis is parallel to *Y*-axis and which passes through the points (1,0) , (0,0) and (−2,4), is

(a) $2x^2 + 2x = 3y$ (b) $2x^2 - 2x = 3y$

(c) $2x^2 + 2x = y$ (d) $2x^2 - 2x = y$

13. Find the equation of the parabola whose focus is (5,3) and directrix is the line $3x - 4y + 1 = 0$.

14. Find the equation of the parabola is focus is at (–6, –6) and vertex is at (–2, 2).

15. Find the vertex, focus, axis, directrix and latusrectum of the parabola $4y^2 + 12x - 20y + 67 = 0$.

16. Find the name of the conic represented by $\sqrt{\left(\frac{x}{a}\right)} + \sqrt{\left(\frac{y}{b}\right)} = 1$.

17. Determine the name of the curve described parametrically by the equations

$x = t^2 + t + 1,\ y = t^2 - t + 1$.

18. Prove that the equation of the parabola whose vertex and focus are on the *X*-axis at a distance a and a' from the origin respectively is $y^2 = 4(a' - a)(x - a)$.

19. Find the equation of the parabola whose axis is parallel to *X*-axis and which passes through the points $(0, 4)$, $(1, 9)$ and (–2, 6). Also, find its latusrectum.

20. The equation $ax^2 + 4xy + y^2 + ax + 3y + 2 = 0$ represents a parabola, then find the value of a.

Session 2

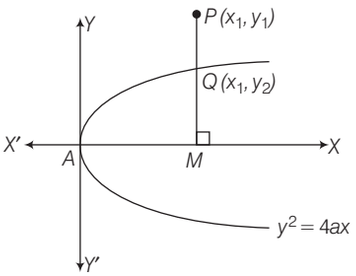
Position of a Point (x_1, y_1) with respect to a Parabola $y^2 = 4ax$, Parametric Relation between the Coordinates of the Ends of a Focal Chord of a Parabola, Intersection of a Line and a Parabola, Equation of Tangent in Different Forms, Point of Intersection of Tangents at any Two Points on the Parabola, Equation of Normals in Different Forms, Point of Intersection of Normals at any Two Points on the Parabola, Circle Through Co-normal Points

Position of a Point (x_1, y_1) with Respect to a Parabola $y^2 = 4ax$

Theorem The point (x_1, y_1) lies outside, on or inside the parabola $y^2 = 4ax$ according as

$$y_1^2 - 4ax_1 >, =, \text{or} < 0.$$

Proof Let $P(x_1, y_1)$ be a point. From P draw $PM \perp AX$ (on the axis of parabola) meeting the parabola $y^2 = 4ax$ at Q let the coordinate of Q be (x_1, y_2).



Since, $Q(x_1, y_2)$ lies on the parabola

$$y_1^2 = 4ax$$

then, $$y_2^2 = 4ax_1 \quad \ldots(i)$$

Now, P will be outside, on or inside the parabola $y^2 = 4ax$ according as

$$PM >, =, \text{or} < QM$$

$$\Rightarrow \quad (PM)^2 >, =, \text{or} < (QM)^2$$

$$\Rightarrow \quad y_1^2 >, =, \text{or} < y_2^2$$

$$\Rightarrow \quad y_1^2 >, =, \text{or} < 4ax_1 \quad \text{[from Eq. (i)]}$$

Hence, $y_1^2 - 4ax_1 >, =, \text{or} < 0$

Remarks

1. The point (x_1, y_1) lies inside, on or outside $y^2 = -4ax$ according as $y_1^2 + 4ax_1 <, =, \text{or} > 0$
2. The point (x_1, y_1) lies inside, on or outside $x^2 = 4ay$ according as $x_1^2 - 4ay_1 <, =, \text{or} > 0$
3. The point (x_1, y_1) lies inside, on or outside $x^2 = -4ay$ according as $x_1^2 + 4ay_1 <, =, \text{or} > 0$

Example 23 Show that the point (2, 3) lies outside the parabola $y^2 = 3x$.

Sol. Let the point $(h, k) = (2, 3)$

We have, $k^2 - 3h = 3^2 - 3.2 = 9 - 6 = 3 > 0$

$\therefore \quad k^2 - 3h > 0$

This shows that (2,3) lies outside the parabola $y^2 = 3x$.

Example 24 ***Find the position of the point*** $(-2,2)$ ***with respect to the parabola*** $y^2 - 4y + 9x + 13 = 0$.

Sol. Let the point $(h,k) = (-2,2)$

We have, $k^2 - 4k + 9h + 13 = (2)^2$

$$- 4(2) + 9(-2) + 13 = 4 - 8 - 18 + 13 = -9 < 0$$

Hence, $k^2 - 4k + 9h + 13 < 0$

Therefore, the point $(-2,2)$ lies inside the parabola

$$y^2 - 4y + 9x + 13 = 0.$$

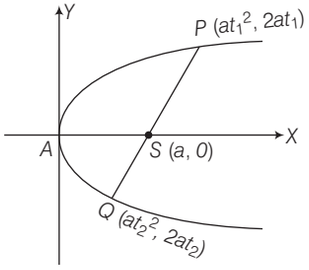
Parameteric Relation between the Coordinates of the Ends of a Focal Chord of a Parabola

Let $y^2 = 4ax$ be a parabola, if PQ be a focal chord.

Then, $P \equiv (at_1^2, 2at_1)$ and $Q \equiv (at_2^2, 2at_2)$

Since, PQ passes through the focus $S(a,0)$.

$\therefore$ Q, S, P are collinear.



$\therefore$ Slope of PS = Slope of QS

$$\Rightarrow \quad \frac{2at_1 - 0}{at_1^2 - a} = \frac{0 - 2at_2}{a - at_2^2} \Rightarrow \frac{2t_1}{t_1^2 - 1} = \frac{2t_2}{t_2^2 - 1}$$

$$\Rightarrow \quad t_1(t_2^2 - 1) = t_2(t_1^2 - 1)$$

$$\Rightarrow \quad t_1 t_2 (t_2 - t_1) + (t_2 - t_1) = 0$$

$$\Rightarrow \quad t_2 - t_1 \neq 0 \quad \text{or} \quad t_1 t_2 + 1 = 0$$

$$\Rightarrow \quad t_1 t_2 = -1 \quad \text{or} \quad t_2 = -\frac{1}{t_1}, \qquad \ldots(i)$$

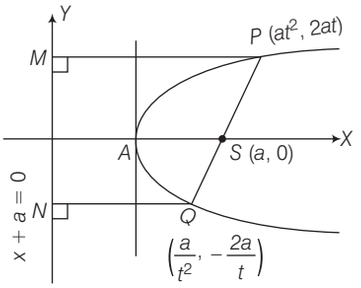
which is required relation.

Remark

If one extremity of a focal chord is $(at_1^2, 2at_1)$ then the other extremity $(at_2^2, 2at_2)$ becomes $\left(\frac{a}{t_1^2}, -\frac{2a}{t_1}\right)$ by virtue of relation Eq. (i).

Example 25 If the point $(at^2, 2at)$ be the extremity of a focal chord of parabola $y^2 = 4ax$ then show that the length of the focal chord is $a\left(t + \frac{1}{t}\right)^2$.

Sol. Since, one extremity of focal chord is $P(at^2, 2at)$, then the other extremity is $Q\left(\frac{a}{t^2}, -\frac{2a}{t}\right)$ [Replacing t by $-1/t$]



$\therefore$ Length of focal chord $= PQ$

$$= SP + SQ \qquad [\because SP = PM \text{ and } SQ = QN]$$

$$= PM + QN$$

$$= at^2 + a + \frac{a}{t^2} + a$$

$$= a\left(t^2 + \frac{1}{t^2} + 2\right) = a\left(t + \frac{1}{t}\right)^2$$

Remark

$\because$ $\left|t + \frac{1}{t}\right| \geq 2$ for all $t \neq 0$ [$\because$ AM $\geq$ GM]

$\therefore$ $a\left(t + \frac{1}{t}\right)^2 \geq 4a$

$\Rightarrow$ Length of focal chord $\geq$ latusrectum i.e. The length of smallest focal chord of the parabola is $4a$. Hence, the latusrectum of a parabola is the smallest focal chord.

Example 26 Prove that the semi-latusrectum of the parabola $y^2 = 4ax$ is the harmonic mean between the segments of any focal chord of the parabola.

Sol. Let parabola be $y^2 = 4ax$

If PQ be the focal chord, if

$$P \equiv (at^2, 2at), \text{ then } Q \equiv \left(\frac{a}{t^2}, \frac{-2a}{t}\right)$$

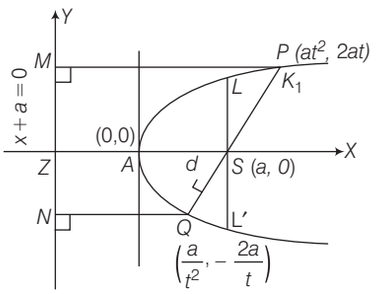
$\therefore$ Length of latusrectum $LL' = 4a$.

$\therefore$ Semi-latusrectum $= \frac{1}{2}(4a) = 2a$.

If sections of focal chord are k_1 and k_2,

then, $k_1 = SP = PM = a + at^2 = a(1 + t^2)$

and $k_2 = SQ = QN = a + \frac{a}{t^2} = \frac{a(1 + t^2)}{t^2}$



$\therefore$ Harmonic mean of k_1

and $k_2 = \frac{2k_1k_2}{k_1 + k_2}$

$$= \frac{2}{\frac{1}{k_2} + \frac{1}{k_1}} = \frac{2}{\frac{t^2}{a(1+t^2)} + \frac{1}{a(1+t^2)}}$$

$$= \frac{2}{\frac{1}{a}} = 2a = \text{Semi-latusrectum.}$$

Remarks

1. The length of focal chord having parameters t_1 and t_2 for its end points is $a(t_2 - t_1)^2$.
2. If l_1 and l_2 are the length of segments of a focal chord of a parabola, then its latusrectum is $\frac{4l_1l_2}{l_1 + l_2}$.

Example 27. ***Show that the focal chord of parabola*** $y^2 = 4ax$ ***makes an angle*** α ***with the X-axis is of length*** $4a\,\text{cosec}^2\alpha$.

Sol. Let $P(at_1^2, 2at_1)$ and $Q(at_2^2, 2at_2)$ be the end points of a focal chord PQ which makes an angle α with the axis of the parabola. Then,

$$PQ = a(t_2 - t_1)^2$$
$$= a[(t_2 + t_1)^2 - 4t_1t_2] \quad \ldots(i)$$
$$= a[(t_2 + t_1)^2 + 4] \quad [\because t_1t_2 = -1]$$

$$\therefore \quad \tan\alpha = \text{slope of } PQ$$
$$= \frac{2at_2 - 2at_1}{at_2^2 - at_1^2}$$

$$\Rightarrow \quad \tan\alpha = \frac{2}{t_2 + t_1}$$

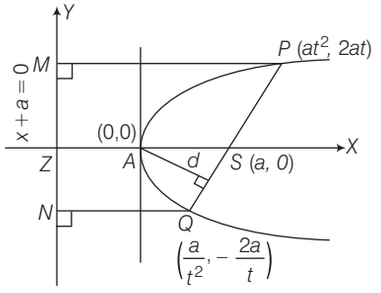
$$\Rightarrow \quad t_2 + t_1 = 2\cot\alpha \quad \ldots(ii)$$

On substituting the value of $t_2 + t_1$ from Eq. (ii) in Eq. (i), then

$$PQ = a(4\cot^2\alpha + 4)$$
$$= 4a\,\text{cosec}^2\alpha.$$

Example 28 ***Prove that the length of a focal chord of a parabola varies inversly as the square of its distance from the vertex.***

Sol. Let $P(at^2, 2at)$ be one end of a focal chord of the parabola $y^2 = 4ax$. The focus of its parabola is $S(a,0)$.



$\therefore$ Equation of focal chord is (i.e. equation of PS)

$$y - 0 = \frac{2at - 0}{at^2 - a}(x - a)$$

$$\Rightarrow \quad y = \frac{2t}{(t^2 - 1)}(x - a)$$

$$\Rightarrow \quad (t^2 - 1)y = 2tx - 2at$$

$$\Rightarrow \quad 2tx - (t^2 - 1)y - 2at = 0$$

If d be the distance of this focal chord from the vertex (0,0) of the parabola $y^2 = 4ax$, then

$$d = \frac{|0 - 0 - 2at|}{\sqrt{(2t)^2 + (t^2 - 1)^2}}$$

$$= \frac{|2at|}{(t^2 + 1)} = \frac{2a}{\left|t + \frac{1}{t}\right|}$$

$$\Rightarrow \quad d^2 = \frac{4a^2}{\left(t + \frac{1}{t}\right)^2} \quad \ldots(i)$$

The other end of the focal chord is $Q\left(\frac{a}{t^2}, -\frac{2a}{t}\right)$

If length of focal chord = $PQ = (l \text{ say})$

$\therefore \quad l = PQ = PS + SQ = PM + QN$

$$\therefore \quad l = at^2 + a + \frac{a}{t^2} + a$$

$$\Rightarrow \quad l = a\left(t^2 + \frac{1}{t^2} + 2\right) \Rightarrow l = a\left(t + \frac{1}{t}\right)^2$$

$$\Rightarrow \quad \frac{l}{a} = \left(t + \frac{1}{t}\right)^2 \quad \ldots(ii)$$

From Eqs. (i) and (ii), $d^2 = \frac{4a^2}{(l/a)} = \frac{4a^3}{l}$

$$\therefore \quad l = \frac{4a^3}{d^2} \Rightarrow l \propto \frac{1}{d^2}$$

i.e. the length of the focal chord varies inversely as the square of its distance from vertex.

Intersection of a Line and a Parabola

Let the parabola be $y^2 = 4ax$ ...(i)

and the given line be $y = mx + c$ ...(ii)

On eliminating x from Eqs. (i) and (ii), then

$$y^2 = 4a\left(\frac{y - c}{m}\right)$$

$$\Rightarrow \quad my^2 - 4ay + 4ac = 0 \quad \ldots(iii)$$

This equation being quadratic in y, gives two values of y, shows that every straight line will cut the parabola in two points may be real, coincident or imaginary according as discriminant of Eq. (iii) $>, =, < 0$

i.e. $(-4a)^2 - 4 \cdot m \cdot 4ac >, =, < 0$ or $a - mc >, =, < 0$

or $a >, =, < mc$ ...(iv)

Condition of tangency

If the line Eq. (ii) touches the parabola Eq. (i), then Eq. (iii) has equal roots

$\therefore$ Discriminant of Eq. (iii) $= 0$

$$\Rightarrow \quad (-4a)^2 - 4m \cdot 4ac = 0$$

$$\Rightarrow \qquad c = \frac{a}{m}, m \neq 0 \qquad \ldots(v)$$

So, the line $y = mx + c$ touches the parabola $y^2 = 4ax$ if $c = \frac{a}{m}$ (which is condition of tangency).

Substituting the value of c from Eq. (v) in Eq. (ii), then

$$y = mx + \frac{a}{m}, m \neq 0$$

Hence, the line $y = mx + \frac{a}{m}$ will always be a tangent to the parabola $y^2 = 4ax$.

The point of contact Substituting $c = \frac{a}{m}$ in Eq. (iii), then

$$my^2 - 4ay + 4a\left(\frac{a}{m}\right) = 0$$

$$\Rightarrow \qquad m^2y^2 - 4amy + 4a^2 = 0$$

$$\Rightarrow \qquad (my - 2a)^2 = 0$$

$$\Rightarrow \qquad my - 2a = 0$$

or $$y = \frac{2a}{m}$$

Substituting this value of y in $y = mx + \frac{a}{m}$

$$\therefore \qquad \frac{2a}{m} = mx + \frac{a}{m}$$

$$\Rightarrow \qquad mx = \frac{a}{m} \quad \text{or} \quad x = \frac{a}{m^2}$$

Hence, the point of contact is $\left(\frac{a}{m^2}, \frac{2a}{m}\right), (m \neq 0)$ this known as ***m*-point** on the parabola.

Remark

If $m = 0$, then Eq. (iii) gives

$$0 - 4ay + 4ac = 0$$

$$\Rightarrow \qquad y = c$$

which gives only one value of y and so every line parallel to X-axis cuts the parabola only in one real point.

Example 29 Prove that the straight line $lx + my + n = 0$ touches the parabola $y^2 = 4ax$, if $\ln = am^2$.

Sol. The given line is $lx + my + n = 0$

or $$y = -\frac{l}{m}x - \frac{n}{m} \qquad \ldots(i)$$

Comparing this line with $y = Mx + c$

$$\therefore \qquad M = -\frac{l}{m} \quad \text{and} \quad c = -\frac{n}{m}$$

The line Eq. (i) will touch the parabola $y^2 = 4ax$, if

$$c = \frac{a}{M} \Rightarrow cM = a$$

$$\Rightarrow \qquad \left(-\frac{n}{m}\right)\left(-\frac{l}{m}\right) = a$$

$$\therefore \qquad \ln = am^2$$

Aliter :

Given line $lx + my + n = 0$ ...(i)

and the parabola $y^2 = 4ax$ ...(ii)

Substituting the value of x from Eq. (i) i.e. $x = -\frac{n + my}{l}$ in Eq. (ii), then

(we should not substituting the value of y from Eq. (i), in Eq. (ii) since y is quadratic, substituting the value of x since x is linear).

$$y^2 = 4a\left(-\frac{n + my}{l}\right)$$

$$\Rightarrow \qquad ly^2 + 4amy + 4an = 0 \qquad \ldots(iii)$$

Since, Eq. (i) touches the parabola Eq. (ii), then roots of Eq. (iii) must be coincident and condition for the same is $B^2 = 4AC$,

i.e., $$(4am)^2 = 4 \cdot l4an$$

$$\Rightarrow \qquad am^2 = ln$$

$$\therefore \qquad ln = am^2$$

Example 30 Show that the line $x\cos\alpha + y\sin\alpha = p$ touches the parabola $y^2 = 4ax$, if $p\cos\alpha + a\sin^2\alpha = 0$ and that the point of contact is $(a\tan^2\alpha, -2a\tan\alpha)$.

Sol. The given line is

$$x\cos\alpha + y\sin\alpha = p$$

$$\Rightarrow \qquad y = -x\cot\alpha + p\,\text{cosec}\alpha$$

Comparing this line with $y = mx + c$.

$$\therefore \qquad m = -\cot\alpha \text{ and } c = p\,\text{cosec}\alpha$$

since, the given line touches the parabola

$$\therefore \qquad c = \frac{a}{m} \text{ or } cm = a$$

$$\Rightarrow \qquad (p\,\text{cosec}\alpha)(-\cot\alpha) = a$$

$$\Rightarrow \qquad a\sin^2\alpha + p\cos\alpha = 0$$

and point of contact is $\left(\frac{a}{m^2}, \frac{2a}{m}\right)$

i.e. $$\left(\frac{a}{\cot^2\alpha}, -\frac{2a}{\cot\alpha}\right)$$

or $$(a\tan^2\alpha, -2a\tan\alpha)$$

Example 31 Prove that the line $\frac{x}{l}+\frac{y}{m}=1$ touches the parabola $y^2=4a(x+b)$, if $m^2(l+b)+al^2=0$.

Sol. The given parabola is

$$y^2 = 4a(x+b) \quad \ldots(i)$$

Vertex of this parabola is $(-b, 0)$.

Now, shifting $(0, 0)$ at $(-b, 0)$,

then, $x = X + (-b)$ and $y = Y + 0$

or $x + b = X$ and $y = Y$ ...(ii)

From Eq. (i), $Y^2 = 4aX$ ...(iii)

and the line $\frac{x}{l}+\frac{y}{m}=1$

reduces to $\frac{X-b}{l}+\frac{Y}{m}=1$

$$Y = m\left(1-\frac{X-b}{l}\right)$$

$$\Rightarrow \quad Y = \left(-\frac{m}{l}\right)X + m\left(1+\frac{b}{l}\right) \quad \ldots(iv)$$

The line Eq. (iv) will touch the parabola Eq. (iii), if

$$m\left(1+\frac{b}{l}\right) = \frac{a}{\left(-\frac{m}{l}\right)}$$

$$\Rightarrow \quad \frac{m^2}{l}\left(1+\frac{b}{l}\right) = -a$$

$$\therefore \quad m^2(l+b)+al^2 = 0$$

Aliter :

The given line and parabola are

$$\frac{x}{l}+\frac{y}{m}=1 \quad \ldots(i)$$

and $$y^2 = 4a(x+b) \quad \ldots(ii)$$

respectively substituting the value of x from Eq. (i)

$$x = l\left(1-\frac{y}{m}\right)$$

in Eq. (ii), then $$y^2 = 4a\left\{l\left(1-\frac{y}{m}\right)+b\right\}$$

or $$y^2 + \frac{4al}{m}y - 4a(l+b) = 0 \quad \ldots(iii)$$

Since, the line Eq. (i) touches the parabola Eq. (ii), then the roots of Eq. (iii) are equal.

$$\therefore \quad \left(\frac{4al}{m}\right)^2 - 4\cdot 1\{-4a(l+b)\} = 0$$

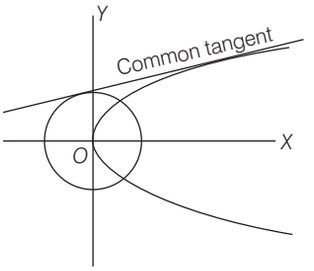
$$\Rightarrow \quad \frac{al^2}{m^2} + (l+b) = 0$$

$$\Rightarrow \quad al^2 + m^2(l+b) = 0$$

$$\Rightarrow \quad m^2(l+b) + al^2 = 0$$

Example 32 Find the equations of the straight lines touching both $x^2+y^2=2a^2$ and $y^2=8ax$.

Sol. The given curves are



$$x^2 + y^2 = 2a^2 \quad \ldots(i)$$

and $$y^2 = 8ax \quad \ldots(ii)$$

The parabola Eq. (ii) is $y^2 = 8ax$

or $$y^2 = 4(2a)x$$

$\therefore$ Equation of tangent of Eq. (ii) is

$$y = mx + \frac{2a}{m}$$

or $$m^2x - my + 2a = 0 \quad \ldots(iii)$$

It is also tangent of Eq. (i), then the length of perpendicular from centre of Eq. (i) i.e. (0, 0) to Eq. (iii) must be equal to the radius of Eq. (i) i.e. $a\sqrt{2}$.

$$\therefore \quad \frac{|0-0+2a|}{\sqrt{(m^2)^2+(-m)^2}} = a\sqrt{2} \quad \Rightarrow \quad \frac{4a^2}{m^4+m^2} = 2a^2$$

$$\Rightarrow \quad m^4 + m^2 - 2 = 0$$

$$\Rightarrow \quad (m^2+2)(m^2-1) = 0$$

$$\because \quad m^2 + 2 \neq 0 \quad \text{[gives the imaginary values]}$$

$$\therefore \quad m^2 - 1 = 0$$

$$\Rightarrow \quad m = \pm 1$$

Hence, from Eq. (iii) the required tangents are

$$x \pm y + 2a = 0.$$

Equation of Tangent in Different Forms

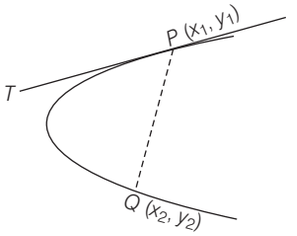
1. Point Form :

To find the equation of the tangent to the parabola $y^2 = 4ax$ at the point (x_1, y_1).

(First Principal Method) Equation of parabola is

$$y^2 = 4ax \quad \ldots(i)$$

Let $P \equiv (x_1, y_1)$ and $Q \equiv (x_2, y_2)$ be any two points on parabola (i), then



$$y_1^2 = 4ax_1 \quad \ldots(ii)$$

and $$y_2^2 = 4ax_2 \quad \ldots(iii)$$

Subtracting Eq. (ii) from Eq. (iii), then

$$y_2^2 - y_1^2 = 4a(x_2 - x_1)$$

$$\Rightarrow \quad \frac{y_2 - y_1}{x_2 - x_1} = \frac{4a}{y_2 + y_1} \quad \ldots(iv)$$

Equation of PQ is

$$y - y_1 = \frac{y_2 - y_1}{x_2 - x_1}(x - x_1) \quad \ldots(v)$$

From Eqs. (iv) and (v), then

$$y - y_1 = \frac{4a}{y_2 + y_1}(x - x_1) \quad \ldots(vi)$$

Now, for tangent at $P, Q \to P$, i.e. $x_2 \to x_1$ and $y_2 \to y_1$, then Eq. (vi) becomes

$$y - y_1 = \frac{4a}{2y_1}(x - x_1) \;\Rightarrow\; yy_1 - y_1^2 = 2ax - 2ax_1$$

$$\Rightarrow \quad yy_1 = 2ax + y_1^2 - 2ax_1$$

$$\Rightarrow \quad yy_1 = 2ax + 4ax_1 - 2ax_1 \quad [\text{from Eq. (ii)}]$$

$$\Rightarrow \quad yy_1 = 2ax + 2ax_1$$

$$\therefore \quad yy_1 = 2a(x + x_1),$$

which is the required equation of tangent at (x_1, y_1).

Remarks

1. The equation of tangent at (x_1, y_1) can also be obtained by replacing x^2 by xx_1, y^2 by yy_1, x by $\frac{x + x_1}{2}$, y by $\frac{y + y_1}{2}$ and xy by $\frac{xy_1 + x_1y}{2}$ and without changing the constant (if any) in the equation of curve. This method is apply only when the equations of parabola is polynomial of second degree in x and y.
2. Equation of tangents of all standard parabolas at (x_1, y_1).

Equations of Parabolas	Tangent at(x_1, y_1)
$y^2 = 4ax$	$yy_1 = 2a(x + x_1)$
$y^2 = -4ax$	$yy_1 = -2a(x + x_1)$
$x^2 = 4ay$	$xx_1 = 2a(y + y_1)$
$x^2 = -4ay$	$xx_1 = -2a(y + y_1)$

2. Parametric Form :

To find the equation of tangent to the parabola $y^2 = 4ax$ at the point $(at^2, 2at)$ or 't'.

Since, the equation of tangent of the parabola $y^2 = 4ax$ at (x_1, y_1) is $yy_1 = 2a(x + x_1)$ ...(i)

replacing x_1 by at^2 and y_1 by $2at$, then Eq. (i) becomes

$$y(2at) = 2a(x + at^2) \;\Rightarrow\; ty = x + at^2$$

Remark

The equations of tangent of all standard parabolas at 't'.

Equations of Parabolas	Parametric coordinates 't'	Tangent at 't'
$y^2 = 4ax$	$(at^2, 2at)$	$ty = x + at^2$
$y^2 = -4ax$	$(-at^2, 2at)$	$ty = -x + at^2$
$x^2 = 4ay$	$(2at, at^2)$	$tx = y + at^2$
$x^2 = -4ay$	$(2at, -at^2)$	$tx = -y + at^2$

3. Slope Form :

To find the equation of tangent and point of contact in terms of m(slope) to the parabola $y^2 = 4ax$.

The equation of tangent to the parabola $y^2 = 4ax$ at (x_1, y_1) is $yy_1 = 2a(x + x_1)$. ...(i)

Since, m is the slope of the tangent, then

$$m = \frac{2a}{y_1} \;\Rightarrow\; y_1 = \frac{2a}{m}$$

Since, (x_1, y_1) lies on $y^2 = 4ax$, therefore

$$y_1^2 = 4ax_1 \Rightarrow \frac{4a^2}{m^2} = 4ax_1$$

$$\therefore \quad x_1 = \frac{a}{m^2}$$

Substituting the values of x_1 and y_1 in Eq. (i), we get

$$y = mx + \frac{a}{m} \quad \ldots(ii)$$

Thus, $y = mx + \frac{a}{m}$ is a tangent to the parabola $y^2 = 4ax$, where, m is the slope of the tangent.

The coordinates of the point of contact are $\left(\frac{a}{m^2}, \frac{2a}{m}\right)$.

Comparing Eq. (ii) with $y = mx + c$,

$$c = \frac{a}{m}$$

which is condition of tangency.

when, $y = mx + c$ is the tangent of $y^2 = 4ax$.

Remark

The equation of tangent, condition of tangency and point of contact in terms of slope (m) of all standard parabolas.

Equation of parabolas	Point of contact in terms of slope (m)	Equation of tangent in terms of slope (m)	Condition of tangency
$y^2 = 4ax$	$\left(\frac{a}{m^2}, \frac{2a}{m}\right)$	$y = mx + \frac{a}{m}$	$c = \frac{a}{m}$
$y^2 = -4ax$	$\left(-\frac{a}{m^2}, \frac{2a}{m}\right)$	$y = mx - \frac{a}{m}$	$c = -\frac{a}{m}$
$x^2 = 4ay$	$(2am, am^2)$	$y = mx - am^2$	$c = -am^2$
$x^2 = -4ay$	$(2am, -am^2)$	$y = mx + am^2$	$c = am^2$
$(y-k)^2 = 4a(x-h)$	$\left(h + \frac{a}{m^2}, k + \frac{2a}{m}\right)$	$y = mx - mh + k + \frac{a}{m}$	$c + mh = k + \frac{a}{m}$
$(y-k)^2 = -4a(x-h)$	$\left(h - \frac{a}{m^2}, k + \frac{2a}{m}\right)$	$y = mx - mh + k - \frac{a}{m}$	$c + mh = k - \frac{a}{m}$
$(x-h)^2 = 4a(y-k)$	$(h + 2am, k + am^2)$	$y = mx - mh + k - am^2$	$c + mh = k - am^2$
$(x-h)^2 = -4a(y-k)$	$(h + 2am, k - am^2)$	$y = mx - mh + k + am^2$	$c + mh = k + am^2$

Point of Intersection of Tangents at any two Points on the Parabola

Let the parabola be $y^2 = 4ax$

let two points on the parabola are

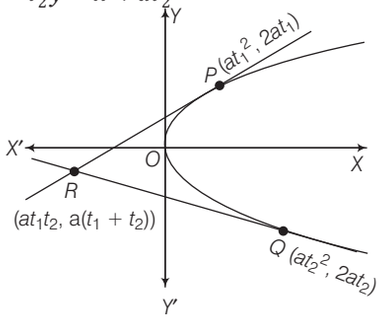
$$P \equiv (at_1^2, 2at_1) \quad \text{and} \quad Q \equiv (at_2^2, 2at_2).$$

Equation of tangents at $P(at_1^2, 2at_1)$

and $Q(at_2^2, 2at_2)$

are $t_1 y = x + at_1^2$ ...(i)

and $t_2 y = x + at_2^2$ ...(ii)



On solving these equations, we get $x = at_1 t_2, y = a(t_1 + t_2)$

Thus, the coordinates of the point of intersection of tangents at

$(at_1^2, 2at_1)$ and $(at_2^2, 2at_2)$ are $(at_1 t_2, a(t_1 + t_2))$.

Remarks

1. The geometric mean of the x-coordinates of P and Q (i.e. $\sqrt{at_1^2 \times at_2^2} = at_1 t_2$) is the x-coordinate of the point of intersection of tangents at P and Q on the parabola. If P and Q are the ends points of focal chord, then x-coordinate of point of intersection of tangents at P and Q is $(-at_1 t_2)$.
2. The arithmetic mean of the y-coordinates of P and Q $\left(\text{i.e. } \frac{2at_1 + 2at_2}{2} = a(t_1 + t_2)\right)$ is the y-coordinate of the point of intersection of tangents at P and Q on the parabola.

Remembering Method :

G O A [GOA rule]

GM of at_1^2 and at_2^2 , AM of $2at_1$ and $2at_2$

i.e. $at_1 t_2$ i.e. $\frac{2at_1 + 2at_2}{2} = a(t_1 + t_2)$

Example 33 Find the equation of the common tangents to the parabola $y^2 = 4ax$ and $x^2 = 4by$.

Sol. The equation of any tangent in terms of slope (m) to the parabola $y^2 = 4ax$ is

$$y = mx + \frac{a}{m} \quad \text{...(i)}$$

If this line is also tangent to the parabola $x^2 = 4ay$, then Eq. (i) meets $x^2 = 4by$ in two coincident points.

Substituting the value of y from Eq. (i) in $x^2 = 4by$, we get

$$x^2 = 4b\left(mx + \frac{a}{m}\right)$$

$$\Rightarrow \quad x^2 - 4bmx - \frac{4ab}{m} = 0$$

The roots of this quadratic are equal provided

$$B^2 = 4AC$$

i.e., $$(-4bm)^2 = 4 \cdot 1\left(\frac{-4ab}{m}\right)$$

$$\Rightarrow \quad 16b^2m^3 + 16ab = 0,\ m \neq 0$$

or $$m^3 = -a/b$$

$$\therefore \quad m = -a^{1/3}/b^{1/3}$$

Substituting the value of m in Eq. (i) the required equation is

$$y = -\frac{a^{1/3}}{b^{1/3}}x - \frac{ab^{1/3}}{a^{1/3}}$$

$$\Rightarrow \quad y = -\frac{a^{1/3}}{b^{1/3}}x - a^{2/3}b^{1/3}$$

$$\therefore \quad a^{1/3}x + b^{1/3}y + a^{2/3}b^{2/3} = 0$$

Example 34 The tangents to the parabola $y^2 = 4ax$ make angle θ_1 and θ_2 with X-axis. Find the locus of their point of intersection, if $\cot\theta_1 + \cot\theta_2 = c$.

Sol. Let the equation of any tangent to the parabola $y^2 = 4ax$ is

$$y = mx + (a/m) \qquad \ldots(i)$$

Let (x_1, y_1) be the point of intersection of the tangents to $y^2 = 4ax$, then Eq. (i) passes through (x_1, y_1).

$$\therefore \quad y_1 = mx_1 + (a/m)$$

or $$m^2x_1 - my_1 + a = 0$$

Let m_1 and m_2 be the roots of this quadratic equation, then

$$m_1 + m_2 = y_1/x_1 \quad \text{and} \quad m_1m_2 = a/x_1$$

or $$\tan\theta_1 + \tan\theta_2 = y_1/x_1$$

and $$\tan\theta_1\tan\theta_2 = a/x_1 \qquad \ldots(ii)$$

Now, $$\cot\theta_1 + \cot\theta_2 = c \qquad \text{(given)}$$

$$\Rightarrow \quad \frac{1}{\tan\theta_1} + \frac{1}{\tan\theta_2} = c$$

$$\Rightarrow \quad \frac{\tan\theta_1 + \tan\theta_2}{\tan\theta_1\tan\theta_2} = c \qquad \text{[from Eq. (ii)]}$$

$$\Rightarrow \quad \frac{y_1/x_1}{a/x_1} = c$$

$$\Rightarrow \quad y_1 = ac$$

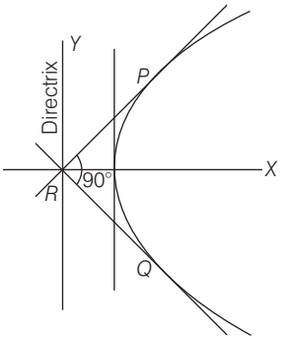
The required locus is $y = ac$,
which is a line parallel to X-axis.

Example 35. Show that the locus of the points of intersection of the mutually perpendicular tangents to a parabola is the directrix of the parabola.

Sol. Let the points $P(at_1^2, 2at_1)$ and $Q(at_2^2, 2at_2)$ on the parabola $y^2 = 4ax$ tangents at P and Q are

$$t_1y = x + at_1^2 \qquad \ldots(i)$$

and $$t_2y = x + at_2^2 \qquad \ldots(ii)$$



$\because$ Point of intersection of these tangents is $(at_1t_2, a(t_1 + t_2))$
Let this point is (h, k),

then, $$h = at_1t_2 \qquad \ldots(iii)$$

and $$k = a(t_1 + t_2) \qquad \ldots(iv)$$

Slope of tangents Eqs. (i) and (ii) are $\frac{1}{t_1}$ and $\frac{1}{t_2}$, respectively.

Since, tangents are perpendicular, then

$$\frac{1}{t_1} \times \frac{1}{t_2} = -1$$

or $$t_1t_2 = -1 \qquad \ldots(v)$$

From Eqs. (iii) and (v), we get

$$h = -a \quad \text{or} \quad h + a = 0$$

$\therefore$ Locus of the point of intersection of tangents is

$$x + a = 0$$

which is directrix of $y^2 = 4ax$.

Aliter :

Let the equation of any tangent to the parabola $y^2 = 4ax$ is

$$y = mx + a/m \qquad \ldots(i)$$

Let the point of intersection of the tangents to $y^2 = 4ax$ then, Eq (i) passes through (x_1, y_1) .

$$\therefore \quad y_1 = mx_1 + a/m$$

or $$m^2x_1 - my_1 + a = 0$$

Let m_1, m_2 be the roots of this quadratic equation then

$$m_1m_2 = a/x_1 = -1$$

[since, tangents are perpendiculars]

$$\Rightarrow \quad a + x_1 = 0$$

$\therefore$ Locus of the point of intersection of tangents is $x + a = 0$ which is directrix of $y^2 = 4ax$.

Remark

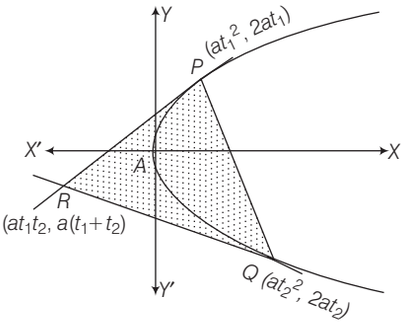
Locus of the point of intersection of the perpendicular tangents to the parabola $y^2 = 4ax$ is called the director circle. Its equation is $x + a = 0$, which is parabola's own directrix.

Example 36 The tangents to the parabola $y^2 = 4ax$ at $P(at_1^2, 2at_1)$ and $Q(at_2^2, 2at_2)$ intersect at R. Prove that the area of the ΔPQR is $\frac{1}{2}a^2|(t_1 - t_2)|^3$.

Sol. Equations of tangents at $P(at_1^2, 2at_1)$ and $Q(at_2^2, 2at_2)$ are

$$t_1 y = x + at_1^2 \quad \ldots(i)$$

and $$t_2 y = x + at_2^2 \quad \ldots(ii)$$



Since, point of intersect of Eqs. (i) and (ii) is $R(at_1t_2, a(t_1 + t_2))$.

$$\therefore \text{ Area of } \Delta PQR = \frac{1}{2}\begin{vmatrix} at_1^2 & 2at_1 & 1 \\ at_2^2 & 2at_2 & 1 \\ at_1t_2 & a(t_1+t_2) & 1 \end{vmatrix}$$

Applying $R_2 \to R_2 - R_1$ and $R_3 \to R_3 - R_1$

$$= \frac{1}{2}\begin{vmatrix} at_1^2 & 2at_1 & 1 \\ a(t_2^2 - t_1^2) & 2a(t_2 - t_1) & 0 \\ at_1(t_2 - t_1) & a(t_2 - t_1) & 0 \end{vmatrix}$$

Expanding with respect to first row

$$= \frac{1}{2}\begin{vmatrix} a(t_2^2 - t_1^2) & 2a(t_2 - t_1) \\ at_1(t_2 - t_1) & a(t_2 - t_1) \end{vmatrix}$$

$$= \frac{1}{2}a^2(t_2 - t_1)^2\begin{vmatrix} t_2 + t_1 & 2 \\ t_1 & 1 \end{vmatrix}$$

$$= \frac{1}{2}a^2(t_1 - t_2)^2|(t_2 - t_1)|$$

$$= \frac{1}{2}a^2(t_1 - t_2)^2|(t_1 - t_2)|$$

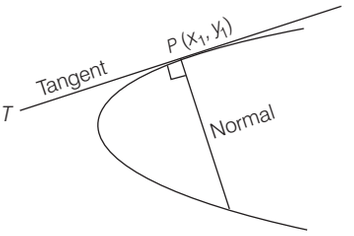
$$= \frac{1}{2}a^2|(t_1 - t_2)^3|.$$

Equations of Normals in Different Forms

1. Point Form: To find the equation of the normal to the parabola $y^2 = 4ax$ at the point (x_1, y_1).

Since, the equation of the tangent to the parabola $y^2 = 4ax$ at (x_1, y_1) is

$$yy_1 = 2a(x + x_1)$$



The slope of the tangent at $(x_1, y_1) = 2a / y_1$

Since, the normal at (x_1, y_1) is perpendicular to the tangent at (x_1, y_1).

$\therefore$ Slope of normal at $(x_1, y_1) = -y_1 / 2a$

Hence, the equation of normal at (x_1, y_1) is

$$y - y_1 = -\frac{y_1}{2a}(x - x_1).$$

Remarks

1. The equation of normal at (x_1, y_1) can also be obtained by this method

$$\frac{x - x_1}{a'x_1 + hy_1 + g} = \frac{y - y_1}{hx_1 + by_1 + f} \quad \ldots(i)$$

a', b, g, f, h are obtained by comparing the given parabola with

$$a'x^2 + 2hxy + by^2 + 2gx + 2fy + c = 0 \quad \ldots(ii)$$

and denominators of Eq. (i) can easily remembered by the first two rows of this determinant

i.e. $$\begin{vmatrix} a' & h & g \\ h & b & f \\ g & f & c \end{vmatrix}$$

Since, first row $a'(x_1) + h(y_1) + g(1)$

and second row, $h(x_1) + b(y_1) + f(1)$

Here, parabola $y^2 = 4ax$

or $$y^2 - 4ax = 0 \quad \ldots(iii)$$

Comparing Eqs. (ii) and (iii), then we get

$a' = 0, b = 1, g = -2a, h = 0, f = 0$

From Eq. (i), equation of normal of Eq. (iii) is

$$\frac{x - x_1}{0 + 0 - 2a} = \frac{y - y_1}{0 + y_1 + 0}$$

or $$y - y_1 = -\frac{y_1}{2a}(x - x_1)$$

2. Equations of normals of all standard parabolas at (x_1, y_1).

Equations of Parabola	Normal at (x_1, y_1)
$y^2 = 4ax$	$y - y_1 = -\frac{y_1}{2a}(x - x_1)$
$y^2 = -4ax$	$y - y_1 = \frac{y_1}{2a}(x - x_1)$
$x^2 = 4ay$	$y - y_1 = -\frac{2a}{x_1}(x - x_1)$
$x^2 = -4ay$	$y - y_1 = \frac{2a}{x_1}(x - x_1)$

2. Parametric form :

To find the equation of normal to the parabola $y^2 = 4ax$ at the point $(at^2, 2at)$ or 't'.

Since, the equation of normal of the parabola $y^2 = 4ax$ at (x_1, y_1) is

$$y - y_1 = -\frac{y_1}{2a}(x - x_1) \quad \ldots(i)$$

Replacing x_1 by at^2 and y_1 by $2at$, then Eq. (i) becomes

$$y - 2at = -t(x - at^2)$$

or $$\boldsymbol{y + tx = 2at + at^3}$$

Remark

The equations of normals of all standard parabolas at 't'

Equations of Parabolas	Parametric coordinates 't'	Normals at 't'
$y^2 = 4ax$	$(at^2, 2at)$	$y + tx = 2at + at^3$
$y^2 = -4ax$	$(-at^2, 2at)$	$y - tx = 2at + at^3$
$x^2 = 4ay$	$(2at, at^2)$	$x + ty = 2at + at^3$
$x^2 = -4ay$	$(2at, -at^2)$	$x - ty = 2at + at^3$

3. Slope form :

To find the Equation of normal, condition for normality and point of contact in terms of m (slope) to the parabola $y^2 = 4ax$

The equation of normal to the parabola $y^2 = 4ax$ at (x_1, y_1) is

$$y - y_1 = -\frac{y_1}{2a}(x - x_1) \quad \ldots(i)$$

Since, m is the slope of the normal,

then, $$m = -\frac{y_1}{2a} \Rightarrow y_1 = -2am$$

Since, (x_1, y_1) lies on $y^2 = 4ax$, therefore

$$y_1^2 = 4ax_1$$

$$\Rightarrow \quad 4a^2m^2 = 4ax_1$$

$$\therefore \quad x_1 = am^2$$

On substituting the values of x_1 and y_1 in Eq. (i) we get

$$y + 2am = m(x - am^2)$$

$$\therefore \quad y = mx - 2am - am^3 \quad \ldots(ii)$$

Thus, $y = mx - 2am - am^3$ is a normal to the parabola $y^2 = 4ax$, where m is the slope of the normal. The coordinates of the point of contact are $(am^2, -2am)$

On comparing Eq. (ii) with

$$y = mx + c$$

$$\therefore \quad c = -2am - am^3$$

which is condition of normality when $y = mx + c$ is the normal of $y^2 = 4ax$.

Remark

The equations of normals, point of contact and condition of normality in terms of slope (m) of all standard parabolas.

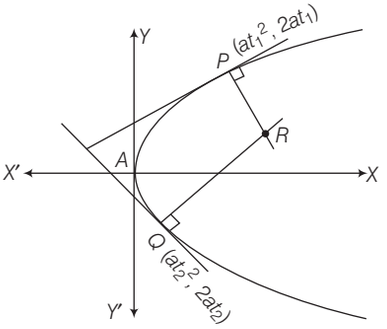
Equation of parabolas	Point of contact in terms of slope (m)	Equation of normals in terms of slope (m)	Condition of normality
$y^2 = 4ax$	$(am^2, -2am)$	$y = mx - 2am - am^3$	$c = -2am - am^3$
$y^2 = -4ax$	$(-am^2, 2am)$	$y = mx + 2am + am^3$	$c = 2am + am^3$
$x^2 = 4ay$	$\left(-\frac{2a}{m}, \frac{a}{m^2}\right)$	$y = mx + 2a + \frac{a}{m^2}$	$c = 2a + \frac{a}{m^2}$
$x^2 = -4ay$	$\left(\frac{2a}{m}, -\frac{a}{m^2}\right)$	$y = mx - 2a - \frac{a}{m^2}$	$c = -2a - \frac{a}{m^2}$
$(y-k)^2 = 4a(x-h)$	$(h + am^2, k - 2am)$	$y - k = m(x-h) - 2am - am^3$	$c = k - mh - 2am - am^3$
$(y-k)^2 = -4a(x-h)$	$(h - am^2, k + 2am)$	$y - k = m(x-h) + 2am + am^3$	$c = k - mh + 2am + am^3$
$(x-h)^2 = 4a(y-k)$	$\left(h - \frac{2a}{m}, k + \frac{a}{m^2}\right)$	$y - k = m(x-h) + 2a + \frac{a}{m^2}$	$c = k - mh + 2a + \frac{a}{m^2}$

Point of Intersection of Normals at any Two Points on the Parabola

Let the parabola be $y^2 = 4ax$.

Let the points on the parabola are

$$P \equiv (at_1^2, 2at_1) \quad \text{and} \quad Q = (at_2^2, 2at_2).$$



Equations of normals at $P(at_1^2, 2at_1)$ and $Q(at_2^2, 2at_2)$ are

$$y = -t_1 x + 2at_1 + at_1^3 \quad \ldots(i)$$

and $$y = -t_2 x + 2at_2 + at_2^3 \quad \ldots(ii)$$

On solving Eqs. (i) and (ii), we get

$$x = 2a + a(t_1^2 + t_2^2 + t_1 t_2) \text{ and } y = -at_1 t_2 (t_1 + t_2)$$

If R is the point of intersection, then

$$\boldsymbol{R \equiv [2a + a(t_1^2 + t_2^2 + t_1 t_2), -at_1 t_2 (t_1 + t_2)]}$$

(Remember)

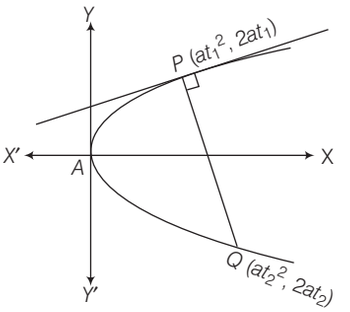
Point of intersection of normals at t_1 and t_2

Parabola	Equation of normal at any point 't'	Point of intersection of normals at t_1 and t_2
$y^2 = 4ax$	$y + tx = 2at + at^3$	$(2a + a(t_1^2 + t_1 t_2 + t_2^2), -at_1 t_2 (t_1 + t_2))$
$y^2 = -4ax$	$y - tx = 2at + at^3$	$(-2a - a(t_1^2 + t_1 t_2 + t_2^2), at_1 t_2 (t_1 + t_2))$
$x^2 = 4ay$	$x + ty = 2at + at^3$	$(-at_1 t_2 (t_1 + t_2), 2a + a(t_1^2 + t_1 t_2 + t_2^2))$
$x^2 = -4ay$	$x - ty = 2at + at^3$	$(at_1 t_2 (t_1 + t_2), -2a - a(t_1^2 + t_1 t_2 + t_2^2))$

Relation between 't_1' and 't_2' if Normal at 't_1' meets the Parabola Again at 't_2'

Let the parabola be $y^2 = 4ax$, equation of normal at $P(at_1^2, 2at_1)$ is

$$y = -t_1 x + 2at_1 + at_1^3 \quad \ldots(i)$$



Since, it meet the parabola again at $Q(at_2^2, 2at_2)$, then Eq. (i) passes through $Q(at_2^2, 2at_2)$.

$$\therefore \quad 2at_2 = -at_1 t_2^2 + 2at_1 + at_1^3$$

$$\Rightarrow \quad 2a(t_2 - t_1) + at_1(t_2^2 - t_1^2) = 0$$

$$\Rightarrow \quad a(t_2 - t_1)[2 + t_1(t_2 + t_1)] = 0$$

$$\because \quad a(t_2 - t_1) \neq 0$$

$[\because t_1 \text{ and } t_2 \text{ are different}]$

$$\therefore \quad 2 + t_1(t_2 + t_1) = 0$$

$$\therefore \quad \boldsymbol{t_2 = -t_1 - \frac{2}{t_1}}$$

Remarks

1. If normals at 't_1' and 't_2' meets the parabola $y^2 = 4ax$ at same point, then $t_1 t_2 = 2$.

   Proof Suppose normals meet at 'T', then

   $$T = -t_1 - \frac{2}{t_1} = -t_2 - \frac{2}{t_2}$$

   $$\Rightarrow \quad (t_1 - t_2) = 2\left(\frac{1}{t_2} - \frac{1}{t_1}\right)$$

   or $$t_1 t_2 = 2 \quad [\because t_1 \neq t_2]$$

2. If the normals to the parabola $y^2 = 4ax$ at the points t_1 and t_2 intersect again on the parabola at the point t_3, then $t_3 = -(t_1 + t_2)$ and the line joining t_1 and t_2 passes through a fixed point $(-2a, 0)$.

Example 37 Show that normal to the parabola $y^2 = 8x$ at the point (2, 4) meets it again at (18, –12). Find also the length of the normal chord.

Sol. Comparing the given parabola (i.e. $y^2 = 8x$) with $y^2 = 4ax$.

$$\therefore \quad 4a = 8 \quad \Rightarrow \quad a = 2$$

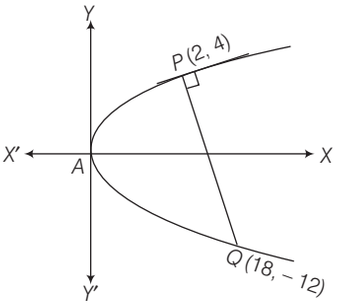
Since, normal at (x_1, y_1) to the parabola $y^2 = 4ax$ is

$$y - y_1 = -\frac{y_1}{2a}(x - x_1)$$

Here, $x_1 = 2$ and $y_1 = 4$.

$\therefore$ Equation of normal is

$$y - 4 = -\frac{4}{4}(x - 2)$$



$\Rightarrow \quad y - 4 = -x + 2$

$\Rightarrow \quad x + y - 6 = 0$ ...(i)

On solving Eq. (i) and $y^2 = 8x$,

then, $y^2 = 8(6 - y)$

$\Rightarrow \quad y^2 + 8y - 48 = 0$

$\Rightarrow \quad (y + 12)(y - 4) = 0$

$\therefore \quad y = -12$ and $y = 4$

then, $x = 18$ and $x = 2$.

Hence, the point of intersection of normal and parabola are $(18, -12)$ and $(2, 4)$, therefore normal meets the parabola at $(18, -12)$ and length of normal chord is distance between their points

$$= PQ = \sqrt{(18-2)^2 + (-12-4)^2} = 16\sqrt{2}$$

Example 38 ***Prove that the chord*** $y - x\sqrt{2} + 4a\sqrt{2} = 0$ ***is a normal chord of the parabola*** $y^2 = 4ax$***. Also, find the point on the parabola when the given chord is normal to the parabola.***

Sol. We have, $y - x\sqrt{2} + 4a\sqrt{2} = 0$

i.e., $y = x\sqrt{2} - 4a\sqrt{2}$ ...(i)

Comparing the Eq. (i) with the equation $y = mx + c$, then

$$m = \sqrt{2},\ c = -4a\sqrt{2}$$

Since, $-2am - am^3 = -2a\sqrt{2} - a(\sqrt{2})^3$

$$= -2a\sqrt{2} - 2a\sqrt{2} = -4a\sqrt{2} = c$$

Hence, the given chord is normal to the parabola $y^2 = 4ax$.

The coordinates of the points are $(am^2, -2am)$ i.e. $(2a, -2\sqrt{2}a)$.

Example 39 If the normal to a parabola $y^2 = 4ax$, makes an angle ϕ with the axis. Show that it will cut the curve again at an angle $\tan^{-1}\left(\frac{1}{2}\tan\phi\right)$.

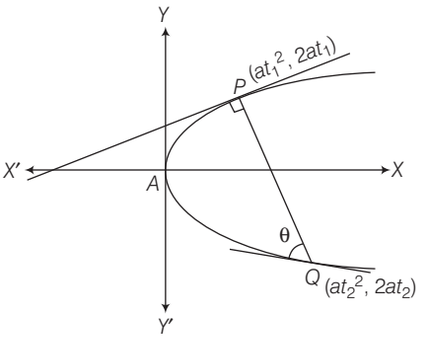
Sol. Let the normal at $P(at_1^2, 2at_1)$ be

$$y = -t_1 x + 2at_1 + at_1^3.$$

$\therefore \quad \tan\phi = -t_1 =$ slope of the normal, ...(i)

it meet the curve again Q say $(at_2^2, 2at_2)$.

$\therefore \quad t_2 = -t_1 - \frac{2}{t_1}$ ...(ii)



Now, angle between the normal and parabola

= Angle between the normal and tangent at Q

(i.e. $t_2 y = x + at_2^2$)

If θ be the angle, then

$$\tan\theta = \frac{m_1 - m_2}{1 + m_1 m_2} = \frac{-t_1 - \frac{1}{t_2}}{1 + (-t_1)\left(\frac{1}{t_2}\right)} = -\frac{t_1 t_2 + 1}{t_2 - t_1}$$

$$= -\frac{t_1\left(-t_1 - \frac{2}{t_1}\right) + 1}{-t_1 - \frac{2}{t_1} - t_1} \quad \text{[from Eq. (ii)]}$$

$$= -\frac{-t_1^2 - 1}{-2\left(\frac{1 + t_1^2}{t_1}\right)} = -\frac{t_1}{2}$$

$$= \frac{\tan\phi}{2} \quad \text{[from Eq. (i)]}$$

$\therefore \quad \theta = \tan^{-1}\left(\frac{1}{2}\tan\phi\right)$

Example 40 P***rove*** that the normal chord to a parabola $y^2 = 4ax$ at the point whose ordinate is equal to abscissa subtends a right angle at the focus.

Sol. Let the normal at $P(at_1^2, 2at_1)$ meet the curve at $Q(at_2^2, 2at_2)$.

$\therefore \quad PQ$ is a normal chord

and $t_2 = -t_1 - \frac{2}{t_1}$. ...(i)

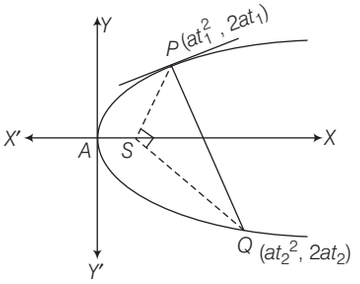
By given condition, $2at_1 = at_1^2$

$\therefore \quad t_1 = 2$ from Eq. (i), $t_2 = -3$

then, $P(4a, 4a)$ and $Q(9a, -6a)$

but focus $S(a, 0)$.

$\therefore \quad$ Slope of $SP = \frac{4a - 0}{4a - a} = \frac{4a}{3a} = \frac{4}{3}$



and slope of $SQ = \dfrac{-6a-0}{9a-a} = -\dfrac{6a}{8a} = -\dfrac{3}{4}$

$\because$ Slope of $SP \times$ Slope of $SQ = \dfrac{4}{3} \times -\dfrac{3}{4} = -1$

$\therefore \quad \angle PSQ = \pi/2$

i.e. PQ subtends a right angle at the focus S.

Example 41 If the normal to the parabola $y^2 = 4ax$ at point t_1 cuts the parabola again at point t_2, prove that $t_2^2 = 8$.

Sol. A normal at point t_1 cuts the parabola again at t_2. Then,

$$t_2 = -t_1 - \frac{2}{t_1} \Rightarrow t_1^2 + t_1 t_2 + 2 = 0$$

Since, t_1 is real , so $(t_2)^2 - 4 \cdot 1 \cdot 2 \geq 0$

$\Rightarrow \quad t_2^2 \geq 8$

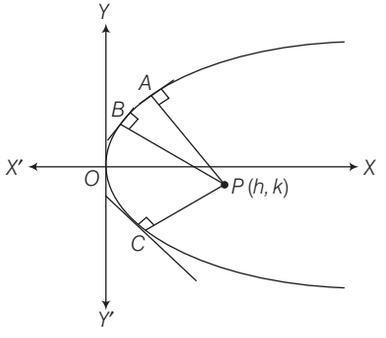
Co-normal Points

In general three normals can be drawn from a point to a parabola and their feet, points where they meet the parabola are called conormal points.

Let $P(h, k)$ be any given point and $y^2 = 4ax$ be a parabola.

The equation of any normal to $y^2 = 4ax$ is

$$y = mx - 2am - am^3$$



If it passes through (h, k), then

$$k = mh - 2am - am^3$$

$\Rightarrow \quad am^3 + m(2a - h) + k = 0 \qquad ...(i)$

This is a cubic equation in m, so it has three roots, say m_1, m_2 and m_3.

$\therefore \quad m_1 + m_2 + m_3 = 0,$

$$m_1 m_2 + m_2 m_3 + m_3 m_1 = \frac{(2a-h)}{a},$$

$$m_1 m_2 m_3 = -\frac{k}{a} \qquad ...(ii)$$

Hence, for any given point $P(h, k)$, Eq. (i) has three real or imaginary roots. Corresponding to each of these three roots, we have one normal passing through $P(h, k)$. Hence, in total, we have three normals PA, PB and PC drawn through P to the parabola.

Points A, B, C in which the three normals from $P(h, k)$ meet the parabola are **called co-normal points.**

Corollary 1 *The algebraic sum of the slopes of three concurrent normals is zero. This follows from Eq.* (ii).

Corollary 2 *The algebraic sum of ordinates of the feets of three normals drawn to a parabola from a given point is zero.*

Let the ordinates of A, B, C be y_1, y_2, y_3 respectively, then

$$y_1 = -2am_1, y_2 = -2am_2 \text{ and } y_3 = -2am_3$$

$\therefore$ Algebraic sum of these ordinates is

$$\begin{aligned} y_1 + y_2 + y_3 &= -2am_1 - 2am_2 - 2am_3 \\ &= -2a(m_1 + m_2 + m_3) \\ &= -2a \times 0 \qquad \text{[from Eq. (ii)]} \\ &= 0 \end{aligned}$$

Corollary 3 *If three normals drawn to any parabola $y^2 = 4ax$ from a given point (h, k) be real then $h > 2a$.*

When normals are real, then all the three roots of Eq. (i) are real and in that case

$$m_1^2 + m_2^2 + m_3^2 > 0 \qquad \text{(for any values of } m_1, m_2, m_3)$$

$\Rightarrow \quad (m_1 + m_2 + m_3)^2 - 2 \qquad (m_1 m_2 + m_2 m_3 + m_3 m_1) > 0$

$\Rightarrow \quad (0)^2 - \dfrac{2(2a-h)}{a} > 0 \Rightarrow h - 2a > 0$

$\therefore \quad h > 2a$

Remark

For $a = 1$ normals drawn to the parabola $y^2 = 4x$ from any point (h, k) are real, if $h > 2$.

Corollary 4 *If three normals drawn to any parabola $y^2 = 4ax$ from a given point (h, k) be real and distinct, then $27ak^2 < 4(h - 2a)^3$*

Let $\quad f(m) = am^3 + m(2a - h) + k$

$\therefore \quad f'(m) = 3am^2 + (2a - h)$

Two distinct roots of $f'(m) = 0$ are

$$\alpha = \sqrt{\left(\frac{h-2a}{3a}\right)} \quad \text{and} \quad \beta = -\sqrt{\left(\frac{h-2a}{3a}\right)},$$

Now, $f(\alpha)\, f(\beta) < 0 \Rightarrow f(\alpha)\, f(-\alpha) < 0$

$\Rightarrow \quad (a\alpha^3 + \alpha(2a-h) + k)(-a\alpha^3 - \alpha(2a-h) + k) < 0$

$\Rightarrow \quad k^2 - (a\alpha^2 + (2a-h))^2 \alpha^2 < 0$

$\Rightarrow \quad k^2 - \left(\frac{h-2a}{3} + (2a-h)\right)^2 \frac{(h-2a)}{3a} < 0$

$\Rightarrow \quad k^2 - \left(\frac{4a-2h}{3}\right)^2 \left(\frac{h-2a}{3a}\right) < 0$

$\Rightarrow \quad k^2 - \frac{4(h-2a)^3}{27a} < 0 \Rightarrow 27ak^2 - 4(h-2a)^3 < 0$

$\therefore \quad 27ak^2 < 4(h-2a)^3$

Corollary 5 *The centroid of the triangle formed by the feet of the three normals lies on the axis of the parabola.*

If $A(x_1, y_1)$, $B(x_2, y_2)$ and $C(x_3, y_3)$ be vertices of ΔABC, then its centroid is

$$\left(\frac{x_1 + x_2 + x_3}{3}, \frac{y_1 + y_2 + y_3}{3}\right) = \left(\frac{x_1 + x_2 + x_3}{3}, 0\right).$$

Since, $y_1 + y_2 + y_3 = 0$ (from corollary 2). Hence, the centroid lies on the X-axis OX, which is the axis of the parabola also.

Now, $\frac{x_1 + x_2 + x_3}{3} = \frac{1}{3}(am_1^2 + am_2^2 + am_3^2)$

$$= \frac{a}{3}(m_1^2 + m_2^2 + m_3^2)$$

$$= \frac{a}{3}\{(m_1 + m_2 + m_3)^2 - 2(m_1m_2 + m_2m_3 + m_3m_1)\}$$

$$= \frac{a}{3}\left[(0)^2 - 2\left\{\frac{2a-h}{a}\right\}\right] = \frac{2h-4a}{3}$$

$\therefore$ Centroid of ΔABC is $\left(\frac{2h-4a}{3}, 0\right)$.

Example 42 *Show that the locus of points such that two of the three normals drawn from them to the parabola* $y^2 = 4ax$ *coincide is* $27ay^2 = 4(x-2a)^3$.

Sol. Let (h, k) be the point of intersection of three normals to the parabola $y^2 = 4ax$. The equation of any normal to $y^2 = 4ax$ is

$$y = mx - 2am - am^3$$

If it passes through (h, k), then

$$k = mh - 2am - am^3$$

$$\Rightarrow \quad am^3 + m(2a-h) + k = 0 \qquad \ldots(i)$$

Let the roots of Eq. (i) be m_1, m_2 and m_3.

Then, from Eq. (i), $m_1 + m_2 + m_3 = 0$ ...(ii)

$$m_1m_2 + m_2m_3 + m_3m_1 = \frac{(2a-h)}{a} \qquad \ldots(iii)$$

and $$m_1m_2m_3 = -\frac{k}{a} \qquad \ldots(iv)$$

But here, two of the three normals are given to be coincident i.e. $m_1 = m_2$.

Putting $m_1 = m_2$ in Eqs. (ii) and (iv), we get

$$2m_1 + m_3 = 0 \qquad \ldots(v)$$

and $$m_1^2 m_3 = -\frac{k}{a} \qquad \ldots(vi)$$

Putting $m_3 = -2m_1$ from Eq. (v) in Eq. (vi), we get

$$-2m_1^3 = -\frac{k}{a}$$

$$\Rightarrow \quad m_1^3 = \frac{k}{2a}$$

Since, m_1 is a root of Eq. (i).

$\therefore \quad am_1^3 + m_1(2a-h) + k = 0$

$$\Rightarrow \quad a\left(\frac{k}{2a}\right) + \left(\frac{k}{2a}\right)^{1/3}(2a-h) + k = 0$$

$$\left[\text{putting } m_1 = \left(\frac{k}{2a}\right)^{1/3}\right]$$

$$\Rightarrow \quad \left(\frac{k}{2a}\right)^{1/3}(2a-h) = -\frac{3k}{2}$$

$$\Rightarrow \quad \frac{k}{2a}(2a-h)^3 = -\frac{27k^3}{8}$$

$$\Rightarrow \quad 27ak^2 = 4(h-2a)^3$$

Hence, the locus of (h, k) is

$$27ay^2 = 4(x-2a)^3.$$

Example 43 *Find the locus of the point through which pass three normals to the parabola* $y^2 = 4ax$ *such that two of them make angles* α *and* β *respectively with the axis such that* $\tan\alpha \tan\beta = 2$.

Sol. Let (h, k) be the point of intersection of three normals to the parabola $y^2 = 4ax$.

The equation of any normal to $y^2 = 4ax$ is

$$y = mx - 2am - am^3$$

If it passes through (h_1, k), then

$$k = mh - 2am - am^3$$

$$\Rightarrow \quad am^3 + m(2a-h) + k = 0 \qquad \ldots(i)$$

Let roots of Eq. (i) be m_1, m_2, m_3 then from Eq. (i)

$$m_1m_2m_3 = -\frac{k}{a} \quad ...(ii)$$

Also $m_1 = \tan\alpha$, $m_2 = \tan\beta$ and $\tan\alpha \tan\beta = 2$

$$\therefore \quad m_1m_2 = 2 \quad ...(iii)$$

From Eqs. (ii) and (iii), $2m_3 = -\frac{k}{a}$

or $$m_3 = -\frac{k}{2a}$$

Which being a root of Eq. (i) must satisfy it

i.e. $$am_3^3 + m_3(2a - h) + k = 0$$

$$\Rightarrow \quad a\left(-\frac{k}{2a}\right)^3 - \frac{k}{2a}(2a - h) + k = 0$$

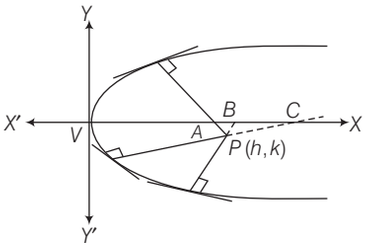
$$\Rightarrow \quad -\frac{k^3}{8a^2} - k + \frac{kh}{2a} + k = 0$$

$$\Rightarrow \quad k^2 - 4ah = 0$$

$\therefore$ Required locus of (h, k) is $y^2 - 4ax = 0$.

Example 44 If the three normals from a point to the parabola $y^2 = 4ax$ cut the axis in points whose distance from the vertex are in AP, show that the point lies on the curve $27ay^2 = 2(x - 2a)^3$.

Sol. Let (h, k) be the point of intersection of three normals to the parabola $y^2 = 4ax$. The equation of any normal to $y^2 = 4ax$ is $y = mx - 2am - am^3$ ...(i)



If it passes through (h, k) then

$$k = mh - 2am - am^3$$

$$\Rightarrow \quad am^3 + m(2a - h) + k = 0 \quad ...(ii)$$

Let roots of Eq. (ii) be m_1, m_2, m_3 then from Eq. (ii)

$$m_1 + m_2 + m_3 = 0 \quad ...(iii)$$

$$m_1m_2 + m_2m_3 + m_3m_1 = \frac{(2a - h)}{a} \quad ...(iv)$$

and $$m_1m_2m_3 = -\frac{k}{a} \quad ...(v)$$

Since, Eq. (i) cuts the axis of parabola *viz.* $y = 0$ at $(2a + am^2, 0)$.

$\therefore$ The normal through (h, k) cut the axis at $A(2a + am_1^2, 0)$, $B(2a + am_2^2, 0)$ and $C(2a + am_3^2, 0)$ and let $V(0, 0)$ be the vertex of the parabola $y^2 = 4ax$.

Then, $VA = 2a + am_1^2$, $VB = 2a + am_2^2$ and $VC = 2a + am_3^2$.

Given, VA, VB and VC are in AP.

$$\therefore \quad 2VB = VA + VC$$

$$\Rightarrow \quad 4a + 2am_2^2 = 2a + am_1^2 + 2a + am_3^2$$

$$\Rightarrow \quad 2m_2^2 = m_1^2 + m_3^2$$

$$\Rightarrow \quad 2m_2^2 = (m_1 + m_3)^2 - 2m_1m_3$$

$$\Rightarrow \quad 2m_2^2 = (m_1 + m_2 + m_3 - m_2)^2 - \frac{2m_1m_2m_3}{m_2}$$

$$\Rightarrow \quad 2m_2^2 = (0 - m_2)^2 - \frac{2}{m_2}\left(-\frac{k}{a}\right)$$

[from Eqs. (iii) and (v)]

$$\Rightarrow \quad m_2^3 = \frac{2k}{a} \quad ...(vi)$$

Now, from Eq. (iv), $m_2(m_1 + m_3) + m_3m_1 = \frac{(2a - h)}{a}$

$$\Rightarrow m_2(m_1 + m_2 + m_3 - m_2) + \frac{m_1m_2m_3}{m_2} = \frac{(2a - h)}{a}$$

$$\Rightarrow \quad m_2(0 - m_2) - \frac{k}{am_2} = \frac{(2a - h)}{a}$$

$$\Rightarrow \quad -am_2^3 - k = m_2(2a - h)$$

$$\Rightarrow \quad (-am_2^3 - k)^3 = m_2^3(2a - h)^3$$

$$\Rightarrow \quad (-2k - k)^3 = \frac{2k}{a}(2a - h)^3 \quad \text{[from Eq. (vi)]}$$

$$\Rightarrow \quad -27k^3 = -\frac{2k}{a}(h - 2a)^3$$

$$\Rightarrow \quad 27ak^2 = 2(h - 2a)^3$$

Hence, locus of (h, k) is

$$27ay^2 = 2(x - 2a)^3.$$

Example 45 The normals at P, Q, R on the parabola $y^2 = 4ax$ meet in a point on the line $y = k$. Prove that the sides of the ΔPQR touch the parabola $x^2 - 2ky = 0$.

Sol. Any normal to the parabola $y^2 = 4ax$ is

$$y = mx - 2am - am^3 \quad ...(i)$$

Also, any point on the line $y = k$ is (x_1, k).

If Eq. (i) passes through (x_1, k) then $k = mx_1 - 2am - am^3$

or $$am^3 + m(2a - x_1) + k = 0$$

If the roots of this equation are m_1, m_2, m_3 then we get

$$m_1 + m_2 + m_3 = 0 \quad ...(ii)$$

$$m_1m_2 + m_2m_3 + m_3m_1 = \frac{(2a - x_1)}{a} \quad ...(iii)$$

and $$m_1m_2m_3 = -\frac{k}{a} \quad ...(iv)$$

Also, coordinates of three points P, Q and R are $(am_1^2, -2am_1)(am_2^2, -2am_2)$ and $(am_3^2, -2am_3)$, respectively.

$\therefore$ The equation of the line PQ is

$$y-(-2am_1)=\frac{(-2am_2)-(-2am_1)}{am_2^2-am_1^2}(x-am_1^2)$$

$$\Rightarrow \quad y+2am_1=-\frac{2}{(m_2+m_1)}(x-am_1^2)$$

$$\Rightarrow \quad y(m_1+m_2)+2am_1(m_1+m_2)=-2x+2am_1^2$$

$$\Rightarrow \quad y(m_1+m_2)+2am_1m_2=-2x$$

$$\Rightarrow \quad y(m_1+m_2+m_3-m_3)+\frac{2am_1m_2m_3}{m_3}=-2x$$

$$\Rightarrow \quad y(0-m_3)-\frac{2k}{m_3}=-2x \qquad \text{[from Eqs. (ii) and (iv)]}$$

$$\Rightarrow \quad -ym_3^2-2k=-2m_3x$$

$$\Rightarrow \quad ym_3^2-2m_3x+2k=0,$$

which is a quadratic in m_3.

Since, PQ will touch it, then

$$B^2-4AC=0$$

$$\Rightarrow \quad (-2x)^2-4\cdot y\cdot 2k=0$$

$$\therefore \quad x^2-2ky=0$$

Example 46 ***Find the point on the axis of the parabola*** $3y^2+4y-6x+8=0$ ***from when three distinct normals can be drawn.***

Sol. Given, parabola is $3y^2+4y-6x+8=0$

$$\Rightarrow \quad 3\left(y^2+\frac{4}{3}y\right)=6x-8$$

$$\Rightarrow \quad 3\left\{\left(y+\frac{2}{3}\right)^2-\frac{4}{9}\right\}=6x-8$$

$$\Rightarrow \quad 3\left(y+\frac{2}{3}\right)^2=\left(6x-8+\frac{4}{3}\right)$$

$$\therefore \quad \left(y+\frac{2}{3}\right)^2=2\left(x-\frac{10}{9}\right)$$

Let $\quad y+\frac{2}{3}=Y,\ x-\frac{10}{9}=X$

Then, $\quad Y^2=2X$

Comparing with $\quad Y^2=4aX$

$$\therefore \quad a=\frac{1}{2}$$

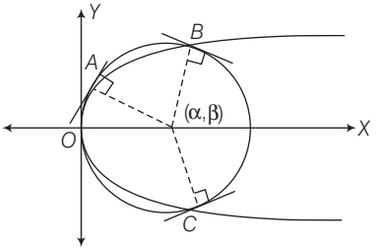
any point on the axis of parabola is $\left(x,-\frac{2}{3}\right)$

and $\quad X>2a \ \Rightarrow \ x-\frac{10}{9}>1$

$$\Rightarrow \quad x>\frac{19}{9}$$

Circle Through Co-normal Points

To find the equation of the circle passing through the three (conormal) points on the parabola, normals at which pass through a given point (α,β).



Let $A(am_1^2,-2am_1)$, $B(am_2^2,-2am_2)$ and $C(am_3^2,-2am_3)$ be the three points on the parabola

$$y^2=4ax$$

Since, point of intersection of normals is (α,β), then

$$am^3+(2a-\alpha)m+\beta=0 \qquad \ldots(E)$$

$$\therefore \quad m_1+m_2+m_3=0 \qquad \ldots(i)$$

$$m_1m_2+m_2m_3+m_3m_1=\frac{(2a-\alpha)}{a} \qquad \ldots(ii)$$

and $$m_1m_2m_3=-\frac{\beta}{a} \qquad \ldots(iii)$$

Let the equation of the circle through A, B, C be

$$x^2+y^2+2gx+2fy+c=0 \qquad \ldots(iv)$$

If the point $(am^2,-2am)$ lies on it, then

$$(am^2)^2+(-2am)^2+2g(am^2)+2f(-2am)+c=0$$

$$\Rightarrow \quad a^2m^4+(4a^2+2ag)m^2-4afm+c=0 \qquad \ldots(v)$$

This is a biquadratic equation in m. Hence, there are four values of m, say m_1, m_2, m_3 and m_4 such that the circle pass through the points.

$A(am_1^2,-2am_1), B(am_2^2,-2am_2), C(am_3^2,-2am_3)$ and $D(am_4^2,-2am_4)$.

$$\therefore \quad m_1+m_2+m_3+m_4=0 \qquad \ldots(F)$$

$$\Rightarrow \quad 0+m_4=0 \qquad \text{[from Eq. (i)]}$$

$$\Rightarrow \quad m_4=0$$

$$\therefore \quad (am_4^2,-2am_4)=(0,0)$$

Thus, the circle passes through the vertex of the parabola $y^2=4ax$ from Eq. (iv),

$$0+0+0+0+c=0$$

$$\therefore \quad c=0$$

From Eq. (v), $a^2m^4+(4a^2+2ag)m^2-4afm=0$

$$\Rightarrow \quad am^3+(4a+2g)m-4f=0 \qquad \ldots(vi)$$

Now, Eqs. (E) and (vi) are identical.

$$\therefore \quad 1 = \frac{4a + 2g}{2a - \alpha} = -\frac{4f}{\beta}$$

$$\therefore \quad 2g = -(2a + \alpha), 2f = -\beta/2$$

$\therefore$ The equation of the required circle is

$$x^2 + y^2 - (2a + \alpha)\, x - \frac{\beta}{2} y = 0$$

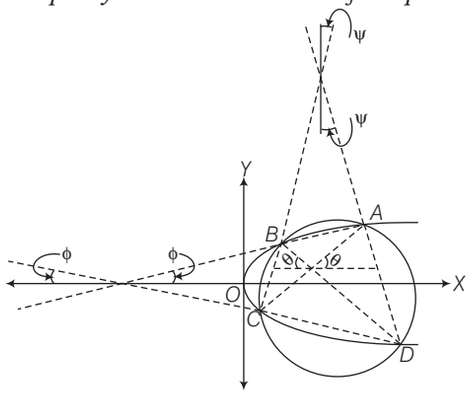
[from Eq. (iv)]

Corollary 1. *The algebraic sum of the ordinates of the four points of intersection of a circle and a parabola is zero.*

Sum of ordinates

$$= -2am_1 - 2am_2 - 2am_3 - 2am_4$$
$$= -2a(m_1 + m_2 + m_3 + m_4) \qquad \text{[from Eq. (F)]}$$
$$= -2a \times 0 = 0$$

Corollary 2. *The common chords of a circle and a parabola are in pairs equally inclined to the axis of the parabola.*



Let A, B, C, D be the points of intersection of the circle and the parabola with $A(am_1^2, -2am_1)$, $B(am_2^2, -2am_2)$ $C(am_3^2, -2am_3)$ and $D(am_4^2, -2am_4)$ then equation of AC and BD are

$$y(m_1 + m_3) = -2x - 2am_1m_3$$

and $\quad y(m_2 + m_4) = -2x - 2am_2m_4$, respectively.

$\therefore$ Slopes of the chords AC and BD are

$$-\frac{2}{m_1 + m_3} \text{ and } -\frac{2}{m_2 + m_4}, \text{ respectively.}$$

$$\therefore \quad \text{Slope of } AC = -\frac{2}{m_1 + m_3}$$
$$= \frac{2}{m_2 + m_4} \qquad [\because m_1 + m_2 + m_3 + m_4 = 0]$$
$$= -\left(-\frac{2}{m_2 + m_4}\right) = -\text{ Slope of } BD$$

$\therefore$ Their slopes are equal in magnitude and opposite in sign.

$\therefore$ The chords of AC and BD are equally inclined to the axis.

Remark

This is likewise true for the pairs of chords AB, CD and AD, BC.

Corollary 3. *The circle through conormal point passes through the vertex $(0, 0)$ of the parabola.*

Corollary 4. *The centroid of four points; in which a circle intersects a parabola, lies on the axis of the parabola.*

$$\text{Centroid} = \left(\frac{\sum_{i=1}^{4} am_i^2}{4}, \frac{\sum_{i=1}^{4}(-2am_i)}{4}\right)$$
$$= \left(\frac{a}{4}\{(\Sigma m_1)^2 - 2\Sigma m_1 m_2\}, -\frac{a}{2}(\Sigma m_1)\right)$$
$$= \left(\frac{a}{4}\left(0 - \frac{2(4a^2 + 2ag)}{a^2}\right), 0\right)$$
$$= (-2a - g, 0)$$

Here $y = 0$, which is axis of the parabola $y^2 = 4ax$.

Example 47 A circle cuts the parabola $y^2 = 4ax$ at right angles and passes through the focus, show that its centre lies on the curve $y^2(a + 2x) = a(a + 3x)^2$.

Sol. Let the circle $x^2 + y^2 + 2gx + 2fy + c = 0$ ...(i)

meet the parabola $y^2 = 4ax$ at any point $P(at^2, 2at)$ cutting it at right angles.

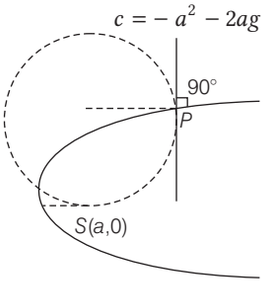
We have to find locus of centre of circle Eq. (i),

i.e. $(-g, -f)$

But given circle Eq. (i) passes through the focus $(a, 0)$, then

$$a^2 + 0 + 2ga + 0 + c = 0$$

$$\Rightarrow \quad c = -a^2 - 2ag \qquad \text{...(ii)}$$



Now, the circle and parabola intersect at $P(at^2, 2at)$ at right angles.

Since, tangent at $P(at^2, 2at)$ to the parabola $y^2 = 4ax$ is

$$ty = x + at^2$$

Hence, this tangent must pass through the centre $(-g, -f)$ of the circle

$$\therefore \quad -ft = -g + at^2$$

$$\Rightarrow \quad ft = g - at^2 \qquad \text{...(iii)}$$

Also the point $P(at^2, 2at)$ lies on the circle (i), then

$$a^2t^4 + 4a^2t^2 + 2agt^2 + 4aft + c = 0$$

Hence, from Eqs. (ii) and (iii) when we put values for c and ft.

$\therefore \quad a^2t^4 + 4a^2t^2 + 2agt^2 + 4ag - 4a^2t^2 - a^2 - 2ag = 0$

$\Rightarrow \quad a^2t^4 + 2agt^2 + 2ag - a^2 = 0$

$\Rightarrow \quad at^4 + 2gt^2 + 2g - a = 0$

$\Rightarrow \quad a(t^4 - 1) + 2g(t^2 + 1) = 0$

$\Rightarrow \quad (t^2 + 1)[a(t^2 - 1) + 2g] = 0 \quad$ But $\quad t^2 + 1 \neq 0$

$\Rightarrow \quad a(t^2 - 1) + 2g = 0 \quad \Rightarrow \quad t^2 = \dfrac{a - 2g}{a}$

Hence, from Eq. (iii),

$$f\sqrt{\left(\frac{a-2g}{a}\right)} = g - a\left(\frac{a-2g}{a}\right)$$

$\Rightarrow \quad f\sqrt{\left(\dfrac{a-2g}{a}\right)} = (3g - a)$

$\Rightarrow \quad f^2(a - 2g) = a(3g - a)^2$

$\Rightarrow \quad (-f)^2[a + 2(-g)] = a(a - 3g)^2$

$\Rightarrow \quad (-f)^2[a + 2(-g)] = a[a + 3(-g)]^2$

Hence, locus of the centre $(-g, -f)$ is the curve

$$y^2(a + 2x) = a(a + 3x)^2.$$

Exercise for Session 2

1. If $2x + y + \lambda = 0$ is a normal to the parabola $y^2 = -8x$, then the value of λ is

(a) -24 (b) -16 (c) -8 (d) 24

2. The slope of a chord of the parabola $y^2 = 4ax$ which is normal at one end and which subtends a right angle at the origin is

(a) $\dfrac{1}{\sqrt{2}}$ (b) $\sqrt{2}$ (c) $-\dfrac{1}{\sqrt{2}}$ (d) $-\sqrt{2}$

3. The common tangent to the parabola $y^2 = 4ax$ and $x^2 = 4ay$ is

(a) $x + y + a = 0$ (b) $x + y - a = 0$ (c) $x - y + a = 0$ (d) $x - y - a = 0$

4. The circle $x^2 + y^2 + 4\lambda x = 0$ which $\lambda \in R$ touches the parabola $y^2 = 8x$. The value of λ is given by

(a) $\lambda \in (0, \infty)$ (b) $\lambda \in (-\infty, 0)$ (c) $\lambda \in (1, \infty)$ (d) $\lambda \in (-\infty, 1)$

5. If the normals at two points P and Q of a parabola $y^2 = 4ax$ intersect at a third point R on the curve, then the product of ordinates of P and Q is

(a) $4a^2$ (b) $2a^2$ (c) $-4a^2$ (d) $8a^2$

6. The normals at three points P, Q, R of the parabola $y^2 = 4ax$ meet in (h, k). The centroid of ΔPQR lies on

(a) $x = 0$ (b) $y = 0$ (c) $x = -a$ (d) $y = a$

7. The set of points on the axis of the parabola $y^2 - 4x - 2y + 5 = 0$ from which all the three normals to the parabola are real, is

(a) $(\lambda, 0)\ ; \lambda > 1$ (b) $(\lambda, 1)\ ; \lambda > 3$ (c) $(\lambda, 2)\ ; \lambda > 6$ (d) $(\lambda, 3)\ ; \lambda > 8$

8. Prove that any three tangents to a parabola whose slopes are in harmonic progression enclose a triangle of constant area.

9. A chord of parabola $y^2 = 4ax$ subtends a right angle at the vertex. Find the locus of the point of intersection of tangents at its extremities.

10. Find the equation of the normal to the parabola $y^2 = 4x$ which is

(a) parallel to the line $y = 2x - 5$. (b) perpendicular to the line $2x + 6y + 5 = 0$.

11. The ordinates of points P and Q on the parabola $y^2 = 12x$ are in the ratio 1 : 2. Find the locus of the point of intersection of the normals to the parabola at P and Q.

12. The normals at P, Q, R on the parabola $y^2 = 4ax$ meet in a point on the line $y = c$. Prove that the sides of the ΔPQR touch the parabola $x^2 = 2cy$.

13. The normals are drawn from $(2\lambda, 0)$ to the parabola $y^2 = 4x$. Show that λ must be greater than 1. One normal is always the X-axis. Find λ for which the other two normals are perpendicular to each other.

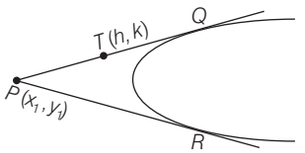
Session 3

Pair of Tangents $SS_1 = T^2$, Chord of Contact, Equation of the Chord Bisected at a Given Point, Diameter, Lengths of Tangent, Subtangent, Normal and Subnormal, Some Standard Properties of the Parabola, Reflection Property of a Parabola, Study of Parabola of the Form $(\alpha x^2 + \beta y)^2 + 2gx + 2fy + c = 0$

Pair of Tangents $SS_1 = T^2$

If $y_1^2 - 4ax_1 > 0$, then any point $P(x_1, y_1)$ lies outside the parabola and a pair of tangents PQ, PR can be drawn to it from P. We find their equation as follows.

Let $T(h, k)$ be any point on the pair of tangents PQ or PR drawn from any external point $P(x_1, y_1)$ to the parabola $y^2 = 4ax$.



Equation of PT is

$$y - y_1 = \frac{k - y_1}{h - x_1}(x - x_1)$$

$$\Rightarrow \quad y = \left(\frac{k - y_1}{h - x_1}\right)x + \left(\frac{hy_1 - kx_1}{h - x_1}\right)$$

which is tangent to the parabola

$$y^2 = 4ax$$

$$\therefore \quad c = \frac{a}{m}$$

$$\Rightarrow \quad cm = a \quad \Rightarrow \quad \left(\frac{hy_1 - kx_1}{h - x_1}\right)\left(\frac{k - y_1}{h - x_1}\right) = a$$

$$\Rightarrow \quad (k - y_1)(hy_1 - kx_1) = a(h - x_1)^2$$

$\therefore$ Locus of (h, k), equation of pair of tangents is

$$(y - y_1)(xy_1 - x_1y) = a(x - x_1)^2$$

$$\Rightarrow \quad (y^2 - 4ax)(y_1^2 - 4ax_1) = \{yy_1 - 2a(x + x_1)\}^2$$

$$\therefore \quad SS_1 = T^2$$

where $S = y^2 - 4ax, S_1 = y_1^2 - 4ax_1$

and $T = yy_1 - 2a(x + x_1)$.

Aliter :

Let the parabola be $y^2 = 4ax$ ...(i)

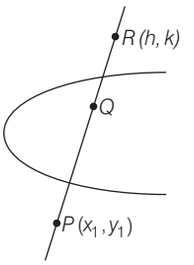
Let $P(x_1, y_1)$ be any point outside the parabola. Let a chord of the parabola through the point $P(x_1, y_1)$ cut the parabola at Q and let $R(h, k)$ be any arbitrary point on the line PQ (R inside or outside).

Let Q divide PR in the ratio $\lambda : 1$, then coordinates of Q are

$$\left(\frac{\lambda h + x_1}{\lambda + 1}, \frac{\lambda k + y_1}{\lambda + 1}\right) \qquad [\because PQ : QR = \lambda : 1]$$

Since, Q lies on parabola Eq. (i), then

$$\left(\frac{\lambda k + y_1}{\lambda + 1}\right)^2 = 4a\left(\frac{\lambda h + x_1}{\lambda + 1}\right)$$



$$\Rightarrow \quad (\lambda k + y_1)^2 - 4a(\lambda h + x_1)(\lambda + 1) = 0$$

$$\Rightarrow \quad (k^2 - 4ah)\lambda^2 + 2[ky_1 - 2a(h + x_1)]\lambda + (y_1^2 - 4ax_1) = 0 \quad ...(ii)$$

Line PR will become tangent to parabola Eq. (i), then roots of Eq. (ii) are equal

$$\therefore \quad 4[ky_1 - 2a(h + x_1)]^2 - 4(k^2 - 4ah)(y_1^2 - 4ax_1) = 0$$

$$\text{or} \quad \{ky_1 - 2a(h + x_1)\}^2 = (k^2 - 4ah)(y_1^2 - 4ax_1)$$

Hence, locus of $R(h, k)$ i.e. equation of pair of tangents from $P(x_1, y_1)$ is

$$\{yy_1 - 2a(x + x_1)\}^2 = (y^2 - 4ax)(y_1^2 - 4ax_1)$$

i.e. $$T^2 = SS_1 \quad \text{or} \quad SS_1 = T^2$$

Remark

$S = 0$ is the equation of the curve, S_1 is obtained from S by replacing x by x_1 and y by y_1 and $T = 0$ is the equation tangent at (x_1, y_1) to $S = 0$.

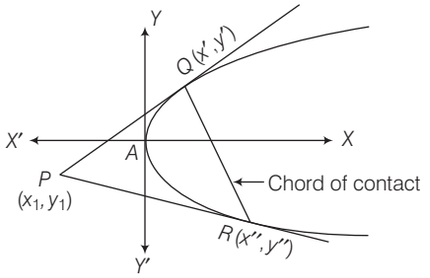
Chord of Contact

The chord joining the points of contact of two tangents drawn from an external point to a parabola is known as the chord of contact of tangents drawn from external point.

Theorem The chord of contact of tangents drawn from a point (x_1, y_1) to the parabola $y^2 = 4ax$ is

$$yy_1 = 2a(x + x_1).$$

Proof Let PQ and PR be tangents to the parabola $y^2 = 4ax$ drawn from any external point $P(x_1, y_1)$, then QR is called **chord of contact** of the parabola $y^2 = 4ax$.



Let $Q \equiv (x', y')$ and $R \equiv (x'', y'')$

Equation of tangent PQ is

$$yy' = 2a(x + x') \quad \ldots(i)$$

and equation of tangent PR is

$$yy'' = 2a(x + x'') \quad \ldots(ii)$$

Since, lines Eqs. (i) and (ii) pass through (x_1, y_1), then

$$y_1y' = 2a(x_1 + x') \text{ and } y_1y'' = 2a(x_1 + x'')$$

Hence, it is clear $Q(x', y')$ and $R(x'', y'')$ lie on

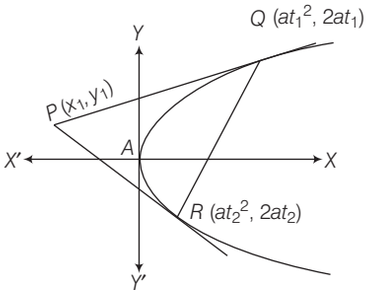
$$yy_1 = 2a(x + x_1)$$

which is **chord of contact** QR.

Example 48 Tangents are drawn from the point (x_1, y_1) to the parabola $y^2 = 4ax$, show that the length of their chord of contact is $\frac{1}{|a|}\sqrt{(y_1^2 - 4ax_1)(y_1^2 + 4a^2)}$.

Sol. Given parabola is

$$y^2 = 4ax \quad \ldots(i)$$



Let $P \equiv (x_1, y_1)$

and the tangents from P touch the parabola at $Q(at_1^2, 2at_1)$ and $R(at_2^2, 2at_2)$ then P is the point of intersection of tangents.

$\therefore \quad x_1 = at_1t_2$ and $y_1 = a(t_1 + t_2)$

$\Rightarrow \quad t_1t_2 = \frac{x_1}{a}$ and $t_1 + t_2 = \frac{y_1}{a}$ ...(ii)

Now, $QR = \sqrt{(at_1^2 - at_2^2)^2 + (2at_1 - 2at_2)^2}$

$= \sqrt{a^2(t_1 - t_2)^2\,[(t_1 + t_2)^2 + 4]}$

$= |a|\,|t_1 - t_2|\sqrt{\{(t_1 + t_2)^2 + 4\}}$

$= |a|\sqrt{\{(t_1 + t_2)^2 - 4t_1t_2\}}\sqrt{\{(t_1 + t_2)^2 + 4\}}$

$= |a|\sqrt{\left(\frac{y_1^2}{a^2} - \frac{4x_1}{a}\right)} \cdot \sqrt{\left(\frac{y_1^2}{a^2} + 4\right)}$

[from Eq. (ii)]

$= |a|\frac{\sqrt{(y_1^2 - 4ax_1)}}{|a|} \cdot \frac{\sqrt{(y_1^2 + 4a^2)}}{|a|}$

$= \frac{1}{|a|}\sqrt{(y_1^2 - 4ax_1)(y_1^2 + 4a^2)}$

Aliter :

Equation of QR is $yy_1 = 2a(x + x_1)$

$\Rightarrow \quad x = \frac{yy_1 - 2ax_1}{2a}$

The ordinates of Q and R are the roots of the equation

$$y^2 = 4a\left(\frac{yy_1 - 2ax_1}{2a}\right)$$

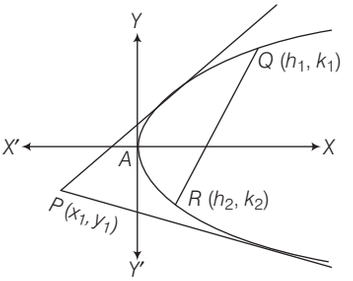
$\Rightarrow \quad y^2 = 2(yy_1 - 2ax_1)$ ... (i)

$\Rightarrow \quad y^2 - 2yy_1 + 4ax_1 = 0$

$\therefore \quad k_1 + k_2 = 2y_1$ and $k_1k = 4ax_1$

$\therefore \quad (k_2 - k_1) = \sqrt{(k_1 + k_2)^2 - 4k_1k_2}$

$= \sqrt{(4y_1^2 - 16ax_1)} = 2\sqrt{(y_1^2 - 4ax_1)}$ ...(ii)



Since, $Q(h_1, k_1)$ and $R(h_2, k_2)$ lie on the parabola $y^2 = 4ax$, therefore

$$k_1^2 = 4ah_1 \quad \text{and} \quad k_2^2 = 4ah_2$$

$\Rightarrow \quad k_2^2 - k_1^2 = 4a(h_2 - h_1)$

$(k_2 + k_1)(k_2 - k_1) = 4a(h_2 - h_1)$

$$\Rightarrow \quad 2y_1(k_2 - k_1) = 4a(h_2 - h_1)$$

$$\Rightarrow \quad (h_2 - h_1) = \frac{y_1(k_2 - k_1)}{2a} \quad \ldots(iii)$$

Now, $QR = \sqrt{(k_2 - k_1)^2 + (h_2 - h_1)^2}$

$$= \sqrt{(k_2 - k_1)^2 + \frac{y_1^2 (k_2 - k_1)^2}{4a^2}} \quad \text{[from Eq. (iii)]}$$

$$= \frac{(k_2 - k_1)}{2|a|}\sqrt{(y_1^2 + 4a^2)}$$

$$= \frac{2\sqrt{(y_1^2 - 4ax_1)}}{2|a|}\sqrt{(y_1^2 + 4a^2)} \quad \text{[from Eq. (ii)]}$$

$$= \frac{1}{|a|}\sqrt{(y_1^2 - 4ax_1)(y_1^2 + 4a^2)}$$

Example 49 Prove that the area of the triangle formed by the tangents drawn from (x_1, y_1) to $y^2 = 4ax$ and their chord of contact is $(y_1^2 - 4ax_1)^{3/2}/2a$.

Sol. Equation of QR (chord of contact) is

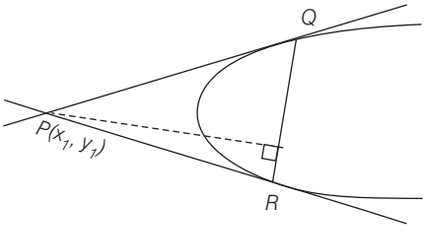
$$yy_1 = 2a(x + x_1)$$

$$\Rightarrow \quad yy_1 - 2a(x + x_1) = 0$$

$\because$ PM = Length of perpendicular from $P(x_1, y_1)$ on QR

$$= \frac{|y_1 y_1 - 2a(x_1 + x_1)|}{\sqrt{(y_1^2 + 4a^2)}} = \frac{|(y_1^2 - 4ax_1)|}{\sqrt{(y_1^2 + 4a^2)}}$$

[Since, $P(x_1, y_1)$ lies outside the parabola. So, $y_1^2 - 4ax_1 > 0$]



Now, area of $\Delta PQR = \frac{1}{2} QR \cdot PM$

$$= \frac{1}{2}\frac{1}{|a|}\sqrt{(y_1^2 - 4ax_1)(y_1^2 + 4a^2)}\,\frac{(y_1^2 - 4ax_1)}{\sqrt{(y_1^2 + 4a^2)}}$$

$$= (y_1^2 - 4ax_1)^{3/2}/2a, \text{ if } a > 0$$

Equation of the Chord Bisected at a Given Point

Theorem The equation of the chord of the parabola $y^2 = 4ax$ which is bisected at (x_1, y_1) is

$$yy_1 - 2a(x + x_1) = y_1^2 - 4ax_1$$

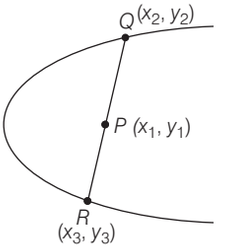
or $$T = S_1,$$

where, $T = yy_1 - 2a(x + x_1)$ and $S_1 = y_1^2 - 4ax_1$.

Proof Since, equation of the parabola is

$$y^2 = 4ax \quad \ldots(i)$$

Let QR be the chord of the parabola whose mid-point is $P(x_1, y_1)$.



Since, Q and R lie on parabola (i),

$$y_2^2 = 4ax_2 \text{ and } y_3^2 = 4ax_3$$

$$\therefore \quad y_3^2 - y_2^2 = 4a(x_3 - x_2)$$

$$\Rightarrow \quad \frac{y_3 - y_2}{x_3 - x_2} = \frac{4a}{y_3 + y_2}$$

$$= \frac{4a}{2y_1} \quad [\because P(x_1, y_1) \text{ is mid-point of } QR]$$

$$\therefore \quad \frac{y_3 - y_2}{x_3 - x_2} = \frac{2a}{y_1} = \text{ Slope of } QR$$

Equation of QR is $y - y_1 = \frac{2a}{y_1}(x - x_1)$

$$\Rightarrow \quad yy_1 - y_1^2 = 2ax - 2ax_1$$

$$\Rightarrow \quad yy_1 - 2a(x + x_1) = y_1^2 - 4ax_1$$

[subtracting $2ax_1$ from both sides]

$$\therefore \quad T = S_1,$$

where $T = yy_1 - 2a(x + x_1)$ and $S_1 = y_1^2 - 4ax_1$.

Example 50 Find the locus of the mid-points of the chords of the parabola $y^2 = 4ax$ which subtend a right angle at the vertex of the parabola.

Sol. Let $P(h, k)$ be the mid-point of a chord QR of the parabola $y^2 = 4ax$ then equation of chord QR is

$$T = S_1$$

or $$yk - 2a(x + h) = k^2 - 4ah$$

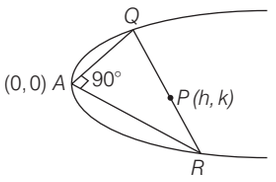
$$\Rightarrow \quad yk - 2ax = k^2 - 2ah \quad \ldots(i)$$

If A is the vertex of the parabola. For combined equation of AQ and AR making homogeneous of $y^2 = 4ax$ with the help of Eq. (i).

$$\therefore \quad y^2 = 4ax$$

$$\Rightarrow \quad y^2 = 4ax\left(\frac{yk - 2ax}{k^2 - 2ah}\right)$$

$$\Rightarrow \quad y^2(k^2 - 2ah) - 4akxy + 8a^2x^2 = 0$$



Since, $\angle QAR = 90°$

$\therefore$ Coefficient of x^2 + Coefficient of $y^2 = 0$

$$k^2 - 2ah + 8a^2 = 0$$

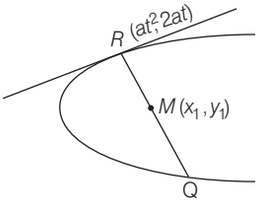
Hence, the locus of $P(h, k)$ is $y^2 - 2ax + 8a^2 = 0$.

Example 51 Show that the locus of the middle points of normal chords of the parabola $y^2 = 4ax$ is

$$y^4 - 2a(x - 2a)y^2 + 8a^4 = 0.$$

Sol. Equation of the normal chord at any point $(at^2, 2at)$ of the parabola $y^2 = 4ax$ is

$$y + tx = 2at + at^3 \qquad \ldots(i)$$



But if $M(x_1, y_1)$ be its middle point its equation must be also

$$T = S_1$$

$$\Rightarrow \quad yy_1 - 2a(x + x_1) = y_1^2 - 4ax_1$$

$$\Rightarrow \quad yy_1 - 2ax = y_1^2 - 2ax_1 \qquad \ldots(ii)$$

$\because$ From Eqs. (i) and (ii) are identical, comparing, them

$$\frac{1}{y_1} = \frac{t}{-2a} = \frac{2at + at^3}{y_1^2 - 2ax_1}$$

From first two relations, $t = -\dfrac{2a}{y_1}$ ...(iii)

From last two relations, $\dfrac{t}{-2a} = \dfrac{2at + at^3}{y_1^2 - 2ax_1}$

$$\Rightarrow \quad \frac{y_1^2 - 2ax_1}{-2a} = 2a + at^2$$

$$\Rightarrow \quad \frac{y_1^2 - 2ax_1}{-2a} = 2a + a\left(\frac{-2a}{y_1}\right)^2 \qquad \text{[from Eq. (iii)]}$$

$$\Rightarrow \quad \frac{y_1^2 - 2ax_1}{-2a} = \frac{2ay_1^2 + 4a^3}{y_1^2}$$

$$\Rightarrow \quad y_1^4 - 2ax_1y_1^2 = -4a^2y_1^2 - 8a^4$$

$$\Rightarrow \quad y_1^4 - 2a(x_1 - 2a)y_1^2 + 8a^4 = 0$$

Hence, the locus of middle point (x_1, y_1) is

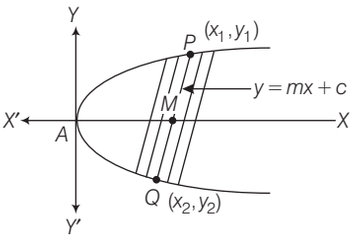
$$y^4 - 2a(x - 2a)y^2 + 8a^4 = 0.$$

Diameter

The locus of the middle points of a system of parallel chords is called a diameter and in case of a parabola this diameter is shown to be a straight line which is parallel to the axis of the parabola.

Theorem The equation of the diameter bisecting chords of slope m of the parabola $y^2 = 4ax$ is $y = \dfrac{2a}{m}$.

Proof Let $y = mx + c$ be system of parallel chords to $y^2 = 4ax$ for different chords c varies, m remains constant. Let the extremities of any chord PQ of the set be $P(x_1, y_1)$ and $Q(x_2, y_2)$ and let its middle point be $M(h, k)$.



On solving equations

$$y^2 = 4ax \quad \text{and} \quad y = mx + c.$$

$$\therefore \quad y^2 = 4a\left(\frac{y - c}{m}\right)$$

$$\therefore \quad my^2 - 4ay + 4ac = 0$$

$$\therefore \quad y_1 + y_2 = \frac{4a}{m} \quad \text{or} \quad \frac{y_1 + y_2}{2} = \frac{2a}{m}$$

[$\because (h, k)$ is the mid-point of PQ]

Hence, locus of $M(h, k)$ is $y = \dfrac{2a}{m}$.

Aliter :

Let (h, k) be the middle point of the chord $y = mx + c$ of the parabola $y^2 = 4ax$ then

$$T = S_1 \Rightarrow ky - 2a(x + h) = k^2 - 4ah$$

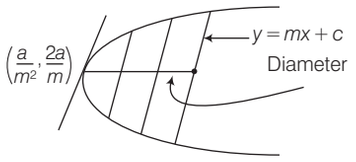
$$\text{slope} = \frac{2a}{k} = m \Rightarrow k = \frac{2a}{m}$$

Hence, locus of the mid-point is $y = \dfrac{2a}{m}$.

Remarks

1. The point in which any diameter meets the curve is called the extremity of the diameter.
2. Any line which is parallel to the axis of the parabola drawn through any point on the parabola is called diameter and its equation is y-coordinate of that point.
   If point on diameter (x_1, y_1), then diameter is $y = y_1$.

Corollary 1. *The tangent at the extremity of a diameter of a parabola is parallel to the system of chords it bisects.*



Let $y = mx + c$ (c variable) represents the system of parallel chords, then the equation of diameter of $y^2 = 4ax$ is $y = \frac{2a}{m}$.

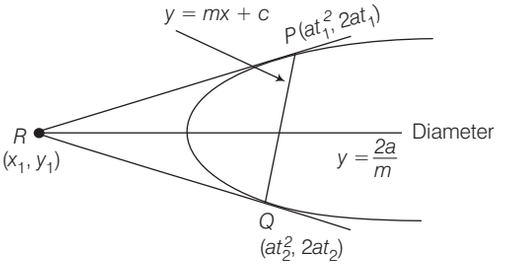
The diameter meets the parabola $y^2 = 4ax$ at $\left(\frac{a}{m^2}, \frac{2a}{m}\right)$

and tangent is $y = mx + \frac{a}{m}$ which is parallel to $y = mx + c$.

Corollary 2. *Tangents at the end of any chord meet on the diameter which bisects the chords.*

If extremities of the chord be $P(at_1^2, 2at_1)$ *and* $Q(at_2^2, 2at_2)$ *then its slope*

$$m = \frac{2at_2 - 2at_1}{at_2^2 - at_1^2} \implies m = \frac{2}{(t_2 + t_1)}.$$



∴ Equation of diameter is

$$y = 2a/m \implies y = a(t_1 + t_2) \quad \ldots(i)$$

Now, tangents at $P(at_1^2, 2at_1)$ and $Q(at_2^2, 2at_2)$ meet at a point $[at_1t_2, a(t_1 + t_2)]$ which lies on Eq. (i).

Aliter

Let equation of any chord PQ be $y = mx + c$.

If tangents at P and Q meet at $R(x_1, y_1)$, then PQ is the chord of contact with respect to $R(x_1, y_1)$.

∴ Equation of PQ is

$$yy_1 = 2x(x + x_1) \quad \text{or} \quad y = \frac{2a}{y_1}x + \frac{2ax_1}{y_1}$$

which is identical to $y = mx + c$

$$m = \frac{2a}{y_1} \quad \text{or} \quad y_1 = \frac{2a}{m}.$$

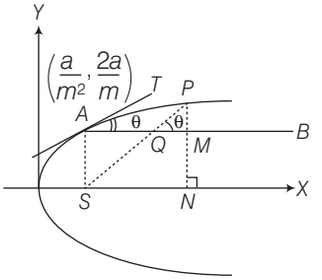
Hence, locus of $R(x_1, y_1)$ is $y = \frac{2a}{m}$, which bisects the chord PQ.

Corollary 3. *To find the equation of a parabola when the axes are any diameter and the tangent to the parabola at the point where this diameter meets the curve.*

Let the equation of the parabola be

$$y^2 = 4ax \quad \ldots(i)$$

Let AB be the diameter of the parabola Eq. (i), then its equation is $y = \frac{2a}{m}$



Since, A is the extremity of the diameter

∴ Coordinates of A is $\left(\frac{a}{m^2}, \frac{2a}{m}\right)$

where, $m = \tan\theta$

then, the equation of tangent AT at A is

$$y = mx + \frac{a}{m}.$$

Now, let P be any point on the parabola Eq. (i), whose coordinates referred to Vx and Vy are (x, y) and referred to diameter AB and tangent AT are (X, Y).

then $X = AQ$ and $Y = QP$ [since, $PQ \| AT$]

Now, $VN = VL + LN = VL + AM = VL + AQ + QM$

$$= \frac{a}{m^2} + X + QP\cos\theta$$

or $$x = \frac{a}{m^2} + X + Y\cos\theta \quad \ldots(ii)$$

and $PN = PM + MN = PM + AL$

$$= QP\sin\theta + \frac{2a}{m}$$

∴ $$y = Y\sin\theta + \frac{2a}{m} \quad \ldots(iii)$$

From Eqs. (ii) and (iii) coordinates of P are

$$\left(\frac{a}{m^2} + X + Y\cos\theta, Y\sin\theta + \frac{2a}{m}\right)$$

Now, P lies on Eq. (i).

∴ $$\left(Y\sin\theta + \frac{2a}{m}\right)^2 = 4a\left(\frac{a}{m^2} + X + Y\cos\theta\right)$$

$$\Rightarrow \quad Y^2 \sin^2\theta + \frac{4a^2}{m^2} + \frac{4a}{m} Y \sin\theta$$

$$= \frac{4a^2}{m^2} + 4aX + 4aY\cos\theta$$

$$\Rightarrow \quad Y^2 \sin^2\theta + 4a^2 \cot^2\theta + 4a\cos\theta Y$$

$$= 4a^2 \cot^2\theta + 4aX + 4aY\cos\theta \quad [\because m = \tan\theta]$$

$$\Rightarrow \quad Y^2 \sin^2\theta = 4aX$$

$$\therefore \quad Y^2 = (4a\,\text{cosec}^2\theta)\, X,$$

which is the required parabola referred to diameter and tangent at the extremity of the diameter as axes.

Remark

The quantity $4a\,\text{cosec}^2\theta$ is called the parameter of the diameter AQ. It is equal to length of the chord which is parallel to AT and passes through the focus.

i.e. $a\,\text{cosec}^2\theta = a(1 + \cot^2\theta) = a + a\cot^2\theta$

$$= a + \frac{a}{m^2}$$

$$= a + VL = SP$$

But length of focal chord if $P(at^2, 2at)$ is $[\because S(a,0)]\ a\left(t + \frac{1}{t}\right)^2$.

$$\therefore \quad \tan\theta = \frac{2at - 0}{at^2 - a} = \frac{2t}{t^2 - 1} \text{ or } t - \frac{1}{t} = 2\cot\theta$$

$$\therefore \quad a\left(t + \frac{1}{t}\right)^2 = a\left\{\left(t - \frac{1}{t}\right)^2 + 4\right\}$$

$$= a\{(2\cot\theta)^2 + 4\}$$

$$= 4a\,\text{cosec}^2\theta = 4 \cdot SP$$

Example 52 If the diameter through any point P of a parabola meets any chord in A and the tangent at the end of the chord meets the diameter in B and C, then prove that $PA^2 = PB \cdot PC$.

Sol. The equation of the parabola referred to the diameter through P and tangent at P as axes is

$$y^2 = 4\lambda x \quad \ldots(i)$$

where, $\lambda = a\,\text{cosec}^2\theta$ [from previous corollary]

Let QR be any chord of the parabola Eq. (i). Let the extremities Q and R be $(\lambda t_1^2, 2\lambda t_1)$ and $(\lambda t_2^2, 2\lambda t_2)$.

Then, the equation of QR is

$$y(t_1 + t_2) - 2x - 2\lambda t_1 t_2 = 0 \quad \ldots(ii)$$

It meets the diameter through P i.e. X-axis or $y = 0$, then Eq. (ii) reduces

$$0 - 2x - 2\lambda\, t_1 t_2 = 0$$

$$\Rightarrow \quad x = -\lambda t_1 t_2 = PA$$

Now, tangent at Q is $t_1 y = x + \lambda t_1^2 \quad \ldots(iii)$

It meets the diameter through P i.e. X-axis or $y = 0$, then Eq. (iii) reduces

$$0 = x + \lambda t_1^2$$

$$\Rightarrow \quad x = -\lambda t_1^2 = PB \quad \ldots(iv)$$

Similarly, $-\lambda t_2^2 = PC \quad \ldots(v)$

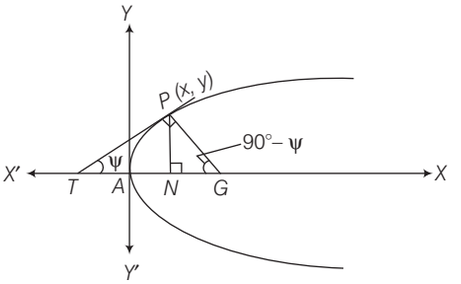
$$\therefore \quad (PA)^2 = (-\lambda t_1 t_2)^2 = \lambda^2 t_1^2 t_2^2$$

$$= (-\lambda t_1^2)(-\lambda t_2^2) \quad \text{[from Eqs. (iv) and (v)]}$$

$$= PB \cdot PC$$

Lengths of Tangent, Subtangent, Normal and Subnormal

Let the parabola $y^2 = 4ax$. Let the tangent and normal at $P(x, y)$ meet the axis of parabola at T and G respectively and let tangent at $P(x, y)$ makes angle ψ with the positive direction of X-axis.



Then, PT = Length of Tangent

PG = Length of Normal

TN = Length of Subtangent

and NG = Length of Subnormal

If $A(0, 0)$ is the vertex of the parabola.

$\because \quad PN = y$

$\therefore \quad PT = PN\ \text{cosec}\ \psi = y\ \text{cosec}\ \psi$

$PG = PN\ \text{cosec}\ (90° - \psi) = y\ \sec\ \psi$

$TN = PN\cot\psi = y\cot\psi$

and $NG = PN\cot(90° - \psi) = y\tan\psi$

where, $\tan\psi = \frac{2a}{y} = m$ [slope of tangent at $P(x, y)$]

Example 53 Find the length of tangent, subtangent, normal and subnormal to $y^2 = 4ax$ at $(at^2, 2at)$.

Sol. $\because$ Equation of tangent of $(at^2, 2at)$ of parabola $y^2 = 4ax$ is

$$ty = x + at^2$$

Slope of this tangent $m = \frac{1}{t}$

Let tangent makes angle ψ with positive direction of X-axis

$$\tan\psi = \frac{1}{t}$$

then $t = \cot\psi$

$\therefore$ Length of tangent at

$$(at^2, 2at) = 2at \operatorname{cosec}\psi$$

$$= 2at\sqrt{(1+\cot^2\psi)} = 2at\sqrt{(1+t^2)}$$

Length of normals at

$$(at^2, 2at) = 2at \sec\psi = 2at\sqrt{(1+\tan^2\psi)}$$

$$= 2a\sqrt{(t^2 + t^2\tan^2\psi)} = 2a\sqrt{(t^2+1)}$$

Length of subtangent at $(at^2, 2at) = 2at \cot\psi$

$$= 2at^2$$

Length of subnormal at $(at^2, 2at) = 2at \tan\psi$

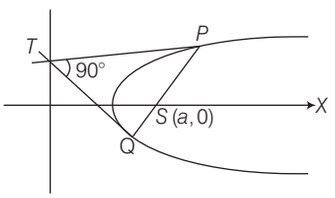
$$= 2a$$

Some Standard Properties of the Parabola

(1) The tangents at the extremities of a focal chord intersect at right angles on the directrix.

The extremities of a focal chord PQ are

$$P \equiv (at^2, 2at) \text{ and } Q \equiv \left(\frac{a}{t^2}, -\frac{2a}{t}\right)$$



Let parabola is $y^2 = 4ax$

$\therefore$ Tangent at $P(at^2, 2at)$ is

$$ty = x + at^2 \quad \ldots(i)$$

Its slope $\frac{1}{t} = m_1$ (say)

and tangent at $Q\left(\frac{a}{t^2}, -\frac{2a}{t}\right)$ is

$$-\frac{y}{t} = x + \frac{a}{t^2} \quad \ldots(ii)$$

$\Rightarrow$ $-ty = xt^2 + a$

Its slope $-t = m_2$ (say)

$\because$ $m_1 m_2 = -1$

$\therefore$ $\angle PTQ = 90°$

and adding Eqs. (i) and (ii), we get

$$(x+a)(1+t^2) = 0 \implies 1 + t^2 \neq 0$$

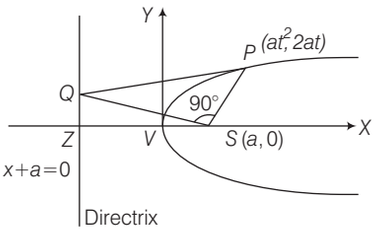
$\therefore$ $x + a = 0$, which is directrix.

(2) The portion of a tangent to a parabola intercepted between the directrix and the curve subtends a right angle at the focus.

The equation of the tangent to the parabola $y^2 = 4ax$ at $P(at^2, 2at)$ is

$$ty = x + at^2 \quad \ldots(i)$$

Let Eq. (i) meet the directrix $x + a = 0$ at Q, then coordinates of Q are $\left(-a, \frac{at^2 - a}{t}\right)$, also focus S is $(a, 0)$.



$\therefore$ Slope of $SP = \frac{2at - 0}{at^2 - a}$

$$= \frac{2t}{t^2 - 1} = m_1 \quad \text{(say)}$$

and slope of $SQ = \frac{\frac{at^2 - a}{t} - 0}{-a - a} = \frac{t^2 - 1}{-2t} = m_2$ (say)

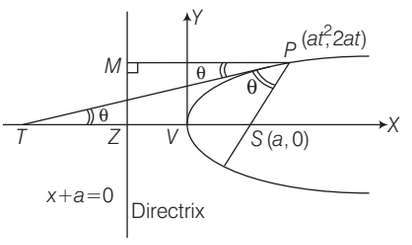
$\therefore$ $m_1 m_2 = -1$

i.e. SP is perpendicular to SQ i.e. $\angle PSQ = 90°$

(3) The tangent at any point P of a parabola bisects the angle between the focal chord through P and the perpendicular from P to the directrix.

Let the tangent at $P(at^2, 2at)$ to the parabola $y^2 = 4ax$ meets the axis of the parabola i.e. X-axis or $y = 0$ at T. The equation of tangent to the parabola $y^2 = 4ax$ at $P(at^2, 2at)$ is

$$ty = x + at^2$$



For coordinates of T solve it with $y = 0$.

$\therefore \quad T(-at^2, 0)$

$\therefore \quad ST = SV + VT = a + at^2 = a(1 + t^2)$

Also, $SP = PM = a + at^2 = a(1 + t^2)$

$\therefore \quad SP = ST$, i.e. $\angle STP = \angle SPT$

But $\angle STP = \angle MPT$ [alternate angles]

$\angle SPT = \angle MPT$

(4) The foot of the perpendicular from the focus on any tangent to a parabola lies on the tangent at the vertex.

Equation of tangent at $P(at^2, 2at)$

On the parabola $y^2 = 4ax$

is $ty = x + at^2$

$\Rightarrow \quad x - ty + at^2 = 0$ ...(i)

Now, the equation of line through $S(a, 0)$ and perpendicular to Eq. (i) is

$tx + y = \lambda$

Since, it passes through $(a, 0)$.

$\therefore \quad ta + 0 = \lambda$

$\therefore$ Equation $tx + y = ta$ or $t^2x + ty - at^2 = 0$ ...(ii)

By adding Eqs. (i) and (ii), we get

$x(1 + t^2) = 0$

$\Rightarrow \quad x = 0 \quad [\because 1 + t^2 \neq 0]$

Hence, the point of intersection of Eq. (i) and (ii) lies on $x = 0$ i.e. on Y-axis (which is tangent at the vertex of a parabola).

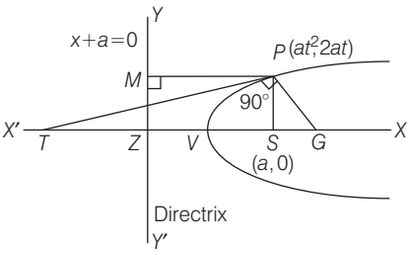
(5) If S be the focus of the parabola and tangent and normal at any point P meet its axis in T and G respectively then $ST = SG = SP$.

Let $P(at^2, 2at)$ be any point on the parabola $y^2 = 4ax$, then equation of tangent and normal at $P(at^2, 2at)$ are

$ty = x + at^2$ and $y = -tx + 2at + at^2$, respectively.

Since, tangent and normal meet its axis in T and G.

$\therefore$ Coordinates of T' and G are $(-at^2, 0)$ and $(2a + at^2, 0)$ respectively.



$\therefore \quad SP = PM = a + at^2$

$SG = VG - VS = 2a + at^2 - a$

$= a + at^2$

and $ST = VS + VT = a + at^2$

Hence, $SP = SG = ST$

(6) If S be the focus and SH be perpendicular to the tangent at P, then H lies on the tangent at the vertex and $SH^2 = OS \cdot SP$, where O is the vertex of the parabola.

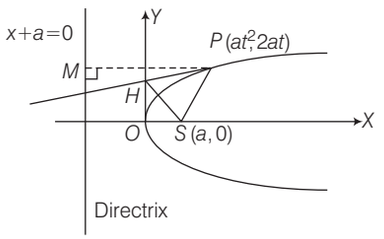
Let $P(at^2, 2at)$ be any point on the parabola

$y^2 = 4ax$ ... (i)

then, tangent at $P(at^2, 2at)$ to the parabola Eq. (i) is

$ty = x + at^2$

It meets the tangent at the vertex i.e. $x = 0$.



$\therefore$ Coordinates of H is $(0, at)$

and $SP = PM = a + at^2 \Rightarrow \quad OS = a$

and $SH = \sqrt{(a-0)^2 + (0-at)^2} = \sqrt{a^2 + a^2t^2}$

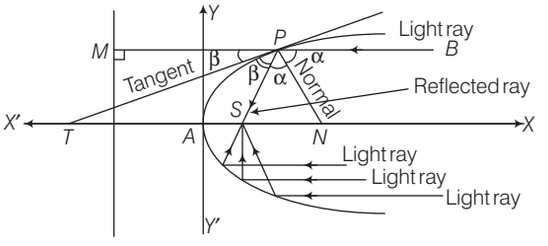
or $(SH)^2 = a\{a(1 + t^2)\} = OS \cdot SP$.

Reflection Property of Parabola

The tangent (PT) and normal (PN) of the parabola

$y^2 = 4ax$

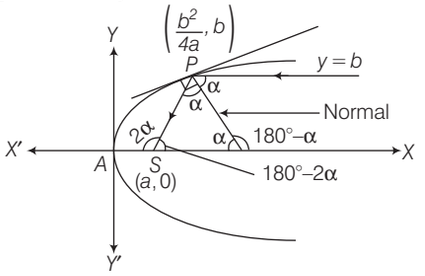
at P are the internal and external bisectors of $\angle SPM$ and BP is parallel to the axis of the parabola and $\angle BPN = \angle SPN$.



All rays of light coming from the positive direction of X-axis and parallel to the axis of the parabola after reflection pass through the focus of the parabola.

Example 54 ***A ray of light is coming along the line $y = b$ from the positive direction of X-axis and strikes a concave mirror whose intersection with the xy-plane is a parabola $y^2 = 4ax$. Find the equation of the reflected ray and show that it passes through the focus of the parabola. Both a and b are positive.***

Sol. Given parabola is $y^2 = 4ax$



Equation of tangent at $P\left(\frac{b^2}{4a}, b\right)$ is $yb = 2a\left(x + \frac{b^2}{4a}\right)$,

Slope of tangent is $\frac{2a}{b}$.

Hence, slope of normal $= -\frac{b}{2a} = \tan(180° - \alpha)$.

$\therefore \quad \tan\alpha = \frac{b}{2a}$

$\therefore$ Slope of reflected ray $= \tan(180° - 2\alpha)$

$$= -\tan 2\alpha$$

$$= -\left\{\frac{2\tan\alpha}{1-\tan^2\alpha}\right\} = -\left\{\frac{2\cdot\frac{b}{2a}}{1-\frac{b^2}{4a^2}}\right\} = -\frac{4ab}{(4a^2-b^2)}$$

Hence, equation of reflected ray is

$$y - b = -\frac{4ab}{(4a^2-b^2)}\left(x - \frac{b^2}{4a}\right)$$

$\Rightarrow \quad (y-b)(4a^2-b^2) = -(4ax - b^2)$

which obviously passes through the focus $S(a, 0)$.

Study of Parabola of the Form $(\alpha x + \beta y)^2 + 2gx + 2fy + c = 0$

Given equation can be written as

$$(\alpha x + \beta y)^2 = -2gx - 2fy - c$$

Now, add an arbitrary constant λ in the square root of the second degree terms. Then the equation will be of the form

i.e. $\quad (\alpha x + \beta y + \lambda)^2 = xf_1(\lambda) + yf_2(\lambda) + f_3(\lambda) \quad$ ...(i)

Now, choose λ such that the lines

$\alpha x + \beta y + \lambda = 0$ and $xf_1(\lambda) + yf_2(\lambda) + f_3(\lambda) = 0$

are perpendicular

i.e. (slope of $\alpha x + \beta y + \lambda = 0$) $\times$ (slope of $xf_1(\lambda) + yf_2(\lambda) + f_3(\lambda) = 0$) $= -1$

$\Rightarrow \quad -\frac{\alpha}{\beta} \times -\frac{f_1(\lambda)}{f_2(\lambda)} = -1$

$\Rightarrow \quad \alpha f_1(\lambda) + \beta f_2(\lambda) = 0 \quad$ ...(ii)

Now, substitute the value of λ in Eq. (i) from Eq. (ii).

Multiply and divide $(\alpha^2 + \beta^2)$ in LHS of Eq. (i)

i.e. $\quad (\alpha x + \beta y + \lambda)^2 = (\alpha^2 + \beta^2)\left(\frac{\alpha x + \beta y + \lambda}{\sqrt{\alpha^2 + \beta^2}}\right)^2$

and RHS of Eq. (i) by $\sqrt{(\alpha^2 + \beta^2)}$

i.e. $\quad xf_1(\lambda) + yf_2(\lambda) + f_3(\lambda)$

$$= \sqrt{(\alpha^2 + \beta^2)}\left(\frac{xf_1(\lambda) + yf_2(\lambda) + f_3(\lambda)}{\sqrt{(\alpha^2 + \beta^2)}}\right)$$

Then, Eq. (i) reduce in the form

$$\left(\frac{\alpha x + \beta y + \lambda}{\sqrt{\alpha^2 + \beta^2}}\right)^2 = 4\rho\left(\frac{\beta x - \alpha y + \mu}{\sqrt{(\alpha^2 + \beta^2)}}\right)$$

which is of the form $Y^2 = 4\rho X$

$$Y = \frac{\alpha x + \beta y + \lambda}{\sqrt{(\alpha^2 + \beta^2)}}, \quad X = \frac{\beta x - \alpha y + \mu}{\sqrt{(\alpha^2 + \beta^2)}} \quad \text{and} \quad 4\rho = \frac{1}{\sqrt{(\alpha^2 + \beta^2)}}.$$

Latusrectum is $4\rho = \frac{1}{\sqrt{(\alpha^2 + \beta^2)}}$.

Axis is $Y = 0$ or $\alpha x + \beta y + \lambda = 0$.

Equation of tangent at vertex is

$$X = 0 \quad \text{or} \quad \beta x - \alpha y + \mu = 0.$$

Vertex is the point of intersection of

$$X = 0 \quad \text{and} \quad Y = 0$$

i.e. $\beta x - \alpha y + \mu = 0$ and $\alpha x + \beta y + \lambda = 0$.

Equation of directrix is $X + \rho = 0$.

Equation of latusrectum is $X - \rho = 0$.

Focus Since, axis and latusrectum intersect at the focus S its coordinates are detained by solving

$$X - \rho = 0 \quad \text{and} \quad Y = 0.$$

Example 55. ***Find the length of latusrectum of the parabola $(a^2 + b^2)(x^2 + y^2) = (bx + ay - ab)^2$.***

Sol. Given equation may be written as

$$a^2x^2 + a^2y^2 + b^2x^2 + b^2y^2 = b^2x^2 + a^2y^2 + a^2b^2 + 2abxy - 2a^2by - 2ab^2x$$

$$\Rightarrow \quad a^2x^2 - 2abxy + b^2y^2 = -2ab^2x - 2a^2by + a^2b^2$$

$$\Rightarrow \quad (ax - by)^2 = -2ab\left(bx + ay - \frac{ab}{2}\right)$$

Since, $ax - by = 0$ and $bx + ay - \frac{ab}{2} = 0$ are perpendicular.

$$\therefore (a^2 + b^2)\left(\frac{ax - by}{\sqrt{a^2 + b^2}}\right)^2 = -2ab\sqrt{(a^2 + b^2)}\left(\frac{bx + ay - \frac{ab}{2}}{\sqrt{(a^2 + b^2)}}\right)$$

$$\Rightarrow \quad \left(\frac{ax - by}{\sqrt{a^2 + b^2}}\right)^2 = \frac{-2ab}{\sqrt{(a^2 + b^2)}}\left(\frac{bx + ay - \frac{ab}{2}}{\sqrt{(a^2 + b^2)}}\right)$$

which is of the form $Y^2 = -4\rho X$.

Therefore, the latusrectum $= 4\rho = \frac{2ab}{\sqrt{(a^2 + b^2)}}$.

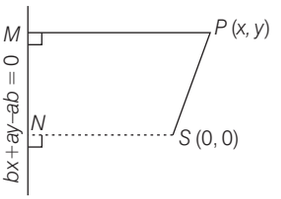
Aliter :

Given equation may be written as

$$x^2 + y^2 = \frac{(bx + ay - ab)^2}{(a^2 + b^2)}$$

$$\Rightarrow \sqrt{(x^2 + y^2)} = \frac{|bx + ay - ab|}{\sqrt{(a^2 + b^2)}}$$

$$\Rightarrow \quad \sqrt{(x - 0)^2 + (y - 0)^2} = \frac{|bx + ay - ab|}{\sqrt{(a^2 + b^2)}}$$

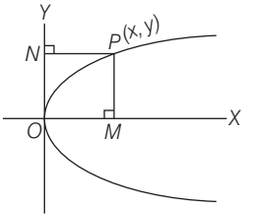


which is of the form $SP = PM$.

Since, distance from focus S to $(bx + ay - ab = 0) = \frac{1}{2}(4\rho)$

$$\Rightarrow \quad \frac{1}{2}(4\rho) = \frac{ab}{\sqrt{a^2 + b^2}}$$

$$\therefore \quad 4\rho = \frac{2ab}{\sqrt{(a^2 + b^2)}}$$



Remark

Consider the equation of parabola is $y^2 = 4ax$.

i.e. $(MP)^2 =$ (Latusrectum) NP.

i.e. if P is any point on the given parabola, then

(the distance of P from its axis)^2 = (Latusrectum)

(The distance of P from the tangent at its vertex).

Exercise for Session 3

1. If m_1, m_2 are slopes of the two tangents that are drawn from (2, 3) to the parabola $y^2 = 4x$, then the value of $\frac{1}{m_1} + \frac{1}{m_2}$ is

(a) –3 (b) 3 (c) $\frac{2}{3}$ (d) $\frac{3}{2}$

2. The angle between the tangents drawn from the origin to the parabola $y^2 = 4a(x - a)$ is

(a) 90° (b) 30° (c) $\tan^{-1}\left(\frac{1}{2}\right)$ (d) 45°

3. If (a, b) is the mid-point of chord passing through the vertex of the parabola $y^2 = 4x$, then

(a) $a = 2b$ (b) $2a = b$ (c) $a^2 = 2b$ (d) $2a = b^2$

4. The diameter of the parabola $y^2 = 6x$ corresponding to the system of parallel chords $3x - y + c = 0$ is

(a) $y - 1 = 0$ (b) $y - 2 = 0$ (c) $y + 1 = 0$ (d) $y + 2 = 0$

5. From the point $(-1, 2)$ tangent lines are drawn to the parabola $y^2 = 4x$, the area of triangle formed by chord of contact and the tangents is given by

(a) 8 (b) $8\sqrt{3}$ (c) $8\sqrt{2}$ (d) None of these

6. For parabola $x^2 + y^2 + 2xy - 6x - 2y + 3 = 0$, the focus is

(a) (1, – 1) (b) (–1, 1) (c) (3, 1) (d) None of these

7. The locus of the mid-point of that chord of parabola which subtends right angle on the vertex will be

(a) $y^2 - 2ax + 8a^2 = 0$ (b) $y^2 = a(x - 4a)$ (c) $y^2 = 4a(x - 4a)$ (d) $y^2 + 3ax + 4a^2 = 0$

8. A ray of light moving parallel to the X-axis gets reflected from a parabolic mirror whose equation is $(y-2)^2 = 4(x+1)$. After reflection, the ray must pass through the point

(a) (–2, 0) (b) (–1, 2) (c) (0, 2) (d) (2, 0)

9. Prove that the locus of the point of intersection of tangents to the parabola $y^2 = 4ax$ which meet at an angle α is $(x+a)^2 \tan^2\alpha = y^2 - 4ax$.

10. Find the locus of the middle points of the chords of the parabola $y^2 = 4ax$ which pass through the focus.

11. From the point $P(-1,2)$ tangents are drawn to the parabola $y^2 = 4x$. Find the equation of the chord of contact. Also, find the area of the triangle formed by the chord of contact and the tangents.

Shortcuts and Important Results to Remember

1 Second degree terms in the equation of a parabola should make perfect squares.

2 If l_1 and l_2 are the lengths of segments of a focal chord then the latusrectum of the parabola is $\frac{4l_1l_2}{l_1+l_2}$.

3 If α be the inclination of a focal chord with axis of the parabola then its length is $4a\text{cosec}^2\alpha$.

4 If tangents of $y^2 = 4ax$ at $P(t_1)$ and $Q(t_2)$ meets at R, then area of ΔPQR is $\frac{1}{2}a^2(t_1-t_2)^3$.

5 The foot of the perpendicular from the focus on any tangent to a parabola lies on the tangent at the vertex.

6 The area of the triangle formed by three points on a parabola is twice the area of the triangle formed by the tangents, at these points.

7 The equation of the common tangent to the parabolas $x^2 = 4ay$ and $y^2 = 4ax$ is $x + y + a = 0$.

8 If the chord joining t_1, t_2 and t_3, t_4 pass through a point $(c, 0)$ on the axis, then

$$t_1t_2 = t_3t_4 = -c/a.$$

9 If the normals to the parabola $y^2 = 4ax$ at the points t_1 and t_2 intersect again on the parabola at the point 't_3', then $t_1t_2 = 2; t_3 = -(t_1+t_2)$ and the line joining t_1 and t_2 passes through a fixed point $(-2a, 0)$.

10 If the length of a focal chord of $y^2 = 4ax$ at a distance b from the vertex is c then $b^2c = 4a^3$.

11 From an external point only one normal can be drawn.

12 If a normal to $y^2 = 4ax$ makes an angle θ with the axis of $y^2 = 4ax$ then it will cut the curve again at an angle of $\tan^{-1}\left(\frac{\tan\theta}{2}\right)$.

13 The orthocentre of any triangle formed by the three tangents to a parabola $y^2 = 4ax$ 't_1', 't_2' and 't'$_3$ lies on the directrix and has the coordinates $(-a, a(t_1+t_2+t_3+t_1t_2t_3))$.

14 Normals at the end points of the latusrectum of a parabola $y^2 = 4ax$ intersect at right angle on the axis of the parabola and their point of intersection is $(3a, 0)$.

15 A line ray parallel to axis of the parabola after reflection passes through the focus.

JEE Type Solved Examples :
Single Option Correct Type Questions

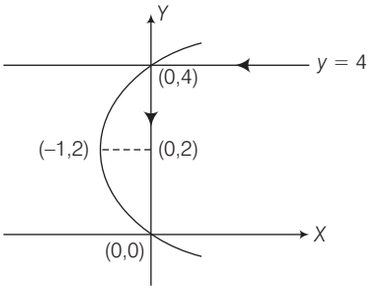
■ This section contains **10 multiple choice examples.** Each example has four choices (a), (b), (c) and (d) out of which **ONLY ONE** is correct.

● ***Ex. 1*** *A ray of light travels along a line $y = 4$ and strikes the surface of curves $y^2 = 4(x + y)$, then the equation of the line along which the reflected ray travels is*

(a) $x = 0$ (b) $x = 2$

(c) $x + y = 4$ (d) $2x + y = 4$

Sol. (a) The given curve is $(y-2)^2 = 4(x+1)$



The focus is $(0, 2)$.

The point of intersection of the curve and $y = 4$ is $(0, 4)$. From the reflection property of parabola the reflected ray passes through the focus.

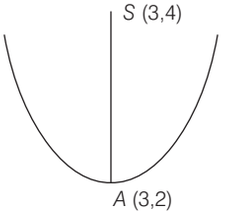
Therefore, $x = 0$ is the reflected ray.

● ***Ex. 2*** *A parabola is drawn with focus at $(3, 4)$ and vertex at the focus of the parabola $y^2 - 12x - 4y + 4 = 0$. The equation of the parabola is*

(a) $x^2 - 6x - 8y + 25 = 0$ (b) $y^2 - 8x - 6y + 25 = 0$

(c) $x^2 - 6x + 8y - 25 = 0$ (d) $x^2 + 6x - 8y - 25 = 0$

Sol. (a) $y^2 - 12x - 4y + 4 = 0 \Rightarrow (y-2)^2 = 12x$



Its vertex is $(0, 2)$ and $a = 3$,

its focus $= (3, 2)$.

Hence, for the required parabola; focus is $(3, 4)$, vertex $= (3, 2)$ and $a = 2$,

Hence, the equation of the parabola is

$$(x-3)^2 = 4(2)(y-2)$$

or $x^2 - 6x - 8y + 25 = 0$

● ***Ex. 3*** *Two parabolas have the same focus. If their directrices are the X-axis and the Y-axis, respectively, then the slope of their common chord is*

(a) ± 1 (b) $\frac{4}{3}$ (c) $\frac{3}{4}$ (d) None of these

Sol. (a) Let the focus be (a, b)

Then, equations are $(x-a)^2 + (y-b)^2 = y^2$ and

$$(x-a)^2 + (y-b)^2 = x^2$$

If $S_1 \equiv (x-a)^2 + (y-b)^2 - y^2 = 0$

and $S_2 \equiv (x-a)^2 + (y-b)^2 - x^2 = 0$

$\therefore$ Equation of common chord $S_1 - S_2 = 0$ gives

$$x^2 - y^2 = 0 \quad \text{or} \quad y = \pm x$$

Hence, slope of common chord is ± 1.

● ***Ex. 4*** *Let us define a region R in xy-plane as a set of points (x, y) satisfying $[x^2] = [y]$ (where $[x]$ denotes greatest integer $\le x$), then the region R defines*

(a) a parabola whose axis is horizontal

(b) a parabola whose axis is vertical

(c) integer point of the parabola $y = x^2$

(d) None of the above

Sol. (d) $\because [x^2] = [y]$

If $0 \le y < 1$,

then, $[y] = 0$

$\therefore$ $[x^2] = 0$

$0 \le x^2 < 1$

$\Rightarrow$ $x \in (-1, 1)$

for $1 \le y < 2$,

then $[y] = 1$

$\therefore$ $[x^2] = 1$

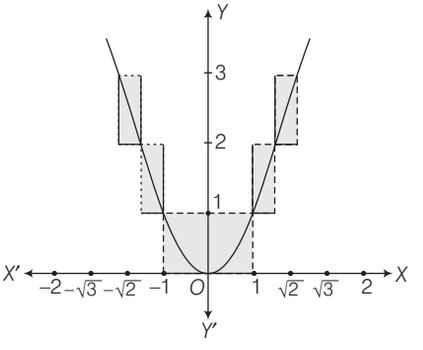
$\Rightarrow$ $1 \le x^2 < 2$

$\Rightarrow$ $x \in (-\sqrt{2}, -1] \cup [1, \sqrt{2})$

for $2 \le y < 3$, then $[y] = 2$

then, $[x^2] = 2 \Rightarrow 2 \le x^2 < 3$

$\therefore$ $x \in (-\sqrt{3}, -\sqrt{2}] \cup [\sqrt{2}, \sqrt{3})$



The graph of the region will not only contain of the parabola $y = x^2$ but $[x^2] = [y]$ contain points within the rectangles of side 1, 2, ; 1, $\sqrt{2} - 1$; 1, $\sqrt{3} - \sqrt{2}$ etc.

Hence, a, b, c are incorrects.

● ***Ex. 5*** *The minimum area of circle which touches the parabolas $y = x^2 + 1$ and $x = y^2 + 1$ is*

(a) $\frac{9\pi}{16}$ sq units (b) $\frac{9\pi}{32}$ sq units

(c) $\frac{9\pi}{8}$ sq units (d) $\frac{9\pi}{4}$ sq units

Sol. (b) The parabolas $y = x^2 + 1$ and $x = y^2 + 1$ are symmetrical about $y = x$.

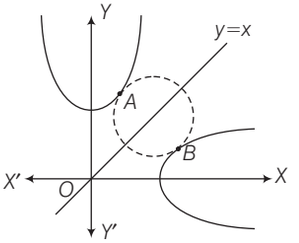
Therefore, the tangent at point A is parallel to $y = x$

then $\frac{dy}{dx} = 2x = 1$

or $x = \frac{1}{2}, y = \frac{5}{4}$

$\therefore$ $A \equiv \left(\frac{1}{2}, \frac{5}{4}\right)$

and $B \equiv \left(\frac{5}{4}, \frac{1}{2}\right)$



Hence, Radius $(r) = \frac{1}{2} AB = \frac{1}{2}\sqrt{\left(\frac{1}{2} - \frac{5}{4}\right)^2 + \left(\frac{5}{4} - \frac{1}{2}\right)^2} = \frac{3\sqrt{2}}{8}$

$\therefore$ Area $= \pi r^2 = \frac{9\pi}{32}$ sq units

● ***Ex. 6*** *Let the line $lx + my = 1$ cut the parabola $y^2 = 4ax$ in the points A and B. Normals at A and B meet at point C. Normal from C other than these two meet the parabola at D, then the coordinate of D are*

(a) $(a, 2a)$ (b) $\left(\frac{4am}{l^2}, \frac{4a}{l}\right)$

(c) $\left(\frac{2am^2}{l^2}, \frac{2a}{l}\right)$ (d) $\left(\frac{4am^2}{l^2}, \frac{4am}{l}\right)$

Sol. (d) Let $A \equiv (am_1^2, -2am_1)$ and $B \equiv (am_2^2, -2am_2)$

Now, A and B lie on $lx + my = 1$

$\Rightarrow$ $l(am_1^2) + m(-2am_1) = 1$ ...(i)

and $l(am_2^2) + m(-2am_2) = 1$ ...(ii)

Subtracting Eq. (ii) from Eq. (i), then

$la(m_1^2 - m_2^2) - 2am(m_1 - m_2) = 0$

$\Rightarrow$ $a(m_1 - m_2) \neq 0$

$\therefore$ $l(m_1 + m_2) - 2m = 0$

$\Rightarrow$ $m_1 + m_2 = \frac{2m}{l}$ ...(iii)

Let $D \equiv (am_3^2, -2am_3)$ and $C \equiv (h, k)$

$\therefore$ Equation of normal in terms of slope

$y = Mx - 2aM - aM^3$

then $aM^3 - (h - 2a)M + k = 0$

$\therefore$ $m_1 + m_2 + m_3 = 0$

$\Rightarrow$ $\frac{2m}{l} + m_3 = 0$

$\therefore$ $m_3 = -\frac{2m}{l}$

$\therefore$ $D \equiv \left(a\left(\frac{-2m}{l}\right)^2, -2a\left(\frac{-2m}{l}\right)\right)$

$\Rightarrow$ $D \equiv \left(\frac{4am^2}{l^2}, \frac{4am}{l}\right)$

● ***Ex. 7*** *If d is the distance between the parallel tangents with positive slope to $y^2 = 4x$ and $x^2 + y^2 - 2x + 4y - 11 = 0$, then*

(a) $10 < d < 20$ (b) $4 < d < 6$

(c) $d < 4$ (d) None of these

Sol. (c) Tangent to the parabola $y^2 = 4x$ having slope m is

$$y = mx + \frac{1}{m}$$

and tangent to the circle $(x-1)^2 + (y+2)^2 = 4^2$ having slope m is

$$y + 2 = m(x - 1) + 4\sqrt{(1 + m^2)}$$

$\therefore$ Distance between tangents $(d) = \left|\frac{4\sqrt{(1+m^2)} - m - 2 - \frac{1}{m}}{\sqrt{(1+m^2)}}\right|$

$$= \left|4 - \frac{2}{\sqrt{(1+m^2)}} - \frac{\sqrt{(1+m^2)}}{m}\right|$$

As $m > 0$ (given)

we get $d < 4$

● ***Ex. 8*** *Two parabolas C and D intersect at two different points, where C is $y = x^2 - 3$ and D is $y = kx^2$. The intersection at which the x value is positive is designated point A , and $x = a$ at this intersection the tangent line l at A to the curve D intersects curve C at point B, other than A. If x-value of point B is 1, then a is equal to*

(a) 1 (b) 2 (c) 3 (d) 4

Sol. (c) $C : y = x^2 - 3$ and $D : y = kx^2$

Solving C and D, then

$kx^2 = x^2 - 3$ ...(i)

or $x^2 = \frac{3}{1-k}$,

then, $y = \frac{3k}{1-k}$

$\therefore$ $A \equiv \left(\sqrt{\frac{3}{1-k}}, \frac{3k}{1-k}\right)$ (given x-value of A is positive)

and $a = \sqrt{\left(\frac{3}{1-k}\right)}$

then $A \equiv (a, ka^2) \equiv (a, a^2 - 3)$ [from Eq. (i)]

tangent 'l' at A to the curve D is

$$\frac{y+a^2-3}{2}=kx\cdot a$$

$$\Rightarrow \quad y+a^2-3=2ax\left(1-\frac{3}{a^2}\right) \qquad \text{[from Eq. (i)]} \quad ...(ii)$$

$$\therefore \quad B\equiv(1,-2)\ (a\neq 1)$$

From Eq. (ii), $\quad -2+a^2-3=2a\left(1-\frac{3}{a^2}\right)$

$$\Rightarrow \quad a^3-5a=2a^2-6$$

$$\Rightarrow \quad a^3-2a^2-5a+6=0$$

$$\Rightarrow \quad (a-1)(a+2)(a-3)=0$$

$$\therefore \quad a=3 \qquad (\because a\neq 1, a\neq -2)$$

● ***Ex. 9*** $\min[(x_1-x_2)^2+(3+\sqrt{(1-x_1^2)}-\sqrt{4x_2})^2]$, $\forall$ $x_1, x_2 \in R$, *is*

(a) $4\sqrt{5}+1$ (b) $3-2\sqrt{2}$ (c) $\sqrt{5}+1$ (d) $\sqrt{5}-1$

Sol. (b) Let $y_1=3+\sqrt{(1-x_1^2)}$ and $y_2=\sqrt{4x_2}$

or $x_1^2+(y_1-3)^2=1$ and $y_2^2=4x_2$

Thus, (x_1, y_1) lies on the circle $x^2+(y-3)^2=1$ and (x_2, y_2) lies on the parabola $y^2=4x$.

Thus, the given expression is the shortest distance between the curve $x^2+(y-3)^2=1$ and $y^2=4x$.

Now, the shortest distance always occurs along the common normal to the curves and normal to the circle passes through the centre of the circle.

Normal to parabola $y^2=4x$ is $y=mx-2m-m^3$. It passes through centre of circle $(0,3)$.

Therefore, $3=-2m-m^3 \Rightarrow m^3+2m+3=0$ which has only one real value $m=-1$.

Hence, the corresponding point on the parabola is $(1,2)$

$$\therefore \sqrt{(x_1-x_2)^2+(3+\sqrt{(1-x_1^2)}-\sqrt{4x_2})^2}=\sqrt{(x_1-x_2)^2+(y_1-y_2)^2}$$

= Distance between $(1,2)$ and $(0,3)$ – radius

$$=\sqrt{(1+1)}-1=(\sqrt{2}-1)$$

or $\quad (x_1-x_2)^2+(3+\sqrt{(1-x_1^2)}-\sqrt{4x_2})^2=(\sqrt{2}-1)^2$

$$\therefore \quad \min\cdot[(x_1-x_2)^2+(3+\sqrt{(1-x_1^2)}-\sqrt{4x_2})^2]=3-2\sqrt{2}$$

● ***Ex. 10*** *The condition that the parabolas* $y^2=4c(x-d)$ *and* $y^2=4ax$ *have a common normal other than X-axis* $(a>0, c>0)$ *is*

(a) $2a<2c+d$ (b) $2c<2a+d$

(c) $2d<2a+c$ (d) $2d<2c+a$

Sol. (a) Normals of parabolas $y^2=4ax$ and $y^2=4c(x-d)$ in terms of slope are

$$y=mx-2am-am^3 \qquad ...(i)$$

and $\quad y=m(x-d)-2cm-cm^3 \qquad ...(ii)$

Subtracting Eqs. (ii) from (i), then

$$md-2am-am^3+2cm+cm^3=0$$

$$m\neq 0$$

$$\therefore \quad d-2a-am^2+2c+cm^2=0$$

$$\Rightarrow \quad (a-c)m^2=d-2a+2c$$

$$\Rightarrow \quad m^2=\frac{d-2a+2c}{(a-c)}$$

$$\Rightarrow \quad \frac{d}{a-c}-2>0$$

$$\Rightarrow \quad d>2a-2c$$

$$\Rightarrow \quad 2a<2c+d$$

JEE Type Solved Examples :
More than One Correct Option Type Questions

▪ This section contains **5 multiple choice examples.** Each example has four choices (a), (b), (c) and (d) out of **which MORE THAN ONE** may be correct.

● ***Ex. 11*** *The locus of the mid-point of the focal radii of a variable point moving on the parabola* $y^2=4ax$ *is a parabola whose*

(a) latusrectum is half the latusrectum of the original parabola

(b) vertex is $\left(\frac{a}{2}, 0\right)$

(c) directrix is Y-axis

(d) focus has the coordinates $(a, 0)$

Sol. (a, b, c, d) Let $P(at^2, 2at)$ be a point on the parabola $y^2=4ax$ with focus $S(a, 0)$

Now, mid-point of focal radii SP is $M\left(\frac{a}{2}(t^2+1), at\right)$.

Let $\quad x=\frac{a}{2}(t^2+1)$ and $y=at$

or $\quad x=\frac{a}{2}\left(\frac{y^2}{a^2}+1\right)$

$$\Rightarrow \quad y^2=2ax-a^2 \qquad \text{or} \quad y^2=2a\left(x-\frac{a}{2}\right)$$

which is a parabola with vertex $\left(\frac{a}{2}, 0\right)$ and latusrectum is $2a$, directrix is $x-\frac{a}{2}=\frac{a}{2}$ i.e. $x=0$ (Y) and focus $\left(\frac{a}{2}+\frac{a}{2}, 0\right)$ i.e. $(a, 0)$.

● ***Ex. 12*** *If P_1P_2 and Q_1Q_2, two focal chords of a parabola $y^2 = 4ax$ at right angles, then*

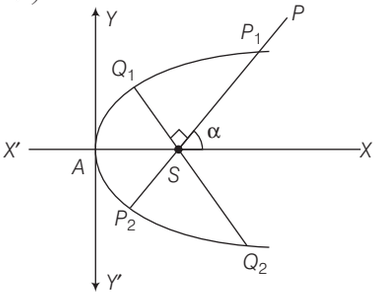
(a) area of the quadrilateral $P_1Q_1P_2Q_2$ is minimum when the chords are inclined at an angle $\pi/4$ to the axis of the parabola.

(b) minimum area is twice the area of the square on the latusrectum of the parabola.

(c) minimum area of quadrilateral $P_1Q_1P_2Q_2$ cannot be found.

(d) minimum area is thrice the area of the square on the latusrectum of the parabola.

Sol. (a, b) Let coordinates of P_1 are $(at^2, 2at)$, then coordinates of P_2 are $\left(\frac{a}{t^2}, -\frac{2a}{t}\right)$.



Let focal chord P_1P_2 makes an angle α with X-axis, then

$$\tan\alpha = \frac{2at - \left(-\frac{2a}{t}\right)}{at^2 - \frac{a}{t^2}} = \frac{2}{t - \frac{1}{t}}$$

$$\Rightarrow \quad t - \frac{1}{t} = 2\cot\alpha \qquad \ldots (i)$$

Now, $$P_1P_2 = a\left(t + \frac{1}{t}\right)^2 = a\left\{\left(t - \frac{1}{t}\right)^2 + 4\right\}$$

$$= a\{4\cot^2\alpha + 4\} = 4a\,\text{cosec}^2\alpha \quad [\text{from Eq. (i)}]$$

Similarly, $$Q_1Q_2 = 4a\,\text{cosec}^2(90 - \alpha) = 4a\sec^2\alpha$$

$\therefore$ Area of quadrilateral $P_1Q_1P_2Q_2 = \frac{1}{2}(P_1P_2)(Q_1Q_2)$

$$= 8a^2\sec^2\alpha\,\text{cosec}^2\alpha = 32a^2\,\text{cosec}^2\alpha$$

$\therefore$ Minimum area $= 32a^2 = 2(\text{latusrectum})^2$ and is inclined at

$$\alpha = \pi/4 \qquad (\because \text{cosec}\,2\alpha = 1)$$

● ***Ex. 13*** *The equation of the line that touches the curves $y = x|x|$ and $x^2 + (y-2)^2 = 4$, where $x \neq 0$, is*

(a) $y = 4\sqrt{5}x + 20$ (b) $y = 4\sqrt{3}x - 12$

(c) $y = 0$ (d) $y = -4\sqrt{5}x - 20$

Sol. (a, b, c) $\because y = x|x| = \begin{cases} x^2, & x \geq 0 \\ -x^2, & x < 0 \end{cases}$

$\because$ Equation of tangent in terms of slope (m) of $x^2 = 4ay$ is

$$y = mx - am^2 \qquad \ldots (i)$$

Also, line (i) touches the circle $x^2 + (y-2)^2 = 4$, then

$$\frac{|2 + am^2|}{\sqrt{(1 + m^2)}} = 2$$

$$\Rightarrow \quad 4 + a^2m^4 + 4am^2 = 4 + 4m^2$$

$$\therefore \quad m^2 = \frac{4 - 4a}{a^2} \text{ and } m^2 = 0$$

Put $4a = 1$ for $y = x^2$, $x \geq 0$, then $m^2 = 48$

and put $4a = -1$ for $y = -x^2$, $x < 0$, then $m^2 = 80$

$\therefore$ Common tangents are

$$y = 0,\ y = 4\sqrt{3}x - 12 \text{ and } y = 4\sqrt{5}x + 20$$

● ***Ex. 14*** *Let V be the vertex and L be the latusrectum of the parabola $x^2 = 2y + 4x - 4$. Then, the equation of the parabola whose vertex is at V, latusrectum $L/2$ and axis is perpendicular to the axis of the given parabola.*

(a) $y^2 = x - 2$ (b) $y^2 = x - 4$

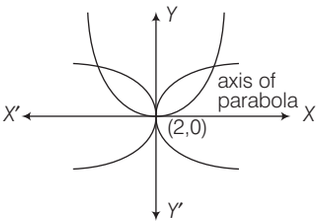
(c) $y^2 = 2 - x$ (d) $y^2 = 4 - x$

Sol. (a, c) Given parabola is $x^2 = 2y + 4x - 4$

$$\Rightarrow \quad (x-2)^2 = 2y$$

Vertex of the parabola is (2, 0) and length of latusrectum $= 2$

$$\therefore \quad V(2, 0) \text{ and } L = 2$$



Length of latusrectum of required parabola $= L/2 = 1$

$\therefore$ Equation of the required parabola is $(y-0)^2 = \pm 1(x-2)$

$$\Rightarrow \quad y^2 = x - 2 \text{ or } y^2 = -x + 2$$

● ***Ex. 15*** *Consider a circle with its centre lying on the focus of the parabola $y^2 = 2ax$ such that it touches the directrix of the parabola. Then a point of intersection of the circle and the parabola is*

(a) $\left(\frac{a}{2}, a\right)$ (b) $\left(\frac{a}{2}, -a\right)$

(c) $\left(-\frac{a}{2}, a\right)$ (d) $\left(-\frac{a}{2}, -a\right)$

Sol. (a, b) Given parabola is $y^2 = 2ax$ ...(i)

$\therefore$ Focus and equation of directrix are $S\left(\frac{a}{2}, 0\right)$ and $x = -\frac{a}{2}$ respectively.

$\therefore$ Equation of circle is $\left(x - \frac{a}{2}\right)^2 + (y-0)^2 = a^2$ ... (ii)

$(\because$ radius = distance between focus and directrix)

From Eqs. (i) and (ii),

$$\left(x-\frac{a}{2}\right)^2+2ax=a^2 \Rightarrow x^2+ax-\frac{3a^2}{4}=0$$

or $x=\frac{a}{2}, x\neq-\frac{3a}{2}$ ($\because$ for $x=-\frac{3a}{2}, y=$ imaginary)

From Eq. (i),

$$y^2=a^2$$

$\therefore$ $y=\pm a$

Hence, required point of intersection are $\left(\frac{a}{2}, \pm a\right)$.

JEE Type Solved Examples : Paragraph Based Questions

- This section contains **2 Solved Paragraphs** based upon each of the paragraph **3 multiple choice question.** Each of these questions has four choices (a), (b), (c) and (d) out of which **ONLY ONE** is correct.

Paragraph I

(Q. Nos. 16 to 18)

Tangents are drawn to the parabola $y^2=4x$ at the point P which is the upper end of latusrectum.

16. Image of the parabola $y^2=4x$ in the tangent line at the point P is

(a) $(x+4)^2=16y$ (b) $(x+2)^2=8(y-2)$

(c) $(x+1)^2=4(y-1)$ (d) $(x-2)^2=2(y-2)$

17. Radius of the circle touching the parabola $y^2=4x$ at the point P and passing through its focus is

(a) 1 (b) $\sqrt{2}$ (c) $\sqrt{3}$ (d) 2

18. Area enclosed by the tangent line at P, X-axis and the parabola is

(a) $\frac{2}{3}$ sq units (b) $\frac{4}{3}$ sq units

(c) $\frac{14}{3}$ sq units (d) $\frac{16}{3}$ sq units

Sol. Upper end of latusrectum is $P(1,2)$

$\therefore$ The equation of tangent at $P(1,2)$ is

$$y\cdot 2=2(x+1)\Rightarrow x-y+1=0$$

16. (c) Any point on the given parabola is $(t^2,2t)$. The image of (h,k) of the point $(t^2,2t)$ on $x-y+1=0$ is given by

$$\frac{h-t^2}{1}=\frac{k-2t}{-1}=\frac{-2(t^2-2t+1)}{1+1}$$

$\Rightarrow$ $h=2t-1$ and $k=t^2+1$

or $k=\left(\frac{h+1}{2}\right)^2+1 \Rightarrow (h+1)^2=4(k-1)$

The required equation of image is $(x+1)^2=4(y-1)$.

17. (c) $\because$ Focus is $S(1,0)$ and P is $(1,2)$.

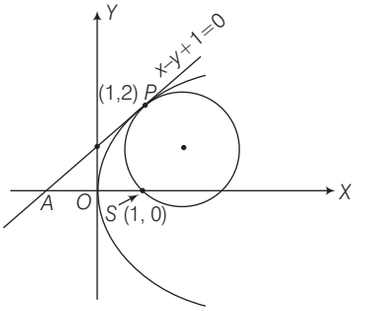
Equation of circle touching the parabola at $(1,2)$ is $(x-1)^2+(y-2)^2+\lambda(x-y+1)=0$ it passes through $(1,0)$.

Therefore, $4+2\lambda=0$ or $\lambda=-2$

Thus, the required circle is

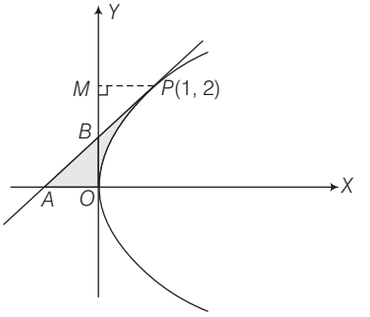
$(x-1)^2+(y-2)^2-2(x-y+1)=0$

or $x^2+y^2-4x-2y+3=0$



Its radius is $\sqrt{(4+1-3)}=\sqrt{2}$.

18. (a) Area bounded by $AOPA$ = Area of ΔAOB + Area of $OPBO$



$$=\frac{1}{2}\times1\times1+\int_0^2\frac{2y^2}{4}dy-\frac{1}{2}\times1\times1=\left[\frac{y^3}{12}\right]_0^2=\frac{8}{12}=\frac{2}{3}\text{ sq unit}$$

Paragraph II

(Q. Nos. 19 to 21)

Let C_1 and C_2 be respectively, the parabolas $x^2=y-1$ and $y^2=x-1$. Let P be any point on C_1 and Q be any point on C_2. Let P_1 and Q_1 be the reflections of P and Q, respectively with respect to the line $y=x$.

19. P_1 and Q_1 lie on

(a) C_1 and C_2 respectively (b) C_2 and C_1 respectively

(c) Cannot be determined (d) None of these

20. If the point $P(\lambda, \lambda^2+1)$ and $Q(\mu^2+1, \mu)$, then P_1 and Q_1 are

(a) (λ^2+1, λ) and (μ^2+1, μ) (b) (λ^2+1, λ) and (μ, μ^2+1)

(c) (λ, λ^2+1) and (μ, μ^2+1) (d) (λ, λ^2+1) and (μ^2+1, μ)

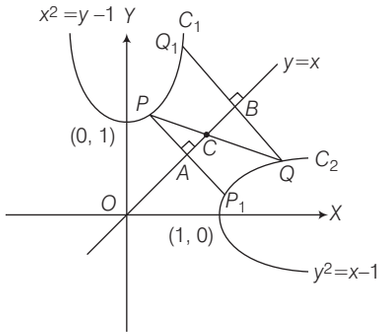
21. Arithmetic mean of PP_1 and QQ_1 is always less than

(a) PQ (b) $\frac{1}{2}PQ$ (c) $2PQ$ (d) $\frac{3}{2}PQ$

Sol. Since, the reflection of a point (p, q) with respect to line $y = x$ is (q, p).

Let $P(\lambda, \lambda^2+1)$ and $Q(\mu^2+1, \mu)$ be points on C_1 and C_2, respectively.

$\therefore$ Reflection of $P(\lambda, \lambda^2+1)$ with respect to line $y = x$ is $P_1(\lambda^2+1, \lambda)$ and reflection of $Q(\mu^2+1, \mu)$ with respect to line $y = x$ is $Q_1(\mu, \mu^2+1)$.



$\therefore$ P_1 and Q_1 are (λ^2+1, λ)

and (μ, μ^2+1) (**Ans.** 20(b))

Also, P_1 and Q_1 lie on $y^2 = x-1$

and $x^2 = y-1$.

Hence, P_1 and Q_1 lie on C_2 and C_1, respectively. (**Ans.** 19(b))

21. (a) $\because$ A is mid-point of PP_1 and B is mid-point of QQ_1.

$$\therefore \quad PA = \frac{1}{2}PP_1$$

$$\text{and} \quad QB = \frac{1}{2}QQ_1 \qquad \text{...(i)}$$

$$\Rightarrow \quad PC \geq PA \qquad \text{...(ii)}$$

$$\text{and} \quad QC \geq QB \qquad \text{...(iii)}$$

On adding Eqs. (ii) and (iii), then

$$PC + QC \geq PA + QB$$

$$= \frac{1}{2}PP_1 + \frac{1}{2}QQ_1 \quad \text{[from Eq. (i)]}$$

$$= \left(\frac{PP_1 + QQ_1}{2}\right)$$

$$\therefore \quad PC + QC \geq \left(\frac{PP_1 + QQ_1}{2}\right)$$

$$\Rightarrow \quad PQ \geq (\text{AM of } PP_1 \text{ and } QQ_1)$$

JEE Type Solved Examples :
Single Integer Answer Type Questions

- This section contains **2 solved examples.** The answer to each example is **a single digit integer,** ranging from 0 to 9 (both inclusive).

● ***Ex. 22*** *Points A, B, C lie on the parabola $y^2 = 4ax$. The tangents to the parabola at A, B, C taken in pairs intersect at points P, Q, R, then, the ratio of the areas of the ΔABC and ΔPQR is*

Sol. (2) Let $(at_1^2, 2at_1)$, $(at_2^2, 2at_2)$ and $(at_3^2, 2at_3)$ be the points A, B and C respectively.

$$\therefore \text{Area of } \Delta ABC = \frac{1}{2}\left|\begin{vmatrix} at_1^2 & 2at_1 & 1 \\ at_2^2 & 2at_2 & 1 \\ at_3^2 & 2at_3 & 1 \end{vmatrix}\right| = a^2\left|\begin{vmatrix} 1 & t_1 & t_1^2 \\ 1 & t_2 & t_2^2 \\ 1 & t_3 & t_3^2 \end{vmatrix}\right|$$

$$= a^2|(t_1 - t_2)(t_2 - t_3)(t_3 - t_1)|$$

Coordinates of P, Q and R are $(at_2t_3, a(t_2+t_3))$, $(at_3t_1, a(t_3+t_1))$, $(at_1t_2, a(t_1+t_2))$ respectively, then

$$\text{Area of } \Delta PQR = \frac{1}{2}\left|\begin{vmatrix} at_2t_3 & a(t_2+t_3) & 1 \\ at_3t_1 & a(t_3+t_1) & 1 \\ at_1t_2 & a(t_1+t_2) & 1 \end{vmatrix}\right| = \frac{a^2}{2}\left|\begin{vmatrix} t_2t_3 & t_2+t_3 & 1 \\ t_3t_1 & t_3+t_1 & 1 \\ t_1t_2 & t_1+t_2 & 1 \end{vmatrix}\right|$$

$$= \frac{a^2}{2}|\Sigma t_2t_3(t_3 - t_2)|$$

$$= \frac{a^2}{2}|(t_1 - t_2)(t_2 - t_3)(t_3 - t_1)|$$

$$= \frac{1}{2} \times \text{Area of } \Delta ABC$$

$$\therefore \quad \frac{\text{Area of } \Delta ABC}{\text{Area of } \Delta PQR} = 2$$

● ***Ex. 23*** *If the orthocentre of the triangle formed by the points t_1, t_2, t_3 on the parabola $y^2 = 4ax$ is the focus, the value of $|t_1t_2 + t_2t_3 + t_3t_1|$ is*

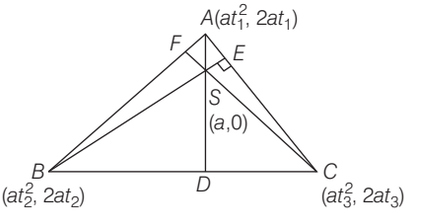
Sol. (5) $\because$ SA is perpendicular to BC[S is focus $(a, 0)$]

$$\Rightarrow \quad \left(\frac{2at_1 - 0}{at_1^2 - a}\right)\left(\frac{2at_3 - 2at_2}{at_3^2 - at_2^2}\right) = -1$$

$$\Rightarrow \quad \left(\frac{2t_1}{t_1^2 - 1}\right)\left(\frac{2}{t_3 + t_2}\right) = -1$$

$$\Rightarrow \quad 4t_1 + t_1^2(t_2 + t_3) = t_2 + t_3 \qquad \ldots(i)$$

Similarly, $\quad 4t_2 + t_2^2(t_3 + t_1) = t_3 + t_1 \qquad \ldots(ii)$



On subtracting Eq. (ii) from Eq. (i), then

$$4 + (t_1t_2 + t_2t_3 + t_3t_1) = -1 \Rightarrow t_1t_2 + t_2t_3 + t_3t_1 = -5$$

$$\therefore \quad |t_1t_2 + t_2t_3 + t_3t_1| = 5$$

JEE Type Solved Examples : Matching Type Questions

- This section contains **one solved example.** Example 24 has three statements (A, B and C) given in **Column I** and five statements (p, q, r, s and t) in **Column II.** Any given statement in **Column I** can have correct matching with one or more statement(s) given in **Column II.**

● ***Ex. 24*** *Match the following.*

	Column I		Column II
(A)	If PQ is any focal chord of the parabola $y^2 = 32x$ and length of PQ can never be less than λ units, then λ is divisible by	(p)	2
(B)	A tangent is drawn to the parabola $y^2 = 4x$ at the point 'P' whose abscissa lies in the interval $[1, 4]$. If maximum possible area of the triangle formed by the tangent at 'P', ordinate of the point 'P' and the X-axis is λ sq units, then λ is divisible by	(q)	3
(C)	The normal at the ends of the latusrectum of the parabola $y^2 = 4x$ meet the parabola again at A and A'. If length $AA' = \lambda$ unit, then λ is divisible by	(r)	4
		(s)	6
		(t)	8

Sol. (A) $\rightarrow$ (p, r, t); (B) $\rightarrow$ (p, r, t); (C) $\rightarrow$ (p, q, r, s)

(A) Let $P(at^2, 2at)$ be any point on the parabola $y^2 = 4ax$ and $S(a, 0)$ be the focus, then the other end of focal chord through P will be $Q\left(\frac{a}{t^2}, -\frac{2a}{t}\right)$.

Then, length of focal chord $PQ = a\left(t + \frac{1}{t}\right)^2$

$\because$ $\quad t + \frac{1}{t} \geq 2 \Rightarrow a\left(t + \frac{1}{t}\right)^2 \geq 4a$

or $\quad PQ \geq 32 \qquad [\because 4a = 32]$

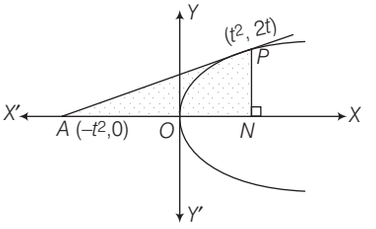
$\therefore \quad \lambda = 32$

(B) Equation of tangent to parabola $y^2 = 4x$ at $P(t^2, 2t)$ is

$$ty = x + t^2$$

Given $\quad t^2 \in [1, 4]$

$\therefore$ Area of $\Delta APN = \frac{1}{2}(AN)(PN)$



$$= \frac{1}{2}(2t^2)(2t)$$

$$\Rightarrow \quad \Delta = 2t^3 = 2(t^2)^{\frac{3}{2}}$$

$\because$ $\quad t^2 \in [1, 4]$

$\Rightarrow$ $\quad \Delta_{\max}$ occurs, when $t^2 = 4$

$$\Rightarrow \quad \Delta_{\max} = 2(4)^{\frac{3}{2}} = 16 \text{ sq units}$$

$$\therefore \quad \lambda = 16$$

(C) Given parabola $y^2 = 4x$. Now, the ends of latusrectum are $P(1, 2)$ and $Q(1, -2)$ or $P(t^2, 2t)$ and $Q(t_1^2, 2t_1)$, where $t = 1$, $t_1 = -1$.

We know that the other end of normal is given by $t_2 = -t - \frac{2}{t}$

$\Rightarrow$ $\quad A(t_2^2, 2t_2)$ and $\quad A'(t_3^2, 2t_3)$,

where $\quad t_2 = -3, t_3 = 3$

or $\quad A(9, -6)$ and $A'(9, 6)$

$\therefore$ $\quad AA' = 12$ units

$\therefore$ $\quad \lambda = 12$

JEE Type Solved Examples :
Statement I and II Type Questions

■ **Directions** (Ex. Nos. 25 and 26) are Assertion-Reason type questions. Each of these question contains two statements :
Statement I (Assertion) and
Statement II (Reason)
Each of these examples also has four alternative choices, only one of which is the correct answer.
You have to select the correct choice

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true, Statement II is false.
(d) Statement I is false, Statement II is true.

● ***Ex. 25*** **Statement I** *Through the point* $(\lambda, \lambda+1)$, $\lambda < 2$, *there cannot be more than one normal to the parabola* $y^2 = 4x$.

Statement II *The point* $(\lambda, \lambda+1)$ *cannot lie inside the parabola* $y^2 = 4x$.

Sol. (b) Let $S = y^2 - 4x$

$\therefore \quad S_1 = (\lambda+1)^2 - 4\lambda = (\lambda-1)^2 \geq 0$

$\therefore$ Point $(\lambda, \lambda+1)$ cannot lie inside the parabola $y^2 = 4x$.

$\therefore$ Statement II is true.

Now, equation of normal at $(t^2, 2t)$ is $y + tx = 2t + t^3$ passes through $(\lambda, \lambda+1)$.

$$\Rightarrow \quad \lambda + 1 + t\lambda = 2t + t^3$$

$$\Rightarrow \quad t^3 + (2-\lambda)t - (\lambda+1) = 0 \qquad \ldots(i)$$

On differentiating w.r.t. t, we get

$$3t^2 + (2-\lambda) > 0, \text{ for } \lambda < 2$$

The cubic Eq. (i) has only one real root.

$\therefore$ Statement I is true.

Hence, both statements are true but Statement II is not correct explanation for Statement I.

● ***Ex. 26*** **Statement I** *If there exist points on the circle* $x^2 + y^2 = \lambda^2$ *from which two perpendicular tangents can be drawn to the parabola* $y^2 = 2x$, *then* $\lambda \geq \frac{1}{2}$.

Statement II *Perpendicular tangents to the parabola meet at the directrix.*

Sol. (a) Statement II is true as it is property of parabola. Equation of directrix of parabola $y^2 = 2x$ is $x = -\frac{1}{2}$.

Any point on directrix is $\left(-\frac{1}{2}, y\right)$, now this point exists on the circle, then

$$\frac{1}{4} + y^2 = \lambda^2$$

$$\Rightarrow \quad y^2 = \lambda^2 - \frac{1}{4} \geq 0$$

$$\therefore \quad \lambda \geq \frac{1}{2}$$

Hence, both statements are true and Statement II is correct explanation for Statement I.

Subjective Type Examples

■ In this section, there are **16 subjective solved examples.**

● ***Ex. 27*** *The two parabolas* $y^2 = 4a(x-l)$ *and* $x^2 = 4a(y-l_1)$ *always touch one another,* l *and* l_1 *being variable parameters. Prove that the point of contact lies on the curve* $xy = 4a^2$.

Sol. Let (h, k) be the common point and if the parabolas touch each other, then the tangents at (h, k) should be identical. Their equations are

$$ky = 2a(x - l + h)$$

$$\Rightarrow \quad 2ax - ky = 2a(l-h) \qquad \ldots(i)$$

and $$hx = 2a(y - l_1 + k)$$

$$\Rightarrow \quad hx - 2ay = 2a(k - l_1) \qquad \ldots(ii)$$

On comparing the coefficients of x and y in Eq. (i) and (ii), we get

$$\frac{2a}{h} = \frac{k}{2a}$$

$$\Rightarrow \quad hk = 4a^2$$

Hence, the locus is $xy = 4a^2$,

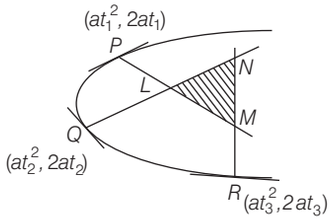
which is independent of l and l_1.

● ***Ex. 28*** *Show that the area formed by the normals to* $y^2 = 4ax$ *at the points* t_1, t_2, t_3 *is* $\frac{1}{2}a^2 |(t_1 - t_2)(t_2 - t_3)(t_3 - t_1)| \lambda^2$, *where* $\lambda = (t_1 + t_2 + t_3)$.

Sol. Equation of normals at P, Q, R are

$$y = -t_1 x + 2at_1 + at_1^3$$

$y = -t_2x + 2at_2 + at_2^3$, $y = -t_3x + 2at_3 + at_3^3$, respectively.



Subtracting them two by two, coordinates of L, M and N are

$$L \equiv \{2a + a(t_1^2 + t_1t_2 + t_2^2), -at_1t_2(t_1 + t_2)\}$$

$$M \equiv \{2a + a(t_1^2 + t_1t_3 + t_3^2), -at_1t_3(t_1 + t_3)\}$$

$$N \equiv \{2a + a(t_2^2 + t_2t_3 + t_3^2), -at_2t_3(t_2 + t_3)\}$$

$\therefore$ Area of ΔLMN

$$= \frac{1}{2}\left|\begin{vmatrix} 2a + a(t_1^2 + t_1t_2 + t_2^2) & -at_1t_2(t_1 + t_2) & 1 \\ 2a + a(t_1^2 + t_1t_3 + t_3^2) & -at_1t_3(t_1 + t_3) & 1 \\ 2a + a(t_2^2 + t_2t_3 + t_3^2) & -at_2t_3(t_2 + t_3) & 1 \end{vmatrix}\right|$$

On applying $R_2 \to R_2 - R_1$ and $R_3 \to R_3 - R_1$

$$= \frac{a^2}{2}\left|\begin{vmatrix} 2 + (t_1^2 + t_1t_2 + t_2^2) & -t_1t_2(t_1 + t_2) & 1 \\ (t_3 - t_2)(t_1 + t_2 + t_3) & t_1(t_3 - t_2)(t_1 + t_2 + t_3) & 0 \\ (t_3 - t_1)(t_1 + t_2 + t_3) & t_2(t_3 - t_1)(t_1 + t_2 + t_3) & 0 \end{vmatrix}\right|$$

Expanding by last column

$$= \frac{a^2}{2}|(t_3 - t_1)(t_3 - t_2)|(t_1 + t_2 + t_3)^2\left|\begin{vmatrix} 1 & t_1 \\ 1 & t_2 \end{vmatrix}\right|$$

$$= \frac{1}{2}a^2|(t_1 - t_2)(t_2 - t_3)(t_3 - t_1)|(t_1 + t_2 + t_3)^2$$

$$= \frac{1}{2}a^2|(t_1 - t_2)(t_2 - t_3)(t_3 - t_1)|\lambda^2$$

Aliter

Equations of sides of ΔLMN formed by the normals are

$$y + t_1x - (2at_1 + at_1^3) = 0$$

$$y + t_2x - (2at_2 + at_2^3) = 0$$

$$y + t_3x - (2at_3 + at_3^3) = 0$$

$\therefore$ Required area $= \dfrac{1}{2|C_1C_2C_3|}\begin{vmatrix} t_1 & 1 & -(2at_1 + at_1^3) \\ t_2 & 1 & -(2at_2 + at_2^3) \\ t_3 & 1 & -(2at_3 + at_3^3) \end{vmatrix}^2$

$$= \frac{a^2}{|2(t_2 - t_3)(t_3 - t_1)(t_1 - t_2)|}\begin{vmatrix} t_1 & 1 & 2t_1 + t_1^3 \\ t_2 & 1 & 2t_2 + t_2^3 \\ t_3 & 1 & 2t_3 + t_3^3 \end{vmatrix}^2$$

$$= \frac{a^2}{2|(t_2 - t_3)(t_3 - t_1)(t_1 - t_2)|}\left\{\begin{vmatrix} t_1 & 1 & 2t_1 \\ t_2 & 1 & 2t_2 \\ t_3 & 1 & 2t_3 \end{vmatrix} + \begin{vmatrix} t_1 & 1 & t_1^3 \\ t_2 & 1 & t_2^3 \\ t_3 & 1 & t_3^3 \end{vmatrix}\right\}^2$$

$$= \frac{a^2}{2|(t_2 - t_3)(t_3 - t_1)(t_1 - t_2)|}$$

$$\{0 - (t_1 - t_2)(t_2 - t_3)(t_3 - t_1)(t_1 + t_2 + t_3)\}^2$$

$$= \frac{1}{2}a^2|(t_1 - t_2)(t_2 - t_3)(t_3 - t_1)|(t_1 + t_2 + t_3)^2$$

$$= \frac{1}{2}a^2|(t_1 - t_2)(t_2 - t_3)(t_3 - t_1)|\lambda^2.$$

● ***Ex. 29*** *Prove that the two parabolas $y^2 = 4ax$ and $y^2 = 4c(x - b)$ cannot have common normal, other than the axis unless $b/(a - c) > 2$.*

Sol. Given parabolas $y^2 = 4ax$ and $y^2 = 4c(x - b)$ have common normals. Then equation of normals in terms of slopes are

$$y = mx - 2am - am^3$$

and $$y = m(x - b) - 2cm - cm^3$$

respectively then normals must be identical, compare the coefficients

$$1 = \frac{2am + am^3}{mb + 2cm + cm^3}$$

$\Rightarrow$ $$m[(c - a)m^2 + (b + 2c - 2a)] = 0,$$

$$m \neq 0 \qquad [\because \text{other than axis}]$$

and $$m^2 = \frac{2a - 2c - b}{c - a},$$

$$m = \pm\sqrt{\frac{2(a - c) - b}{c - a}}$$

$\Rightarrow$ $$m = \pm\sqrt{\left(-2 - \frac{b}{c - a}\right)}$$

$\therefore$ $$-2 - \frac{b}{c - a} > 0$$

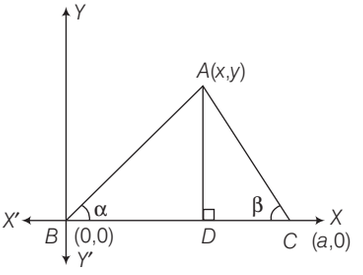
$\Rightarrow$ $$-2 + \frac{b}{a - c} > 0$$

$\Rightarrow$ $$\frac{b}{a - c} > 2$$

● ***Ex. 30*** *If on a given base BC, a triangle is described such that the sum of the tangents of the base angles is m, then prove that the locus of the opposite vertex A is a parabola.*

Sol. Let the given point B and C be $(0, 0)$ and $(a, 0)$, respectively.

Given, $\tan\alpha + \tan\beta = m$ (constant)



$\Rightarrow$ $$\frac{y}{x} + \frac{y}{a - x} = m$$

$\Rightarrow$ $$\frac{ay}{x(a - x)} = m$$

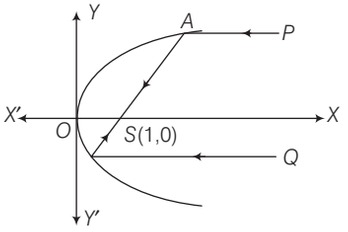
$\therefore$ $$ay = amx - mx^2$$

which is the equation of parabola.

● ***Ex. 31*** *A parabolic mirror is kept along $y^2 = 4x$ and two light rays parallel to its axis are reflected along one straight line. If one of the incident rays is at 3 units distance from the axis, then find the distance of the other incident ray from the axis.*

Sol. Let the incident rays be PA and QB.

After reflection, both rays passes through the focus $S(1, 0)$.



Therefore, AB is a focal chord.

Let A be $(t^2, 2t)$, then B be $\left(\frac{1}{t^2}, \frac{-2}{t}\right)$.

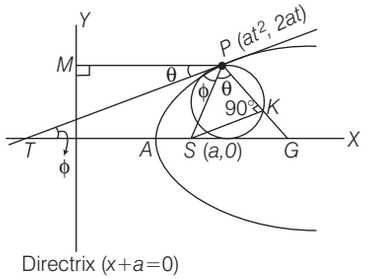
Given, $2t = 3 \ \therefore \ t = 3/2$

Hence, distance of B from the axis of parabola is $\left|-\frac{2}{t}\right| = \frac{4}{3}$ units.

● ***Ex. 32*** *Prove that the length of the intercept on the normal at the point $P(at^2, 2at)$ of a parabola $y^2 = 4ax$ made by the circle on the line joining the focus and point P as diameter is $a\sqrt{(1+t^2)}$.*

Sol. Let the normal at $P(at^2, 2at)$ cut the circle in K and the axis of parabola at G then PK is required intercept.

$$SP = PM = a + at^2$$



Since angle in a semi-circle being right angle.

$\therefore \quad \angle SKP = 90°$

and normal at $P(at^2, 2at)$ is

$$y = -tx + 2at + at^3$$

$$\Rightarrow \quad tx + y - 2at - at^3 = 0 \qquad \ldots(i)$$

$\therefore$ SK is the perpendicular distance from $S(a, 0)$ to the normal (i),

then $$SK = \frac{|at + 0 - 2at - at^3|}{\sqrt{t^2+1}} = a|t|\sqrt{1+t^2}$$

$\therefore$ In ΔSPK, $(Pk)^2 = (SP)^2 - (SK)^2$

$$= a^2(1+t^2)^2 - a^2t^2(1+t^2) = a^2(1+t^2)$$

$$\therefore \quad PK = a\sqrt{(1+t^2)}$$

● ***Ex. 33*** *A parabola of latusrectum $4a$, touches a fixed equal parabola , the axes of the two curves being parallel; prove that the locus of the vertex of the moving curve is a parabola of latusrectum $8a$.*

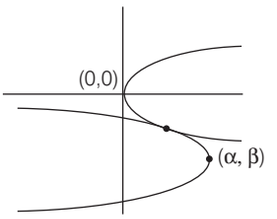
Sol. Let the given parabola is

$$y^2 = 4ax \qquad \ldots(i)$$

If the vertex of moving parabola is (α, β), then equation of moving parabola is

$$(y-\beta)^2 = -4a(x-\alpha) \qquad \ldots(ii)$$

On substituting the value of i.e. $x = \frac{y^2}{4a}$ in Eq. (ii),



then $$(y-\beta)^2 = -4a\left(\frac{y^2}{4a} - \alpha\right)$$

$$\Rightarrow \quad y^2 - 2\beta y + \beta^2 = -y^2 + 4a\alpha$$

$$2y^2 - 2\beta y + \beta^2 - 4a\alpha = 0 \qquad \ldots(iii)$$

Since, two parabolas (i) and (ii) touch each other.

Hence, roots of Eq. (iii) are equal i.e. Discriminant = 0

$$\Rightarrow \quad \text{“}B^2 - 4AC = 0\text{”}$$

$$\therefore \quad (-2\beta)^2 = 4 \cdot 2 \cdot (\beta^2 - 4a\alpha)$$

$$\Rightarrow \quad 4\beta^2 = 32a\alpha$$

or $$\beta^2 = 8a\alpha$$

the required locus is $$y^2 = 8ax$$

which has latusrectum double that of given parabola.

● ***Ex. 34*** *The normal at point P on a given parabola meet the axis of parabola at Q. Then prove that a line through Q and perpendicular to this normal always touches a fixed parabola whose length of latusrectum is same as that of given parabola.*

Sol. Let the equation of parabola is

$$y^2 = 4ax. \qquad \ldots(i)$$

Let $P(at^2, 2at)$

Normal at P is $$y + tx = 2at + at^3$$

$\because$ Normal meet the axis of parabola (i.e. X-axis), then $Q(2a + at^2, 0)$.

Now, equation of the line through Q and perpendicular to the normal is

$$y - 0 = \frac{1}{t}(x - 2a - at^2)$$

$\Rightarrow \quad ty = x - 2a - at^2$

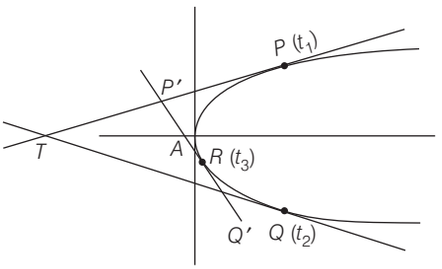
$\Rightarrow \quad ty = (x - 2a) - at^2$

which is clearly tangent to the parabola

$$y^2 = 4a(2a - x).$$

● **Ex. 35** *TP and TQ are any two tangents to a parabola and the tangent at a third point R cuts them in P′ and Q′, prove that* $\frac{TP'}{TP} + \frac{TQ'}{TQ} = 1$.

Sol. Let parabola be $y^2 = 4ax$ and coordinates of P and Q on this parabola are $P \equiv (at_1^2, 2at_1)$ and $Q \equiv (at_2^2, 2at_2)$; T is the point of intersection of tangents at t_1 and t_2.



$\therefore$ Coordinates of $T \equiv \{at_1 t_2, a(t_1 + t_2)\}$

Similarly $\quad P' \equiv \{at_3 t_1, a(t_3 + t_1)\}$

$\quad Q' \equiv \{at_2 t_3, a(t_2 + t_3)\}$

Let $\quad TP' : TP = \lambda : 1$

$\therefore \quad \lambda = \frac{t_3 - t_2}{t_1 - t_2} \quad \Rightarrow \quad \frac{TP'}{TP} = \frac{t_3 - t_2}{t_1 - t_2}$

Similarly, $\quad \frac{TQ'}{TQ} = \frac{t_1 - t_3}{t_1 - t_2}$

$\therefore \quad \frac{TP'}{TP} + \frac{TQ'}{TQ} = 1$

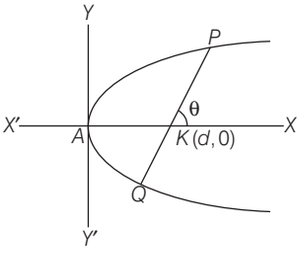
● **Ex. 36** *Prove that on the axis of any parabola there is a certain point 'K' which has the property that, if a chord PQ of parabola be drawn through it, then* $\frac{1}{PK^2} + \frac{1}{QK^2}$ *is the same for all positions of the chord .*

Sol. Any line passing through K is $\frac{x - d}{\cos\theta} = \frac{y - 0}{\sin\theta} = r$

$\therefore$ Coordinates of P and Q are

$$(d + KP\cos\theta, KP\sin\theta)$$

and $\quad (d - KQ\cos\theta, -KQ\sin\theta).$



Points P and Q lie on $y^2 = 4ax$ then

$$(KP)^2 \sin^2\theta = 4a(d + KP\cos\theta) \quad \ldots(i)$$

and $\quad (KQ)^2 \sin^2\theta = 4a(d - KQ\cos\theta) \quad \ldots(ii)$

From Eq. (i), $\quad KP = \frac{4a\cos\theta + \sqrt{(16a^2\cos^2\theta + 16ad\sin^2\theta)}}{2\sin^2\theta}$

From Eq. (ii), $\quad KQ = \frac{-4a\cos\theta + \sqrt{(16a^2\cos^2\theta + 16ad\sin^2\theta)}}{2\sin^2\theta}$

$\therefore \quad \frac{1}{(KP)^2} + \frac{1}{(KQ)^2} = \frac{2a\cos^2\theta + d\sin^2\theta}{2ad^2}$

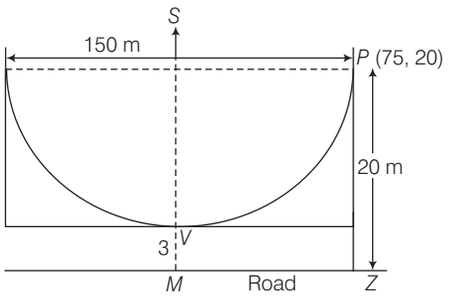
For $d = 2a$

$\therefore \quad \frac{1}{(KP)^2} + \frac{1}{(KQ)^2} = \frac{1}{d^2}$

$= \frac{1}{4a^2}$, which is independent of θ.

● **Ex. 37** *If the distribution of weight is uniform, then the rope of the suspended bridge takes the form of parabola. The height of the supporting towers is* 20 m*, the distance between these towers is* 150 *m and the height of the lowest point of the rope from the road is* 3 m*. Find the equation of the parabolic shape of the rope considering the floor of the bridge as X-axis and the axis of the parabola as Y-axis. Find the height of that tower which supports the rope and is at a distance of* 30 m *from the centre of the road .*

Sol. Here MZ is the road let V is lowest point of the rope given $VZ = 3$ m.



Let MZ is X-axis and let MVS is Y-axis.

Taking X and Y-axes as shown in the given figure, the equation of parabola is of the form

$$x^2 = 4ay$$

if V is origin

Coordinates of P is $\left\{\frac{1}{2}(150), 20 - 3\right\}$ i.e. $(75, 17)$ P lies on Eq. (i), then

$$(75)^2 = 4a(17)$$

or $\quad 4a = \frac{5625}{17}$

From Eq. (i), $\quad x^2 = \frac{5625}{17} y$

Now, shifting the origin (0, 0) to $M(0,-3)$,
then equation of parabola in new form is

$$x^2=\frac{5625}{17}(y-3) \qquad ...(ii)$$

Again, let the required height of supporting tower at a distance of 30 m from the centre of road be h metres, then the coordinates of the top of this tower are $(30, h)$ referred to given axes

from Eq. (ii), $(30)^2=\frac{5625}{17}(h-3)$

$$\therefore \quad h=\left(\frac{900\times17}{5625}\right)+3=5.72 \text{ m}$$

● ***Ex. 38*** *Tangent is drawn at any point (x_1, y_1) on the parabola $y^2=4ax$. Now tangents are drawn from any point on this tangent to the circle $x^2+y^2=a^2$ such that all the chords of contact pass through a fixed point (x_2, y_2). Prove that* $4\left(\frac{x_1}{x_2}\right)+\left(\frac{y_1}{y_2}\right)^2=0.$

Sol. Tangent at (x_1, y_1) on the parabola $y^2=4ax$

$$\therefore \quad yy_1=2a(x+x_1)$$

Any point on this tangent will be $\left(x', \frac{2a(x'+x_1)}{y_1}\right)$

Equation of chord of contact of the point $\left(x', \frac{2a(x'+x_1)}{y_1}\right)$ w.r.t. circle $x^2+y^2=a^2$ is $xx'+y\cdot\frac{2a(x'+x_1)}{y_1}=a^2$

$$\Rightarrow \quad xx'y_1+2ayx'+2ayx_1=a^2y_1$$

$$\Rightarrow \quad (2ayx_1-a^2y_1)+x'(xy_1+2ay)=0$$

which is family of straight lines passing through point of intersection of

$$2ayx_1-a^2y_1=0 \quad \text{and} \quad xy_1+2ay=0$$

$$\therefore \quad y=\frac{ay_1}{2x_1}$$

and $$x=-\frac{2ay}{y_1}=\left(-\frac{2a}{y_1}\right)\left(\frac{ay_1}{2x_1}\right)$$

$$x=-\frac{a^2}{x_1}$$

The fixed point is (x_2, y_2).

$$\therefore \quad x_2=-\frac{a^2}{x_1} \quad \text{and} \quad y_2=\frac{ay_1}{2x_1}$$

$$\therefore \quad 4\left(\frac{x_1}{x_2}\right)+\left(\frac{y_1}{y_2}\right)^2=4\left(\frac{x_1}{-a^2/x_1}\right)+\left(\frac{y_1}{ay_1/2x_1}\right)^2$$

$$=-\frac{4x_1^2}{a^2}+\frac{4x_1^2}{a^2}=0$$

Hence, $4\left(\frac{x_1}{x_2}\right)+\left(\frac{y_1}{y_2}\right)^2=0.$

● ***Ex. 39*** *A variable chord PQ of the parabola $y=4x^2$ subtends a right angle at the vertex. Find the locus of the points of intersection of the normals at P and Q.*

Sol. Parametric point on the parabola

$$y=4x^2 \text{ is } (t, 4t^2)$$

Let $P(t_1, 4t_1^2)$ and $Q(t_2, 4t_2^2)$,
if A is vertex of the parabola, then
Slope of $AP\times$ Slope of $AQ=-1$ $[\because AP\perp AQ]$

$$\therefore \quad 4t_1\times4t_2=-1$$

$$\therefore \quad t_1t_2=-\frac{1}{16}$$

Equations of normals at P and Q are

$$x+4t_1y=t_1+16t_1^3 \qquad ...(i)$$

and $$x+4t_2y=t_2+16t_2^3 \qquad ...(ii)$$

Let the normals (i) and (ii) intersect at (h, k), then on solving Eqs. (i) and (ii), then we get

$$k=\frac{1+16(t_1^2+t_2^2+t_1t_2)}{4}$$

$$\Rightarrow \quad k=\frac{1+16(t_1^2+t_2^2)+16t_1t_2}{4}$$

$$=\frac{1+16((t_1+t_2)^2-2t_1t_2)-1}{4} \qquad [\because 16t_1t_2=-1]$$

$$=4\left\{(t_1+t_2)^2+\frac{1}{8}\right\}$$

$$k=4(t_1+t_2)^2+\frac{1}{2} \qquad ...(iii)$$

Again $$h=-16t_1t_2(t_1+t_2)$$

$$\Rightarrow \quad h=t_1+t_2 \qquad ...(iv)$$

On eliminating t_1 and t_2 from Eqs. (iii) and (iv), we get

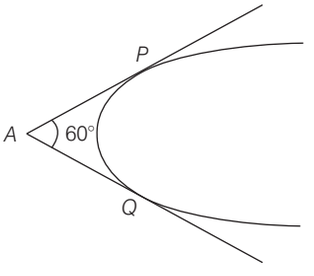
$$k=4h^2+\frac{1}{2}$$

$$\Rightarrow \quad 2k=8h^2+1$$

Hence, locus of (h, k) is $2y=8x^2+1$.

● ***Ex. 40*** *Equilateral triangles are circumscribed to the parabola $y^2=4ax$. Prove that their angular points lie on the conic $(3x+a)(x+3a)=y^2$.*

Sol. Let coordinates of P and Q are $(at_1^2, 2at_1)$ and $(at_2^2, 2at_2)$, respectively.



Tangents at P and Q are $t_1y = x + at_1^2$ and $t_2y = x + at_2^2$, respectively.

Slope of tangents at P and Q are $\frac{1}{t_1}$ and $\frac{1}{t_2}$, respectively.

Let one angular point of equilateral triangle is A.

$\therefore \quad A \equiv (at_1t_2, a(t_1 + t_2))$

Given, $\tan 60° = \left| \frac{\frac{1}{t_1} - \frac{1}{t_2}}{1 + \frac{1}{t_1} \cdot \frac{1}{t_2}} \right| = \left| \frac{t_2 - t_1}{1 + t_1t_2} \right|$

$\Rightarrow \quad (\sqrt{3})^2 (1 + t_1t_2)^2 = (t_2 - t_1)^2$

$\Rightarrow \quad 3(1 + t_1t_2)^2 = (t_1 + t_2)^2 - 4t_1t_2$

For locus of A, put $at_1t_2 = x$ and $a(t_1 + t_2) = y$, then

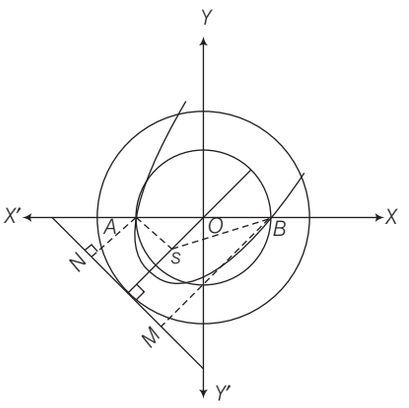
$$3\left(1 + \frac{x}{a}\right)^2 = \left(\frac{y}{a}\right)^2 - 4\frac{x}{a}$$

$\Rightarrow \quad y^2 = 3x^2 + 10ax + 3a^2$

$\therefore \quad (3x + a)(x + 3a) = y^2$

● ***Ex. 41*** *A parabola is drawn to pass through A and B, the ends of diameter of a given circle of radius a and to have a directrix a tangent to a concentric circle of radius b, the axes being AB and the perpendicular diameter. Prove that the locus of the focus of the parabola is* $\frac{x^2}{b^2} + \frac{y^2}{b^2 - a^2} = 1$.

Sol. Let AB be taken along X-axis, it mid-point O as origin and a line through O perpendicular to AB as Y-axis.



Equation of circle on AB as diameter is

$$x^2 + y^2 = a^2 \qquad \ldots(i)$$

The equation of a circle of radius b and concentric to circle (i) is

$$x^2 + y^2 = b^2 \qquad \ldots(ii)$$

Let $S(h, k)$ be the focus of the parabola which passes through $A(-a, 0)$ and $B(a, 0)$.

Let equation of tangent to circle (ii) be

$$x\cos\theta + y\sin\theta = 6. \qquad \ldots(iii)$$

This is taken as directrix, then

$$SP = PM$$

$\Rightarrow \quad BS = BM \Rightarrow (h - a)^2 + (k - 0)^2 = (a\cos\theta - b)^2 \qquad \ldots(iv)$

and $\quad AS = AN$

$\Rightarrow \quad (h + a)^2 + (k - 0)^2 = (a\cos\theta + b)^2 \qquad \ldots(v)$

On adding Eqs. (iv) and (v), then

$$a^2\cos^2\theta + b^2 = h^2 + k^2 + a^2 \qquad \ldots(vi)$$

On subtracting Eq. (iv) from Eq. (v), then

$$4ab\cos\theta = 4ah \text{ or } \cos\theta = \frac{h}{b} \qquad \ldots(vii)$$

From Eqs. (vi) and (vii), we get

$$\frac{a^2h^2}{b^2} + b^2 = h^2 + k^2 + a^2$$

$\Rightarrow \quad h^2\frac{(b^2 - a^2)}{a^2} + k^2 = b^2 - a^2$

$\Rightarrow \quad \frac{h^2}{a^2} + \frac{k^2}{b^2 - a^2} = 1$

Hence, the locus of $S(h, k)$ is

$$\frac{x^2}{a^2} + \frac{y^2}{b^2 - a^2} = 1.$$

● ***Ex. 42*** *Two straight lines are at right angles to one another and one of them touches* $y^2 = 4a(x + a)$ *and the other* $y^2 = 4b(x + b)$ *. Prove that the point of intersection of the lines lies on the line* $x + a + b = 0$.

Sol. We know that any tangent in terms of slope (m) of the parabola $y^2 = 4ax$ is $y = mx + \frac{a}{m}$.

Replacing x by $x + a$, we get

$$y = m(x + a) + \frac{a}{m} \text{ which is tangent to}$$

$$y^2 = 4a(x + a) \qquad \ldots(i)$$

Similarly, tangent in terms of slope of $y^2 = 4b(x + b)$ is

$$y = m_1(x + b) + \frac{b}{m_1} \qquad \ldots(ii)$$

Given tangents are perpendicular, we have

$$mm_1 = -1 \quad \text{or} \quad m_1 = -\frac{1}{m}$$

then Eq. (ii) becomes $y = -\frac{(x + b)}{m} - bm$

On subtracting Eqs. (i) and (ii), then

$$0 = (x + a + b)\left(m + \frac{1}{m}\right)$$

$\Rightarrow \quad m + \frac{1}{m} \neq 0$

Hence, $\quad x + a + b = 0$

Parabola Exercise 1 :
Single Option Correct Type Questions

■ This section contains **30 multiple choice questions.** Each question has four choices (a), (b), (c) and (d) out of which **ONLY ONE** is correct

1. A common tangent is drawn to the circle $x^2 + y^2 = a^2$ and the parabola $y^2 = 4bx$. If the angle which this tangent makes with the axis of x is $\frac{\pi}{4}$, then the relationship between a and b is $(a, b > 0)$

(a) $b = \sqrt{2}a$ (b) $a = b\sqrt{2}$ (c) $c = 2a$ (d) $a = 2c$

2. The equation of parabola whose vertex and focus lie on the axis of x at distances a and a_1 from the origin respectively, is

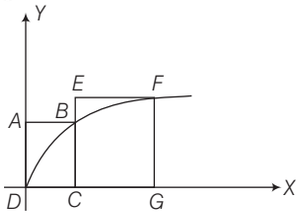
(a) $y^2 = 4(a_1 - a)x$ (b) $y^2 = 4(a_1 - a)(x - a)$

(c) $y^2 = 4(a_1 - a)(x - a_1)$ (d) $y^2 = 4aa_1 x$

3. If parabolas $y^2 = ax$ and $25[(x-3)^2 + (y+2)^2] = (3x - 4y - 2)^2$ are equal, then the value of a is

(a) 3 (b) 6 (c) 7 (d) 9

4. $ABCD$ and $EFGC$ are squares and the curve $y = \lambda\sqrt{x}$ passes through the origin D and the points B and F. The ratio $\frac{FG}{BC}$ is



(a) $\frac{\sqrt{3}+1}{4}$ (b) $\frac{\sqrt{3}+1}{2}$ (c) $\frac{\sqrt{5}+1}{4}$ (d) $\frac{\sqrt{5}+1}{2}$

5. Let A and B be two points on a parabola $y^2 = x$ with vertex V such that VA is perpendicular to VB and θ is the angle between the chord VA and the axis of the parabola. The value of $\frac{|VA|}{|VB|}$ is

(a) $\tan\theta$ (b) $\cot^2\theta$ (c) $\tan^3\theta$ (d) $\cot^3\theta$

6. The vertex of the parabola whose parametric equation is $x = t^2 - t + 1, y = t^2 + t + 1, t \in R$, is

(a) (1, 1) (b) (2, 2) (c) (3, 3) (d) $\left(\frac{1}{2}, \frac{1}{2}\right)$

7. The circle $x^2 + y^2 + 2px = 0$, $p \in R$, touches the parabola $y^2 = 4x$ externally, then

(a) $p > 0$ (b) $p < 0$ (c) $p > 1$ (d) $p > 2$

8. If $a \neq 0$ and the line $2bx + 3cy + 4d = 0$ passes through the points of intersection of the parabolas $y^2 = 4ax$ and $x^2 = 4ay$, then

(a) $d^2 + (2b + 3c)^2 = 0$ (b) $d^2 + (3b + 2c)^2 = a^2$

(c) $d^2 + (2b - 3c)^2 = 0$ (d) $d^2 + (2b + 3c)^2 = a^2$

9. A parabola $y = ax^2 + bx + c$ crosses the X-axis at $(\alpha, 0)$ and $(\beta, 0)$ both to the right of the origin. A circle also passes through these two points. The length of a tangent from the origin to the circle is

(a) $\sqrt{\frac{bc}{a}}$ (b) ac^2 (c) $\frac{b}{a}$ (d) $\sqrt{\frac{c}{a}}$

10. Two mutually perpendicular tangent of the parabola $y^2 = 4ax$ meet the axis at P_1 and P_2. It S is the focus of the parabola, then $\frac{1}{SP_1} + \frac{1}{SP_2}$ is equal to

(a) $\frac{1}{4a}$ (b) $\frac{1}{a}$ (c) $\frac{2}{a}$ (d) $\frac{4}{a}$

11. If the normal to the parabola $y^2 = 4ax$ at P meets the curve again at Q and if PQ and the normal at Q make angles α and β respectively with the X-axis, then $\tan\alpha(\tan\alpha + \tan\beta)$ has the value equal to

(a) -2 (b) -1 (c) $-\frac{1}{2}$ (d) 0

12. If the normals to the parabola $y^2 = 4ax$ at three points P, Q and R meet at A and S is the focus, then $SP \cdot SQ \cdot SR$ is equal to

(a) $(SA)^2$ (b) $(SA)^3$ (c) $a(SA)^2$ (d) $a(SA)^3$

13. The length of the shortest normal chord of the parabola $y^2 = 4ax$ is

(a) $2a\sqrt{27}$ (b) $9a$ (c) $a\sqrt{54}$ (d) $18a$

14. The largest value of a for which the circle $x^2 + y^2 = a^2$ falls totally in the interior of the parabola $y^2 = 4(x + 4)$ is

(a) $4\sqrt{3}$ (b) 4 (c) $\frac{4\sqrt{6}}{7}$ (d) $2\sqrt{3}$

15. From a point $(\sin\theta, \cos\theta)$, if three normals can be drawn to the parabola $y^2 = 4ax$, then the value of a is

(a) $\left(\frac{1}{2}, 1\right)$ (b) $\left[-\frac{1}{2}, 0\right)$

(c) $\left[\frac{1}{2}, 1\right]$ (d) $\left(\frac{-1}{2}, 0\right) \cup \left(0, \frac{1}{2}\right)$

16. If two different tangents of $y^2 = 4x$ are the normals to $x^2 = 4$ by, then

(a) $|b| < \frac{1}{2\sqrt{2}}$ (b) $|b| < \frac{1}{\sqrt{2}}$

(c) $|b| > \frac{1}{2\sqrt{2}}$ (d) $|b| > \frac{1}{\sqrt{2}}$

17. The shortest distance between the parabolas $2y^2 = 2x - 1$ and $2x^2 = 2y - 1$ is

(a) $\frac{1}{2\sqrt{2}}$ (b) $\frac{1}{2}$ (c) $2\sqrt{2}$ (d) 4

18. Normals at two points (x_1, y_1) and (x_2, y_2) of the parabola $y^2 = 4x$ meet again on the parabola, where $x_1 + x_2 = 4$, then $|y_1 + y_2|$ is equal to

(a) $\sqrt{2}$ (b) $2\sqrt{2}$ (c) $4\sqrt{2}$ (d) $8\sqrt{2}$

19. A line is drawn from $A(-2, 0)$ to intersect the curve $y^2 = 4x$ at P and Q in the first quadrant such that $\frac{1}{AP} + \frac{1}{AQ} < \frac{1}{4}$. Then the slope of the line is always

(a) $< \frac{1}{\sqrt{3}}$ (b) $> \frac{1}{\sqrt{3}}$ (c) $> \sqrt{2}$ (d) $> \sqrt{3}$

20. An equilateral triangle SAB is inscribed in the parabola $y^2 = 4ax$ having its focus at S. If chord AB lies towards the left of S, then the side length of this triangle is

(a) $a(2 - \sqrt{3})$ (b) $2a(2 - \sqrt{3})$

(c) $4a(2 - \sqrt{3})$ (d) $8a(2 - \sqrt{3})$

21. Let C be a circle with centre (0, 1) and radius unity. P is the parabola $y = ax^2$. The set of values of a for which they meet at a point other than origin is

(a) $(0, \infty)$ (b) $\left(0, \frac{1}{2}\right)$ (c) $\left(\frac{1}{4}, \frac{1}{2}\right)$ (d) $\left(\frac{1}{2}, \infty\right)$

22. Let S be the focus of $y^2 = 4x$ and a point P be moving on the curve such that its abscissa is increasing at the rate of 4 units/s. Then the rate of increase of the projection of SP on $x + y = 1$ when p is at (4, 4) is

(a) $-\sqrt{2}$ (b) $-\frac{3}{\sqrt{2}}$ (c) -1 (d) $\sqrt{2}$

23. If P is a point on the parabola $y^2 = 3(2x - 3)$ and M is the foot of perpendicular drawn from P on the directrix of the parabola, then the length of each side of the equilateral triangle SMP, where S is the focus of the parabola, is

(a) 2 (b) 4 (c) 6 (d) 8

24. Consider the parabola $y^2 = 4x$. Let $A \equiv (4, -4)$ and $B \equiv (9, 6)$ be two fixed points on the parabola. Let C be a moving point on the parabola between A and B such that the area of the triangle ABC is maximum. Then the coordinates of C are

(a) $\left(\frac{1}{4}, 1\right)$ (b) $(3, -2\sqrt{3})$

(c) $(3, 2\sqrt{3})$ (d) (4, 4)

25. Through the vertex O of the parabola $y^2 = 4ax$, two chords OP and OQ are drawn and the circles on OP and OQ as diameters intersect at R. If θ_1, θ_2 and ϕ are the angles made with the axis by the tangents at P and Q on the parabola and by OR, then the value of $\cot\theta_1 + \cot\theta_2$ is

(a) $-2\tan\phi$ (b) $2\tan\phi$

(c) 0 (d) $2\cot\phi$

26. AB is a double ordinate of the parabola $y^2 = 4ax$. Tangents drawn to the parabola at A and B meet the Y-axis at A_1 and B_1 respectively. If the area of trapezium AA_1B_1B is equal to $24a^2$, then the angle subtended by A_1B_1 at the focus of the parabola is equal to

(a) $\tan^{-1}2$ (b) $\tan^{-1}3$ (c) $2\tan^{-1}2$ (d) $2\tan^{-1}3$

27. If the 4th term in the expansion of $\left(px + \frac{1}{x}\right)^n$, $n \in N$ is $\frac{5}{2}$ and three normals to the parabola $y^2 = x$ are drawn through a point $(q, 0)$, then

(a) $q = p$ (b) $q > p$ (c) $q < p$ (d) $pq = 1$

28. The set of points on the axis of the parabola $y^2 - 4x - 2y + 5 = 0$ from which all the three normals to the parabola are real is

(a) $(k, 0); k > 1$ (b) $(k, 1); k > 3$

(c) $(k, 2); k > 6$ (d) $(k, 3); k > 8$

29. The triangle formed by the tangent to the parabola $y = x^2$ at the point whose abscissa is x_0 ($x_0 \in [1, 2]$), the Y-axis and the straight line $y = x_0^2$ has the greatest area if x_0 is equal to

(a) 0 (b) 1 (c) 2 (d) 3

30. The set of points (x, y) whose distance from the line $y = 2x + 2$ is the same as the distance from (2, 0) is a parabola. This parabola is congruent to the parabola in standard from $y = kx^2$ for some k which is equal to

(a) $\frac{4}{\sqrt{5}}$ (b) $\frac{12}{\sqrt{5}}$ (c) $\frac{\sqrt{5}}{4}$ (d) $\frac{\sqrt{5}}{12}$

Parabola Exercise 2 :
More than One Correct Option Type Questions

This section contains **15 multiple choice questions**. Each question has four choices (a), (b), (c) and (d) out of which **MORE THAN ONE** may be correct.

31. Equation of the common tangent to the circle $x^2 + y^2 = 50$ and the parabola $y^2 = 40x$ can be
(a) $x + y - 10 = 0$ (b) $x - y + 10 = 0$
(c) $x + y + 10 = 0$ (d) $x - y - 10 = 0$

32. Let PQ be a chord of the parabola $y^2 = 4x$. A circle drawn with PQ as a diameter passes through the vertex V of the parabola. If area of $\Delta PVQ = 20$ unit^2, then the coordinates of P are
(a) $(16,8)$ (b) $(16, -8)$
(c) $(-16, 8)$ (d) $(-16, -8)$

33. Let $y^2 = 4ax$ be a parabola and $x^2 + y^2 + 2bx = 0$ be a circle. If parabola and circle touch each other externally, then
(a) $a > 0, b < 0$ (b) $a > 0, b > 0$
(c) $a < 0, b > 0$ (d) $a < 0, b < 0$

34. Tangent is drawn at any point (x_1, y_1) other than the vertex on the parabola $y^2 = 4ax$. If tangents are drawn from any point on this tangent to the circle $x^2 + y^2 = a^2$ such that all the chords of chords of contact pass through a fixed point (x_2, y_2), then
(a) x_1, a, x_2 are in GP (b) $\frac{y_1}{2}, a, y_2$ are in GP
(c) $-4, \frac{y_1}{y_2}, \frac{x_1}{x_2}$ are in GP (d) $x_1x_2 + y_1y_2 = a^2$

35. Let P, Q and R are three co-normal points on the parabola $y^2 = 4ax$. Then the correct statement(s) is/at
(a) algebraic sum of the slopes of the normals at P, Q and R vanishes
(b) algebraic sum of the ordinates of the points P, Q and R vanishes
(c) centroid of the triangle PQR lies on the axis of the parabola
(d) Circle circumscribing the triangle PQR passes through the vertex of the parabola

36. Let P be a point whose coordinates differ by unity and the point does not lie on any of the axes of reference. If the parabola $y^2 = 4x + 1$ passes through P, then the ordinate of P may be
(a) 3 (b) -1
(c) 5 (d) 1

37. If a point P on $y^2 = 4x$, the foot of the perpendicular from P on the directrix and the focus form an equilateral triangle, then the coordinates of P may be
(a) $(3, -2\sqrt{3})$ (b) $(-3, 2\sqrt{3})$
(c) $(3, 2\sqrt{3})$ (d) $(-3, -2\sqrt{3})$

38. The locus of the foot of the perpendicular from the focus on a tangent to the parabola $y^2 = 4ax$ is
(a) the directrix (b) the tangent at the vertex
(c) $x = a$ (d) $x = 0$

39. The extremities of latusrectum of a parabola are (1, 1) and (1, −1). Then the equation of the parabola can be
(a) $y^2 = 2x - 1$ (b) $y^2 = 1 - 2x$
(c) $y^2 = 2x - 3$ (d) $y^2 = 2x - 4$

40. If from the vertex of a parabola $y^2 = 4ax$ a pair of chords be drawn at right angles to one another and with these chords as adjacent sides a rectangle be made, then the locus of the further angle of the rectangle is
(a) an equal parabola
(b) a parabola with focus at $(8a, 0)$
(c) a parabola with directrix as $x - 7a = 0$
(d) not a parabola

41. If two chords drawn from the point (4, 4) to the parabola $x^2 = 4y$ are divided by the line $y = mx$ in the ratio 1 : 2, then
(a) $m \in (-\infty, -\sqrt{3})$ (b) $m \in (-\infty, -\sqrt{3} - 1)$
(c) $m \in (\sqrt{3}, \infty)$ (d) $m \in (\sqrt{3} - 1, \infty)$

42. Through a point $P(-2, 0)$, tangents PQ and PR are drawn to the parabola $y^2 = 8x$. Two circles each passing through the focus of the parabola and one touching at Q and the other at R are drawn. Which of the following point (s) with respect to the triangle PQR lie (s) on the common chord of the two circles?
(a) centroid (b) orthocentre
(c) incentre (d) circumcentre

43. The set of points on the axis of the parabola $(y-2)^2 = 4\left(x - \frac{1}{2}\right)$ from which three distinct normals can be drawn to the parabola are
(a) (3, 2) (b) (1, 2)
(c) (4, 2) (d) (5, 2)

44. Three normals are drawn from the point (14, 7) to the curve $y^2 - 16x - 8y = 0$. Then the coordinates of the feet of the normals are
(a) $(3, -4)$ (b) (8, 16)
(c) (0, 0) (d) (2, 2)

45. A quadrilateral is inscribed in a parabola, then
(a) the quadrilateral may be cyclic
(b) diagonals of the quadrilateral may be equal
(c) all possible pairs of adjacent sides may be perpendicular
(d) None of the above

Parabola Exercise 3 : Paragraph Based Questions

- This section contains **8 paragraphs** based upon each of the paragraph **3 multiple choice questions** have to be answered. Each of these questions has four choices (a), (b), (c) and (d) out of which **ONLY ONE** is correct.

Paragraph I

(Q. Nos. 46 to 48)

Consider a parabola P touches coordinate axes at $(4, 0)$ *and* $(0, 3)$.

46. If focus of parabola P is (a, b), then the value of $b - a$ is
(a) $\frac{1}{25}$ (b) $\frac{3}{25}$ (c) $\frac{4}{25}$ (d) $\frac{12}{25}$

47. Length of latus rectum of parabola P is
(a) $\frac{72}{125}$ (b) $\frac{144}{125}$
(c) $\frac{288}{125}$ (d) $\frac{576}{125}$

48. Equation of directrix of parabola P is
(a) $4x + 3y = 0$ (b) $3x + 4y = 12$
(c) $3x + 4y = 0$ (d) $4x + 3y = 12$

Paragraph II

(Q. Nos. 49 to 51)

Let C be the locus of the circumcentre of a variable triangle having sides Y-axis, $y = 2$ *and* $ax + by = 1$, *where* (a, b) *lies on the parabola* $y^2 = 4\lambda x$.

49. For $\lambda = 2$, the product of coordinates of the vertex of the curve C is
(a) -8 (b) -6 (c) 6 (d) 8

50. For $\lambda = \frac{1}{32}$, the length of smallest focal chord of the curve C is
(a) $\frac{8}{3}$ (b) 2 (c) 4 (d) 8

51. The curve C is symmetrical about the line
(a) $x = -\frac{3}{2}$ (b) $y = -\frac{3}{2}$
(c) $x = \frac{3}{2}$ (d) $y = \frac{3}{2}$

Paragraph III

(Q. Nos. 52 to 54)

Consider a parabola (P) $x^2 - 4xy + 4y^2 - 32x + 4y + 16 = 0$.

52. The focus of the parabola (P) is
(a) $(2, 1)$ (b) $(-2, 1)$ (c) $(-2, -1)$ (d) $(2, -1)$

53. Length of latusrectum of the parabola (P) is
(a) $\frac{3}{\sqrt{5}}$ (b) $\frac{6}{\sqrt{5}}$ (c) $\frac{12}{\sqrt{5}}$ (d) $\frac{24}{\sqrt{5}}$

54. Equation of directrix of parabola (P) is
(a) $x - 2y - 4 = 0$ (b) $2x + y - 3 = 0$
(c) $x - 2y + 4 = 0$ (d) $2x + y + 3 = 0$

Paragraph IV

(Q. Nos. 55 to 57)

If l and m are variable real numbers such that $5l^2 - 4lm + 6m^2 + 3l = 0$, *then the variable line* $lx + my = 1$ *always touches a fixed parabola, whose axis is parallel to the X-axis.*

55. If (a, b) is the vertex of the parabola, then the value of $|a - b|$ is
(a) 2 (b) 3
(c) 4 (d) 5

56. If (c, d) is the focus of the parabola, then the value of $2^{|d-c|}$ is
(a) 1 (b) 2 (c) 4 (d) 8

57. If $ex + f = 0$ is directrix of the parabola and e, f are prime numbers, then the value of $|e - f|$ is
(a) 2 (b) 4
(c) 6 (d) 8

Paragraph V

(Q. Nos. 58 to 60)

C_1 is a curve $y^2 = 4x$, *C_2 is curve obtained by rotating C_1, 120° in anti-clockwise direction C_3 is reflection of C_2 with respect to* $y = x$ *and S_1, S_2, S_3 are focii of C_1, C_2 and C_3, respectively, where O is origin.*

58. If $(t^2, 2t)$ are parametric form of curve C_1, then the parametric form of curve C_2 is

(a) $\left(\frac{1}{2}(t^2 + 2\sqrt{3}t), \frac{1}{2}(\sqrt{3}t^2 + 2t)\right)$

(b) $\left(\frac{1}{2}(-t^2 + 2\sqrt{3}t), \frac{1}{2}(\sqrt{3}t^2 + 2t)\right)$

(c) $\left(\frac{1}{2}(-t^2 + 2\sqrt{3}t), \frac{1}{2}(-\sqrt{3}t^2 + 2t)\right)$

(d) $\left(\frac{1}{2}(-t^2 + 2\sqrt{3}t), \frac{1}{2}(-\sqrt{3}t^2 - 2t)\right)$

59. Area of ΔOS_2S_3 is

(a) $\frac{1}{8}$ (b) $\frac{1}{4}$

(c) $\frac{1}{2}$ (d) 1

60. If $S_1(x_1, y_1)$, $S_2(x_2, y_2)$ and $S_3(x_3, y_3)$, then the value of $\Sigma x_1^2 + \Sigma y_1^2$ is

(a) 2 (b) 3

(c) 4 (d) 5

Paragraph VI

(Q. Nos. 61 to 63)

Tangent to the parabola $y = x^2 + ax + 1$ at the point of intersection of the Y-axis also touches the circle $x^2 + y^2 = c^2$. It is known that no point of the parabola is below X-axis.

61. The value of $5c^2$ when a attains its maximum value is

(a) 1 (b) 3

(c) 5 (d) 7

62. The slope of the tangent when C is maximum, is

(a) -1 (b) 0 (c) 1 (d) 2

63. Let Δ be the minimum area bounded by the tangent and the coordinate axes, then the value of 8Δ is

(a) 1 (b) 2 (c) 4 (d) 8

Paragraph VII

(Q. Nos. 64 to 66)

A parabola (P) touches the conic

$$x^2 + xy + y^2 - 2x - 2y + 1 = 0$$

at the points when it is cut by the line $x + y + 1 = 0$.

64. If equation of parabola (P) is $ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$, then the value of $|a + b + c + f + g + h|$ is

(a) 8 (b) 10 (c) 12 (d) 14

65. The length of latusrectum of parabola (P) is

(a) $\sqrt{2}$ (b) $3\sqrt{2}$ (c) $5\sqrt{2}$ (d) $7\sqrt{2}$

66. If (a, b) is the vertex of the parabola (P), then the value of $|a - b|$ is

(a) 0 (b) $\frac{1}{2}$ (c) 1 (d) $\frac{3}{2}$

Paragraph VIII

(Q. Nos. 67 to 69)

$y = 3x$ is tangent to the parabola $2y = ax^2 + b$.

67. The minimum value of $a + b$ is

(a) 2 (b) 4 (c) 6 (d) 8

68. If $(2, 6)$ is the point of contact, then the value of $2a$ is

(a) 2 (b) 3 (c) 4 (d) 5

69. If $b = 18$, then the point of contact is

(a) (1, 3) (b) (2, 6)

(c) (3, 9) (d) (6, 18)

Parabola Exercise 4 : Single Integer Answer Type Questions

- This section contains **10 questions**. The answer to each question is a **single digit integer**, ranging from 0 to 9 (both inclusive).

70. Two tangents are drawn from the point $(-2, -1)$ to the parabola $y^2 = 4x$. If θ is the angle between these tangents, then the value of $\tan\theta$ is

71. If the distances of two points P and Q from the focus of a parabola $y^2 = 4x$ are 4 and 9 respectively, the distance of the point of intersection of tangents at P and Q from the focus is

72. The tangents and normals are drawn at the extremities of the latusrectum of the parabola $y^2 = 4x$. The area of quadrilateral so formed is λ sq units, the value of λ is

73. Three normals are drawn from the point $(a, 0)$ to the parabola $y^2 = x$. One normal is the X-axis. If other two normals are perpendicular to each other, then the value of $4a$ is

74. AB is the chord of the parabola $y^2 = 6x$ with the vertex at A. BC is drawn perpendicular to AB meeting the axis at C. The projection of BC on the axis is λ units, then the value of λ is

75. The parabolas $y = x^2 - 9$ and $y = \lambda x^2$ intersect at points A and B. If length of AB is equal to $2a$ and if $\lambda a^2 + \mu = a^2$, then the value of μ is

76. Let n be the number of integral points lying inside the parabola $y^2 = 8x$ and circle $x^2 + y^2 = 16$, then the sum of the digits of number n is

77. Radius of the largest circle which passes through the focus of the parabola $y^2 = 4x$ and contained in it, is

78. If the circle $(x-6)^2 + y^2 = r^2$ and the parabola $y^2 = 4x$ have maximum number of common chords, then the least integral value of r is

79. The slope of the line which belongs to the family of lines $(1+a)x + (a-1)y + 2(1-a) = 0$ and makes shortest intercept on $x^2 - 4y + 4 = 0$ is

Parabola Exercise 5 : Matching Type Questions

- This section contains **3 questions.** Each question has four statements (A, B, C and D) given in **Column** I and four statements (p, q, r and s) in **Column** II. Any given statement in **Column** I can have correct matching with one or more statement(s) given in **Column** II.

80. Match the following.

	Column I		**Column II**
(A)	The number of common chords of the parabola $x = y^2 - 6y + 11$ and $y = x^2 - 6x + 11$ is	(p)	Prime number
(B)	AB is a chord of the parabola $y^2 = 4x$ with vertex A, BC is drawn perpendicular to AB meeting the axis at C. The projection of BC on the axis of the parabola is	(q)	Composite number
(C)	The maximum number of common normals of $y^2 = 4ax$ and $x^2 = 4by$ is	(r)	Perfect number
(D)	If the locus of the middle of point of contact of tangents drawn to the parabola $y^2 = 8x$ and the foot of perpendicular drawn from its focus to the tangents is a conic, then the length of latusrectum of this conic is	(s)	Even number

81. Match the following.

	Column I		**Column II**
(A)	If the parabola $x^2 = ay$ makes an intercept of length $\sqrt{40}$ on the line $y - 2x = 1$, then the values of a are	(p)	-2
(B)	If the tangents drawn from the point $(0, 2)$ to the parabola $y^2 = 4ax$ are inclined at an angle $\frac{3\pi}{4}$, then the values of a are	(q)	1
(C)	If two distinct chords of a parabola $y^2 = 4ax$ passing through $(a, 2a)$ are bisected on the line $x + y = 1$, then the length of latusrectum can be	(r)	2
(D)	If the focus of the parabola $x^2 - ay + 3 = 0$ is $(0, 2)$ and if two values of a are a_1, a_2 such that $a_1 > a_2$, then the value of $\frac{a_1}{a_2}$ is	(s)	3

82. Match the following.

	Column I		**Column II**
(A)	The common chord of the circle $x^2 + y^2 = 5$ and the parabola $6y = 5x^2 + 7x$ will passes through the point (s)	(p)	$(1, 2)$
(B)	Tangents are drawn from point $(2, 3)$ to the parabola $y^2 = 4x$. Then, the points of contact are	(q)	$(4, 4)$
(C)	From a point P on the circle $x^2 + y^2 = 5$, the equation of chord of contact to the parabola $y^2 = 4x$ is $y = 2(x - 2)$. Then, the coordinates of point P will be	(r)	$(-2, 1)$
(D)	$P(4, -4)$ and Q are points on the parabola $y^2 = 4x$ such that the area of ΔPOQ is 6 sq units, where O is the vertex. Then, the coordinates of Q may be	(s)	$(9, -6)$

Parabola Exercise 6 :
Statement I and II Type Questions

■ **Directions** (Q. Nos. 83 to 90) are Assertion-Reason type questions. Each of these questions contains two statements:
Statement I (Assertion) and
Statement II (Reason)
Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select the correct choice as given below :

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(c) Statement I is true, Statement II is false
(d) Statement I is false, Statement II is true

83. **Statement I** The equation of the common tangent to the parabolas $y^2 = 4x$ and $x^2 = 4y$ is $x + y + 1 = 0$.

Statement II Both the parabolas are reflected to each other about the line $y = x$.

84. **Statement I** Two perpendicular normals can be drawn from the point $\left(\frac{5}{2}, -2\right)$ to the parabola $(y+2)^2 = 2(x-1)$.

Statement II Two perpendicular normals can be drawn from the point $(3a, 0)$ to the parabola $y^2 = 4ax$.

85. **Statement I** The line $y = mx + \frac{a}{m}$ is tangent to the parabola $y^2 = 4ax$ for all values of m.

Statement II A straight line $y = mx + c$ that intersects the parabola $y^2 = 4ax$ one point is a tangent line.

86. **Statement I** The conic $\sqrt{ax} + \sqrt{by} = 1$ represents a parabola.

Statement II Conic $ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$ represents a parabola, if $h^2 = ab$.

87. **Statement I** The lines from the vertex to the two extremities of a focal chord of the parabola $y^2 = 4ax$ are perpendicular to each other.

Statement II If extremities of focal chord of a parabola are $(at_1^2, 2at_1)$ and $(at_2^2, 2at_2)$, then $t_1 t_2 = -1$.

88. **Statement I** Length of focal chord of a parabola $y^2 = 8x$ making an angle of $60°$ with X-axis is $32/3$.

Statement II Length of focal chord of a parabola $y^2 = 4ax$ making an angle α with X-axis is $4a\sec^2(\alpha/2)$.

89. **Statement I** Straight line $x + y = \lambda$ touch the parabola $y = x - x^2$, if $k = 1$.

Statement II Discriminant of $(x-1)^2 = x - x^2$ is zero.

90. **Statement I** Length of latusrectum of parabola $(3x + 4y + 5)^2 = 4(4x + 3y + 2)$ is 4.

Statement II Length of latusrectum of parabola $y^2 = 4ax$ is $4a$.

Parabola Exercise 7 :
Subjective Type Questions

■ In this section, there are **15 subjective questions**.

91. If the tangent to the parabola $y^2 = 4ax$ meets the axis in T and tangent at the vertex A in Y and the rectangle $TAYG$ is completed, show that the locus of G is $y^2 + ax = 0$.

92. If incident ray from point $(-1, 2)$ parallel to the axis of the parabola $y^2 = 4x$ strikes the parabola, find the equation of the reflected ray.

93. Prove that the normal chord to a parabola at the point whose ordinate is equal to the abscissa subtends a right angle at the focus.

94. Find the shortest distance between the parabola $y^2 = 4x$ and circle $x^2 + y^2 - 24y + 128 = 0$.

95. Show that the locus of a point that divides a chord of slope 2 of the parabola $y^2 = 4x$ internally in the ratio 1 : 2 is a parabola. Find the vertex of this parabola.

96. Show that the locus of the points of intersection of tangents to $y^2 = 4ax$, which intercept a constant length d on the directrix is $(y^2 - 4ax)(x + a)^2 = d^2x^2$.

97. Through the vertex O of the parabola $y^2 = 4ax$ two chords OP and OQ are drawn and the circle on OP and OQ as diameters intersect in R. If θ_1 and θ_2 are the angles made with the axes by the tangents at P and Q to the parabola and ϕ is the angle made by OR with the axis of the parabola, then prove that $\cot\theta_1 + \cot\theta_2 + 2\tan\phi = 0$.

98. Three normals with slopes m_1, m_2 and m_3 are drawn from a point P not on the axis of the parabola $y^2 = 4x$. If $m_1m_2 = \alpha$, results in the locus of P being a part of the parabola, find the value of α.

99. Find the locus of centres of a family of circles passing through the vertex of the parabola $y^2 = 4ax$ and cutting the parabola orthogonally at the other point of intersection.

100. TP and TQ are tangents to the parabola $y^2 = 4ax$. The normals at P and Q intersect at R on the curve. Prove that the circle circumscribing the ΔTPQ lies on the parabola $2y^2 = a(x - a)$.

101. A family of chords of the parabola $y^2 = 4ax$ is drawn so that their projections on a straight line inclined equally to both the axes are all of a constant length c; prove that the locus of their middle points is the curve $(y^2 - 4ax)(y + 2a)^2 + 2a^2c^2 = 0$.

102. The normals at P, Q, R are concurrent and PQ meets the diameter through R on the directrix $x = -a$. Prove that PQ touches [or PQ envelopes] the parabola $y^2 + 16a(x + a) = 0$.

103. If the normals to the parabola $y^2 = 4ax$ at three points P, Q and R meet at A and S be the focus, prove that $SP \cdot SQ \cdot SR = a(SA)^2$.

104. From a point A common tangents are drawn to the circle $x^2 + y^2 = (a^2/2)$ and the parabola $y^2 = 4ax$. Find the area of the quadrilateral formed by the common tangents, the chords of contact of the point A, with respect to the circle and the parabola.

105. Prove that the any three tangents to a parabola whose slopes are in harmonic progression enclose a triangle of constant area.

Parabola Exercise 8 : Questions Asked in Previous 13 Year's Exams

■ This section contains questions asked in **IIT-JEE, AIEEE, JEE Main & JEE Advanced** from year **2005** to **2017**.

106. Tangent to the curve $y = x^2 + 6$ at a point (1, 7) touches the circle $x^2 + y^2 + 16x + 12y + c = 0$ at a point Q. Then the coordinates of Q are **[IIT-JEE 2005, 3M]**

(a) $(-6, -11)$ (b) $(-9, -13)$
(c) $(-10, -15)$ (d) $(-6, -7)$

107. Let P be a point (1, 0) and Q a point on the locus $y^2 = 8x$. The locus of mid-point of PQ is **[AIEEE 2005, 3M]**

(a) $x^2 - 4y + 2 = 0$ (b) $x^2 + 4y + 2 = 0$
(c) $y^2 + 4x + 2 = 0$ (d) $y^2 - 4x + 2 = 0$

108. The axis of a parabola is along the line $y = x$ and the distance of its vertex from origin is $\sqrt{2}$ and that from its focus is $2\sqrt{2}$. If vertex and focus both lie in the first quadrant, the equation of the parabola is **[IIT-JEE 2006, 3M]**

(a) $(x + y)^2 = (x - y - 2)$ (b) $(x - y)^2 = (x + y + 2)$
(c) $(x - y)^2 = 4(x + y - 2)$ (d) $(x - y)^2 = 8(x + y - 2)$

109. The equations of the common tangents to the parabolas $y = x^2$ and $y = -(x - 2)^2$ is/are **[IIT-JEE 2006, 5M]**

(a) $y = 4(x - 1)$ (b) $y = 0$
(c) $y = -4(x - 1)$ (d) $y = -30x - 50$

110. The locus of the vertices of the family of parabolas $y = \frac{a^3x^2}{3} + \frac{a^2x}{2} - 2a$ is **[AIEEE 2006, 4.5 M]**

(a) $xy = \frac{105}{64}$ (b) $xy = \frac{3}{4}$
(c) $xy = \frac{35}{16}$ (d) $xy = \frac{64}{105}$

111. Angle between the tangents to the curve $y = x^2 - 5x + 6$ at the points (2, 0) and (3, 0) is **[AIEEE 2006, 4.5 M]**

(a) $\pi/3$ (b) $\pi/2$
(c) $\pi/6$ (d) $\pi/4$

112. Consider the circle $x^2 + y^2 = 9$ and the parabola $y^2 = 8x$. They intersect at P and Q in the first and fourth quadrants, respectively. Tangents to the circle at P and Q intersect the X-axis at R and tangents to the parabola at P and Q intersect the X-axis at S.

(i) The ratio of the areas of the ΔPQS and ΔPQR is

(a) $1:\sqrt{2}$ (b) 1 : 2

(c) 1 : 4 (d) 1 : 8

(ii) The radius of the circumcircle of the ΔPRS is

(a) 5 (b) $3\sqrt{3}$

(c) $3\sqrt{2}$ (d) $2\sqrt{3}$

(iii) The radius of the incircle of the ΔPQR is

[IIT-JEE 2007, (4 + 4 + 4) M]

(a) 4 (b) 3

(c) 8/3 (d) 2

113. **Statement I** The curve $y = -\frac{x^2}{2} + x + 1$ is symmetric with respect to the line $x = 1$ because

Statement II A parabola is symmetric about its axis.

[IIT-JEE 2007, 3M]

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I

(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I

(c) Statement I is true, Statement II is false

(d) Statement I is false, Statement II is true

114. The equation of a tangent to the parabola $y^2 = 8x$ is $y = x + 2$. The point on this line from which the other tangent to the parabola is perpendicular to the given tangent is

[AIEEE 2007, 3M]

(a) $(-1, 1)$ (b) $(0, 2)$

(c) $(2, 4)$ (d) $(-2, 0)$

115. Consider the two curves $C_1: y^2 = 4x, C_2: x^2 + y^2 - 6x + 1 = 0$, then

[IIT-JEE 2008, 3M]

(a) C_1 and C_2 touch each other only at one point

(b) C_1 and C_2 touch each other exactly at two points

(c) C_1 and C_2 intersect (but do not touch) at exactly two points

(d) C_1 and C_2 neither intersect nor touch each other

116. A parabola has the origin as its focus and the line $x = 2$ as the directrix. The vertex of the parabola is at

[AIEEE 2008, 3M]

(a) (0, 2) (b) (1, 0)

(c) (0, 1) (d) (2, 0)

117. The tangent PT and the normal PN to the parabola $y^2 = 4ax$ at a point P on it meet its axis at points T and N, respectively. The locus of the centroid of the ΔPTN is a parabola whose

[IIT-JEE 2009, 4M]

(a) vertex is $\left(\frac{2a}{3}, 0\right)$ (b) directrix is at $x = 0$

(c) latusrectum is $\frac{2a}{3}$ (d) focus is $(a, 0)$

118. Let A and B be two distinct points on the parabola $y^2 = 4x$. If the axis of the parabola touches a circle of radius r having AB as its diameter, The slope of the line joining A and B can be

[IIT-JEE 2010, 3M]

(a) $-\frac{1}{r}$ (b) $\frac{1}{r}$ (c) $\frac{2}{r}$ (d) $-\frac{2}{r}$

119. If two tangents drawn from a point P to the parabola $y^2 = 4x$ are at right angles, the locus of P is

[AIEEE 2010, 4M]

(a) $2x + 1 = 0$ (b) $x = -1$

(c) $2x - 1 = 0$ (d) $x = 1$

120. Consider the parabola $y^2 = 8x$. Let Δ_1 be the area of the triangle formed by the end points of its latusrectum and the point $P\left(\frac{1}{2}, 2\right)$ on the parabola and Δ_2 be the area of the triangle formed by drawing tangent at P and at the end points of the latusrectum. Then, $\frac{\Delta_1}{\Delta_2}$ is

[IIT-JEE 2011, 4M]

121. Let (x, y) be any point on the parabola $y^2 = 4x$. Let P be the point that divides the line segment from $(0, 0)$ to (x, y) in the ratio 1 : 3. Then, the locus of P is

[IIT-JEE 2011, 3M]

(a) $x^2 = y$ (b) $y^2 = 2x$

(c) $y^2 = x$ (d) $x^2 = 2y$

122. Let L be a normal to the parabola $y^2 = 4x$. If L passes through the point (9, 6), then L is given by

[IIT-JEE 2011, 4M]

(a) $y - x + 3 = 0$ (b) $y + 3x - 33 = 0$

(c) $y + x - 15 = 0$ (d) $y - 2x + 12 = 0$

123. The shortest distance between line $y - x = 1$ and curve $x = y^2$ is

[AIEEE 2011, 4M]

(a) $\frac{3\sqrt{2}}{8}$ (b) $\frac{8}{3\sqrt{2}}$

(c) $\frac{4}{\sqrt{3}}$ (d) $\frac{\sqrt{3}}{4}$

124. Let S be the focus of the parabola $y^2 = 8x$ and let PQ be the common chord of the circle $x^2 + y^2 - 2x - 4y = 0$ and the given parabola. The area of the ΔPQS is **[IIT-JEE 2012, 4M]**

Paragraph

(Q. Nos. 125 and 126)

Let PQ be a focal chord of the parabola $y^2 = 4ax$. The tangent to the parabola at P and Q meet at a point lying on the line $y = 2x + a, a > 0$. **[JEE Advanced 2013, 3+3 M]**

125. If chord PQ subtends an angle θ at the vertex of $y^2 = 4ax$, them $\tan\theta$ is equal to

(a) $\frac{2}{3}\sqrt{7}$ (b) $-\frac{2}{3}\sqrt{7}$ (c) $\frac{2}{3}\sqrt{5}$ (d) $-\frac{2}{3}\sqrt{5}$

126. Length of chord PQ is

(a) $7a$ (b) $5a$ (c) $2a$ (d) $3a$

127. The slope of the line touching the parabolas $y^2 = 4x$ and $x^2 = -32y$ is **[JEE Main 2014, 4M]**

(a) 1/8 (b) 2/3
(c) 1/2 (d) 3/2

128. The common tangent to the circle $x^2 + y^2 = 2$ and the parabola $y^2 = 8x$ touch the circle at the points P, Q and the parabola at the points R, S. Then, the area of the quadrilateral $PQRS$ is **[JEE Advanced 2014, 3 M]**

(a) 3 (b) 6 (c) 9 (d) 15

Paragraph

(Q. Nos. 129 and 130)

Let a, r, s and t be non-zero real numbers. Let $P(at^2\ 2at)$, $Q\left(\frac{a}{t^2}, \frac{-2a}{t}\right)$, $R(ar^2, 2ar)$ and $S(as^2, 2as)$ be distinct points on the parabola $y^2 = 4ax$. Suppose that PQ is the focal chord and lines QR and PK are parallel, where K is the point $(2a, 0)$. **[JEE Advanced 2014, (3 + 3) M]**

129. The value of r is

(a) $-\frac{1}{t}$ (b) $\frac{t^2+1}{t}$ (c) $\frac{1}{t}$ (d) $\frac{t^2-1}{t}$

130. If $st = 1$, then the tangent at P and the normal at S to the parabola meet at a point whose ordinate is

(a) $\frac{(t^2+1)^2}{2t^3}$ (b) $\frac{a(t^2+1)^2}{2t^3}$
(c) $\frac{a(t^2+1)^2}{t^3}$ (d) $\frac{a(t^2+2)^2}{t^3}$

131. Let O be the vertex and Q be any point on the parabola $x^2 = 8y$. If the point P divides the line segment OQ internally in the ratio 1 : 3, then the locus of P is **[JEE Main 2015, 4M]**

(a) $x^2 = y$ (b) $y^2 = x$
(c) $y^2 = 2x$ (d) $x^2 = 2y$

132. If the normals of the parabola $y^2 = 4x$ drawn at the end points of its latusrectum are tangents to the circle $(x-3)^2 + (y+2)^2 = r^2$, then the value of r^2 is **[JEE Advanced 2015, 4M]**

133. Let the curve C be the mirror image of the parabola $y^2 = 4x$ with respect to the line $x + y + 4 = 0$. If A and B are the points of intersection of C with the line $y = -5$, the distance between A and B is **[JEE Advanced 2015, 4M]**

134. Let P and Q be distinct points on the parabola $y^2 = 2x$ such that a circle with PQ as diameter passes through the vertex O of the parabola. If P lies in the first quadrant and the area of the ΔOPQ is $3\sqrt{2}$, then which of the following is (are) the coordinates of P? **[JEE Advanced 2015, 4M]**

(a) $(4, 2\sqrt{2})$ (b) $(9, 3\sqrt{2})$
(c) $\left(\frac{1}{4}, \frac{1}{\sqrt{2}}\right)$ (d) $(1, \sqrt{2})$

135. Let P be the point on the parabola $y^2 = 8x$, which is at a minimum distance from the centre C of the circle $x^2 + (y+6)^2 = 1$, the equation of the circle passing through C and having its centre at P, is **[JEE Main 2016, 4M]**

(a) $x^2 + y^2 - 4x + 8y + 12 = 0$
(b) $x^2 + y^2 - x + 4y - 12 = 0$
(c) $x^2 + y^2 - \frac{x}{4} + 2y - 24 = 0$
(d) $x^2 + y^2 - 4x + 9y + 18 = 0$

136. The circle $C_1 : x^2 + y^2 = 3$ with centre at O, intersects the parabola $x^2 = 2y$ at the point P in the first quadrant. Let the tangent to the circle C_1 at P touches other two circles C_2 and C_3 at R_2 and R_3, respectively. Suppose C_2 and C_3 have equal radii $2\sqrt{3}$ and centres Q_2 and Q_3, respectively. If Q_2 and Q_3 lie on the Y-axis, then **[JEE Advanced 2016, 4M]**

(a) $Q_2Q_3 = 12$
(b) $R_2R_3 = 4\sqrt{6}$
(c) area of ΔOR_2R_3 is $6\sqrt{2}$
(d) area of ΔPQ_2Q_3 is $4\sqrt{2}$

137. Let P be the point on the parabola $y^2 = 4x$ which is at the shortest distance from the centre S of the circle $x^2 + y^2 - 4x - 16y + 64 = 0$. Let Q be the point on the circle dividing the line segment SP internally. Then,

(a) $SP = 2\sqrt{5}$ **[JEE Advanced 2016, 4M]**

(b) $SQ : QP = (\sqrt{5} + 1) : 2$

(c) the x-intercept of the normal to the parabola at P is 6

(d) the slope of the tangent to the circle at Q is $\frac{1}{2}$

138. The radius of a circle, having minimum area, which touches the curve $y = 4 - x^2$ and the lines, $y = |x|$ is **[JEE Main 2017, 4M]**

(a) $4(\sqrt{2} + 1)$

(b) $2(\sqrt{2} + 1)$

(c) $2(\sqrt{2} - 1)$

(d) $4(\sqrt{2} - 1)$

139. If a chord, which is not a tangent of the parabola $y^2 = 16x$ has the equation $2x + y = p$, and mid-point (h, k), then which of the following is (are) possible value(s) of p, h and k ? **[JEE Advanced 2017, 4M]**

(a) $p = 2, h = 3, k = -4$

(b) $p = -1, h = 1, k = -3$

(c) $p = -2, h = 2, k = -4$

(d) $p = 5, h = 4, k = -3$

Solutions

1. Equation of tangent of $y^2 = 4bx$ is

$$y = mx + \frac{b}{m} \qquad \ldots(i)$$

Here, $m = \tan\frac{\pi}{4} = 1$

From Eq. (i), $y = x + b$

For common tangent $y = x + b$ is also tangent of circle $x^2 + y^2 = a^2$, then

$$\frac{|0 - 0 + b|}{\sqrt{1+1}} = a$$

$\Rightarrow$ $b = a\sqrt{2}$ $[\because\ a > 0, b > 0]$

2. The coordinates of vertex and focus of required parabola are $(a, 0)$ and $(a_1, 0)$ respectively. Therefore, the distance between the vertex and the focus is $AS = a_1 - a$. So, the length of latusrectum is $4(a_1 - a)$. Thus, the equation of the required parabola is

$$(y-0)^2 = 4(a_1 - a)(x - a)$$

or $y^2 = 4(a_1 - a)(x - a)$.

3. The parabolas are equal if the lengths of their latusrectum are equal.

The length of latusrectum of $y^2 = ax$ is a

The equation of second parabola can be written as

$$\sqrt{(x-3)^2 + (y+2)^2} = \left(\frac{3x - 4y - 2}{5}\right)$$

Here, focus is $(3, -2)$ and the equation of directrix is $3x - 4y - 2 = 0$.

$\therefore$ Length of latusrectum= $2\times$ Distance between focus and directrix

$$= 2\left|\frac{9 - 4\times -2 - 2}{\sqrt{(9+16)}}\right| = 6$$

Thus, the two parabolas are equal if $a = 6$.

4. Let $DC = CB = BA = AD = k$

$\therefore$ Coordinates of B are (k, k),

which lie on $y = \lambda\sqrt{x}$

$\therefore$ $k = \lambda\sqrt{k}$

$\therefore$ $k = \lambda^2$

$\therefore$ $BC = k = \lambda^2$ $\ldots(i)$

Also, let $CG = GF = FE = EC = k_1$

$\therefore$ Coordinates of F are $(\lambda^2 + k_1, k_1)$,

which lie on $y = \lambda\sqrt{x}$

Then $k_1 = \lambda\sqrt{(\lambda^2 + k_1)}$

$\Rightarrow$ $k_1^2 = \lambda^4 + \lambda^2 k_1$

or $k_1^2 - \lambda^2 k_1 - \lambda^4 = 0$

$\therefore$ $k_1 = \dfrac{\lambda^2 \pm \sqrt{(\lambda^4 + 4\lambda^4)}}{2}$ $[\because\ k_1 > 0]$

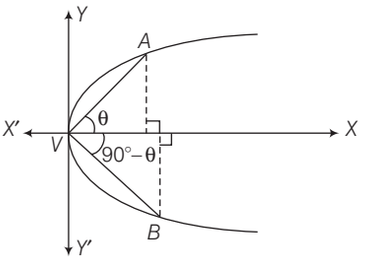
or $\dfrac{k_1}{\lambda^2} = \dfrac{1+\sqrt{5}}{2}$

or $\dfrac{FG}{BC} = \dfrac{\sqrt{5}+1}{2}$

5. Coordinates of A and B are

$(VA\cos\theta, VA\sin\theta)$ and $(VB\sin\theta, -VB\cos\theta)$ respectively

$\because$ A and B lie on $y^2 = x$, then $(VA\sin\theta)^2 = VA\cos\theta$



$\Rightarrow$ $VA = \dfrac{\cos\theta}{\sin^2\theta}$

Similarly, $VB = \dfrac{\sin\theta}{\cos^2\theta}$

$\therefore$ $\dfrac{|VA|}{|VB|} = \cot^3\theta$

6. $\because$ $x = t^2 - t + 1, y = t^2 + t + 1$

$\therefore$ $x + y = 2t^2 + 2$ and $y - x = 2t$

or $2(x + y - 2) = 4t^2 = (2t)^2 = (y - x)^2$

or $(x-y)^2 = 2(x + y - 2)$

or $\left(\dfrac{x-y}{\sqrt{2}}\right)^2 = \sqrt{2}\left(\dfrac{x+y-2}{\sqrt{2}}\right)$

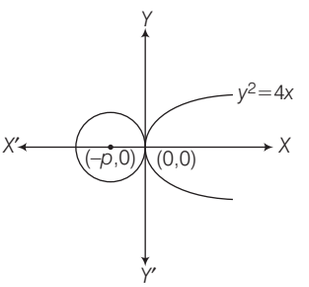
For vertex, $\dfrac{x-y}{\sqrt{2}} = 0$ and $\dfrac{x+y-2}{\sqrt{2}} = 0$

or $x = y$ and $x + y = 2$

$\therefore$ $x = y = 1$

Hence, vertex is $(1, 1)$.

7. It is clear from figure



$-p < 0$ or $p > 0$

8. The point of intersection of the parabolas $y^2 = 4ax$ and $x^2 = 4ay$ are $(0, 0)$ and $(4a, 4a)$ but $a \neq 0$.

Now, $2bx + 3cy + 4d = 0$ passes through $(0, 0)$ and $(4a, 4a)$.

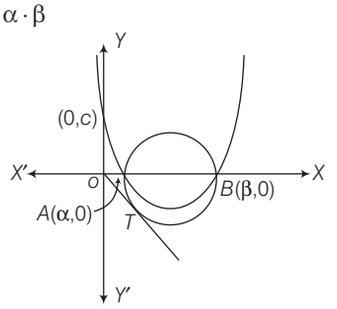
Therefore, $d = 0$ and $2b\,(4a) + 3c\,(4a) = 0$ i.e.,

$$2b + 3c = 0 \qquad [\because\ a \neq 0]$$

or $$d^2 + (2b + 3c)^2 = 0$$

9. $\because (OT)^2 = OA \cdot OB$

$= \alpha \cdot \beta$



or $$OT = \sqrt{\alpha\beta} \qquad \ldots(i)$$

Parabola cuts X-axis at α and β.

$\therefore \alpha, \beta$ are the roots of $ax^2 + bx + c = 0$

$$\therefore \qquad \alpha\beta = \frac{c}{a} \qquad \ldots(ii)$$

From Eqs. (i) and (ii), we get

$$OT = \sqrt{\frac{c}{a}}$$

10. $\because$ Two perpendicular tangents meet a point on directrix**.**

Now, equations of tangents at $(at_1^2, 2at_1)$ and $(at_2^2, 2\,at_2)$ are $t_1y = x + at_1^2$ and $t_2y = x + at_2^2$, respectively.

$\therefore \quad P_1 \equiv (-at_1^2, 0), P_2 \equiv (-at_2^2, 0)$

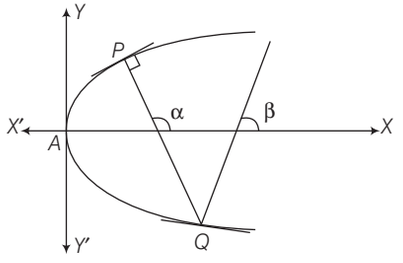
$\Rightarrow \quad SP_1 = a\,(1 + t_1^2), SP_2 = a\,(1 + t_2^2)$ and $t_1t_2 = -1$

$$\therefore \qquad \frac{1}{SP_1} + \frac{1}{SP_2} = \frac{1}{a\,(1 + t_1^2)} + \frac{1}{a\,(1 + t_2^2)}$$

$$= \frac{1}{a\,(1 + t_1^2)} + \frac{1}{a\left(1 + \frac{1}{t_1^2}\right)} \qquad \left[\because t_2 = -\frac{1}{t_1}\right]$$

$$= \frac{1}{a\,(1 + t_1^2)} + \frac{t_1^2}{a\,(1 + t_1^2)} = \frac{1}{a}$$

11. Let $P \equiv (at_1^2, 2at_1)$ and $Q \equiv (at_2^2, 2at_2)$



Equation of normal at P is

$$y + t_1\,x = 2at_1 + at_1^3$$

meet the curve again at Q, then

$$t_2 = -t_1 - \frac{2}{t_1} \qquad \ldots(i)$$

Here $\tan\alpha = -t_1$ and $\tan\beta = -t_2$, from Eq. (i)

$$\therefore \qquad -\tan\beta = \tan\alpha + \frac{2}{\tan\alpha}$$

$$\Rightarrow \qquad \tan\alpha\,(\tan\alpha + \tan\beta) = -2$$

12. Let $A \equiv (\alpha, \beta)$

The equation of normal at $(at^2, 2at)$

$$y + tx = 2at + at^3 \qquad \ldots(i)$$

(α, β) lie on Eq. (i), then

$$at^3 + (2a - \alpha)\,t - \beta = 0 \qquad \ldots(ii)$$

Let t_1, t_2 and t_3 be the roots of Eq. (ii), then

$$at^3 + (2a - \alpha)\,t - \beta = a\,(t - t_1)\,(t - t_2)\,(t - t_3) \qquad \ldots(iii)$$

Let $P \equiv (at_1^2, 2at_1)$, $Q \equiv (at_2^2, 2at_2)$ and $R \equiv (at_3^2, 2at_3)$

Since, the focus is $S\,(a, 0)$

$$\therefore \qquad SP = a\,(1 + t_1^2), SQ = a\,(1 + t_2^2)$$

and $$SR = a\,(1 + t_3^2)$$

On putting $t = i = \sqrt{-1}$ in Eq. (iii), we get

$$-ai + (2a - \alpha)\,i - \beta = a\,(i - t_1)\,(i - t_2)\,(i - t_3)$$

or $|\,(a - \alpha)\,i - \beta\,| = a\,|\,i - t_1\,|\,|\,i - t_2\,|\,i - t_3\,|$

$$\Rightarrow \qquad \sqrt{(a - \alpha)^2 + \beta^2} = a\sqrt{(1 + t_1^2)}\,\sqrt{(1 + t_2^2)}\,\sqrt{(1 + t_3^2)}$$

or $a\,((a - \alpha)^2 + \beta^2) = a\,(1 + t_1^2) \cdot a\,(1 + t_2^2) \cdot a\,(1 + t_3^2)$

$$a\,(SA)^2 = SP \cdot SQ \cdot SR$$

or $$SP \cdot SQ \cdot SR = a\,(SA)^2$$

13. Let AB be a normal chord, where $A \equiv (at_1^2, 2at_1)$ and $B \equiv (at_2^2, 2at_2)$, we have $t_2 = -t_1 - \frac{2}{t_1}$

Now, $$AB = \sqrt{(at_1^2 - at_2^2)^2 + (2at_1 - 2at_2)^2}$$

$$= a\,|\,t_1 - t_2\,|\,\sqrt{(t_1 + t_2)^2 + 4}$$

$$= a\left|\,2\left(t_1 + \frac{1}{t_1}\right)\right|\sqrt{\left(\frac{4}{t_1^2} + 4\right)}$$

$$= 4a\sqrt{\frac{(t_1^2 + 1)^3}{t_1^4}}$$

$$(AB)^2 = 16a^2\,\frac{(t_1^2 + 1)^3}{t_1^4}$$

$$\frac{d\,(AB)^2}{dt_1} = 16a^2\left\{\frac{(1 + t_1^2)^2}{t_1^5}\,(t_1^2 - 2)\right\}$$

For $$\frac{d\,(AB)^2}{dt_1} = 0 \ \Rightarrow\ t_1 = \sqrt{2}$$

For which $(AB)^2$ is minimum, thus

$$AB_{\min} = \sqrt{\frac{16a^2\,(2 + 1)^3}{4}} = 2a\sqrt{27}$$

14. On solving

$$x^2 + y^2 = a^2 \text{ and } y^2 = 4(x + 4)$$

$$\Rightarrow \quad x^2 + 4(x + 4) = a^2$$

or $$x^2 + 4x + 16 - a^2 = 0$$

If the circle and parabola touch each other, then

$$D = 0 \Rightarrow 16 - 4 \cdot 1 \cdot (16 - a^2) = 0$$

$$\Rightarrow \quad a^2 = 12 \text{ or } a = 2\sqrt{3}$$

15. $\sin\theta > |2a|$ $[\because \ h > 2a]$

$$\Rightarrow \quad 0 < |2a| < 1 \quad \text{or} \quad 0 < |a| < \frac{1}{2}$$

$$\therefore \quad a \in \left(-\frac{1}{2}, 0\right) \cup \left(0, \frac{1}{2}\right)$$

16. Tangent to $y^2 = 4x$ in terms of m is

$$y = mx + \frac{1}{m} \qquad \ldots(i)$$

and normal to $x^2 = 4by$ in terms of m is

$$y = mx + 2b + \frac{b}{m^2} \qquad \ldots(ii)$$

$\because$ Eqs. (i) and (ii) are same, then

$$\frac{1}{m} = 2b + \frac{b}{m^2}$$

$$\Rightarrow \quad 2bm^2 - m + b = 0$$

For two different tangents

$$\therefore \quad D > 0 \Rightarrow 1 - 8b^3 > 0$$

or $$|b| < \frac{1}{2\sqrt{2}}$$

17. The given parabolas $2y^2 = 2x - 1$ and $2x^2 = 2y - 1$ are symmetrical about the line $y = x$. The shortest distance occurs along the common normal which is perpendicular to the line $y = x$.

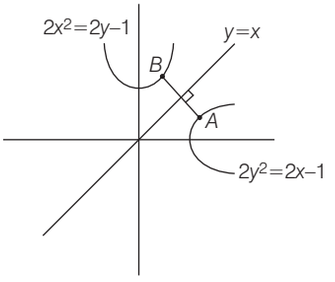
Therefore, the tangent at point A on $2y^2 = 2x - 1$ is parallel to $y = x$. Therefore,

$$4y\frac{dy}{dx} = 2 \quad \Rightarrow \quad \frac{dy}{dx} = \frac{1}{2y} = 1$$

or $$y = \frac{1}{2} \quad \text{and} \quad x = \frac{3}{4}$$

$\therefore$ $A \equiv \left(\frac{3}{4}, \frac{1}{2}\right)$, then coordinates of B on $2x^2 = 2y - 1$ is

$B \equiv \left(\frac{1}{2}, \frac{3}{4}\right)$



$\therefore$ Shortest distance $= AB$

$$= \sqrt{\left(\frac{3}{4} - \frac{1}{2}\right)^2 + \left(\frac{1}{2} - \frac{3}{4}\right)^2}$$

$$= \sqrt{\left(\frac{1}{16} + \frac{1}{16}\right)} = \frac{1}{\sqrt{8}} = \frac{1}{2\sqrt{2}}$$

18. We know that normals at $(at_1^2, 2at_1)$ and $(at_2^2, 2at_2)$ meet again on the parabola. Then $t_1t_2 = 2$

Here, $a = 1$

and $$x_1 = at_1^2 = t_1^2 \text{ and } y_1 = 2at_1 = 2t_1$$

$$x_2 = at_2^2 = t_2^2 \text{ and } y_2 = 2at_2 = 2t_2$$

Given $$x_1 + x_2 = 4 \quad \Rightarrow t_1^2 + t_2^2 = 4$$

or $$(t_1 + t_2)^2 - 2t_1t_2 = 4$$

$$\Rightarrow \quad (t_1 + t_2)^2 = 8 \qquad [\because \ t_1t_2 = 2]$$

or $$|t_1 + t_2| = \sqrt{8}$$

or $$|2t_1 + 2t_2| = 2\sqrt{8}$$

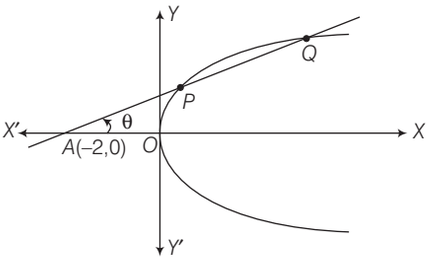
or $$|y_1 + y_2| = 2\sqrt{8} = 4\sqrt{2}$$

19. Let any point at distance r from A on the parabola is

$$(-2 + r\cos\theta, r\sin\theta),$$

then $$r^2\sin^2\theta = 4(-2 + r\cos\theta)$$

or $$r^2\sin^2\theta - 4r\cos\theta + 8 = 0$$



Let P and Q are distances r_1 and r_2 from A, then

$$r_1 + r_2 = \frac{4\cos\theta}{\sin^2\theta}$$

and $$r_1r_2 = \frac{8}{\sin^2\theta}$$

Now, $$\frac{1}{AP} + \frac{1}{AQ} = \frac{1}{r_1} + \frac{1}{r_2} = \frac{r_1 + r_2}{r_1r_2} = \frac{\cos\theta}{2}$$

given that $$\frac{1}{AP} + \frac{1}{AQ} < \frac{1}{4}$$

$$\Rightarrow \quad \frac{\cos\theta}{2} < \frac{1}{4}$$

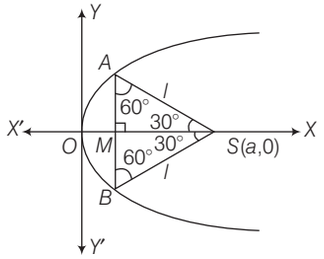
or $$\cos\theta < \frac{1}{2}$$

or $$\tan\theta > \sqrt{3}$$

$$\left[\because \cos\theta \text{ is decreasing and } \tan\theta \text{ is increasing in } \left(0, \frac{\pi}{2}\right)\right]$$

$\therefore$ Slope $(m) > \sqrt{3}$

20. Coordinates of A are $(a - l\cos 30°, l\sin 30°)$



or $$A \equiv \left(a - \frac{l\sqrt{3}}{2}, \frac{l}{2}\right)$$

which lies on $y^2 = 4ax$, then

$$\frac{l^2}{4} = 4a\left(a - \frac{l\sqrt{3}}{2}\right) \Rightarrow l^2 + 8a\sqrt{3}l - 16a^2 = 0$$

$\therefore$ $$l = \frac{-8a\sqrt{3} \pm \sqrt{(192a^2 + 64a^2)}}{2}$$

$$= \frac{-8a\sqrt{3} \pm 16a}{2}$$

$$= 4a(2 - \sqrt{3}) \qquad \text{[taking +ve sign]}$$

Aliter :

Let $A \equiv (at_1^2, 2at_1)$ and $B \equiv (at_1^2 - 2at_1)$.

Slope of $SA = \tan(180° - 30°)$

$$\frac{2at_1}{at_1^2 - a} = -\tan 30°$$

$$\frac{2t_1}{t_1^2 - 1} = -\frac{1}{\sqrt{3}}$$

or $t_1^2 + 2\sqrt{3}t_1 - 1 = 0'$ or $t_1 = -\sqrt{3} \pm 2$

Thus, $t_1 = 2 - \sqrt{3}$ $[\because\ t_1 = -2 - \sqrt{3}$ rejected]

Here, $AB = 4at_1 = 4a(2 - \sqrt{3})$

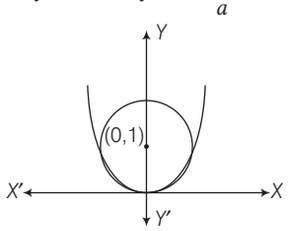
21. $C : x^2 + (y-1)^2 = 1$ and $P : y = ax^2$

Putting $x^2 = \frac{y}{a}$ in $x^2 + (y-1)^2 = 1$

or $$\frac{y}{a} + (y-1)^2 = 1$$

or $$y^2 - 2y + \frac{y}{a} = 0$$

$\therefore$ $$y = 0 \quad \text{or} \quad y = 2 - \frac{1}{a}$$



On substituting $y = 2 - \frac{1}{a}$ in $y = ax^2$, then

$$ax^2 = 2 - \frac{1}{a}$$

or $$x^2 = \frac{2a-1}{a^2} > 0$$

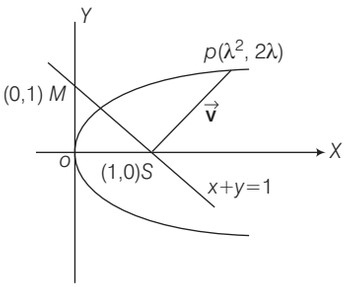
or $$2a - 1 > 0$$

$\therefore$ $$a > \frac{1}{2}$$

or $$a \in \left(\frac{1}{2}, \infty\right)$$

22. $\vec{\mathbf{V}} = (\lambda^2 - 1)\,\hat{\mathbf{i}} + (2\lambda - 0)\,\hat{\mathbf{j}}$

$$\vec{\mathbf{V}} = (\lambda^2 - 1)\,\hat{\mathbf{i}} + (2\lambda)\,\hat{\mathbf{j}} \qquad \text{...(i)}$$



and $$\vec{\mathbf{n}} = (0-1)\,\hat{\mathbf{i}} + (1-0)\,\hat{\mathbf{j}}$$

$$= -\hat{\mathbf{i}} + \hat{\mathbf{j}}$$

The projection of $\vec{\mathbf{V}}$ on $\vec{\mathbf{n}} = y$ [given]

$\therefore$ $$y = \frac{\vec{\mathbf{V}} \cdot \vec{\mathbf{n}}}{|\vec{\mathbf{n}}|} = \frac{-(\lambda^2 - 1) + 2\lambda}{\sqrt{2}} \qquad \text{...(ii)}$$

Given, $$\frac{dx}{dt} = 4$$

$\Rightarrow$ $$\frac{d}{dt}(\lambda^2 - 1) = 4 \quad \Rightarrow \quad 2\lambda\frac{d\lambda}{dt} = 4$$

When $P \equiv (4, 4)$,

We have $\lambda = 2$, therefore

$$\frac{d\lambda}{dt} = 1 \qquad \text{...(iii)}$$

From Eq. (ii),

$$\frac{dy}{dt} = \frac{(2 - 2\lambda)\frac{d\lambda}{dt}}{\sqrt{2}} \qquad \text{[from Eq. (ii)]}$$

$$= \frac{(2-4)\times 1}{\sqrt{2}} = -\sqrt{2}$$

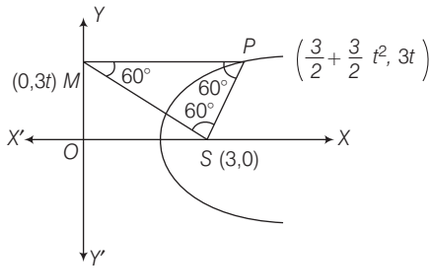
23. Given parabola is

$$y^2 = 6\left(x - \frac{3}{2}\right)$$

The equation of directrix is $x - \frac{3}{2} + \frac{6}{4} = 0$

i.e. $$x = 0$$

Let the coordinates of P be $\left(\frac{3}{2} + \frac{3}{2}t^2, 3t\right)$



Therefore, $MS = MP$

$$\sqrt{(9+9t^2)} = \frac{3}{2} + \frac{3}{2}t^2$$

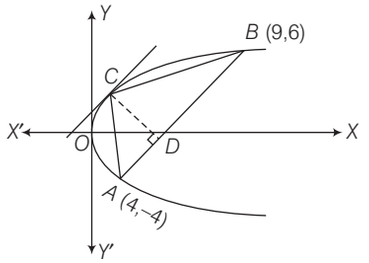
or $$9 + 9t^2 = \frac{9}{4}(1+t^2)^2$$

or $$1 + t^2 = 4$$

$\therefore$ Length of each side $= MS$

$$= \sqrt{9(1+t^2)} = \sqrt{36} = 6$$

24. The area of ΔABC is maximum if CD is maximum, because AB is fixed.



It is clear that tangent drawn to the parabola at C should be parallel to AB.

For $y^2 = 4x$

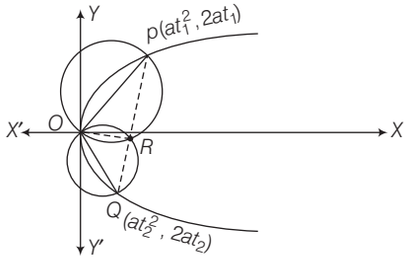
$\therefore$ $$2y\frac{dy}{dx} = 4 \quad \text{or} \quad \frac{dy}{dx} = \frac{2}{y} = \text{slope of } AB$$

$\Rightarrow$ $$\frac{2}{y} = \frac{6+4}{9-4} = 2 \quad \text{or} \quad y = 1, \text{ then } x = \frac{1}{4}$$

Hence, coordinates of C are $\left(\frac{1}{4}, 1\right)$.

25. $\because$ Tangent at $P(at_1^2, 2at_1)$ is $t_1 y = x + at_1^2$.

$\therefore$ $$\tan\theta_1 = \frac{1}{t_1}$$



Similarly, $$\tan\theta_2 = \frac{1}{t_2}$$

$\because$ Angle in a semicircle is 90°.

$\therefore$ $\angle ORP = \angle ORQ = 90°$

$\Rightarrow$ P, R, Q are collinear.

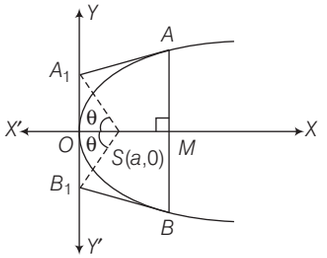
Slope of $PQ = \dfrac{2}{t_1 + t_2}$ $\quad [\because\ OR \perp PQ]$

$\therefore$ Slope of $OR = -\dfrac{(t_1 + t_2)}{2} = \tan\phi$

or $$t_1 + t_2 = -2\tan\phi$$

$\Rightarrow$ $$\cot\theta_1 + \cot\theta_2 = -2\tan\phi$$

26. Let $A \equiv (at^2, 2at)$ and $B \equiv (at^2, -2at)$



The equations of tangents at A and B are

$$ty = x + at^2 \text{ and } -ty = x + at^2.$$

These tangents meet the Y-axis at $A_1(0, at)$ and $B_1(0, -at)$ respectively.

Area of trapezium

$$AA_1B_1B = \frac{1}{2}(AB + A_1B_1) \times OM$$

$$24a^2 = \frac{1}{2}(4at + 2at) \times at^2$$

$$24a^2 = 3a^2t^3 \Rightarrow t^3 = 8$$

$\therefore$ $$t = 2$$

$\therefore$ Coordinates of A_1 and B_1 are $(0, 2a)$ and $(0, -2a)$ respectively.

If $\angle OSA_1 = \angle OSB_1 = \theta$, then

$\therefore$ $$\tan\theta = \frac{2a}{a} = 2$$

$\Rightarrow$ $$\theta = \tan^{-1} 2$$

Hence, subtended angle $= 2\theta = 2\tan^{-1} 2$

27. Given, $$\frac{5}{2} = {}^nC_3(px)^{n-3}\left(\frac{1}{x}\right)^3 = {}^nC_3 \cdot p^{n-3}x^{n-6} \qquad \ldots(i)$$

Since, LHS of Eq. (i) is independent of x

$\therefore$ $$n - 6 = 0 \Rightarrow n = 6$$

From Eq. (i),

$$\frac{5}{2} = {}^6C_3p^3 = 20p^3$$

$\Rightarrow$ $$p^3 = \left(\frac{1}{2}\right)^3 \Rightarrow p = \frac{1}{2}$$

Given, parabola is $y^2 = x$

Here, $$4a = 1$$

$\Rightarrow$ $$a = \frac{1}{4}$$

Since, three normals are drawn from point $(q, 0)$,

$\therefore$ $$q > 2a \text{ or } q > \frac{1}{2} \text{ or } q > p \qquad \left[\because\ p = \frac{1}{2}\right]$$

28. $y^2 - 4x - 2y + 5 = 0$

$\Rightarrow \quad (y-1)^2 - 4x + 4 = 0$

$\Rightarrow \quad (y-1)^2 = 4(x-1)$

Let $y - 1 = Y$ and $x - 1 = X$

then, $y^2 = 4X$ comparing with $Y^2 = 4aX$

$\therefore \quad a = 1$

$\because$ All three normals to the parabola are real and meet on the axis of parabola, then

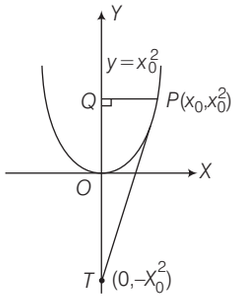
$X > 2a$ and $Y = 0$

i.e., $x - 1 > 2$ and $y - 1 = 0$

$\therefore \quad x > 3$ and $y = 1$

or $(k, 1); k > 3$

29. Let $P(x_0, x_0^2)$ be any point on the parabola $y = x^2$



Equation of tangent at $P(x_0, x_0^2)$ is

$$xx_0 = \frac{1}{2}(y + x_0^2)$$

$\Rightarrow \quad 2xx_0 - y - x_0^2 = 0$

Tangent meets the Y-axis at $T(0, -x_0^2)$.

Hence, the area of the triangle $\Delta PTQ = \frac{1}{2} \times PQ \times QT$

$$= \frac{1}{2} \times x_0 \times 2x_0^2 = x_0^3$$

which increases in the interval $[1, 2]$ and hence is greatest when $x_0 = 2$.

30. $\left(\frac{2x - y + 2}{\sqrt{5}}\right) = \sqrt{(x-2)^2 + (y-0)^2}$ [given]

$\Rightarrow \quad (2x - y + 2)^2 = 5(x^2 + y^2 - 4x + 4)$

or $x^2 + 4y^2 + 4xy = 28x - 4y - 16$

$\Rightarrow \quad (x + 2y)^2 = 4(7x - y - 4)$

$\because \quad x + 2y = 0$ and $7x - y - 4 = 0$ and are not perpendicular.

$\therefore \quad (x + 2y + \lambda)^2 = (2\lambda + 28)x + (4\lambda - 4)y + \lambda^2 - 16$ ...(i)

Now, (slope of $x + 2y + \lambda = 0$) $\times$ (slope of $(2\lambda + 28)x + (4\lambda - 4)y + \lambda^2 - 16 = 0$) $= -1$

$\therefore \quad -\frac{1}{2} \times -\frac{(2\lambda + 28)}{(4\lambda - 4)} = -1$

$\Rightarrow \quad 2\lambda + 28 = -8\lambda + 8$

or $10\lambda = -20$

$\therefore \quad \lambda = -2$

From Eq. (i),

$(x + 2y - 2)^2 = (24x - 12y - 12)$

$\Rightarrow \quad \left(\frac{x + 2y - 2}{\sqrt{5}}\right)^2 = \frac{12}{\sqrt{5}}\left(\frac{2x - y - 1}{\sqrt{5}}\right)$

Let $\frac{x + 2y - 2}{\sqrt{5}} = X, \frac{2x - y - 1}{\sqrt{5}} = Y$

or $X^2 = \frac{12}{\sqrt{5}} Y$ or $Y = \frac{\sqrt{5}}{12} X^2$

$\therefore \quad k = \frac{\sqrt{5}}{12}$

31. Equation of tangent of parabola

$$y^2 = 40x \text{ is } y = mx + \frac{10}{m} \quad \text{... (i)}$$

which is also tangent of circle $x^2 + y^2 = 50$, then

$$\frac{\left|\frac{10}{m}\right|}{\sqrt{(m^2 + 1)}} = 5\sqrt{2}$$

$\Rightarrow \quad m^4 + m^2 - 2 = 0$

$\Rightarrow \quad (m^2 + 2)(m^2 - 1) = 0$

$\therefore \quad m^2 = 1, m^2 + 2 \neq 0$ or $m = \pm 1$

From Eq. (i), common tangents are

$y = x + 10$ and $y = -x - 10$

or $x - y + 10 = 0$ and $x + y + 10 = 0$

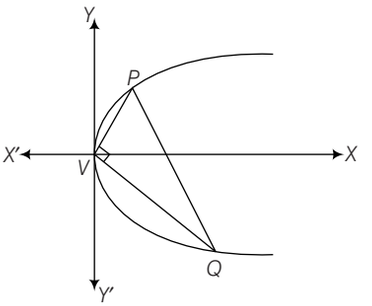
32. Let coordinates of P be $(t^2, 2t)$

$\therefore$ Slope of $PV = \frac{2t - 0}{t^2 - 0} = \frac{2}{t}$

$\Rightarrow$ Slope of QV is $-\frac{t}{2}$

$\therefore$ Equation of QV is $y = \frac{-t}{2}x$

Solving it with $y^2 = 4x$, we get $Q\left(\frac{16}{t^2}, \frac{-8}{t}\right)$



Area of $\Delta PVQ = 20$ (given)

$\Rightarrow \quad \frac{1}{2}\left|\begin{vmatrix} t^2 & 2t \\ \frac{16}{t^2} & \frac{-8}{t} \end{vmatrix}\right| = 20$

$\Rightarrow \quad t + \frac{4}{t} = \pm 5$

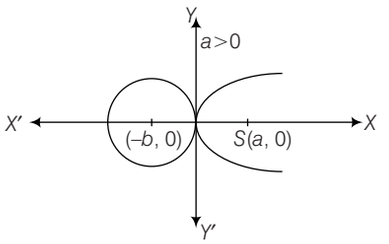
$\Rightarrow \quad t^2 - 5t + 4 = 0$ or $t^2 + 5t + 4 = 0$

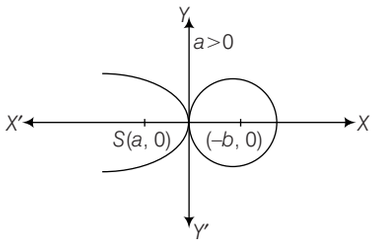
$\therefore \quad t = 1, 4$ or $t = -1, -4$

Hence coordinates of P are $(1, 2), (16, 8), (1 - 2), (16, -8)$

33. Parabola is $y^2 = 4ax$ and circle is $(x + b)^2 + (y - 0)^2 = b^2$

If parabola and circle touch each other externally, then





If $a > 0, -b < 0$ and if $a < 0, -b > 0$

or $a > 0, b > 0$ and $a < 0, b < 0$

34. Let $(x_1, y_1) \equiv (at^2, 2at)$

Equation of tangent at $(at^2, 2at)$ is $ty = x + at^2$

Let any point on this tangent is $\left(\lambda, \dfrac{\lambda + at^2}{t}\right)$

The chord of contact of this point w.r.t the circle $x^2 + y^2 = a^2$ is

$$x \cdot \lambda + y \cdot \left(\frac{\lambda + at^2}{t}\right) = a^2$$

$$\Rightarrow \quad (aty - a^2) + \lambda \cdot \left(x + \frac{y}{t}\right) = 0$$

which is family of straight lines passing through the point of intersection of

$$aty - a^2 = 0 \text{ and } x + \frac{y}{t} = 0$$

So, the fixed point is $\left(\dfrac{-a}{t^2}, \dfrac{a}{t}\right)$, therefore

$$x_2 = -\frac{a}{t^2} \quad , \quad y_2 = \frac{a}{t}$$

Clearly, $x_1x_2 = -a^2 \quad , \quad y_1y_2 = 2a^2$

$$\Rightarrow \quad x_1x_2 + y_1y_2 = a^2$$

Also, $\dfrac{x_1}{x_2} = -t^4 \quad , \quad \dfrac{y_1}{y_2} = 2t^2$

or $$\left(\frac{y_1}{y_2}\right)^2 + 4\left(\frac{x_1}{x_2}\right) = 0$$

$\Rightarrow -4, \dfrac{y_1}{y_2}, \dfrac{x_1}{x_2}$ are in G.P.

Also, $y_1y_2 = 2a^2 \Rightarrow \dfrac{y_1}{2}, a, y_2$ are in G.P.

35. Equation of normal in slope form is

$$y = mx - 2am - am^3,$$

if normals meet at (h, k), then

$$am^3 - (h - 2a)m + k = 0 \qquad \text{...(i)}$$

Let $P \equiv (am_1^2, -2am_1), Q = (am_2^2, -2am_2)$

and $R \equiv (am_3^2, -2am_3)$

$\Rightarrow$ m_1, m_2, m_3 are the roots of Eq. (i), then

$$m_1 + m_2 + m_3 = 0 \qquad \text{...(ii)}$$

i.e. algebraic sum of the slopes of the normals at P, Q and R vanishes.

From Eq. (ii)

$$-2am_1 - 2am_2 - 2am_3 = 0$$

i.e. algebraic sum of the ordinates of the points P, Q and R vanishes.

Also, y-coordinate of centroid of ΔPQR is zero

$\therefore$ centroid lies on X-axis

and circle circumscribing the triangle PQR always passes through the vertex of the parabola.

36. Let $P \equiv (\lambda, \lambda + 1)$, where $\lambda \neq 0, -1$

or $P \equiv (\lambda, \lambda - 1)$, where $\lambda \neq 0, 1$

The point $(\lambda, \lambda + 1)$ is on $y^2 = 4x + 1$, therefore

$$(\lambda + 1)^2 = 4\lambda + 1$$

$$\Rightarrow \quad \lambda^2 - 2\lambda = 0$$

$$\therefore \quad \lambda = 2$$

Therefore, the ordinate of P is 3

and the point $(\lambda, \lambda - 1)$ is on $y^2 = 4x + 1$, therefore

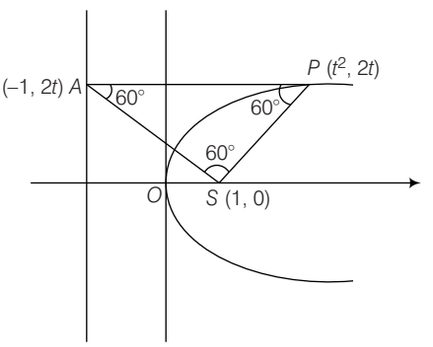
$$(\lambda - 1)^2 = 4(\lambda) + 1$$

$$\Rightarrow \quad \lambda^2 - 6\lambda = 0$$

$$\therefore \quad \lambda = 6$$

Therefore, the ordinate of P is 5,

37. From figure,



Slope of $AP = 0$ and slope of $AS = -t$

$$\therefore \quad \tan 60° = \left|\frac{0 - (-t)}{1 + 0}\right|$$

$$\Rightarrow \quad \sqrt{3} = |t|$$

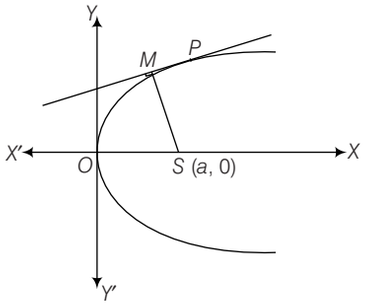
$$\Rightarrow \quad t = \pm\sqrt{3}$$

$\therefore$ Coordinates of P are $(3, \pm 2\sqrt{3})$

38. Let $M(\alpha, \beta)$ be the foot of the perpendicular from the focus $S(a, 0)$ on any tangent to the parabola at $P(at^2, 2at)$.

i.e. $ty + x + at^2$

$\Rightarrow \quad \alpha - t\beta + at^2 = 0 \quad \ldots(i)$



Since, SM is perpendicular to the tangent

$\therefore \quad \frac{1}{t} \times \frac{\beta - 0}{\alpha - a} = -1$

$\Rightarrow \quad \alpha t + \beta - at = 0 \quad \ldots(ii)$

On solving Eqs. (i) and (ii), we get

$$\alpha = 0$$

The locus of $M(\alpha, \beta)$ is the tangent at the vertex.

i.e. $x = 0$

39. Given that the extremities of the latusrectum are (1, 1) and (1, − 1), then $4a = 2$ or $a = \frac{1}{2}$

So, the focus of the parabola is (1, 0).

Hence, the vertex can be $\left(\frac{1}{2}, 0\right)$ or $\left(\frac{3}{2}, 0\right)$.

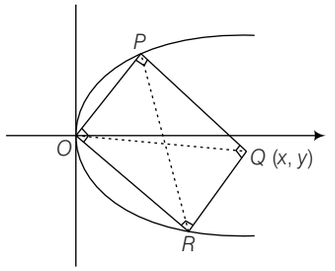
Therefore, the equations of the parabola can be $y^2 = 2\left(x - \frac{1}{2}\right)$

or $y^2 = 2\left(x - \frac{3}{2}\right)$

$\Rightarrow y^2 = 2x - 1$ or $y^2 = 2x - 3$.

40. Let $P \equiv (at^2, 2at)$ and $R \equiv (at_1^2, 2at_1)$

$\because \quad OP \perp OR$



$\therefore$ Slope of $OP \times$ Slope of $OR = -1$

$\Rightarrow \quad \frac{2}{t} \times \frac{2}{t_1} = -1$

$\therefore \quad t_1 = -\frac{4}{t}$

Now, coordinates of R are $\left(\frac{16a}{t^2}, \frac{-8a}{t}\right)$

$\because$ $OPQR$ is a rectangle.

$\therefore$ Mid-point of OQ = mid-point of PR

$\Rightarrow \quad x = at^2 + \frac{16a}{t^2} \quad \Rightarrow \quad \frac{x}{a} = t^2 + \frac{16}{t^2} \quad \ldots$ (i)

and $\quad y = 2at - \frac{8a}{t} \quad \Rightarrow \quad \frac{y}{2a} = t - \frac{4}{t} \quad \ldots$ (ii)

From Eqs. (i) and (ii), we get

$$\left(\frac{y}{2a}\right)^2 = t^2 + \frac{16}{t^2} - 8 = \frac{x}{a} - 8$$

$\Rightarrow \quad y^2 = 4ax - 32a^2$

or $\quad y^2 = 4a(x - 8a)$

which is equal parabola and focus $(9a, 0)$ and directrix

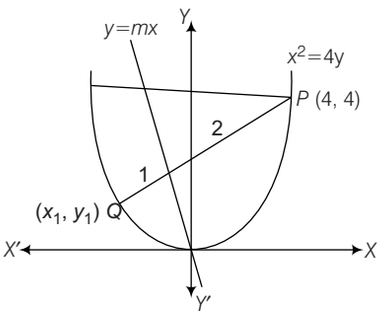
$$x - 8a = -a$$

or $\quad x - 7a = 0.$

41. Let point of intersection of the line $y = mx$ with the chord be $(\lambda, m\lambda)$, then

$$\lambda = \frac{1.4 + 2.x_1}{1 + 2} \quad \Rightarrow \quad x_1 = \frac{3\lambda - 4}{2}$$

and $\quad m\lambda = \frac{1.4 + 2.y_1}{1 + 2} \quad \Rightarrow \quad y_1 = \frac{3m\lambda - 4}{2}$



$\because Q(x_1, y_1)$ lies on the parabola $x^2 = 4y$, then

$$\left(\frac{3\lambda - 4}{2}\right)^2 = 4\left(\frac{3m\lambda - 4}{2}\right)$$

$\Rightarrow \quad 9\lambda^2 - 24\lambda(1 + m) + 48 = 0$

For two distinct chords $\quad D > 0$

$\Rightarrow \quad (24)^2 (1 + m)^2 - 4 \cdot 9 \cdot 48 > 0$

or $\quad (1 + m)^2 > 3$

$\Rightarrow \quad 1 + m < -\sqrt{3}$

or $\quad 1 + m > \sqrt{3}$

$\therefore \quad m < -\sqrt{3} - 1$

or $\quad m > \sqrt{3} - 1$

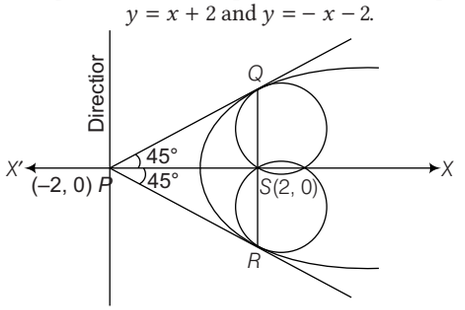
Hence , $m \in (-\infty, -\sqrt{3} - 1) \cup (\sqrt{3} - 1, \infty)$

42. The given parabola is $y^2 = 4(2)x$

$\Rightarrow \quad a = 2$

Since, $P(-2, 0)$ lies on the directrix and the axis.

$\Rightarrow$ The tangents will have slope $m = \pm 1$ and the equations are $y = x + 2$ and $y = -x - 2$.



The chord of contact of tangents is QR as $x = 2$ (i.e. L.R.)

$\because$ Common chord of two circles is X-axis.

$\because$ $\angle QPR = 90°$

$\therefore$ Circumcentre is $S(2, 0)$ on X-axis and orthocentre is $P(-2, 0)$ on X-axis.

Centroid and incentre also lies on X-axis,

($\because$ orthocentre, centroid, circumcentre and incentre are collinear).

43. Given parabola is $(y-2)^2 = 4\left(x - \frac{1}{2}\right)$

Let $x - \frac{1}{2} = X, y - 2 = Y$

$\therefore$ Parabola is $Y^2 = 4X$

Any point on axis of parabola is $(x, 2)$ for three distinct normals $X > 2.1$

$\Rightarrow$ $x - \frac{1}{2} > 2$ or $x > \frac{5}{2}$

$\therefore$ $x = 3, 4, 5$

Hence, points are (3, 2), (4, 2) and (5, 2).

44. The given parabola is $y^2 - 16x - 8y = 0$

$\Rightarrow$ $(y-4)^2 = 16(x+1)$

Shifting the origin to the point $(-1, 4)$ the equation of parabola becomes $y^2 = 16x$

then the coordinates of the point (14, 7) becomes (15, 3).

$\therefore$ Equation of any normal to the parabola is $Y + tX = 8t + 4t^3$.

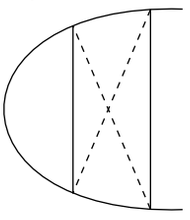
Since, it passes through (15, 3)

$\therefore$ $3 + 15t = 8t + 4t^3 \Rightarrow 4t^3 - 7t - 3 = 0$

or $(t+1)(2t-3)(2t+1) = 0 \Rightarrow t = -1, \frac{3}{2}, -\frac{1}{2}$

$\therefore$ Corresponding points are $(4, -8)$, $(9, 12)$ and $(1, -4)$.
Hence, the coordinates of the feet of the normals w.r.t. the original system of coordinates are $(3, -4)$, $(8, 16)$ and $(0, 0)$.

45. As a circle can intersect a parabola at four points, the quadrilateral may be cyclic.



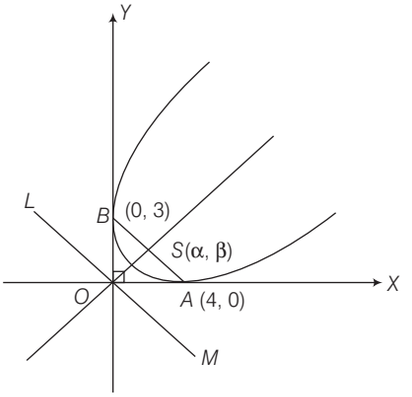
The diagonals of the quadrilateral may be equal as the quadrilateral may be an isosceles trapezium.

A rectangle cannot be inscribed in a parabola.

Sol. (Q. Nos. 46 to 48)

Let $A \equiv (4, 0)$ and $B \equiv (0, 3)$.

$\because$ OA and OB are mutually perpendicular tangents to the parabola. Therefore, O will lie on the directrix of the parabola.



Let $S(\alpha, \beta)$ be the focus of the parabola.

$\because$ Portion of a tangent to a parabola intercepted between the directrix and point of contact subtends a right angle at the focus.

$\therefore$ $\angle OSA = \angle OSB = \frac{\pi}{2}$

Now, $OS \perp SA \Rightarrow$ Slope of $OS \times$ Slope of $SA = -1$

$\Rightarrow$ $\left(\frac{\beta - 0}{\alpha - 0}\right) \times \left(\frac{\beta - 0}{\alpha - 4}\right) = -1$

$\Rightarrow$ $\alpha^2 + \beta^2 - 4\alpha = 0$ ...(i)

Again, $OS \perp SB \Rightarrow$ Slope of $OS \times$ Slope of $SB = -1$

$\Rightarrow$ $\left(\frac{\beta - 0}{\alpha - 0}\right) \times \left(\frac{\beta - 3}{\alpha - 0}\right) = -1$

$\Rightarrow$ $\alpha^2 + \beta^2 - 3\beta = 0$ ...(ii)

From Eqs. (i) and (ii), we get

$4\alpha = 3\beta$ ...(iii)

Since, tangents AO and BO at A and B to parabola are at right angles, therefore AB will be a focal chord of the parabola.

Equation of AB is

$\frac{x}{4} + \frac{y}{3} = 1 \Rightarrow \frac{\alpha}{4} + \frac{\beta}{3} = 1$

$\Rightarrow$ $3\alpha + 4\beta = 12$ ...(iv)

From Eqs. (iii) and (iv), we get

$\alpha = \frac{36}{25}$ and $\beta = \frac{48}{25}$

$\therefore$ Focus of parabola is $\left(\frac{36}{25}, \frac{48}{25}\right)$.

46. $\because$ Focus is (a, b).

$\therefore$ $b - a = \beta - \alpha = \frac{12}{25}$

47. $\because \quad AS = \sqrt{\left(4 - \frac{36}{25}\right)^2 + \left(0 - \frac{48}{25}\right)^2} = \frac{16}{5}$

and $\quad BS = \sqrt{\left(0 - \frac{36}{25}\right)^2 + \left(3 - \frac{48}{25}\right)^2} = \frac{9}{5}$

If l be the semi-latusrectum, then l = HM of AS and BS

$\therefore \quad \frac{2}{l} = \frac{5}{16} + \frac{5}{9} = \frac{125}{144}$

$\Rightarrow \quad l = \frac{288}{125}$

$\therefore \quad 2l = \frac{576}{125}$

48. $\because$ Slope of $OS = \frac{\beta}{\alpha} = \frac{4}{3}$

$\therefore$ Slope of directrix $LM = -\frac{3}{4}$

$\therefore$ Equation of directrix is $y = -\frac{3}{4}x$

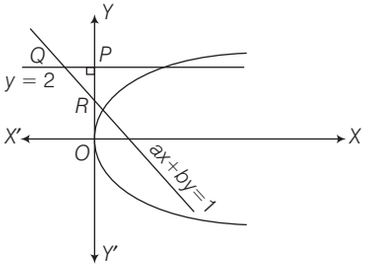
$\Rightarrow \quad 3x + 4y = 0.$

Sol. (Q. Nos. 49 to 51)

Since, (a, b) lies on parabola, $y^2 = 4\lambda x$

$\therefore \quad b^2 = 4a\lambda$ ...(i)

It is clear that ΔPQR is right angled at $P(0, 2)$.



So, its circumcentre is the mid-point of Q and R, where

$$Q \equiv \left(\frac{1-2b}{a}, 2\right) \text{ and } R \equiv \left(0, \frac{1}{b}\right).$$

$\therefore$ Circumcentre $\equiv \left(\frac{1-2b}{2a}, 1 + \frac{1}{2b}\right)$

$\therefore \quad x = \frac{1-2b}{2ab}, y = 1 + \frac{1}{2b}$

$\Rightarrow \quad 2b = \frac{1}{y-1}$ and $2a = \frac{(y-2)}{x(y-1)}$ ...(ii)

From Eqs. (i) and (ii), we get

$$(y-1)(y-2) = \frac{x}{8\lambda}$$

$\Rightarrow \quad \left(y - \frac{3}{2}\right)^2 = \frac{1}{8\lambda}(x + 2\lambda)$

$\therefore$ Vertex is $\left(-2\lambda, \frac{3}{2}\right)$

and length of latusrectum is $\frac{1}{8\lambda}$.

49. Product of coordinates of vertex $= -2\lambda \times \frac{3}{2} = -3\lambda$

$= -3 \times 2 \quad [\because \lambda = 2]$

$= -6$

50. Length of smallest focal chord = Length of latusrectum

$= \frac{1}{8\lambda}$

$= \frac{1}{8 \times \left(\frac{1}{32}\right)} = 4 \quad \left[\because \lambda = \frac{1}{32}\right]$

51. Let $y - \frac{3}{2} = Y$, $x + 2\lambda = X$

$\therefore \quad Y^2 = \frac{1}{8\lambda}X$

Curve is symmetrical about $Y = 0$

$\Rightarrow \quad y - \frac{3}{2} = 0$

$\therefore \quad y = \frac{3}{2}$

Sol. (Q. Nos. 52 to 54)

Given parabola (P) can be written as

$$(x - 2y)^2 = 32x - 4y - 16$$

On adding $2(x - 2y)\lambda + \lambda^2$ both sides, it becomes

$$(x - 2y + \lambda)^2 = 32x - 4y - 16 + 2(x - 2y)\lambda + \lambda^2$$

$$= 2(\lambda + 16)x - 4(\lambda + 1)y + \lambda^2 - 16 \quad ...(i)$$

We choose λ such that lines

$$x - 2y + \lambda = 0 \text{ and } 2(\lambda + 16)x - 4(\lambda + 1)y + \lambda^2 - 16 = 0$$

are perpendicular to each other. It requires

$$\frac{1}{2} \times \frac{2(\lambda + 16)}{4(\lambda + 1)} = -1$$

$\Rightarrow \quad \lambda + 16 = -4\lambda - 4$

$\Rightarrow \quad \lambda = -4$

Hence, Eq. (i) becomes

$$(x - 2y - 4)^2 = 24x + 12y = 12(2x + y)$$

$\Rightarrow \quad \left(\frac{x - 2y - 4}{\sqrt{5}}\right)^2 = \frac{12}{\sqrt{5}}\left(\frac{2x + y}{\sqrt{5}}\right) \Rightarrow Y^2 = 4\rho X$

where, $\quad X = \frac{2x + y}{\sqrt{5}}, Y = \frac{x - 2y - 4}{\sqrt{5}}$

and $\quad 4\rho = \frac{12}{\sqrt{5}} \Rightarrow \rho = \frac{3}{\sqrt{5}}.$

52. $\because$ Equation of axis is $Y = 0$

$\Rightarrow \quad x - 2y - 4 = 0$ ...(i)

and equation of latusrectum is $X = \rho$

$\Rightarrow \quad \frac{2x + y}{\sqrt{5}} = \frac{3}{\sqrt{5}}$

$\Rightarrow \quad 2x + y - 3 = 0$ ...(ii)

On solving Eqs. (i) and (ii),

focus is $\quad (x, y) = (2, -1).$

53. Length of latusrectum $= 4\rho = \frac{12}{\sqrt{5}}$

54. Equation of directrix is $X + \rho = 0$

$\Rightarrow \quad \frac{2x + y}{\sqrt{5}} + \frac{3}{\sqrt{5}} = 0$

$\therefore \quad 2x + y + 3 = 0$

Sol. (Q. Nos. 55 to 57)

Any parabola whose axis is parallel to the X-axis will be of the form

$$(y - q)^2 = 4\lambda(x - p) \quad \text{...(i)}$$

Now, $lx + my = 1$ can be written as

$$(y - q) = -\frac{l}{m}(x - p) + \left(\frac{1 - mq - lp}{m}\right) \quad \text{...(ii)}$$

Eq. (ii) will touch Eq. (i), then

$$\frac{1 - mq - lp}{m} = \frac{\lambda}{-\frac{l}{m}}$$

$\Rightarrow \quad -l + mlq + l^2p = m^2\lambda$

$\Rightarrow \quad pl^2 + qlm - \lambda m^2 - l = 0 \quad \text{...(iii)}$

But given that

$$5l^2 - 4lm + 6m^2 + 3l = 0 \quad \text{...(iv)}$$

On comparing Eqs. (iii) and (iv), we get

$$\frac{p}{5} = \frac{q}{-4} = \frac{-\lambda}{6} = \frac{-1}{3}$$

$\Rightarrow \quad p = -\frac{5}{3}, q = \frac{4}{3}, \lambda = 2$

So, the parabola is

$$\left(y - \frac{4}{3}\right)^2 = 8\left(x + \frac{5}{3}\right).$$

55. $\because$ Vertex is $\left(-\frac{5}{3}, \frac{4}{3}\right)$.

Here, $a = -\frac{5}{3}$ and $b = \frac{4}{3}$

$\therefore \quad a - b = -3$

$\Rightarrow \quad |a - b| = 3$

56. For focus,

$$x + \frac{5}{3} = 2 \text{ and } y - \frac{4}{3} = 0$$

$\therefore$ Coordinates of focus are $\left(\frac{1}{3}, \frac{4}{3}\right)$.

Here, $c = \frac{1}{3}$ and $d = \frac{4}{3}$

$\therefore \quad d - c = 1$

$\Rightarrow \quad 2^{|d-c|} = 2$

57. For directrix $\left(x + \frac{5}{3}\right) + 2 = 0$

$\Rightarrow \; 3x + 11 = 0$ given $ex + f = 0$

$\therefore \quad e = 3, f = 11$

Now, $\quad |e - f| = |3 - 11| = 8$

Sol. (Q. Nos. 58 to 60)

$\because \quad C_1 : y^2 = 4x$

$\therefore \quad S_1 : (1, 0)$

Let $z = x + iy$ and $z_1 = x_1 + iy_1$

If z_1 is obtained by rotating z, 120° in anti-clockwise direction, then

$$z_1 = ze^{2\pi i/3} = (x + iy)\left(-\frac{1}{2} + \frac{i\sqrt{3}}{2}\right)$$

$$= \left(-\frac{x}{2} - \frac{\sqrt{3}y}{2}\right) + i\left(\frac{\sqrt{3}}{2}x - \frac{y}{2}\right)$$

$\therefore$ Equation of curve C_2 is

$$\left(\frac{\sqrt{3}}{2}x - \frac{y}{2}\right)^2 = 4\left(-\frac{x}{2} - \frac{\sqrt{3}}{2}y\right) \quad \text{...(i)}$$

For focus $-\frac{x}{2} - \frac{\sqrt{3}}{2}y = 1$ and $\frac{\sqrt{3}}{2}x - \frac{y}{2} = 0$.

$\therefore \quad x = -\frac{1}{2}, y = -\frac{\sqrt{3}}{2}$

$\Rightarrow \quad S_2 : \left(-\frac{1}{2}, -\frac{\sqrt{3}}{2}\right)$

$\because \quad C_3$ is reflection of C_2 with respect to $y = x$.

$\therefore \quad S_3 : \left(-\frac{\sqrt{3}}{2}, -\frac{1}{2}\right)$.

58. $\because (t^2, 2t)$ are parametric form of curve C_1.

$\therefore$ From Eq. (i),

$\frac{\sqrt{3}}{2}x - \frac{y}{2} = 2t$ and $-\frac{x}{2} - \frac{\sqrt{3}}{2}y = t^2$,

we get $x = \frac{1}{2}(-t^2 + 2\sqrt{3}t), y = \frac{1}{2}(-\sqrt{3}t^2 - 2t)$

$\therefore$ Parametric coordinates of C_2 are

$$\left(\frac{1}{2}(-t^2 + 2\sqrt{3}t), \frac{1}{2}(-\sqrt{3}t^2 - 2t)\right).$$

59. Area of ΔOS_2S_3

$$= \frac{1}{2}\left|\begin{vmatrix} -\frac{1}{2} & -\frac{\sqrt{3}}{2} \\ -\frac{\sqrt{3}}{2} & -\frac{1}{2} \end{vmatrix}\right|$$

$$= \frac{1}{2}\left|\frac{1}{4} - \frac{3}{4}\right| = \frac{1}{4} \text{ sq unit}$$

60. $\Sigma x_1^2 + \Sigma y_1^2 = (1)^2 + \left(-\frac{1}{2}\right)^2 + \left(-\frac{\sqrt{3}}{2}\right)^2 + (0)^2 + \left(-\frac{\sqrt{3}}{2}\right)^2 + \left(-\frac{1}{2}\right)^2$

$$= 1 + \frac{1}{4} + \frac{3}{4} + 0 + \frac{3}{4} + \frac{1}{4} = 3$$

Sol. (Q. Nos. 61 to 63)

Since, no point of the parabola $y = x^2 + ax + 1$ is below the X-axis.

$\therefore \quad D \le 0$

$\Rightarrow \quad a^2 - 4 \le 0$

$\Rightarrow \quad -2 \le a \le 2$

61. The maximum value of a is 2.

The equation of the parabola is $y = x^2 + 2x + 1$.

It intersect the Y-axis at $(0, 1)$.

$\therefore$ Equation of tangent at $(0, 1)$ is

$$\frac{y+1}{2} = 0 \cdot x + (x + 0) + 1$$

$$\Rightarrow \quad y = 2x + 1$$

$$\Rightarrow \quad 2x - y + 1 = 0$$

Since, $2x - y + 1 = 0$ touches the circle $x^2 + y^2 = c^2$, then

$$\frac{0 - 0 + 1}{\sqrt{4+1}} = c \qquad [\because c > 0]$$

$$\Rightarrow \quad c = \frac{1}{\sqrt{5}}$$

$$\therefore \quad 5c^2 = 1$$

62. Equation of the tangent at $(0, 1)$ to the parabola

$$y = x^2 + ax + 1 \text{ is}$$

$$\Rightarrow \quad \frac{y+1}{2} = 0 \cdot x + \frac{a}{2}(x + 0) + 1$$

$$\Rightarrow \quad y = ax + 1$$

$$\Rightarrow \quad ax - y + 1 = 0$$

As it touches the circle $x^2 + y^2 = c^2$, then

$$\frac{1}{\sqrt{(a^2+1)}} = c$$

i.e. c is maximum, when $a = 0$.

Therefore, the equation of the tangent is $y = 1$.

$\therefore$ Slope of the tangent is 0.

63. Equation of tangent is

$$y = ax + 1$$

$$\Rightarrow \quad ax - y = -1$$

$$\Rightarrow \quad \frac{x}{\left(-\frac{1}{a}\right)} + \frac{y}{(1)} = 1$$

Therefore, the area of the triangle bounded by the tangent and the axes is

$$\frac{1}{2}\left|-\frac{1}{a}\right||1| = \frac{1}{2|a|}$$

$$\therefore \quad \Delta = \frac{1}{4} \qquad [\text{for minimum area } a = 2]$$

$$\Rightarrow \quad 8\Delta = 2$$

Sol. (Q. Nos. 64 to 66)

The conic is $S \equiv x^2 + xy + y^2 - 2x - 2y + 1 = 0$

and the line is $L \equiv x + y + 1 = 0$

It is required to find equation of the parabola (P) which touches the conic $S = 0$ at those (two) points, where the line $L = 0$ intersect the conic. Obviously at these points the parabola is in double contact with the conic.

$\therefore$ The equation of any such conic is $\phi \equiv S + \lambda L^2 = 0$

$$\Rightarrow (x^2 + xy + y^2 - 2x - 2y + 1) + \lambda(x + y + 1)^2 = 0 \qquad ...(i)$$

$$\Rightarrow (1 + \lambda)x^2 + (1 + 2\lambda)xy + (1 + \lambda)y^2 + 2(\lambda - 1)x + 2(\lambda - 1)y + \lambda + 1 = 0$$

It will be a parabola, if $h^2 = ab$

$$\Rightarrow \quad \frac{1}{4}(1 + 2\lambda)^2 = (1 + \lambda)^2$$

$$\Rightarrow \quad 1 + 4\lambda + 4\lambda^2 = 4 + 8\lambda + 4\lambda^2$$

$$\therefore \quad \lambda = -\frac{3}{4}$$

Hence, from Eq. (i), the required parabola is

$$(x^2 + xy + y^2 - 2x - 2y + 1) - \frac{3}{4}(x + y + 1)^2 = 0$$

$$\Rightarrow \quad x^2 - 2xy + y^2 - 14x - 14y + 1 = 0 \qquad ...(ii)$$

64. Comparing parabola (ii) with

$$ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$$

$\therefore$ $a = 1, h = -1, b = 1, g = -7, f = -7, c = 1$

Now, $|a + b + c + f + g + h| = |1 + 1 + 1 - 7 - 7 - 1| = 12$

65. The parabola (P) can be written as

$$(x - y)^2 = (14x + 14y - 1)$$

$$\Rightarrow \quad \left(\frac{x-y}{\sqrt{2}}\right)^2 = 7\sqrt{2}\left(\frac{14x + 14y - 1}{\sqrt{(14)^2 + (14)^2}}\right) \qquad ...(iii)$$

$\therefore$ Length of latusrectum is $7\sqrt{2}$.

66. For vertex,

$$\frac{x-y}{\sqrt{2}} = 0, \frac{14x + 14y - 1}{\sqrt{(14)^2 + (14)^2}} = 0 \qquad [\text{from Eq. (iii)}]$$

$$\Rightarrow \quad x = y, 14x + 14y = 1$$

$$\therefore \quad x = y = \frac{1}{28}$$

$$\text{Vertex is } \left(\frac{1}{28}, \frac{1}{28}\right) = (a, b) \qquad [\text{given}]$$

$$\therefore \quad |a - b| = 0$$

Sol. (Q. Nos. 67 to 69)

$\because$ $y = 3x$ is tangent to the parabola

$$2y = ax^2 + b \qquad ...(i)$$

$$\therefore \quad 2(3x) = ax^2 + b$$

[substitute the value of $y = 3x$ in $2y = ax^2 + b$]

$$\Rightarrow \quad ax^2 - 6x + b = 0$$

$$D = 0$$

$[\because y = 3x \text{ is tangent to } 2y = ax^2 + b]$

$$\therefore \quad 36 - 4ab = 0$$

$$\Rightarrow \quad ab = 9 \qquad ...(ii)$$

From Eqs. (i) and (ii), we get

$$2y = ax^2 + \frac{9}{a} \qquad ...(iii)$$

67. $\because$ $\frac{a+b}{2} \geq \sqrt{ab} = 3$ [from Eq. (ii)]

$$\Rightarrow \quad a + b \geq 6$$

$\therefore$ Minimum value of $a + b$ is 6.

68. $\because$ (2, 6) is the point of contact.

From Eq. (iii), we get

$$12 = 4a + \frac{9}{a}$$

$$\Rightarrow \quad 4a^2 - 12a + 9 = 0$$

$$\Rightarrow \quad (2a - 3)^2 = 0$$

$$\therefore \quad 2a = 3$$

69. For $b = 18$

From Eq. (ii), $\quad a = \frac{1}{2}$

From Eq. (iii), $\quad 2y = \frac{x^2}{2} + 18$ ...(iv)

On solving $y = 3x$ and Eq. (iv), we get

$$6x = \frac{x^2}{2} + 18$$

$$\Rightarrow \quad x^2 - 12x + 36 = 0$$

$$\Rightarrow \quad (x - 6)^2 = 0$$

$$\therefore \quad x = 6, \text{ then } y = 3x = 18$$

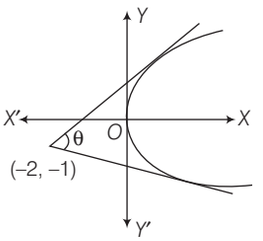
$\therefore$ Point of contact is (6, 18).

70. Equation of tangent in terms of slope (m) of the parabola $y^2 = 4x$ is $y = mx + \frac{1}{m}$.

$\because$ Point of intersection of tangents is $(-2, -1)$, then

$$-1 = -2m + \frac{1}{m}$$

$$\Rightarrow \quad 2m^2 - m - 1 = 0$$



Let m_1, m_2 be slopes of the tangents, then

$$m_1 - m_2 = \frac{\sqrt{D}}{a} = \frac{\sqrt{(1+8)}}{2} = \frac{3}{2}$$

and $\quad m_1 m_2 = -\frac{1}{2}$

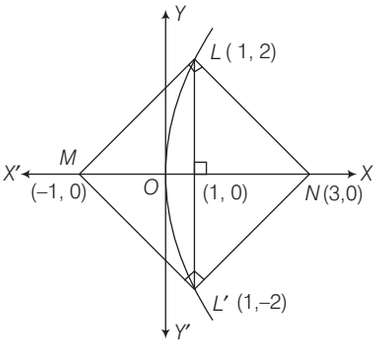
$$\therefore \quad \tan\theta = \left| \frac{m_1 - m_2}{1 + m_1 m_2} \right| = \left| \frac{3/2}{1 - 1/2} \right| = 3$$

71. Let S be the focus and point of intersection of tangents at P and Q is R.

$\because \quad (SR)^2 = SP \cdot SQ = 4 \times 9 = 36$

$\therefore \quad SR = 6$

72. The four lines form a square. The tangents at $L(1, 2)$ and $L'(1, -2)$ are $x - y + 1 = 0$ and $x + y + 1 = 0$. They intersect at $M(-1, 0)$.



The area of the square $MLNL'$ is $(ML)^2 = (1 + 1)^2 + (2 - 0)^2 = 8$ sq units

$\therefore \quad \lambda = 8$

73. Parabola is $y^2 = x$

$\therefore \quad a = \frac{1}{4}$

The normal at t is

$$tx + y = \frac{t^3}{4} + \frac{t}{2}$$

It passes through $(a, 0)$.

$$\therefore \quad ta = \frac{t^3}{4} + \frac{t}{2}$$

$$\Rightarrow \quad t^2 = 4\left(a - \frac{1}{2}\right) \Rightarrow a > \frac{1}{2}$$

$$\therefore \quad t_1 = 2\sqrt{\left(a - \frac{1}{2}\right)}, \; t_2 = -2\sqrt{\left(a - \frac{1}{2}\right)}$$

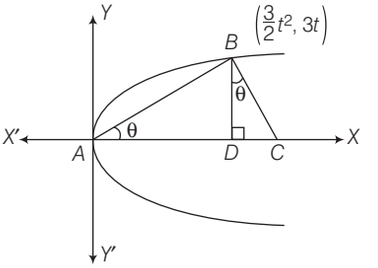
The normals are perpendicular $\Rightarrow t_1 t_2 = -1$

$$\Rightarrow \quad -4\left(a - \frac{1}{2}\right) = -1$$

$$\therefore \quad 4a = 3$$

74. Let B as $\left(\frac{3}{2}t^2, 3t\right)$ $\quad \left[\text{Here, } a = \frac{3}{2}\right]$

and let $BD \perp AC$ and $\angle DAB = \theta$



$$\Rightarrow \quad \tan\theta = \frac{BD}{AD} = \frac{3t}{\frac{3}{2}t^2} = \frac{2}{t}$$

$\therefore$ Projection of BC on the axis $= DC$

$$= BD\tan\theta = 3t\left(\frac{2}{t}\right) = 6 \text{ units}$$

$$\therefore \quad \lambda = 6$$

75. The parabolas are $y = x^2 - 9$ and $y = \lambda x^2$.

$\Rightarrow \quad x^2 - 9 = \lambda x^2 \Rightarrow \quad x^2(1-\lambda) = 9$

$\Rightarrow \quad x^2 = \dfrac{9}{1-\lambda}$

$\therefore \quad x = \pm \dfrac{3}{\sqrt{(1-\lambda)}}$

Now, from the symmetry about Y-axis,

$AB = 2a = \dfrac{6}{\sqrt{(1-\lambda)}} \Rightarrow \quad a = \dfrac{3}{\sqrt{(1-\lambda)}}$

$\Rightarrow \quad a^2(1-\lambda) = 9 \quad \Rightarrow \quad \lambda a^2 + 9 = a^2$

$\Rightarrow \quad a^2 + \mu = a^2$ [given]

$\therefore \quad \mu = 9$

76. Given, $y^2 - 8x < 0$, $x^2 + y^2 < 16$ and $x > 0$.

For $x = 1$,

$y^2 < 8$ and $y^2 < 15 \Rightarrow y^2 < 8$

$\therefore \quad y = 0, \pm 1, \pm 2$

$\therefore \quad$ 5 points.

For $x = 2$,

$y^2 < 16, y^2 < 12 \Rightarrow y^2 < 12$

$\therefore \quad y = 0, \pm 1, \pm 2, \pm 3$

$\therefore \quad$ 7 points

For $x = 3$,

$y^2 < 24, y^2 < 7 \Rightarrow y^2 < 7$

$\therefore \quad y = 0, \pm 1, \pm 2$

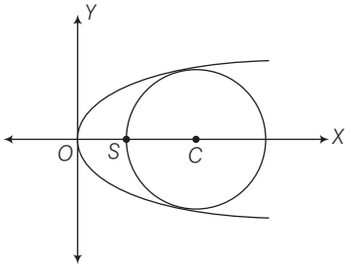
$\therefore \quad$ 5 points

Hence, total points is 17.

$\therefore \quad n = 17$

Sum of digits of n is 8.

77. Focus of the parabola $y^2 = 4x$ is $S(1, 0)$.



Let radius of circle be r.

$\therefore$ Centre of circle is $(1 + r, 0)$.

$\Rightarrow$ Equation of circle is $(x - 1 - r)^2 + y^2 = r^2$

$\Rightarrow \quad (x - 1 - r)^2 + 4x = r^2$ [$\because y^2 = 4x$]

$\Rightarrow \quad x^2 + 2(2 - 1 - r)x + 2r + 1 = 0$

$\Rightarrow \quad x^2 + 2(1 - r)x + 2r + 1 = 0$

It would have same roots due to symmetry.

$\therefore \quad D = 0$

$\Rightarrow \quad 4(1 - r)^2 - 4 \cdot 1 \cdot (2r + 1) = 0$

$\therefore \quad r = 0, 4$

Hence, $r = 4$ [$\because r \neq 0$]

78. For maximum number of common chords, the circle and the parabola must intersect at four points.

Now, solving the given curves, we have

$(x - 6)^2 + 4x = r^2$

$\Rightarrow \quad x^2 - 8x + 36 - r^2 = 0$

The curves touch, if $D = 0$

$\Rightarrow \quad 64 - 4 \cdot 1 \cdot (36 - r^2) = 0$

$\Rightarrow \quad r^2 = 20$

$\therefore \quad r = 2\sqrt{5}$

Hence, the least integral value of r for which the curves intersect is 5.

79. Given parabola is

$x^2 = 4(y - 1)$

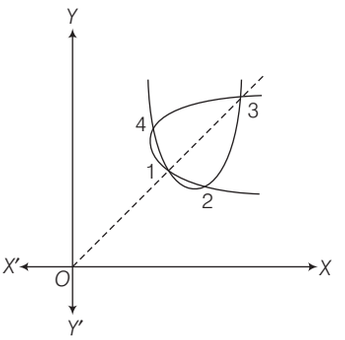
$\therefore$ Focus is $(0, 2)$.

Now, the shortest intercept of the line on the parabola which passes through the focus is latusrectum. The axis of the given parabola is the Y-axis.

Therefore, the latusrectum is parallel to the X-axis.

$\therefore \quad$ Slope = 0

80. (A) The given parabolas are symmetrical about the line $y = x$ as shown in the figure



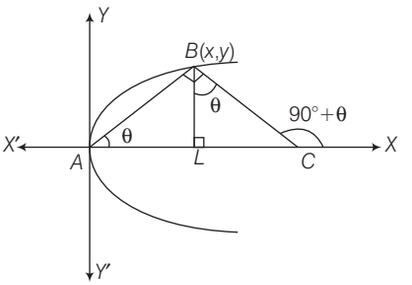
They intersect each other at four distinct points.

Hence, the number of common chords is

$${}^4C_2 = \frac{4 \cdot 3}{1 \cdot 2} = 6$$

Which is perfect number [$\because 1 \times 2 \times 3 = 1 + 2 + 3 = 6$]

(B) $\because \quad \tan\theta = \dfrac{y}{x}$ ...(i)



LC = Projection of BC on X-axis

$= BL \tan\theta = y \tan\theta$

$$= y \times \frac{y}{x} \qquad \text{[from Eq. (i)]}$$

$$= \frac{y^2}{x}$$

$$= 4 \qquad [\because y^2 = 4x]$$

(C) Normals to $y^2 = 4ax$ and $x^2 = 4by$ in terms of m are

$y = mx - 2am - am^3$ and $y = mx + 2b + \frac{b}{m^2}$.

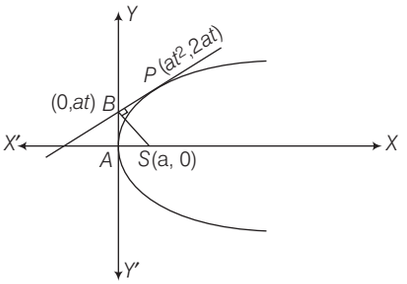
For common normal,

$$2b + \frac{b}{m^2} = -2am - am^3$$

or $$am^5 + 2am^3 + 2bm^2 + b = 0$$

It is clear that at most five common normals.

(D) Let middle point of P and B be (h,k), then $2h = at^2$



and $$2k = 3at$$

or $$2h = a\left(\frac{2k}{3a}\right)^2$$

or $$2k^2 = 9ah$$

∴ Locus of mid-point is

$$2y^2 = 9ax$$

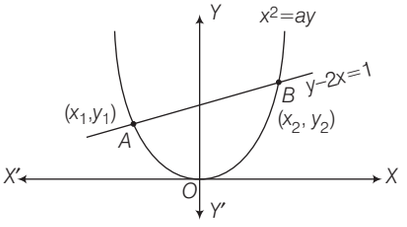
∴ Length of latusrectum $= \frac{9a}{2}$

$$= \frac{9}{2} \times 2 \qquad [\because a = 2]$$

$$= 9$$

81. (A) Given parabola is $x^2 = ay$ ...(i)

and the given line is $y - 2x = 1$ ...(ii)



On solving Eqs. (i) and (ii), we get

$$x^2 = a(2x + 1) \Rightarrow x^2 - 2ax - a = 0$$

Let coordinates of A and B are (x_1, y_1) and (x_2, y_2) respectively, then

$$|x_1 - x_2| = \frac{\sqrt{D}}{a} = \frac{\sqrt{(4a^2 + 4a)}}{1} = 2\sqrt{(a^2 + a)} \qquad \text{...(iii)}$$

Also A, B lie on $y - 2x = 1$

∴ $$y_1 - 2x_1 = 1 \text{ and } y_2 - 2x_2 = 1$$

or $$y_2 - y_1 = 2(x_2 - x_1) \qquad \text{...(iv)}$$

∴ Length of $AB = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$

$$= \sqrt{5}\,|x_1 - x_2| \qquad \text{[from Eq. (iv)]}$$

$$= 2\sqrt{5}\,\sqrt{(a^2 + a)} \qquad \text{[from Eq. (iii)]}$$

Given, $2\sqrt{5}\,\sqrt{(a^2 + a)} = \sqrt{40}$

$\Rightarrow$ $$a^2 + a = 2$$

$\Rightarrow$ $$a^2 + a - 2 = 0$$

$\Rightarrow$ $$(a + 2)(a - 1) = 0$$

$\Rightarrow$ $$a = -2, 1$$

(B) If tangents are drawn from (x_1, y_1) to the parabola $y^2 = 4ax$ and angle between tangents is θ, then

$$|\tan\theta| = \frac{\sqrt{(y_1^2 - 4ax_1)}}{|x_1 + a|}$$

Here, $$x_1 = 0, y_1 = 2, \theta = \frac{3\pi}{4}, \text{ then}$$

$$|-1| = \frac{2}{|0 + a|}$$

$\Rightarrow$ $$|a| = 2$$

∴ $$a = \pm 2$$

Aliter :

Observe that one tangent is the Y-axis, the other tangent is at $\theta = \frac{\pi}{4}$ and its equation is $ty = x + at^2$

for $t = 1$, we get $y = x + a$

$\Rightarrow a = 2$ from the symmetry $a = -2$ is also possible.

(C) Let the other end be at $(at^2, 2at)$

So, mid-point is $\left(\frac{at^2 + a}{2}, \frac{2at + 2a}{2}\right)$

which satisfy $x + y = 1$

or $$\frac{at^2 + a}{2} + at + a = 1$$

$\Rightarrow$ $$at^2 + 2at + 3a - 2 = 0$$

Since, two distinct chords are possible, so $D > 0$.

∴ $$4a^2 - 4a(3a - 2) > 0$$

$\Rightarrow$ $$-8a^2 + 8a > 0$$

$\Rightarrow$ $$8a(a - 1) < 0$$

∴ $$0 < a < 1$$

or $$0 < 4a < 4$$

or $0 <$ Length of latusrectum < 4

∴ Length of latusrectum can be 1 or 2 or 3 from the given values.

(D) The given parabola is

$$x^2 - ay + 3 = 0$$

or $$x^2 = a\left(y - \frac{3}{a}\right)$$

Let $x = X, y - \frac{3}{a} = Y$

Then, the parabola is

$$X^2 = aY$$

For focus $X = 0, Y = \frac{a}{4}$

$\Rightarrow$ $x = 0, y - \frac{3}{a} = \frac{a}{4}$

$\therefore$ Focus is $\left(0, \frac{3}{a} + \frac{a}{4}\right)$ given focus is $(0, 2)$

$\therefore$ $\frac{3}{a} + \frac{a}{4} = 2$

$\Rightarrow$ $a^2 - 8a + 12 = 0$

$\Rightarrow$ $(a - 6)(a - 2) = 0$

$\therefore$ $a = 2, 6$

Here, $a_1 = 6, a_2 = 2$

$\therefore$ $\frac{a_1}{a_2} = 3$

82. (A) Points $(1, 2)$ and $(-2, 1)$ satisfy both the curves.

(B) Equation of tangent at $(t^2, 2t)$ on $y^2 = 4x$ is

$$ty = x + t^2$$

It passes through the point $(2, 3)$, then

$$3t = 2 + t^2$$

$\Rightarrow$ $t^2 - 3t + 2 = 0$

or $(t - 1)(t - 2) = 0$

or $t = 1$ or 2

The point of contact is $(1, 2)$ or $(4, 4)$.

(C) Let $P(\sqrt{5}\cos\theta, \sqrt{5}\sin\theta)$, then the chord of contact of the parabola $y^2 = 4x$ w.r.t. P is

$$y \cdot \sqrt{5}\sin\theta = 2(x + \sqrt{5}\cos\theta)$$

or $y = \frac{2x}{\sqrt{5}\sin\theta} + 2\cot\theta$

On comparing with $y = 2(x - 2)$, then

$$\sqrt{5}\sin\theta = 1 \text{ and } \cot\theta = -2$$

or $\sqrt{5}\sin\theta = 1$ and $\sqrt{5}\cos\theta = -2$

Hence, coordinates of P are $(-2, 1)$.

(D) Let coordinates of Q be $(t^2, 2t)$.

Now, the area of ΔOPQ is

$$\frac{1}{2}\left|\begin{vmatrix} t^2 & 2t \\ 4 & -4 \end{vmatrix}\right| = 6 \qquad \text{[given]}$$

$\Rightarrow$ $2t^2 + 4t = \pm 6$

or $t^2 + 2t \pm 3 = 0$

$\therefore$ $t^2 + 2t - 3 = 0$ $\quad [\because t^2 + 2t + 3 \neq 0]$

$\Rightarrow$ $(t + 3)(t - 1) = 0$

Then, $t = 1$ or -3

Hence, the point Q are $(1, 2)$ or $(9, -6)$.

83. Equation of tangent to $y^2 = 4x$ is

$$y = mx + \frac{1}{m}$$

it is also tangent to $x^2 = 4y$, then

$$x^2 = 4\left(mx + \frac{1}{m}\right)$$

$\Rightarrow$ $x^2 - 4mx - \frac{4}{m} = 0$

It discriminant $= 0$

$\Rightarrow$ $16m^2 + \frac{16}{m} = 0$

$\Rightarrow$ $m^3 = -1$

$\therefore$ $m = -1$

$\therefore$ Equation of common tangent is $x + y + 1 = 0$.

Statement II is also true and it is correct explanation of Statement I.

84. The vertex of $(y + 2)^2 = 2(x - 1)$ is $(1, -2)$ and equation of axis is $y = -2$.

Here, $4a = 2$

$\therefore$ $a = \frac{1}{2} \Rightarrow 3a = \frac{3}{2}$

$\therefore$ Required point is $\left(1 + \frac{3}{2}, -2\right)$, i.e. $\left(\frac{5}{2}, -2\right)$.

Hence, both statements are true and Statement II is correct explanation for Statement I.

85. $\because$ $y = mx + c$ ...(i)

and $y^2 = 4ax$ ...(ii)

From Eqs. (i) and (ii),

$$y^2 = 4a\left(\frac{y - c}{m}\right)$$

$\Rightarrow$ $my^2 - 4ay + 4ac = 0$

If line Eq. (i) intersect the parabola $y^2 = 4ax$ at one point, then

$$B^2 = 4AC$$

$\Rightarrow$ $(-4a)^2 = 4 \cdot m \cdot 4ac$

$\Rightarrow$ $c = \frac{a}{m}$

From Eq. (i), equation of tangent is

$$y = mx + \frac{a}{m}$$

$\therefore$ Statement I and Statement II are individual true and Statement II is correct explanation of Statement I.

86. $\because$ $\sqrt{ax} + \sqrt{by} = 1$ ...(i)

On squaring both sides, then

$$ax + by + 2\sqrt{abxy} = 1$$

$\Rightarrow$ $(ax + by - 1) = -2\sqrt{abxy}$

Again, on squaring both sides, we get

$$a^2x^2 + b^2y^2 + 1 + 2abxy - 2ax - 2by + 1 = 4abxy$$

$\Rightarrow$ $a^2x^2 - 2abxy + b^2y^2 - 2ax - 2by + 1 = 0$

Now, comparing with

$$Ax^2 + 2Hxy + By^2 + 2Gx + 2Fy + C = 0$$

$\therefore \quad A = a^2, H = -ab, B = b^2, G = -a, F = -b, C = 1$

$\therefore \quad \Delta = ABC + 2FGH - AF^2 - BG^2 - CH^2$

$= a^2b^2 - 2a^2b^2 - a^2b^2 - a^2b^2 - a^2b^2$

$= -4a^2b^2 \neq 0$

and $H^2 = AB$

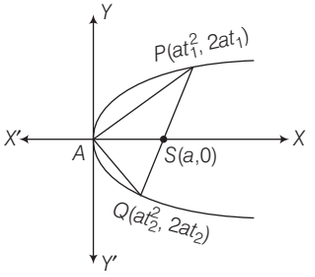
Hence, Eq. (i) represent a parabola.

$\therefore$ Statement I is true and Statement II is false.

87. $\because$ Slope of $AP = m_1 = \dfrac{2at_1 - 0}{at_1^2 - 0} = \dfrac{2}{t_1}$

and slope of $AQ = m_2 = \dfrac{2at_2 - 0}{at_2^2 - 0} = \dfrac{2}{t_2}$

$\because \quad m_1m_2 = \dfrac{4}{t_1t_2} \neq -1$



Also, P, S, Q are collinear, then

$$\frac{2at_1 - 0}{at_1^2 - a} = \frac{0 - 2at_2}{a - at_2^2}$$

$\Rightarrow \quad t_1 - t_1t_2^2 = -t_1^2t_2 + t_2$

$\Rightarrow \quad (t_1 - t_2) + t_1t_2(t_1 - t_2) = 0$

$\because \quad t_1 - t_2 \neq 0, 1 + t_1t_2 = 0$

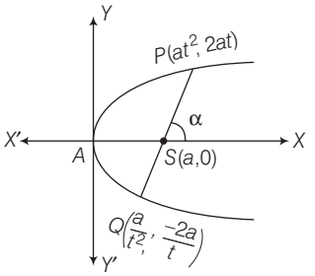
$\therefore \quad t_1t_2 = -1$

Hence, Statement I is false and Statement II is true.

88. Length of focal chord $PQ = a\left(t + \dfrac{1}{t}\right)^2$ ...(i)

and $\tan\alpha = \dfrac{2at + \dfrac{2a}{t}}{at^2 - \dfrac{a}{t^2}} = \dfrac{2t}{t^2 - 1} = \dfrac{2\left(\dfrac{1}{t}\right)}{1 - \left(\dfrac{1}{t}\right)^2}$

$\therefore \quad \dfrac{1}{t} = \tan(\alpha/2)$



From Eq. (i)

$$PQ = a(\cot(\alpha/2) + \tan(\alpha/2))^2$$

$$= a\left(\frac{1}{\sin(\alpha/2)\cos(\alpha/2)}\right)^2$$

$$= a\left(\frac{2}{\sin\alpha}\right)^2 = 4a\ \text{cosec}^2\ \alpha$$

For $\alpha = 60°$, $4a = 8$ and

$$PQ = 8\ \text{cosec}^2\ 60° = 8\left(\frac{2}{\sqrt{3}}\right)^2 = 32/3$$

$\therefore$ Statement I is true and Statement II is false.

89. $\because \quad x + y = \lambda \Rightarrow y = \lambda - x$ ...(i)

and $\quad y = x - x^2$ ...(ii)

From Eqs. (i) and (ii), we get

$$\lambda - x = x - x^2$$

$\Rightarrow \quad x^2 - 2x + \lambda = 0$

$\because$ Eq. (i) touch the parabola Eq. (ii), then

$$B^2 - 4AC = 0$$

$\Rightarrow \quad (-2)^2 - 4 \cdot 1 \cdot \lambda = 0$

$\therefore \quad \lambda = 1$

$\Rightarrow$ Statement I is true.

From Statement II,

$$(x - 1)^2 = x - x^2$$

$\Rightarrow \quad 2x^2 - 3x + 1 = 0$

$\therefore$ Discriminant $= (-3)^2 - 4 \cdot 2 \cdot 1 = 1 \neq 0$

$\therefore$ Statement II is false.

90. $\because \quad 3x + 4y + 5 = 0$ and $4x + 3y + 2 = 0$ are not perpendicular to each other.

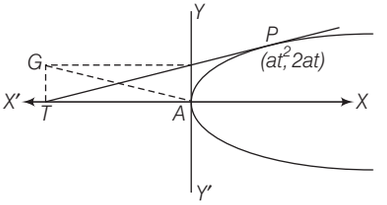
$\therefore$ Latusrectum $\neq 4$

$\therefore$ Statement I is false and Statement II is true.

91. Let $P(at^2, 2at)$ be any point on the parabola $y^2 = 4ax$.

Then, tangent at $P(at^2, 2at)$ is $ty = x + at^2$.

Since, tangent meet the axis of parabola in T and tangent at the vertex in Y



$\therefore$ Coordinates of T and Y are $(-at^2, 0)$ and $(0, at)$ respectively.

Let coordinates of G be (x_1, y_1).

Since, $TAYG$ is rectangle.

$\because$ Mid-points of diagonals TY and GA is same.

$$\Rightarrow \quad \frac{x_1 + 0}{2} = \frac{-at^2 + 0}{2}$$

$$\Rightarrow \quad x_1 = -at^2 \quad \text{...(i)}$$

and $\frac{y_1 + 0}{2} + \frac{0 + at}{2} \quad \Rightarrow \quad y_1 = at$ ...(ii)

Eliminating t from Eqs. (i) and (ii), we get

$$x_1 = -a\left(\frac{y_1}{a}\right)^2$$

$\Rightarrow \quad y_1^2 = -ax_1$

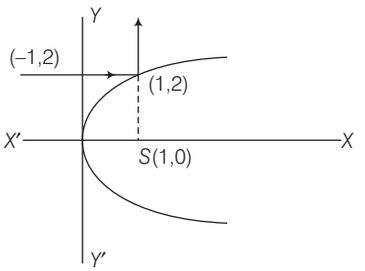
$\Rightarrow \quad y_1^2 + ax_1 = 0$

Hence, the locus of $G(x_1, y_1)$ is $y^2 + ax = 0$.

92. Equation of incident ray parallel to axis of parabola (X-axis) is $y = \lambda$, which pass through $(-1, 2)$, then $2 = \lambda$.

$\therefore$ Equation of incident ray is $y = 2$

Incident ray strikes the parabola $y^2 = 4x$ at $(1, 2)$.



The reflected ray passes through the focus $(1, 0)$.

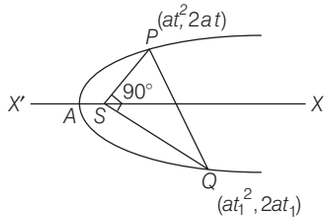
Hence, the equation of the reflected ray is $x = 1$.

93. Let PQ be a normal chord to a parabola at $P(at^2, 2at)$.

Since, the ordinate and abscissa of P are equal.

$\Rightarrow \quad at^2 = 2at, t \neq 0$

$\therefore \quad t = 2$



Since, normal at $P(at^2, 2at)$ meet the parabola at $Q(at_1^2, 2at_1)$.

$\therefore \quad t_1 = -t - \frac{2}{t}$

or $\quad t_1 = -2 - 1$

or $\quad t_1 = -3$

$\therefore$ Coordinates of P and Q are $(4a, 4a)$ and $(9a, -6a)$, respectively.

$\therefore$ Slope of $SP = \frac{4a - 0}{4a - a} = \frac{4}{3} = m_1$ (say)

and slope of $SQ = \frac{-6a - 0}{9a - a} = -\frac{3}{4} = m_2$ (say)

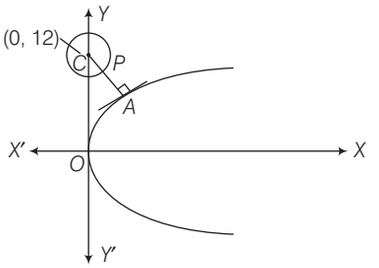
$\therefore \quad m_1 m_2 = -1$

Hence, SP and SQ are perpendicular to each other

i.e. $\quad \angle PSQ = 90°$

94. The centre and radius of the given circle are $(0, 12)$ and 4, respectively.

Now, the shortest distance always occurs along the common normal.



Let $\quad A \equiv (t^2, 2t)$

Equation of normal at A is $y + tx = 2t + t^3$,

which passes through $(0, 12)$, then

$$12 + 0 = 2t + t^3 \Rightarrow t^3 + 2t - 12 = 0$$

or $\quad (t - 2)(t^2 + 2t + 6) = 0$

$\therefore \quad t = 2 \quad [\because t^2 + 2t + 6 \neq 0]$

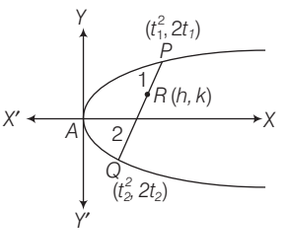
Coordinates of A are $(4, 4)$.

$\therefore$ Shortest distance $= AP = AC - CP = \sqrt{80} - 4 = 4(\sqrt{5} - 1)$

95. Let $P(t_1^2, 2t_1)$ and $Q(t_2^2, 2t_2)$ be extremities of the chord with slope 2.

$\therefore \quad \frac{2t_1 - 2t_2}{t_1^2 - t_2^2} = 2$

$\Rightarrow \quad t_1 + t_2 = 1$ ...(i)



Let $R(h, k)$ be coordinates of the point which divides PQ in the ratio 1 : 2, then

$$h = \frac{2t_1^2 + t_2^2}{3}$$

and $\quad k = \frac{4t_1 + 2t_2}{3}$

$\Rightarrow \quad 3h = 2t_1^2 + (1 - t_1)^2$

and $\quad 3k = 4t_1 + 2(1 - t_1)$ [from Eq. (i)]

or $\quad 3h = 3t_1^2 - 2t_1 + 1$

and $\quad 3k = 2t_1 + 2$

Eliminating t_1

$\therefore \quad 3h = 3\left(\frac{3k - 2}{2}\right)^2 - 2\left(\frac{3k - 2}{2}\right) + 1$

$\Rightarrow \quad 9k^2 - 16k - 4h + 8 = 0$

$\Rightarrow \quad k^2 - \frac{16k}{9} - \frac{4h}{9} + \frac{8}{9} = 0$

$$\Rightarrow \quad \left(k-\frac{8}{9}\right)^2 = \frac{4}{9}\left(h-\frac{2}{9}\right)$$

$\therefore$ Locus of $R(h, k)$ is $\left(y-\frac{8}{9}\right)^2 = \frac{4}{9}\left(x-\frac{2}{9}\right)$,

which is a parabola with vertex $\left(\frac{8}{9}, \frac{2}{9}\right)$.

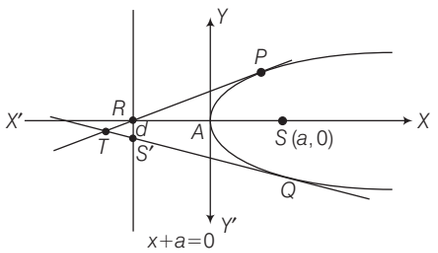
96. Let coordinates of P and Q on the parabola $y^2 = 4ax$ are $(at_1^2, 2at_1)$ and $(at_2^2, 2at_2)$.

Equation of tangents at P and Q are

$$t_1y = x + at_1^2 \quad \text{and} \quad t_2y = x + at_2^2$$

Let these tangents meet $x + a = 0$ at R and S, then coordinates of R and S' are $\left(-a, \frac{a(t_1^2-1)}{t_1}\right)$ and $\left(-a, \frac{a(t_2^2-1)}{t_2}\right)$,

respectively.



Given, $|RS'| = d$

$$\therefore \quad \left|a\left(\frac{t_1^2-1}{t_1}\right) - a\left(\frac{t_2^2-1}{t_2}\right)\right| = d$$

$$\Rightarrow \quad \left|\frac{a}{t_1t_2}t_1^2t_2 - t_2 - t_1t_2^2 + t_1\right| = d$$

$$\Rightarrow \quad \left|\frac{a}{t_1t_2}((t_1-t_2)(1+t_1t_2))\right| = d$$

$$\Rightarrow \quad \left|\frac{a\sqrt{\{(t_1+t_2)^2 - 4t_1t_2\}}\,(1+t_1t_2)}{t_1t_2}\right| = d$$

Let the point of intersection of tangents at P at Q is T then

$$T = (at_1t_2, a(t_1 + t_2))$$

Now, let $T = (h, k)$

$$\therefore \quad h = at_1t_2 \quad \text{and} \quad k = a(t_1 + t_2)$$

$$\therefore \quad t_1t_2 = \frac{h}{a} \quad \text{and} \quad t_1 + t_2 = \frac{k}{a} \qquad \ldots(ii)$$

From Eqs. (i) and (ii), we get

$$\left|\frac{a\sqrt{\left(\frac{k^2}{a^2} - \frac{4h}{a}\right)}\left(1+\frac{h}{a}\right)}{\frac{h}{a}}\right| = d$$

$$\Rightarrow \quad (k^2 - 4ah)(h + a)^2 = h^2d^2$$

Hence, required locus is

$$(y^2 - 4ax)(x + a)^2 = d^2x^2.$$

Aliter :

Let point of intersection of tangents at P and Q is $T(h, k)$ then equation of pair of tangents TP and TQ is

$$SS_1 = T^2$$

$$\Rightarrow \quad (y^2 - 4ax)(k^2 - 4ah) = [ky - 2a(x + h)]^2 \qquad \ldots(i)$$

Let the pair of tangents cut the directrix $x + a = 0$ are in R and S, then substitute $x = -a$ in Eq. (i), then we get

$$hy^2 - k(h - a)y + a\{(h + a)^2 - k^2\} = 0$$

Now let coordinates of R and S be

$$(-a, y_1) \quad \text{and} \quad (-a, y_2).$$

$$\therefore \quad y_1 + y_2 = \frac{k(h-a)}{h}$$

and $$y_1y_2 = \frac{a\{(h+a)^2 - k^2\}}{h}$$

but given $$|RS| = d$$

$$\Rightarrow \quad (RS)^2 = d^2$$

$$\Rightarrow \quad (y_1 - y_2)^2 = d^2$$

$$\Rightarrow \quad (y_1 + y_2)^2 - 4y_1y_2 = d^2$$

$$\Rightarrow \quad \frac{k^2}{h^2}(h-a)^2 - \frac{4a}{h}\{(h+a)^2 - k^2\} = d^2$$

$$\Rightarrow \quad k^2\{(h-a)^2 + 4ah\} - 4ah(h+a)^2 = d^2h^2$$

$$\Rightarrow \quad (k^2 - 4ah)(h + a)^2 = d^2h^2$$

Hence, locus of $T(h, k)$ is

$$(y^2 - 4ax)(x + a)^2 = d^2x^2.$$

97. Let $P(at_1^2, 2at_1)$ and $Q(at_2^2, 2at_2)$ be two points on the parabola $y^2 = 4ax$

The equations of tangents at P and Q are

$$t_1y = x + at_1^2$$

and $$t_2y = x + at_2^2$$

$$\therefore \quad \tan\theta_1 = \frac{1}{t_1}, \tan\theta_2 = \frac{1}{t_2}$$

Equations of circles with OP and OQ as diameters are

$$(x - 0)(x - at_1^2) + (y - 0)(y - 2at_1) = 0$$

and $(x - 0)(x - at_2^2) + (y - 0)(y - 2at_2) = 0$ respectively.

i.e. $$x^2 + y^2 - axt_1^2 - 2at_1y = 0$$

and $$x^2 + y^2 - axt_2^2 - 2at_2y = 0$$

then, point of intersection of circles are $O(0, 0)$

and $$R\left(\frac{-4at_1t_2}{(t_1+t_2)^2+4}, \frac{2at_1t_2(t_1+t_2)}{(t_1+t_2)^2+4}\right)$$

Since, OR makes an angle ϕ with the X-axis. Therefore,

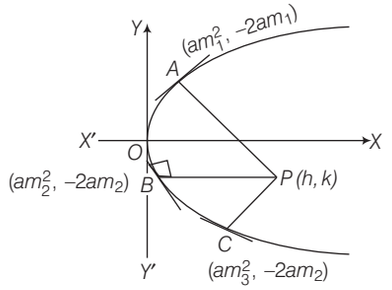
$$\tan\phi = -\left(\frac{t_1+t_2}{2}\right)$$

Now, $\cot\theta_1 + \cot\theta_2 + 2\tan\phi = t_1 + t_2 - (t_1 + t_2)$

$= 0$

98. Any normal of the parabola $y^2 = 4x$ with slope m is

$$y = mx - 2m - m^3$$



It passes through P, then

$$k = mh - 2m - m^3$$

$$\Rightarrow m^3 + (2 - h)m + k = 0 \quad \ldots(i)$$

Thus, $m_1m_2m_3 = -k$

$$\alpha m_3 = -k \quad (\because m_1m_2 = \alpha)$$

$$\Rightarrow m_3 = -\frac{k}{\alpha}$$

$\because$ m_3 is a root of Eq. (i), then

$$-\frac{k^3}{\alpha^3} + (2 - h)\left(-\frac{k}{\alpha}\right) + k = 0$$

$$\Rightarrow k^3 + (2 - h)k\alpha^2 - k\alpha^3 = 0$$

$\therefore$ Locus of $P(h, k)$ is

$$y^3 + (2 - x)y\alpha^2 - y\alpha^3 = 0$$

$$\Rightarrow y^2 + (2 - x)\alpha^2 - \alpha^3 = 0 \quad [\because y \neq 0]$$

(P does not lie on the axis of the parabola)

$$\Rightarrow y^2 = \alpha^2 x - 2\alpha^2 + \alpha^3$$

If it is a part of the parabola $y^2 = 4x$

then, $\alpha^2 = 4$

and $-2\alpha^2 + \alpha^3 = 0$

$$\Rightarrow \alpha^2(\alpha - 2) = 0$$

$$\Rightarrow \alpha - 2 = 0, \alpha \neq 0$$

$$\therefore \alpha = 2$$

99. Let $P(at^2, 2at)$ be any point on $y^2 = 4ax$. Then, vertex $A(0,0)$.

The equation of tangent at P is

$$ty = x + at^2 \quad \ldots(i)$$

Tangent at P will be normal to the circle, AP is a chord whose mid-point is $\left(\frac{at^2}{2}, at\right)$ and slope is $\frac{2}{t}$.

$\therefore$ Equation of the line passing through mid-point of AP and perpendicular to AP is

$$y - at = -\frac{t}{2}\left(x - \frac{at^2}{2}\right)$$

$$\Rightarrow tx + 2y = \frac{at^3}{2} + 2at \quad \ldots(ii)$$

Eqs. (i) and (ii) both pass through (x_1, y_1) which is the centre of the circle

$$ty_1 = x_1 + at^2 \quad \ldots(iii)$$

and $2tx_1 + 4y_1 = at^3 + 4at \quad \ldots(iv)$

Multiplying Eq. (iii) by t and subtracting Eq. (iv), we have

$$t^2y_1 + t(4a - 3x_1) - 4y_1 = 0 \quad \ldots(v)$$

Also, from Eq. (iii), $at^2 - ty_1 + x_1 = 0 \quad \ldots(vi)$

Eliminating t from Eqs. (v) and (vi), we get

$$\frac{t^2}{x_1(4a - 3x_1) - 4y_1^2} = \frac{t}{-4ay_1 - x_1y_1} = \frac{1}{-y_1^2 - a(4a - 3x_1)}$$

On simplyfying, we get

$$2y_1^2(2y_1^2 + x_1^2 - 12ax_1) = ax_1(3x_1 - 4a)^2$$

Hence, required locus is

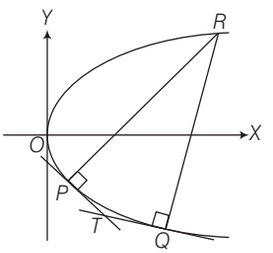
$$2y^2(2y^2 + x^2 - 12ax) = ax(3x - 4a)^2.$$

100. Let $P(at_1^2, 2at_1)$ and $Q(at_2^2, 2at_2)$ be two points on the parabola $y^2 = 4ax$ such that the normals at P and Q intersect at a point $R(aT^2, 2aT)$ on the parabola $y^2 = 4ax$, then

$$T = -t_1 - \frac{2}{t_1} = -t_2 - \frac{2}{t_2}, \text{ then } t_1t_2 = 2$$

$\because$ Tangents at P and Q intersect at $T(at_1t_2, a(t_1 + t_2))$

i.e. $T(2a, a(t_1 + t_2))$.



Also, the coordinates of R being the point of intersection of normals at P and Q are

$$(2a + a(t_1^2 + t_2^2 + t_1t_2), -at_1t_2(t_1 + t_2))$$

$$\Rightarrow (4a + a(t_1^2 + t_2^2), -2a(t_1 + t_2))$$

Now, $\angle TPR = \angle TQR = 90^\circ$

$$\Rightarrow \angle TPR + \angle TQR = 180^\circ$$

$\Rightarrow$ Quadrilateral $PTQR$ is a cyclic quadrilateral, therefore centre of the circle circumscribing the ΔTPQ is at the mid-point of TR.

Let its coordinates be (h, k), then

$$2h = 2a + 4a + a(t_1^2 + t_2^2)$$

$$\Rightarrow \frac{2h - 6a}{a} = (t_1 + t_2)^2 - 2t_1t_2$$

$$\Rightarrow \frac{2h - 2a}{a} = (t_1 + t_2)^2 \quad [\because t_1t_2 = 2] \ldots(i)$$

and $2k = a(t_1 + t_2) - 2a(t_1 + t_2)$

$$\Rightarrow -\frac{2k}{a} = (t_1 + t_2) \quad \ldots(ii)$$

From Eqs. (i) and (ii), then $\left(\frac{2h-2a}{a}\right)=\left(-\frac{2k}{a}\right)^2$

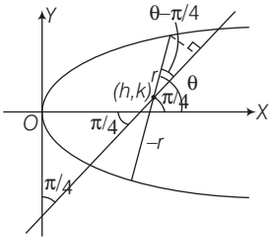
$\Rightarrow \quad 2k^2 = a(h-a)$

Hence, locus of (h, k) is $2y^2 = a(x-a)$.

101. Let the equation of straight line (h, k) as its mid-point,

then, $\frac{x-h}{\cos\theta}=\frac{y-k}{\sin\theta}=r$ ...(i)

Any point on the line Eq. (i) is $(h + r\cos\theta, k + r\sin\theta)$.



Solving with the equation of parabola

$y^2 = 4ax$, we get

$(k + r\sin\theta)^2 = 4a(h + r\cos\theta)$

$\Rightarrow \quad r^2\sin^2\theta + 2r(k\sin\theta - 2a\cos\theta) + k^2 - 4ah = 0$ ...(ii)

which is quadratic in r.

The roots of the quadratic equation will be equal but of opposite sign as (h, k) is the mid-point.

$$\text{Sum of roots} = -\frac{2(k\sin\theta - 2a\cos\theta)}{\sin^2\theta} = 0$$

$\therefore \quad k\sin\theta - 2a\cos\theta = 0$

$\therefore \quad \tan\theta = \frac{2a}{k}$

Now, from Eq. (ii),

$$r^2\sin^2\theta + (k^2 - 4ah) = 0$$

$\Rightarrow \quad r^2 \cdot \frac{4a^2}{(4a^2 + k^2)} + (k^2 - 4ah) = 0$ ...(iii)

Length of the chord will be $2r$. Angle between the two lines will be $(\theta - \pi/4)$ and the projection of the chord on the given line will be $2r\cos(\theta - \pi/4) = c$

$\Rightarrow \quad \frac{2r}{\sqrt{2}}(\cos\theta + \sin\theta) = c$

$\Rightarrow \quad \frac{2r}{\sqrt{2}}\left(\frac{k+2a}{\sqrt{4a^2+k^2}}\right) = c$

$\Rightarrow \quad 2r^2(k + 2a)^2 = c^2(4a^2 + k^2)$

$\Rightarrow \quad \frac{2r^2}{(4a^2 + k^2)} = \frac{c^2}{(k + 2a)^2}$ ...(iv)

From Eqs. (iii) and (iv), we get

$$\frac{2a^2c^2}{(k + 2a)^2} + (k^2 - 4ah) = 0$$

$\Rightarrow \quad (k^2 - 4ah)(k + 2a)^2 + 2a^2c^2 = 0$

Hence, the locus of the middle points is

$$(y^2 - 4ax)(y + 2a)^2 + 2a^2c^2 = 0.$$

102. Equation of normal at $(am^2, -2am)$ is

$$y = mx - 2am - am^3$$

If the three normals of P, Q, R meet at (h, k), then

$$am^3 + m(2a - h) + k = 0$$

$\therefore \quad \Sigma m_1 = 0$

$$\Sigma m_1 m_2 = \frac{(2a - h)}{a},$$

$$m_1 m_2 m_3 = \frac{-k}{a}$$

$P \equiv (am_1^2, -2am_1)$

$Q \equiv (am_2^2, -2am_2)$

and $R \equiv (am_3^2, -2am_3)$

Equation of PQ is

$-y(m_1 + m_2) = 2(x + am_1m_2)$ ...(i)

and equation of diameter through R is

$y = -2am_3$ ...(ii)

Point of intersection of Eqs. (i) and (ii) is on the directrix and hence it must be $(-a, -2am_3)$ and it satisfies Eq. (ii), then

$2am_3(m_1 + m_2) = 2(-a + am_1m_2)$

$\Rightarrow \quad m_3(-m_3) = -1 + m_1m_2$

$\Rightarrow \quad m_1m_2 = 1 - m_3^2$

$\therefore$ Equation of PQ becomes

$$-y(0 - m_3) = 2(x + a - am_3^2)$$

$\Rightarrow \quad 2am_3^2 + m_3y - 2(x + a) = 0 \qquad [m_3 \text{ is parameter}]$

Its envelope is given by the discriminant of this quadratic equated to zero.

$\therefore \quad (y)^2 - 4\cdot 2a\cdot\{-2\cdot(x + a)\} = 0$

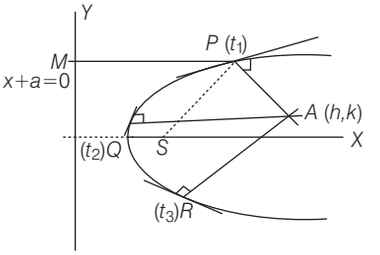
$\Rightarrow \quad y^2 + 16a(x + a) = 0$

103. Equation of normal at 't' is $y = -tx + 2at + at^3$.

Let A be (h, k), then $k = -th + 2at + at^3$

or $at^3 - t(h - 2a) - k = 0$ ...(i)

Let the coordinates of P, Q, R are $(at_1^2, 2at_1)$, $(at_2^2, 2at_2)$, $(at_3^2, 2at_3)$ respectively, then from Eq. (i),



$t_1 + t_2 + t_3 = 0$

$\Rightarrow \quad t_1t_2 + t_2t_3 + t_3t_1 = -\left(\frac{h - 2a}{a}\right)$

and $t_1t_2t_3 = \frac{k}{a}$

Since, $SP = PM = a + at_1^2$

Similarly, $SQ = a + at_2^2$

and $SR = a + at_3^2$

$\therefore \quad SP \cdot SQ \cdot SR = a(1 + t_1^2) \cdot a(1 + t_2^2) \cdot a(1 + t_3^2)$

$= a^3\{1 + (t_1^2 + t_2^2 + t_3^2) + (t_1^2t_2^2 + t_2^2t_3^2 + t_3^2 t_1^2) + (t_1^2\, t_2^2\, t_3^2)\}$

$= a^3\{1 + (t_1 + t_2 + t_3)^2 - 2(t_1t_2 + t_2t_3 + t_3t_1)$

$+ (t_1t_2 + t_2t_3 + t_3t_1)^2 - 2t_1t_2t_3(t_1 + t_2 + t_3) + (t_1t_2t_3)^2\}$

$= a^3\left\{1 + 0 + 2\left(\frac{h-2a}{a}\right) + \left(\frac{h-2a}{a}\right)^2 - 0 + \frac{k^2}{a^2}\right\}$

$= a^3\left\{\left(\frac{h-2a}{a} + 1\right)^2 + \frac{k^2}{a^2}\right\}$

$= a\{(h-a)^2 + (k-0)^2\} = a(SA)^2$

104. Equation of tangent at $P(at^2, 2at)$ is

$$ty = x + at^2 \quad \Rightarrow \quad x - ty + at^2 = 0 \qquad \ldots(i)$$

which is also tangent to the circle

$$x^2 + y^2 = a^2/2 \qquad \ldots(ii)$$

then, length of perpendicular from centre of Eq. (ii) to Eq. (i) radius of the circle

$$\Rightarrow \quad \frac{|at^2|}{\sqrt{1+t^2}} = \frac{a}{\sqrt{2}}$$

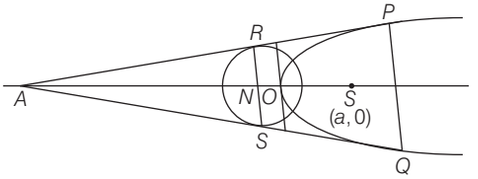
$$\Rightarrow \quad 2t^4 = (1 + t^2)$$

$$\Rightarrow \quad (t^2 - 1)(2t^2 + 1) = 0$$

$$\therefore \quad 2t^2 + 1 \neq 0 \quad \therefore \quad t^2 - 1 = 0$$

then, $t = \pm 1$

then, coordinates of P and Q are $(a, 2a)$ and $(a, -2a)$ respectively.



$$\therefore \quad PQ = 4a$$

$\therefore$ Equation of tangent at $P(a, 2a)$ is

$$x - y + a = 0 \qquad \ldots(iii)$$

[from Eq. (i)]

Let R be (x_1, y_1)

then, equation of tangent at $R(x_1, y_1)$ on Eq. (ii) is

$$xx_1 + yy_1 = \frac{a^2}{2} \qquad \ldots(iv)$$

Hence, Eqs. (iii) and (iv) are identical.

$$\therefore \quad \frac{x_1}{1} = \frac{y_1}{-1} = -\frac{a}{2}$$

$$\therefore \quad (x_1, y_1) = \left(-\frac{a}{2}, \frac{a}{2}\right)$$

Hence coordinates of S are $\left(-\frac{a}{2}, \frac{a}{2}\right)$.

$$\therefore \quad RS' = a$$

Hence, quadrilateral $PQRS'$ is trapezium whose area

$$= \frac{1}{2}(PQ + RS') \times \left(a + \frac{a}{2}\right)$$

$$= \frac{1}{2} \times (4a + a) \times \frac{3a}{2} = \frac{15a^2}{4} \text{ sq units.}$$

Aliter :

Here, centre of the circle is the vertex of the parabola and both circle and parabola are symmetrical about axis of parabola. In this case the point of intersection of common tangents must lie on the directrix and axis of the parabola.

i.e. $A(-a, 0)$.

Chord of contact of circle w.r.t. $A(-a, 0)$ is

$$x(-a) + y \cdot 0 = \frac{a^2}{2}$$

$$\therefore \quad x = -\frac{a}{2}$$

$\therefore$ Coordinates of R are $\left(-\frac{a}{2}, \frac{a}{2}\right)$ and chord of contact of parabola w.r.t. $A(-a, 0)$ is

$$y \cdot 0 = 2a(x - a)$$

i.e. $x = a$

$\therefore$ Coordinates of P is $(a, 2a)$

$\therefore$ Area of quadrilateral

$$PQRS' = 2\{\text{Area of } \Delta PAS - \text{Area of } \Delta RAN\}$$

$$= 2\left\{\frac{1}{2} \cdot 2a \cdot 2a - \frac{1}{2} \cdot \frac{a}{2} \cdot \frac{a}{2}\right\}$$

$$= 4a^2 - \frac{a^2}{4} = \frac{15a^2}{4} \text{ sq units}$$

105. Let parabola be $y^2 = 4ax$ and let $P(at_1^2, 2at_1)$, $Q(at_2^2, 2at_2)$ and $R(at_3^2, 2at_3)$ are three points on the parabola.

$\because$ Tangents at P, Q and R on parabola $y^2 = 4ax$

are $t_1y = x + at_1^2$, $t_2y = x + at_2^2$

and $t_3y = x + at_3^2$

Slopes of these tangents are $\frac{1}{t_1}, \frac{1}{t_2}, \frac{1}{t_3}$

but given slopes are in HP.

$\therefore$ t_1, t_2, t_3 are in AP if d is the common difference. Then,

$$t_2 - t_1 = d, \; t_3 - t_2 = d$$

and $t_3 - t_1 = 2d \qquad \ldots(i)$

Let the tangents at Q and R meet at P', R and P meet at Q', P and Q meet at R'.

$$\therefore \quad P' = \{at_2t_3, a(t_2 + t_3)\}$$

$$Q' = \{at_3t_1, a(t_3 + t_1)\}$$

and $R' = \{at_1t_2, a(t_1 + t_2)\}$

$$\therefore \text{ Area of } \Delta P'Q'R' = \frac{1}{2}\begin{vmatrix} at_2t_3 & a(t_2+t_3) & 1 \\ at_3t_1 & a(t_3+t_1) & 1 \\ at_1t_2 & a(t_1+t_2) & 1 \end{vmatrix}$$

$$= \frac{1}{2}\{at_2t_3\{a(t_3+t_1)-(t_1+t_2)\}+\ldots+\ldots\}$$

$$= \frac{1}{2}a^2\Sigma\, t_2t_3(t_3-t_2)$$

$$= \frac{1}{2}a^2(t_1-t_2)(t_2-t_3)(t_3-t_1)$$

$$= \frac{1}{2}a^2(-d)(-d)(2d) \qquad \text{[by using Eq. (i)]}$$

$$= a^2d^3, \text{ which is constant.}$$

Remark

$\Sigma t_1^2(t_2-t_3) = \Sigma\, t_2t_3(t_3-t_2) = (t_1-t_2)(t_2-t_3)(t_3-t_1)$

Corollary Area of triangle of $P(at_1^2, 2at_1)$, $Q(at_2^2, 2at_2)$ and $R(at_3^2, 2at_3)$ is $a^2(t_1-t_2)(t_2-t_3)(t_3-t_1) = \Delta$ (say)

It is clear from just previous example the area of the triangle inscribed in a parabola is twice the area of the triangle formed by the tangents at the vertices.

106. Equation of tangent at (1, 7) to $y = x^2 + 6$

$$\Rightarrow \quad \frac{1}{2}(y+7) = x\cdot 1 + 6$$

$$\Rightarrow \quad y = 2x + 5 \qquad \ldots(i)$$

This tangent also touches the circle.

$$x^2 + y^2 + 16x + 12y + c = 0 \qquad \ldots(ii)$$

Now, solving Eqs. (i) and (ii), we get

$$x^2 + (2x+5)^2 + 16x + 12(2x+5) + c = 0$$

$$\Rightarrow \quad 5x^2 + 60x + 85 + c = 0$$

Since, roots are equal, so

$$B^2 - 4AC = 0$$

$$\Rightarrow \quad (60)^2 - 4\times 5\times(85+c) = 0$$

$$\Rightarrow \quad 85 + c = 180$$

$$\Rightarrow \quad 5x^2 + 60x + 180 = 0$$

$$\Rightarrow \quad x = -\frac{60}{10} = -6 \quad \Rightarrow \quad y = -7$$

Hence, point of contact is $(-6, -7)$.

107. $\because$ $P \equiv (1,0)$, let $Q \equiv (h, k)$

such that $k^2 = 8h \qquad \ldots(i)$

Let (α, β) be the mid-point of PQ.

$$\therefore \quad \alpha = \frac{h+1}{2}, \beta = \frac{k+0}{2}$$

$$\Rightarrow \quad h = 2\alpha - 1, k = 2\beta$$

From Eq. (i), we get

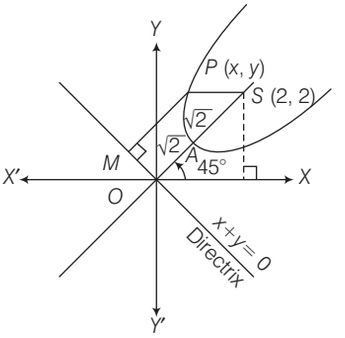
$$(2\beta)^2 = 8(2\alpha - 1)$$

$$\Rightarrow \quad \beta^2 = 4\alpha - 2$$

$$\Rightarrow \quad \beta^2 - 4\alpha + 2 = 0$$

$\therefore$ Required locus is $y^2 - 4x + 2 = 0$.

108. Coordinates of S are $(2\sqrt{2}\cos 45°, 2\sqrt{2}\sin 45°)$ i.e. (2, 2).



$$\therefore \quad SP = PM$$

$$\Rightarrow \quad (SP)^2 = (PM)^2$$

$$\Rightarrow \quad (x-2)^2 + (y-2)^2 = \left[\frac{(x+y)}{\sqrt{2}}\right]^2$$

$$\Rightarrow \quad 2(x^2 + y^2 - 4x - 4y + 8) = x^2 + y^2 + 2xy$$

$$\Rightarrow \quad x^2 + y^2 - 2xy - 8x - 8y + 16 = 0$$

$$\therefore \quad (x-y)^2 = 8(x+y-2)$$

109. Equation of tangent to $y = x^2$ is

$$y = mx - \frac{1}{4}m^2 \qquad \ldots(i)$$

Equation of tangent to $(x-2)^2 = -y$ is

$$y = m(x-2) + \frac{1}{4}m^2 \qquad \ldots(ii)$$

$\because$ Eqs. (i) and (ii) are identical.

$$\Rightarrow \quad m = 0 \text{ or } 4$$

$\therefore$ Common tangents are $y = 0$ and $y = 4x - 4 = 4(x-1)$.

110. Given parabola is

$$y = \frac{a^3x^2}{3} + \frac{a^2x}{2} - 2a \qquad \ldots(i)$$

For vertex $\frac{dy}{dx} = 0 \Rightarrow x = -\frac{3}{4a}$

Substitute $x = -\frac{3}{4a}$ in Eq. (i), we get

$$y = -\frac{35a}{16}$$

$\therefore$ Coordinates of vertex are $\left(-\frac{3}{4a}, -\frac{35a}{16}\right)$.

For locus let $x = -\frac{3}{4a}$ and $y = -\frac{35a}{16}$.

$\therefore \quad xy = \frac{105}{64}$, which is the required locus.

111. $\because$ $y = x^2 - 5x + 6$

$\therefore$ Equation of tangent at (2, 0) is

$$\frac{y+0}{2} = x\cdot 2 - \frac{5}{2}(x+2) + 6$$

$$\Rightarrow \quad y = -x + 2 \qquad \ldots(i)$$

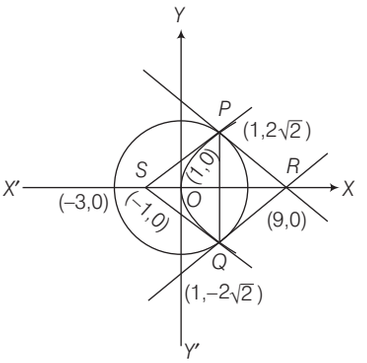
and equation of tangent at (3, 0) is

$\Rightarrow \quad y = x - 3$ ...(ii)

$\because$ Eqs. (i) and (ii) are perpendicular.

$\therefore$ Angle between tangents is $\pi / 2$.

112. (i) Coordinates of P and Q are $(1, 2\sqrt{2})$ and $(1, -2\sqrt{2})$.



Area of $\Delta PQR = \frac{1}{2} \cdot 4\sqrt{2} \cdot 8 = 16\sqrt{2}$

Area of $\Delta PQS = \frac{1}{2} \cdot 4\sqrt{2} \cdot 2 = 4\sqrt{2}$

$\therefore$ Ratio of area of ΔPQS and ΔPQR is 1 : 4.

(ii) Equation of circumcircle of ΔPRS is

$$(x + 1)(x - 9) + y^2 + \lambda y = 0$$

It will pass through $(1, 2\sqrt{2})$, then

$$-16 + 8 + \lambda\, 2\sqrt{2} = 0 \Rightarrow \lambda = \frac{8}{2\sqrt{2}} = 2\sqrt{2}$$

Equation of circumcircle is

$$x^2 + y^2 - 8x + 2\sqrt{2}y - 9 = 0$$

Hence, radius is $3\sqrt{3}$.

Aliter :

Let $\angle PSR = \theta \Rightarrow \sin\theta = \frac{2\sqrt{2}}{2\sqrt{3}}$

$\Rightarrow \quad PR = 6\sqrt{2} = 2R \cdot \sin\theta \Rightarrow R = 3\sqrt{3}$.

(iii) Radius of incircle is $r = \frac{\Delta}{s}$.

As $\quad \Delta = 16\sqrt{2}$

$\therefore \quad s = \frac{6\sqrt{2} + 6\sqrt{2} + 4\sqrt{2}}{2} = 8\sqrt{2}$

$\therefore \quad r = \frac{16\sqrt{2}}{8\sqrt{2}} = 2$

113. $y = -\frac{x^2}{2} + x + 1 \Rightarrow y - \frac{3}{2} = -\frac{1}{2}(x - 1)^2$

$\Rightarrow$ It is symmetric about $x = 1$.

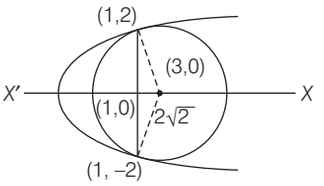
Hence, both statement are true and Statement II is correct explanation of Statement I.

114. $\because$ Point of intersection of two perpendicular tangents to the parabola lies on directrix of the parabola.

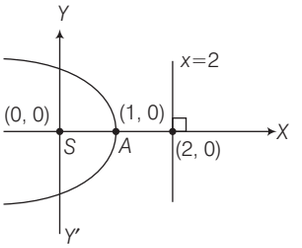
$\therefore$ Equation of directrix is $x + 2 = 0$.

So, point is $(-2, 0)$.

115. The circle and the parabola touch each other at $x = 1$, i.e. at the points (1, 2) and (1, – 2) as shown in figure.

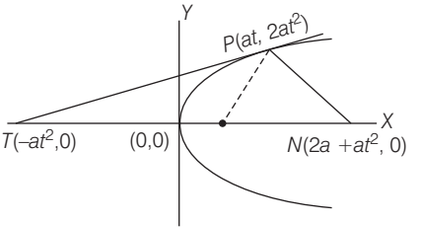


116. Vertex is (1,0).



117. $G \equiv (h, k)$

$\Rightarrow \quad h = \frac{2a + at^2}{3}, k = \frac{2at}{3}$



$\Rightarrow \quad \left(\frac{3h - 2a}{a}\right) = \frac{9k^2}{4a^2}$

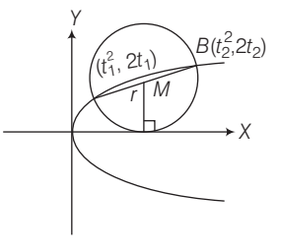
$\therefore$ Required parabola is

$$\frac{9y^2}{4a^2} = \frac{(3x - 2a)}{a} = \frac{3}{a}\left(x - \frac{2a}{3}\right)$$

$\Rightarrow \quad y^2 = \frac{4a}{3}\left(x - \frac{2a}{3}\right)$

$\therefore$ Vertex $\equiv \left(\frac{2a}{3}, 0\right)$; Focus $\equiv (a, 0)$.

118. Slope of $AB = \frac{2t_2 - 2t_1}{(t_2^2 - t_1^2)} = \frac{2}{(t_2 + t_1)}$ ...(i)



$M = \text{Mid-point of } AB = \left(\frac{t_1^2 + t_2^2}{2}, t_1 + t_2\right)$

$\therefore \quad r = |t_1 + t_2| \Rightarrow t_1 + t_2 = \pm r$

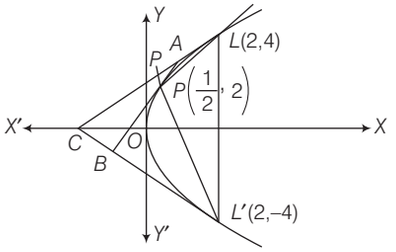
Now, from Eq. (i),

$$\text{slope of } AB = \pm \frac{2}{r}.$$

119. The locus of perpendicular tangent is directrix, i.e., $x + 1 = 0$ or $x = -1$.

120. $\Delta_1 =$ Area of $\Delta PLL'$

$$= \frac{1}{2} \times 8 \times \left(2 - \frac{1}{2}\right) = 6 \text{ sq unitss}$$



Now, equation of AB is $y = 2x + 1$,
equation of AC is $y = x + 2$ and
equation of BC is $y = -x - 2$
On solving above equations, we get
$A(1, 3)$, $B(-1, -1)$ and $C(-2, 0)$

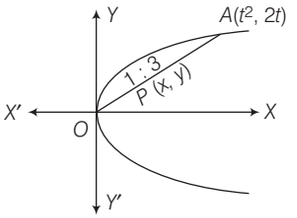
$$\therefore \quad \Delta_2 = \frac{1}{2}\begin{Vmatrix} 1+2 & 3-0 \\ -1+2 & -1-0 \end{Vmatrix} = 3 \text{ sq units}$$

$$\therefore \quad \frac{\Delta_1}{\Delta_2} = 2$$

121. Let $A(x, y) = A(t^2, 2t)$ be any point on the parabola $y^2 = 4x$, then

$$x = \frac{t^2}{4} \quad \ldots(i)$$

and
$$y = \frac{2t}{4} \quad \ldots(ii)$$



From Eqs. (i) and (ii), we get

$$x = y^2$$

122. The equation of normal to

$$y^2 = 4x \text{ is } y = mx - 2m - m^3 \quad \ldots(i)$$

As it passes through (9, 6), then

$$6 = 9m - 2m - m^3$$

$$\Rightarrow \quad m^3 - 7m + 6 = 0$$

$$\Rightarrow (m-1)(m-2)(m+3) = 0$$

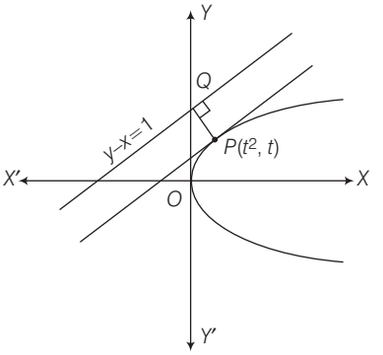
$$\Rightarrow \quad m = 1, 2, -3$$

From Eq. (i), equations of normals are

$y = x - 3, y = 2x - 12, \ y = -3x + 33$

$\Rightarrow \ y - x + 3 = 0, y - 2x + 12 = 0, \ y + 3x - 33 = 0$

123. The shortest distance between $y = x - 1$ and $y^2 = x$ is along the normal of $y^2 = x$.



Let $P(t^2, t)$ be any point on $y^2 = x$.

$\therefore$ Tangent at P is $y = \frac{x}{2t} + \frac{t}{2}$.

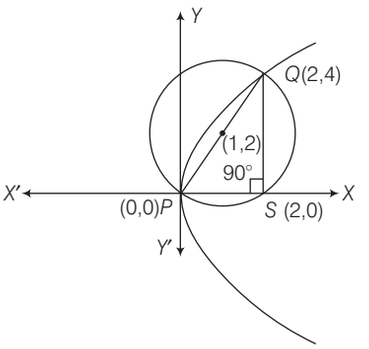
$\therefore$ Slope of tangent $= \frac{1}{2t}$

and tangent at P is parallel to $y - x = 1$

$$\therefore \quad \frac{1}{2t} = 1 \ \Rightarrow \ t = \frac{1}{2} \Rightarrow P\left(\frac{1}{4}, \frac{1}{2}\right)$$

Hence, shortest distance $= PQ = \dfrac{\left|\frac{1}{2} - \frac{1}{4} - 1\right|}{\sqrt{(1+1)}} = \dfrac{3}{4\sqrt{2}} = \dfrac{3\sqrt{2}}{8}$

124. We observe that both parabola $y^2 = 8x$ and circle $x^2 + y^2 - 2x - 4y = 0$ pass through origin say $P(0, 0)$.



Let Q be the point $(2t^2, 4t)$, then it will satisfy the equation of circle.

$$\therefore \quad (2t^2)^2 + (4t)^2 - 2(2t^2) - 4(4t) = 0$$

$$\Rightarrow \quad 4t^4 + 12t^2 - 16t = 0$$

$$\Rightarrow \quad t(t-1)(t^2 + t - 4) = 0 \ \Rightarrow \ t = 0 \text{ or } 1$$

For $t = 0$, we get point P, therefore $t = 1$ gives point Q as (2, 4).
Here, $P(0, 0)$ and $Q(2, 4)$ are end points of diameter of the given circle and focus of the parabola is the point $S(2, 0)$.

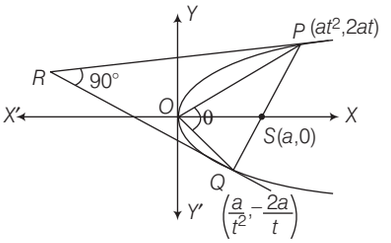
$$\therefore \quad \angle PSQ = 90^\circ$$

Hence, area of $\Delta PQS = \frac{1}{2} \times 2 \times 4 = 4$ sq units.

Sol. (Q. Nos. 125 and 126)

$\because$ PQ is the focal chord of $y^2 = 4ax$.

$\therefore$ Coordinates of P and Q are $(at^2, 2at)$ and $\left(\frac{a}{t^2}, -\frac{2a}{t}\right)$.



Tangents at P and Q are

$$ty = x + at^2 \text{ and } ty = xt^2 + a$$

which intersect each other at $R\left(-a, a\left(t - \frac{1}{t}\right)\right)$.

As R lies on the line $y = 2x + a, a > 0$

$$\therefore \quad a\left(t - \frac{1}{t}\right) = -2a + a$$

$$\Rightarrow \quad t - \frac{1}{t} = -1$$

125. $\because$ Slope of $OP = \frac{2}{t}$ and slope of $OQ = -2t$

$$\therefore \quad \tan\theta = \left|\frac{\frac{2}{t} + 2t}{1 - 4}\right| = \frac{2}{3}\left|t + \frac{1}{t}\right|$$

$$= \frac{2}{3}\sqrt{\left(t - \frac{1}{t}\right)^2 + 4} = \frac{2}{3}\sqrt{5} \qquad \left[\because t - \frac{1}{t} = -1\right]$$

$\because$ $\theta > 90°$

$$\therefore \quad \tan\theta = -\frac{2}{3}\sqrt{5}$$

126. $PQ = a\left(t + \frac{1}{t}\right)^2 = a\left\{\left(t - \frac{1}{t}\right)^2 + 4\right\}$

$= a(1 + 4) = 5a \qquad \left[\because t - \frac{1}{t} = -1\right]$

127. Equation of tangent of $y^2 = 4x$ in terms of slope is

$$y = mx + \frac{1}{m} \qquad \ldots(i)$$

$\because$ Line Eq. (i) touches $x^2 = -32y$

$$\Rightarrow \quad x^2 = -32\left(mx + \frac{1}{m}\right)$$

$$\Rightarrow \quad x^2 + 32mx + \frac{32}{m} = 0 \qquad \ldots(ii)$$

For touching roots of Eq. (ii) are equal.

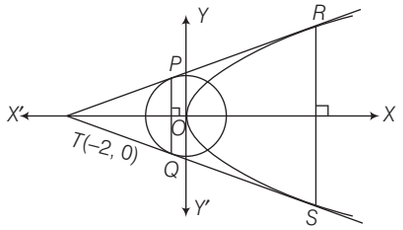
$$\therefore \quad D = 0$$

$$\Rightarrow \quad (32m)^2 = 4 \cdot 1 \cdot \left(\frac{32}{m}\right)$$

$$\Rightarrow \quad m^3 = \frac{1}{8}$$

$$\therefore \quad m = 1/2$$

128. Let the tangent to, $y^2 = 8x$ be $y = mx + \frac{2}{m}$.



If it is common tangent to parabola and circle, then

$y = mx + \frac{2}{m}$ is a tangent to $x^2 + y^2 = 2$.

$$\therefore \quad \frac{\frac{2}{m}}{\sqrt{(1 + m^2)}} = \sqrt{2}$$

$$\Rightarrow \quad \frac{4}{m^2(1 + m^2)} = 2$$

$$\Rightarrow \quad m^4 + m^2 - 2 = 0$$

$$\Rightarrow \quad (m^2 + 2)(m^2 - 1) = 0$$

$$\therefore \quad m = \pm 1$$

$\therefore$ Required tangents are $y = x + 2$ and $y = -x - 2$.

Their common point is $T(-2, 0)$.

Chord of contact PQ to circle is

$$x \cdot (-2) + y \cdot 0 = 2$$

$$\Rightarrow \quad x = -1$$

Hence, coordinates of P and Q are $(-1, 1)$ and $(-1, -1)$ and chord of contact RS to parabola is

$$y \cdot 0 = 4(x - 2)$$

$$\Rightarrow \quad x = 2$$

Hence, coordinates of R and S are $(2, 4)$ and $(2, -4)$.

$\therefore$ Area of trapezium $PQRS = \frac{1}{2}(2 + 8) \times 3 = 15$ sq units

Sol. (Q. Nos. 129 and 130)

$\because$ PQ is a focal chord, then $Q\left(\frac{a}{t^2}, \frac{-2a}{t}\right)$.

Also, $\quad QR \parallel PK \Rightarrow m_{QR} = m_{PK}$

$$\Rightarrow \quad \frac{2ar + \frac{2a}{t}}{ar^2 - \frac{a}{t^2}} = \frac{0 - 2at}{2a - at^2}$$

$$\Rightarrow \quad \frac{2}{r - \frac{1}{t}} = \frac{-2t}{2 - t^2}$$

$[\because r + \frac{1}{t} \neq 0$, otherwise Q will coincide with $R]$

$$\Rightarrow \quad 2 - t^2 = -rt + 1$$

$$\therefore \quad r = \frac{t^2 - 1}{t}$$

129. $r = \frac{t^2 - 1}{t}$

130. Tangent at P is $ty = x + at^2$ ...(i)

Normal at S is $y + sx = 2as + as^3$ ...(ii)

Putting the value of x from Eq. (i) in Eq. (ii), then

$$y + s(ty - at^2) = 2as + as^3$$

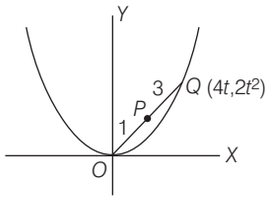
$$\Rightarrow \quad y + (st)y - a(st)t = 2as + as^3$$

$$\Rightarrow \quad y + y - at = \frac{2a}{t} + \frac{a}{t^3} \qquad [\because st = 1]$$

$$\Rightarrow \quad 2y = a\left(t + \frac{2}{t} + \frac{1}{t^3}\right)$$

$$\therefore \quad y = \frac{a(t^2 + 1)^2}{2t^3}$$

131. Let any point Q on $x^2 = 8y$ is $(4t, 2t^2)$ and given $P(h, k)$ divides OQ in the ratio 1:3 (internally).



Then, $h = \frac{4t}{4} = t$ and $k = \frac{2t^2}{4} \Rightarrow 2k = h^2$

$\therefore$ Required locus of P is $x^2 = 2y$.

132. End points of latusrectum of

$$y^2 = 4x \text{ are } (1, \pm 2).$$

Equation of normal to $y^2 = 4x$ at $(1, 2)$ is

$$y - 2 = -\frac{2}{2}(x - 1)$$

$$\Rightarrow \quad x + y - 3 = 0$$

As it is tangent to circle $(x - 3)^2 + (y + 2)^2 = r^2$

$$\therefore \quad \frac{|3 - 2 - 3|}{\sqrt{(1 + 1)}} = r \Rightarrow r^2 = 2$$

133. Let $(t^2, 2t)$ be any point on $y^2 = 4x$. Let (h, k) be image of $(t^2, 2t)$ with respect to the line $x + y + 4 = 0$, then

$$\frac{h - t^2}{1} = \frac{k - 2t}{1} = \frac{-2(t^2 + 2t + 4)}{1 + 1}$$

$$\Rightarrow \quad h = -(2t + 4) \text{ and } k = -(t^2 + 4)$$

$$\Rightarrow \quad (k + 4) = -\left(\frac{h + 4}{-2}\right)^2$$

$$\Rightarrow \quad (h + 4)^2 = -4(k + 4)$$

Locus of (h, k) is $(x + 4)^2 = -4(y + 4)$.

$\therefore$ Curve C is $(x + 4)^2 = -4(y + 4)$

Now, intersection of C with $y = -5$, then

$$(x + 4)^2 = -4(-5 + 4) = 4$$

$$\therefore \quad x + 4 = \pm 2 \Rightarrow x = -6, -2$$

$\therefore$ $A(-6, -5)$ and $B(-2, -5)$

$$\therefore \quad AB = 4$$

134. Let $P\left(\frac{t_1^2}{2}, t_1\right)$ and $Q\left(\frac{t_2^2}{2}, t_2\right)$ such that $t_1 > 0$

$[\because P \text{ lies in first quadrant}]$

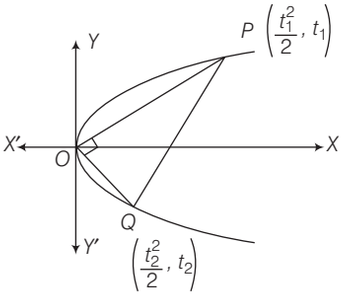
$\because$ Circle with PQ as diameter passes through the vertex $O(0, 0)$ of the parabola.

$$\therefore \quad \angle POQ = 90^\circ$$

$\Rightarrow$ Slope of $OP \times$ Slope of $OQ = -1$

$$\Rightarrow \quad \frac{2}{t_1} \times \frac{2}{t_2} = -1$$

$$\Rightarrow \quad t_1 t_2 = -4 \qquad [\because t_2 < 0]$$



Now, area of $\Delta OPQ = 3\sqrt{2}$

$$\Rightarrow \quad \frac{1}{2}\begin{vmatrix} \frac{t_1^2}{2} & t_1 \\ \frac{t_2^2}{2} & t_2 \end{vmatrix} = 3\sqrt{2}$$

$$\Rightarrow \quad \frac{1}{4}t_1 t_2(t_1 - t_2) = \pm 3\sqrt{2}$$

$$\Rightarrow \quad t_1 - t_2 = \pm 3\sqrt{2} \qquad [\because t_1 t_2 = -4]$$

$$\Rightarrow \quad t_1 + \frac{4}{t_1} = \pm 3\sqrt{2}$$

or $\quad t_1 + \frac{4}{t_1} = 3\sqrt{2} \qquad [\because t_1 > 0]$

$$\Rightarrow \quad t_1^2 - 3\sqrt{2}t_1 + 4 = 0$$

$$\therefore \quad t_1 = \frac{3\sqrt{2} \pm \sqrt{2}}{2} = 2\sqrt{2}, \sqrt{2}.$$

$\therefore$ Point P can be $(4, 2\sqrt{2})$ or $(1, \sqrt{2})$.

135. Let $P(2t^2, 4t)$ and $C(0, -6)$.

$$\therefore \quad (CP)^2 = 4t^4 + (4t + 6)^2 = z \qquad \text{(say)}$$

$$\therefore \quad \frac{dz}{dt} = 0$$

$$\Rightarrow \quad 16t^3 + 2(4t + 6) \cdot 4 = 0$$

$$\Rightarrow \quad t^3 + 2t + 3 = 0$$

$$\Rightarrow \quad (t + 1)(t^2 - t + 3) = 0$$

$$\therefore \quad t = -1$$

$$\Rightarrow \quad P(2, -4)$$

Equation of circle is

$$(x - 2)^2 + (y + 4)^2 = (2 - 0)^2 + (-4 + 6)^2$$

$$\Rightarrow \quad x^2 + y^2 - 4x + 8y + 12 = 0$$

136. $\because C_1 : x^2 + y^2 = 3$ and parabola $x^2 = 2y$, then

$$y^2 + 2y - 3 = 0 \Rightarrow y = 1, -3$$

$\therefore \quad P(\sqrt{2}, 1)$ [$\because P$ lies in first quadrant]

Now, tangent at $P(\sqrt{2}, 1)$ on the circle C_1 is

$$x\sqrt{2} + y = 3$$

Let Q_2 or $Q_3(0, \lambda)$

$$\therefore \quad \frac{|0 + \lambda - 3|}{\sqrt{(2+1)}} = 2\sqrt{3}$$

$$\Rightarrow \quad |\lambda - 3| = 6$$

$$\therefore \quad \lambda = 9 \text{ or } -3$$

$\Rightarrow Q_2(0, -3)$ and $Q_3(0, 9)$.

Alternate (a) $Q_2Q_3 = 12$

Alternate (b) $R_2R_3 =$ Length of external common tangent

$$= \sqrt{(Q_2Q_3)^2 - (2\sqrt{3} + 2\sqrt{3})^2}$$

$$= \sqrt{(144 - 48} = 4\sqrt{6}$$

Alternate (c) Area of $\Delta OR_2R_3 = \frac{1}{2} \times R_2R_3 \times \frac{|0 + 0 - 3|}{\sqrt{(2+1)}}$

$$= \frac{1}{2} \times 4\sqrt{6} \times \frac{3}{\sqrt{3}} = 6\sqrt{2}$$

Alternate (d) Area of $\Delta PQ_2Q_3 = \frac{1}{2} \times Q_2Q_3 \times \sqrt{2}$

$$= \frac{1}{2} \times 12 \times \sqrt{2} = 6\sqrt{2}$$

137. Let $P(t^2, 2t)$, $S(2, 8)$ and $r = \sqrt{(4 + 64 - 64)} = 2$

We know that, shortest distance between two curves lies along their common normal. The common normal will pass through centre of circle.

$\therefore$ Slope of $PS =$ Slope of normal to the parabola $y^2 = 4x$ at $P(t^2, 2t)$

$$\Rightarrow \quad \frac{2t - 8}{t^2 - 2} = -t \text{ or } t^3 = 8 \Rightarrow t = 2$$

$\therefore \quad P(4, 4)$

Alternate (a) $SP = \sqrt{(2-4)^2 + (8-4)^2} = 2\sqrt{5}$

Alternate (b) $SQ = r = 2$

$$\therefore \quad \frac{SQ}{QP} = \frac{SQ}{SP - SQ} = \frac{2}{2\sqrt{5} - 2}$$

$$= \frac{1}{(\sqrt{5} - 1)} \times \frac{(\sqrt{5} + 1)}{(\sqrt{5} + 1)} = \frac{\sqrt{5} + 1}{4}$$

$$\Rightarrow \quad SQ : QP = (\sqrt{5} + 1) : 4$$

Alternate (c) Equation of normal at $P(4, 4)$ is

$$y - 4 = -\frac{4}{2}(x - 4)$$

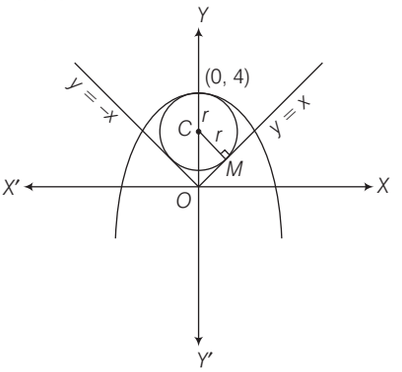
$$\Rightarrow \quad y - 4 = -2x + 8$$

$$\Rightarrow \quad 2x + y = 12$$

$\therefore$ Intercept on X-axis is 6.

Alternate (d) Slope of tangent at $Q =$ Slope of tangent at $P = \frac{1}{2}$

138. Centre of circle



$$C \equiv (0, 4 - r)$$

$$\because \quad CM = r$$

$$\therefore \quad \frac{|10 - (4 - r)|}{\sqrt{2}} = r$$

$$\Rightarrow \quad 4 - r = r\sqrt{2}$$

or $$r = \frac{4}{\sqrt{2} + 1}$$

$$= 4(\sqrt{2} - 1)$$

139. (a) Equation of chord of parabola $y^2 = 16x$ whose mid-point (h, k) is

$$T = S_1$$

or $$ky - 8(x + h) = k^2 - 16h$$

or $$8x - ky = 8h - k^2 \quad \text{...(i)}$$

Now comparing Eq. (i) and $2x + y = p$, then

$$\frac{8}{2} = \frac{-k}{1} = \frac{8h - k^2}{p}$$

$$\Rightarrow \quad k = -4 \text{ and } 4p = 8h - k^2$$

or $$k = -4 \text{ and } p = 2h - 4$$

Hence, $$p = 2, h = 3, k = -4$$

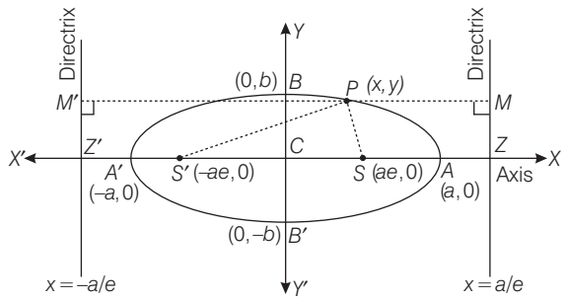
Ellipse Definition, Standard Equation of Ellipse, Tracing of the Ellipse,Focal Distances of a Point, The Shape of the Ellipse $x^2/a^2 + y^2/b^2 = 1$, When $b > a$, Mechanical Construction of an Ellipse,

Ellipse Definition

An ellipse is the locus of a point which moves in a plane such that its distance from a fixed point (i.e. focus) is a constant ratio from a fixed line (i.e. directrix).
This ratio is called eccentricity and is denoted by e.
For an ellipse $0 < e < 1$.

Standard Equation of Ellipse

Let S be the focus and ZM the directrix of the ellipse. Drow $SZ \perp ZM$. Divide SZ internally and externally in the ratio $e:1 (0 < e < 1)$ and let A and A' be these internal and external point of division



Then, $SA = eAZ$ ...(i)

and $SA' = eA'Z$ ...(ii)

Clearly A and A' will lie on the ellipse

Let $AA' = 2a$ and take C the mid point of AA' as origin

$\therefore$ $CA = CA' = a$ ...(iii)

Let $P(x, y)$ by any point on the ellipse referred to CA and CB as co-ordinate axes

Then, adding Eqs. (i) and (ii),

$$SA + SA' = e(AZ + A'Z)$$

$\Rightarrow$ $AA' = e(CZ - CA + CA' + CZ)$ (from figure)

$\Rightarrow$ $AA' = e(2CZ)$ ($\because CA = CA'$)

$\Rightarrow$ $2a = 2eCZ$

$\because$ $CZ = a/e$

$\therefore$ The directrix MZ is $x = CZ = a/e$

or $\dfrac{a}{e} - x = 0$ $\left(\because e < 1, \therefore \dfrac{a}{e} > 1\right)$

and subtracting Eqs. (i) from (ii), then

$$SA' - SA = e(A'Z - AZ)$$

$\Rightarrow$ $(CA' + CS) - (CA - CS) = e(AA')$

$\Rightarrow$ $2CS = e(AA')$ ($\because CA = CA'$)

$\Rightarrow$ $2CS = e(2a)$

$\therefore$ $CS = ae$

$\therefore$ The focus S is $(CS, 0)$ i.e. $(ae, 0)$

Now draw $PM \perp MZ$

$\therefore$ $\dfrac{SP}{PM} = e$ or $(SP)^2 = e^2 (PM)^2$

$$(x - ae)^2 + (y - 0)^2 = e^2 \left(\frac{a}{e} - x\right)^2$$

$\Rightarrow$ $(x - ae)^2 + y^2 = (a - ex)^2$

$\Rightarrow$ $x^2 + a^2e^2 - 2aex + y^2 = a^2 - 2aex + e^2x^2$

$\Rightarrow$ $x^2(1 - e^2) + y^2 = a^2(1 - e^2)$

$\Rightarrow$ $\dfrac{x^2}{a^2} + \dfrac{y^2}{a^2(1 - e^2)} = 1$

or $$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$$

where, $$b^2=a^2(1-e^2)$$

This is the standard equation of an ellipse, AA' and BB' are called the major and minor axes of the ellipse. (Here $b<a$) and A and A' are the vertices of the ellipse.

Remark

Two ellipse are said to be similar if they have the same value of eccentricity.

Generally,

The equation to the ellipse, whose focus is the point (h, k) and directrix is $lx+my+n=0$ and whose eccentricity is e, is

$$(x-h)^2+(y-k)^2=e^2\cdot\frac{(lx+my+n)^2}{(l^2+m^2)}$$

The Foci and Two Directrices of an Ellipse

On the negative side of origin take a point S' which is such that

$$CS=CS'=ae$$

and another point Z', then

$$CZ=CZ'=\frac{a}{e}$$

$\therefore$ Coordinates of S' are $(-ae, 0)$ and equation of second directrix (*i.e.*, $Z'M'$) is $x=-\frac{a}{e}$

Let $P(x, y)$ be any point on the ellipse, then

$$S'P=ePM'$$

or $$(S'P)^2=e^2(PM')^2$$

or $$(x+ae)^2+(y-0)^2=e^2\left(x+\frac{a}{e}\right)^2$$

or $$(x+ae)^2+y^2=(ex+a)^2$$

or $$x^2(1-e^2)+y^2=a^2(1-e^2)$$

or $$\frac{x^2}{a^2}+\frac{y^2}{a^2(1-e^2)}=1$$

or $$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1,$$

where, $$b^2=a^2(1-e^2)$$

The equation being the same as that of the ellipse when $S(ae, 0)$ is focus and MZ i.e. $x=a/e$ is directrix.

Hence, coordinates of foci are $(\pm ae, 0)$ and equations of directrices are $x=\pm a/e$.

Remarks

1. Distance between foci $SS'=2ae$ and distance between directrices $ZZ'=2a/e$
2. If $e=0$

   then $$b^2=a^2(1-0)$$

   $\therefore$ $$b^2=a^2$$

   then equation of ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ changes in circle

   i.e. $$x^2+y^2=a^2$$
3. Since, $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$

   $\Rightarrow$ $$\frac{y^2}{b^2}=1-\frac{x^2}{a^2}=\frac{a^2-x^2}{a^2}$$

   $$\frac{y^2}{b^2}=\frac{(a+x)(a-x)}{a^2}$$

   or $$\frac{(PN)^2}{b^2}=\frac{A'N\cdot AN}{a^2}$$

   or $$\frac{(PN)^2}{AN\cdot A'N}=\frac{b^2}{a^2}=\frac{(BC)^2}{(AC)^2}$$

   i.e. $$(PN)^2:AN\cdot A'N::(BC)^2:(AC)^2$$
4. The distance of every focus from the extremity of minor axis is equal to a.

   i.e. $$\sqrt{(a^2e^2+b^2)}=\sqrt{(a^2-b^2+b^2)}=a$$

Tracing of the Ellipse

Equation of the ellipse is

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1 \qquad \ldots(i)$$

1. The ellipse (i) cuts X-axis at $A(a, 0)$ and $A'(-a, 0)$ and cuts Y-axis at $B(0, b)$ and $B'(0, -b)$.
2. The Eq. (i) does not change when y is replaced $by-y$ and x is replaced by $-x$, Hence ellipse (i) is symmetrical about both axes

3. The equation (i), may be written in either of the form

$$y = \pm b\sqrt{\left(1-\frac{x^2}{a^2}\right)} \quad \text{...(ii)}$$

or $$x = \pm a\sqrt{\left(1-\frac{y^2}{b^2}\right)} \quad \text{...(iii)}$$

From Eq. (ii), it follows that (y is real)

if $$1-\frac{x^2}{a^2} \geq 0 \text{ or } a^2 - x^2 \geq 0$$

or $$x^2 \leq a^2 \text{ or } -a \leq x \leq a$$

Also from Eq. (iii), it follows that (x is real)

if $$1-\frac{y^2}{b^2} \geq 0 \text{ or } b^2 - y^2 \geq 0 \text{ or } y^2 \leq b^2$$

$\therefore$ $$-b \leq y \leq b$$

Ellipse (i) is a closed curve lies entirely between the lines $x = a$ and $x = -a$ and the lines $y = b$ and $y = -b$.

Since, when x increases, then y decreases from Eq. (ii) and when y decreases, then x increases from Eq. (iii).

Remark

Area of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ is πab.

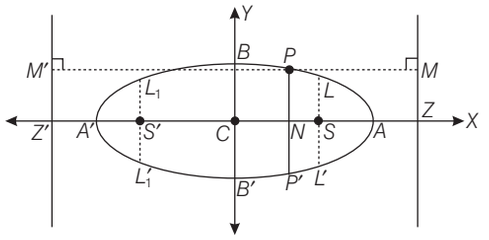
Some Terms Related to an Ellipse

Let the equation of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$

($a > b$)

1. **Centre :** All chords passing through C is bisected at C

   Here $C \equiv (0, 0)$



2. **Foci :** S and S' are two foci of the ellipse and their coordinates are $(ae, 0)$ and $(-ae, 0)$ respectively.
3. **Directrices :** ZM and $Z'M'$ are two directrices of the ellipse and their equation are $x = \frac{a}{e}$ and $x = -\frac{a}{e}$ respectively.
4. **Axes :** The lines AA' and BB' are called the **major** and **minor** axes of the ellipse

   $\because$ $0 < e < 1$

   or $0 < e^2 < 1 \quad (\therefore\ 0 > -e^2 > -1)$

   or $0 < 1 - e^2 < 1 \quad (\text{or } 1 > 1 - e^2 > 1 - 1)$

   or $a^2(1 - e^2) < a^2 \quad (\text{or } 0 < 1 - e^2 < 1)$

   or $b^2 < a^2$

   i.e. $b < a$

Remark

The major and minor axis together are called **principal axes** of the ellipse.

5. **Double ordinates :** If P be a point on the ellipse draw PN perpendicular to the axis of the ellipse and produced to meet the curve again at P'. Then PP' is called a double ordinate.

   If abscissa of P is h, then ordinate of P,

$$\frac{y^2}{b^2} = 1 - \frac{h^2}{a^2}$$

$$y = \frac{b}{a}\sqrt{(a^2 - h^2)} \quad \text{(for first quadrant)}$$

   and ordinate of P' is

$$y = -\frac{b}{a}\sqrt{(a^2 - h^2)} \quad \text{(for fourth quadrant)}$$

   Hence, coordinates of P and P' are

$$\left(h, \frac{b}{a}\sqrt{(a^2 - h^2)}\right) \text{ and } \left(h, -\frac{b}{a}\sqrt{(a^2 - h^2)}\right)$$

   respectively.

6. **Latusrectum** The double ordinates LL' and L_1L_1' are latusrectums of the ellipse. These line are perpendicular to major axis $A'A$ and through the foci S and S', respectively.

   Length of the latusrectum

   Now let $LL' = 2k$

   then $LS = L'S = k$

   Coordinates of L and L' are (ae, k) and $(ae, -k)$ lies on the ellipse

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$$

$\therefore$ $$\frac{a^2e^2}{a^2}+\frac{k^2}{b^2}=1 \text{ or } k^2 = b^2(1 - e^2)$$

$$= b^2\left(\frac{b^2}{a^2}\right) \quad [\because b^2 = a^2(1 - e^2)]$$

$\therefore \quad k = \dfrac{b^2}{a} \qquad (\because k > 0)$

$\therefore \quad 2k = \dfrac{2b^2}{a} = LL'$

$\therefore$ Length of latusrectum $LL' = L_1 L_1' = \dfrac{2b^2}{a}$ and end of points of latusrectum are

$$L \equiv \left(ae, \frac{b^2}{a} \right); \; L' \equiv \left(ae, -\frac{b^2}{a} \right)$$

$$L_1 \equiv \left(-ae, \frac{b^2}{a} \right); \; L_1' \equiv \left(-ae, -\frac{b^2}{a} \right)$$

respectively.

Remark

Latusrectum

$$= LL' = \frac{2b^2}{a} = \frac{(2b)^2}{(2a)} = \frac{(\text{Minor axis})^2}{(\text{Major axis})}$$

$$= 2a(1 - e^2) = 2e\left(\frac{a}{e} - ae \right)$$

$= 2e$ (distance from focus to the corresponding directrix)

7. **Focal chord :** A chord of the ellipse passing through its focus is called a focal chord.

Remark

Semi latusrectum is the harmonic mean of the segments of focal chord or $\dfrac{1}{SP} + \dfrac{1}{SQ} = \dfrac{2a}{b^2}$, $(a > b)$, where PQ is the focal chord and S is the focus.

8. **Vertices :** The vertices of the ellipse are the points where the ellipse meets its major axis.

   Hence, A and A' are the vertices

   $\therefore \quad A \equiv (a, 0)$ and $A' \equiv (-a, 0)$

Example 1 If PSQ is a focal chord of the ellipse $16x^2 + 25y^2 = 400$, such that $SP = 8$, then find the length of SQ.

Sol. The given ellipse is $16x^2 + 25y^2 = 400$ or $\dfrac{x^2}{25} + \dfrac{y^2}{16} = 1$

$\because \quad \dfrac{1}{SP} + \dfrac{1}{SQ} = \dfrac{2a}{b^2}$

$\Rightarrow \quad \dfrac{1}{8} + \dfrac{1}{SQ} = \dfrac{2(5)}{16} = \dfrac{5}{8}$ or $\dfrac{1}{SQ} = \dfrac{1}{2}$

$\therefore \quad SQ = 2$

Example 2 If the latusrectum of an ellipse is equal to half of its minor-axis, then find its eccentricity.

Sol. $\because$ Latusrectum $= \dfrac{1}{2}$ (minor axis)

$\Rightarrow \quad \dfrac{2b^2}{a} = \dfrac{1}{2}(2b)$

or $\quad 2b = a$

or $\quad 4b^2 = a^2$

$\Rightarrow \quad 4a^2(1 - e^2) = a^2$

or $\quad 4e^2 = 3$

$\therefore \quad e = \dfrac{\sqrt{3}}{2}$

Example 3 If the distance between the directrices is thrice the distance between the foci, then find eccentricity of the ellipse.

Sol. Given, $\dfrac{2a}{e} = 3(2ae) \Rightarrow e^2 = \dfrac{1}{3}$

$\therefore \quad e = \dfrac{1}{\sqrt{3}}$

Example 4 If $P(x, y)$ be any point on the ellipse $16x^2 + 25y^2 = 400$ and $F_1 \equiv (3, 0), F_2 \equiv (-3, 0)$, then find the value of $PF_1 + PF_2$.

Sol. We have, $16x^2 + 25y^2 = 400$

$\Rightarrow \quad \dfrac{x^2}{5^2} + \dfrac{y^2}{4^2} = 1$

$\because$ Coordinates of foci an $(\pm ae, 0)$

or $\quad \left(\pm \sqrt{(a^2 - b^2)}, 0 \right)$

i.e. $\quad (\pm \sqrt{(25 - 16)}, 0)$ or $(\pm 3, 0)$

Thus, F_1 and F_2 are foci of the ellipse.

$\therefore \quad PF_1 + PF_2 =$ Length of major axis

$= 2a = 2 \times 5 = 10$

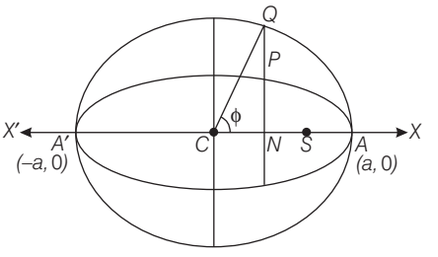
9. **Parametric equation of the ellipse :** The circle described on the major-axis of an ellipse as diameter is called the **auxiliary circle** of the ellipse.

   Let the equation of ellipse be

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

$\therefore$ Equation of its auxiliary circle is

$x^2 + y^2 = a^2$ ($\because AA'$ is diameter of the circle)



Let Q be a point on the auxiliary circle $x^2 + y^2 = a^2$ such that QP produced is perpendicular to the X-axis.

Then P and Q are the **corresponding points** on the ellipse and the auxiliary circle respectively.

Let $\angle QCA = \phi \qquad (0 \le \phi < 2\pi)$

i.e. the eccentric angle of P on an ellipse is the angle which the radius (or **radius vector)** through the corresponding point on the auxiliary circle makes with the major axis.

$\therefore \quad Q \equiv (a\cos\phi, a\sin\phi)$

$\therefore$ Now x-coordinate of P is $a\cos\phi$

Let y-coordinate of P is y, then $(a\cos\phi, y)$ lies on the ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

$$\frac{a^2\cos^2\phi}{a^2} + \frac{y^2}{b^2} = 1$$

$$\Rightarrow \quad y^2 = b^2\sin^2\phi$$

$$\therefore \quad y = \pm b\sin\phi$$

$\because P$ is in I quadrant

$$\therefore \quad y = b\sin\phi$$

Coordinates of P are $(a\cos\phi, b\sin\phi)$. We have $x = a\cos\phi, y = b\sin\phi$ are called parametric equations of the ellipse.

This point $(a\cos\phi, b\sin\phi)$ is also called the point 'ϕ'.

Remark

The equation of the chord joining the points

$P \equiv (a\cos\phi_1, b\sin\phi_1)$

and $Q \equiv (a\cos\phi_2, b\sin\phi_2)$ is

$$\frac{x}{a}\cos\left(\frac{\phi_1+\phi_2}{2}\right) + \frac{y}{b}\sin\left(\frac{\phi_1+\phi_2}{2}\right) = \cos\left(\frac{\phi_1-\phi_2}{2}\right)$$

If its focal chord, then it pass through $(ae, 0)$ or $(-ae, 0)$, then

$$\pm e\cos\left(\frac{\phi_1+\phi_2}{2}\right) + 0 = \cos\left(\frac{\phi_1-\phi_2}{2}\right)$$

$$\Rightarrow \quad \frac{\cos\left(\frac{\phi_1-\phi_2}{2}\right)}{\cos\left(\frac{\phi_1+\phi_2}{2}\right)} = \pm\frac{e}{1}$$

$$\Rightarrow \quad \frac{\cos\left(\frac{\phi_1-\phi_2}{2}\right) - \cos\left(\frac{\phi_1+\phi_2}{2}\right)}{\cos\left(\frac{\phi_1-\phi_2}{2}\right) + \cos\left(\frac{\phi_1+\phi_2}{2}\right)} = \left(\frac{\pm e-1}{\pm e+1}\right)$$

$$\Rightarrow \quad \tan\left(\frac{\phi_1}{2}\right)\tan\left(\frac{\phi_2}{2}\right) = \left(\frac{\pm e-1}{\pm e+1}\right)$$

if focal chord pass through $(ae, 0)$, then

$$\tan\left(\frac{\phi_1}{2}\right)\tan\left(\frac{\phi_2}{2}\right) = \left(\frac{e-1}{e+1}\right)$$

and if focal chord pass through $(-ae, 0)$, then

$$\tan\left(\frac{\phi_1}{2}\right)\tan\left(\frac{\phi_2}{2}\right) = \left(\frac{e+1}{e-1}\right)$$

or $$\cot\left(\frac{\phi_1}{2}\right)\cot\left(\frac{\phi_2}{2}\right) = \left(\frac{e-1}{e+1}\right)$$

Remark

Circle described on focal length as diameter always touches the auxiliary circle.

Proof

Consider ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$

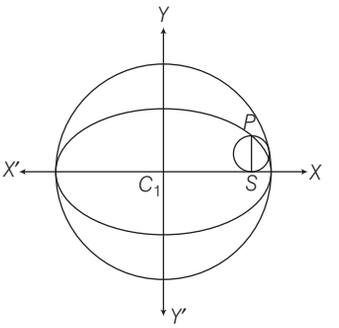
Let P be $(a\cos\theta, b\sin\theta)$

and S be $(ae, 0)$

$$\therefore \quad SP = ePM = e\left(\frac{a}{e} - a\cos\theta\right)$$

$$= (a - ae\cos\theta)$$

The auxiliary circle $x^2 + y^2 = a^2$ having center $C_1(0,0)$ and radius $r_1 = a$



The circle having SP as the diameter has center

$$C_2\left(\frac{ae + a\cos\theta}{2}, \frac{b\sin\theta}{2}\right)$$

and radius $r_2 = \frac{SP}{2} = \frac{a(1 - e\cos\theta)}{2}$

$$\text{Now, } C_1C_2 = \sqrt{\left(\frac{ae + a\cos\theta}{2}\right)^2 + \left(\frac{b\sin\theta}{2}\right)^2}$$

$$= \frac{1}{2}\sqrt{a^2(e + \cos\theta)^2 + a^2(1 - e^2)\sin^2\theta}$$

$$= \frac{a}{2}\sqrt{(e^2 + \cos^2\theta + 2e\cos\theta + \sin^2\theta - e^2\sin^2\theta)}$$

$$= \frac{a}{2}\sqrt{(e^2\cos^2\theta + 2e\cos\theta + 1)}$$

$$= \frac{a}{2}(1 + e\cos\theta)$$

$$= r_1 - r_2$$

Hence, the circle on SP as diameter touches the auxiliary circle internally.

Example 5 Find the eccentric angle of a point on the ellipse $\frac{x^2}{6}+\frac{y^2}{2}=1$. Whose distance from the center of the ellipse is $\sqrt{5}$.

Sol. Any point on the ellipse is $P(\sqrt{6}\cos\theta, \sqrt{2}\sin\theta)$

Where, $0 \le \theta < 2\pi$ and $C(0,0)$ is center, given $CP = \sqrt{5}$

$$\Rightarrow \quad (CP)^2 = 5$$

$$\Rightarrow \quad 6\cos^2\theta + 2\sin^2\theta = 5$$

$$\Rightarrow \quad 6(1-\sin^2\theta) + 2\sin^2\theta = 5$$

$$\text{or} \quad \sin^2\theta = \frac{1}{4}$$

$$\text{or} \quad \sin\theta = \pm\frac{1}{2} = \pm\sin\frac{\pi}{6}$$

$$\therefore \quad \theta = \frac{\pi}{6}, \frac{5\pi}{6}, \frac{7\pi}{6}, \frac{11\pi}{6}$$

Focal Distances of a Point

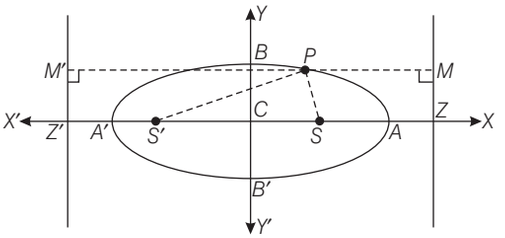
The sum of focal distances of any point on the ellipse is equal to the major axis. The ellipse is

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1 \qquad \ldots(i)$$

The foci S and S' are $(ae, 0)$ and $(-ae, 0)$.

The equations of its directrices MZ and $M'Z'$ are $x = a/e$ and $x = -a/e$

Let $P(x_1, y_1)$ be any point on Eq. (i)



Now $$SP = ePM = e\left(\frac{a}{e} - x_1\right)$$

$$= a - ex_1$$

and $$S'P = ePM' = e\left(\frac{a}{e} + x_1\right)$$

$$= a + ex_1$$

$$SP + S'P = (a - ex_1) + (a + ex_1)$$

$$= 2a = AA' = \text{major axis}$$

Hence, the sum of the focal distances of a point on the ellipse is constant and is equal to the length of the major axis of the ellipse.

Another definition of ellipse : An ellipse is the locus of a point which moves in a plane such that the sum of its distances from two fixed points in the same plane is always constant.

Remark

SP and *S'P* are also called focal radii of the ellipse

$\therefore \quad SP = a - ex_1$ and $S'P = a + ex_1$

Example 6 An ellipse having foci at (3, 3) and (−4, 4) and passing through the origin, then find eccentricity of the ellipse.

Sol. The ellipse is passing through $O(0,0)$ and has foci $P(3,3)$ and $Q(-4,4)$, then

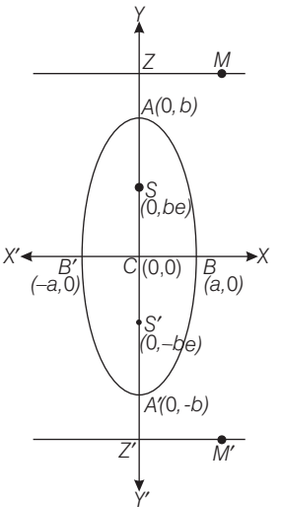
$$OP + OQ = 2a \text{ and } PQ = 2ae$$

$$\therefore \quad e = \frac{PQ}{OP+OQ} = \frac{\sqrt{50}}{3\sqrt{2}+4\sqrt{2}} = \frac{5}{7}$$

The Shape of the Ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, when $b > a$

In this case major and minor-axis of the ellipse along Y-axis and X-axis respectively.

then $AA' = 2b$ and $BB' = 2a$



The foci S and S' are $(0, be)$ and $(0, -be)$ respectively

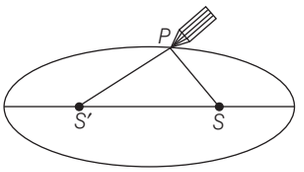
The directrices are MZ and $M'Z'$ are

$$y = \frac{b}{e} \quad \text{and} \quad y = -\frac{b}{e}$$

are respectively,

Mechanical Construction of an Ellipse

Let S and S' be two drawing pins and let an inextensible string whose ends at S and S' and length is equal to sum of SP and $S'P$ i.e. $2a$, where P is point of pencil. The point of pencil move on paper and the fixed ends always tight. So as to satisfy these conditions it will trace out the curve on the paper. This curve is an ellipse. Hence the locus of the point of pencil is an ellipse.



Smart Table : Difference between both (Horizontal and Vertical) Ellipses will be clear from the following table

Equation and graph of the ellipse → / Basic fundamentals ↓	**Horizontal ellipse** $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1\,;\,a>b$ 	**Vertical ellipse** $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1\,;\,a<b$ Centre	$(0, 0)$	$(0, 0)$
Vertices	$(\pm a, 0)$	$(0, \pm b)$
Length of major axis	$2a$	$2b$
Length of minor axis	$2b$	$2a$
Foci	$(\pm ae, 0)$ or $(\pm \sqrt{(a^2-b^2)}, 0)$	$(0, \pm be)$ or $(0, \pm \sqrt{(b^2-a^2)})$
Distance between foci	$2ae$ or $2\sqrt{(a^2-b^2)}$	$2be$ or $2\sqrt{(b^2-a^2)}$
Equation of directrices	$x = \pm \frac{a}{e}$	$y = \pm \frac{b}{e}$
Distance between directrices	$\frac{2a}{e}$	$\frac{2b}{e}$
Relation between a, b and e	$b^2 = a^2(1-e^2)$	$a^2 = b^2(1-e^2)$
Length of latusrectum	$\frac{2b^2}{a}$ or $2a(1-e^2)$	$\frac{2a^2}{b}$ or $2b(1-e^2)$
End points of latusrectum	$\left(\pm ae, \pm \frac{b^2}{a}\right)$	$\left(\pm \frac{a^2}{b}, \pm be\right)$
Focal radii	$SP = a - ex_1$, $S'P = a + ex_1$ and $SP + S'P = 2a$	$SP = b - ey_1$, $S'P = b + ey_1$ and $SP + S'P = 2b$
Parametric Coordinates	$(a\cos\theta, b\sin\theta)$, $0 \le \theta < 2\pi$	$(a\cos\theta, b\sin\theta)$, $0 \le \theta < 2\pi$
Tangents at the vertices	$x = \pm a$	$y = \pm b$

Example 7 Find the lengths of major and minor axes, the coordinates of foci, vertices and the eccentricity of the ellipse $3x^2 + 2y^2 = 6$. Also, find the equation of the directrices.

Sol. The equation of ellipse is

$$3x^2 + 2y^2 = 6$$

$$\Rightarrow \quad \frac{x^2}{2} + \frac{y^2}{3} = 1$$

$$\Rightarrow \quad \frac{x^2}{(\sqrt{2})^2} + \frac{y^2}{(\sqrt{3})^2} = 1$$

Comparing this equation with

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

$$\therefore \quad a = \sqrt{2},\ b = \sqrt{3} \qquad \text{(Here } b > a\text{)}$$

Length of major axis $= 2b = 2\sqrt{3}$

and Length of minor axis $= 2a = 2\sqrt{2}$

If e be the eccentricity, then $a^2 = b^2(1 - e^2)$

$$\Rightarrow \quad 2 = 3(1 - e^2) \ \Rightarrow \ e^2 = \frac{1}{3}$$

$$\therefore \quad e = \frac{1}{\sqrt{3}}$$

Vertices $= (0, \pm b) = (0, \pm \sqrt{3})$

and foci are $(0, \pm be) = (0, \pm 1)$

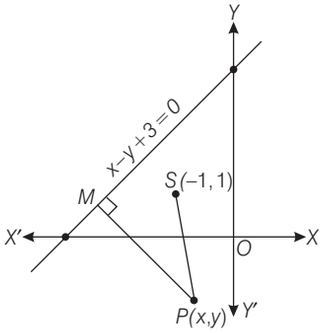
and equation of the directrices are $y = \pm b/e$

$$y = \pm \frac{\sqrt{3}}{(1/\sqrt{3})}$$

$$\therefore \quad y = \pm 3$$

Example 8 Find the equation of an ellipse whose focus is $(-1, 1)$, eccentricity is $\frac{1}{2}$ and the directrix is $x - y + 3 = 0$.

Sol. Let $P(x, y)$ be any point on the ellipse whose focus is $S(-1, 1)$ and the directrix is $x - y + 3 = 0$. Draw PM perpendicular from $P(x, y)$ on the directrix $x - y + 3 = 0$. Then by definition



$SP = ePM$

$$\Rightarrow \quad (SP)^2 = e^2 (PM)^2$$

$$\Rightarrow \quad (x + 1)^2 + (y - 1)^2 = \frac{1}{4}\left\{\frac{x - y + 3}{\sqrt{2}}\right\}^2$$

$$\Rightarrow \quad 8(x^2 + y^2 + 2x - 2y + 2)$$

$$= x^2 + y^2 + 9 - 2xy + 6x - 6y$$

$$\Rightarrow \quad 7x^2 + 7y^2 + 2xy + 10x - 10y + 7 = 0$$

which is the required equation of the ellipse.

Example 9 Show that the line $lx + my + n = 0$ will cut the ellipse $x^2/a^2 + y^2/b^2 = 1$ in points whose eccentric angles differ by $(\pi/2)$, if $a^2l^2 + b^2m^2 = 2n^2$.

Sol. Let eccentric angles are θ and ϕ, then

$$\theta - \phi = \frac{\pi}{2} \qquad \text{(given)}$$

$$\therefore \quad \theta = \frac{\pi}{2} + \phi$$

The line joining the point 'θ' and 'ϕ' is

$$\frac{x}{a}\cos\left(\frac{\theta + \phi}{2}\right) + \frac{y}{b}\sin\left(\frac{\theta + \phi}{2}\right) = \cos\left(\frac{\theta - \phi}{2}\right)$$

or $$\frac{x}{a}\cos\left(\frac{\pi}{4} + \phi\right) + \frac{y}{b}\sin\left(\frac{\pi}{4} + \phi\right) = \cos\frac{\pi}{4} \quad \left(\because \theta = \frac{\pi}{2} + \phi\right)$$

or $$\frac{x}{a}\cos\left(\frac{\pi}{4} + \phi\right) + \frac{y}{b}\sin\left(\frac{\pi}{4} + \phi\right) = \frac{1}{\sqrt{2}} \qquad \text{...(i)}$$

and the given line is $lx + my + n = 0$

or $$lx + my = -n \qquad \text{...(ii)}$$

Now, Eqs. (i) and (ii) represent the same line, so comparing them, we get

$$\frac{\cos\left(\frac{\pi}{4} + \phi\right)}{la} = \frac{\sin\left(\frac{\pi}{4} + \phi\right)}{mb} = -\frac{1}{n\sqrt{2}}$$

$$\therefore \quad \cos\left(\frac{\pi}{4} + \phi\right) = -\frac{la}{n\sqrt{2}} \qquad \text{...(iii)}$$

and $$\sin\left(\frac{\pi}{4} + \phi\right) = -\frac{mb}{n\sqrt{2}} \qquad \text{...(iv)}$$

Squaring and adding Eqs. (iii) and (iv), then

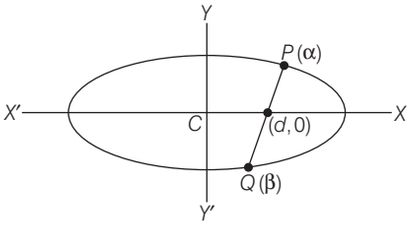
$$\frac{l^2a^2}{2n^2} + \frac{m^2b^2}{2n^2} = 1$$

$$l^2a^2 + m^2b^2 = 2n^2$$

Example 10 If a chord joining two points whose eccentric angles are α, β cut the major axis of an ellipse at a distance d from the centre. Show that $\tan(\alpha/2)\tan(\beta/2) = (d - a)/(d + a)$, where $2a$ is the length of major axis.

Sol. Let the equation of the ellipse be

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1 \qquad \ldots(i)$$



The equation of the line joining 'α' and 'β' on the ellipse Eq. (i) is

$$\frac{x}{a}\cos\left(\frac{\alpha+\beta}{2}\right)+\frac{y}{b}\sin\left(\frac{\alpha+\beta}{2}\right)=\cos\left(\frac{\alpha-\beta}{2}\right) \quad \ldots(ii)$$

Since, it cuts the major axis of the ellipse at a distance d from the centre i.e. passes through the point $(d, 0)$, then

$$\frac{d}{a}\cos\left(\frac{\alpha+\beta}{2}\right)+0=\cos\left(\frac{\alpha-\beta}{2}\right)$$

or $$\frac{d}{a}=\frac{\cos\left(\frac{\alpha-\beta}{2}\right)}{\cos\left(\frac{\alpha+\beta}{2}\right)}$$

or $$\frac{d-a}{d+a}=\frac{\cos\left(\frac{\alpha-\beta}{2}\right)-\cos\left(\frac{\alpha+\beta}{2}\right)}{\cos\left(\frac{\alpha-\beta}{2}\right)+\cos\left(\frac{\alpha+\beta}{2}\right)}$$

(By componendo and dividendo)

$$=\frac{2\sin(\alpha/2)\sin(\beta/2)}{2\cos(\alpha/2)\cos(\beta/2)}$$

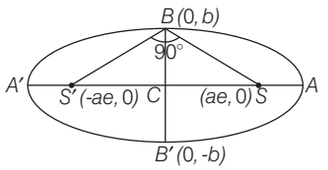
$$=\tan(\alpha/2)\tan(\beta/2)$$

$\therefore$ $$\tan(\alpha/2)\tan(\beta/2)=\frac{d-a}{d+a}$$

Example 11 If the angle between the straight lines joining foci and the ends of the minor axis of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, is 90°. Find its eccentricity.

Sol. The equation of the ellipse is $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$

Let $a > b$



$\therefore$ The ends of minor axis are $B(0, b)$ and $B'(0, -b)$. If the eccentricity of the ellipse is e, then the foci are $S(ae, 0)$ and $S'(-ae, 0)$

$\therefore$ Slope of BS is $m_1=\frac{b-0}{0-ae}=-\frac{b}{ae}$

and slope of BS' is $m_2=\frac{b-0}{0+ae}=\frac{b}{ae}$

$\because$ The angle between BS and BS' is 90°,

$\therefore$ $m_1m_2=-1$

$\Rightarrow$ $-\frac{b}{ae}\times\frac{b}{ae}=-1$

$\Rightarrow$ $b^2=a^2e^2$

$a^2(1-e^2)=a^2e^2$

$\Rightarrow$ $1-e^2=e^2$

$\Rightarrow$ $2e^2=1$

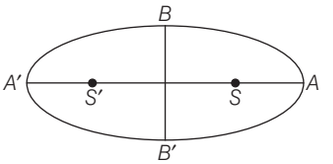
$\therefore$ $e=\frac{1}{\sqrt{2}}$

Example 12 Find the equation of the ellipse referred to its centre whose minor axis is equal to the distance between the foci and whose latusrectum is 10.

Sol. Let the equation of the ellipse is

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1 \qquad (\text{let } a>b)$$

Then, the foci are $S(ae, 0)$ and $S'(-ae, 0)$, length of minor axis $BB'=2b$ and length of latusrectum $=\frac{2b^2}{a}$



$\therefore$ According to the question

$$BB'=SS' \Rightarrow 2b=2ae$$

$\Rightarrow$ $b=ae$ ...(i)

and $\frac{2b^2}{a}=10$

$\Rightarrow$ $b^2=5a$ ...(ii)

also we have $b^2=a^2(1-e^2)$ ...(iii)

Putting the value of b from Eq. (i) in Eq. (iii), we have

$$a^2e^2=a^2(1-e^2)$$

$\Rightarrow$ $e^2=1-e^2$

$\Rightarrow$ $2e^2=1$

$\therefore$ $e=\frac{1}{\sqrt{2}}$

From Eq. (i), we have

$$b=\frac{a}{\sqrt{2}}$$

$\therefore$ $b^2=\frac{a^2}{2}$

$\Rightarrow \quad 5a = \frac{a^2}{2}$ [from Eq. (ii)]

$\Rightarrow \quad a = 10$

From Eq. (ii)

$$b^2 = 5 \times 10 = 50$$

Putting the values of a and b in $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, the equation of required ellipse is

$$\frac{x^2}{100} + \frac{y^2}{50} = 1$$

$$x^2 + 2y^2 = 100$$

Example 13 Prove that the ratio of area of any triangle PQR inscribed in the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ and that of triangle formed by the corresponding points on the auxiliary circle is $\frac{b}{a}$.

Sol. Let the three points on the ellipse be $P(a\cos\alpha, b\sin\alpha)$, $Q(a\cos\beta, b\sin\beta)$ and $R(a\cos\gamma, b\sin\gamma)$.

Then, the corresponding points on the auxiliary circle are $A(a\cos\alpha, a\sin\alpha)$, $B(a\cos\beta, a\sin\beta)$ and $C(a\cos\gamma, a\sin\gamma)$, then

$$\frac{\text{Area of } \Delta PQR}{\text{Area of } \Delta ABC} = \frac{\frac{1}{2}\begin{vmatrix} a\cos\alpha & b\sin\alpha & 1 \\ a\cos\beta & b\sin\beta & 1 \\ a\cos\gamma & b\sin\gamma & 1 \end{vmatrix}}{\frac{1}{2}\begin{vmatrix} a\cos\alpha & a\sin\alpha & 1 \\ a\cos\beta & a\sin\beta & 1 \\ a\cos\gamma & a\sin\gamma & 1 \end{vmatrix}}$$

$$= \frac{ab\begin{vmatrix} \cos\alpha & \sin\alpha & 1 \\ \cos\beta & \sin\beta & 1 \\ \cos\gamma & \sin\gamma & 1 \end{vmatrix}}{a^2\begin{vmatrix} \cos\alpha & \sin\alpha & 1 \\ \cos\beta & \sin\beta & 1 \\ \cos\gamma & \sin\gamma & 1 \end{vmatrix}}$$

$$= \frac{b}{a}$$

Example 14 The extremities of a line segment of length l move in two fixed perpendicular straight lines. Find the locus of that point which divides this line segment in ratio 1 : 2.

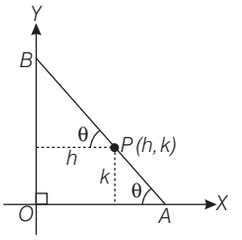
Sol. Let $PA : PB = 1 : 2$

$$PA = \frac{l}{3} \quad \text{and} \quad PB = \frac{2l}{3}$$

$$k = \frac{l}{3}\sin\theta$$

or $\quad 3k = l\sin\theta$ ...(i)

and $\quad h = \frac{2l}{3}\cos\theta$



or $\quad \frac{3h}{2} = l\cos\theta$ ...(ii)

Squaring and adding Eqs. (i) and (ii), then

$$9k^2 + \frac{9h^2}{4} = l^2$$

or $\quad 9h^2 + 36k^2 = 4l^2$

$\therefore$ Locus of $P(h, k)$ is

$$9x^2 + 36y^2 = 4l^2$$

Aliter :

Let $A \equiv (a, 0)$ and $B \equiv (0, b)$

$\because$ $P(h, k)$ divide AB in the ratio 1 : 2 (internally), then

$$h = \frac{1.0 + 2.a}{1 + 2} \Rightarrow a = \frac{3h}{2}$$

and $\quad k = \frac{1.b + 2.0}{1 + 2} \Rightarrow b = 3k$

$\because \quad a^2 + b^2 = l^2$

$\Rightarrow \quad \frac{9h^2}{4} + 9k^2 = l^2$

or $\quad 9h^2 + 36k^2 = 4l^2$

$\therefore$ Locus of $P(h, k)$ is

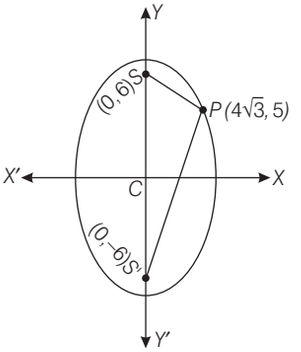
$$9x^2 + 36y^2 = 4l^2$$

Example 15 ***Find the lengths and equations of the focal radii drawn from the point*** $(4\sqrt{3}, 5)$ ***on the ellipse*** $25x^2 + 16y^2 = 1600$.

Sol. The equation of the ellipse is

$$25x^2 + 16y^2 = 1600$$

or $\quad \frac{x^2}{64} + \frac{y^2}{100} = 1$



Here, $b > a$

$$a^2 = 64,\ b^2 = 100$$

$$a^2 = b^2(1 - e^2)$$

$$\therefore \quad 64 = 100(1 - e^2)$$

$$\Rightarrow \quad e = 3/5$$

Let $P(x_1, y_1) \equiv (4\sqrt{3}, 5)$

be a point on the ellipse, then SP and $S'P$ are the focal radii

$$\therefore \quad SP = b - ey_1 \text{ and } S'P = b + ey_1$$

$$\therefore \quad SP = 10 - \frac{3}{5} \times 5 \text{ and } S'P = 10 + \frac{3}{5} \times 5$$

$$\Rightarrow \quad SP = 7 \text{ and } S'P = 13$$

Also, S is $(0, be)$

i.e. $\left(0, 10 \times \frac{3}{5}\right)$ i.e. $(0, 6)$

and S' is $(0, -be)$

i.e. $\left(0, -10 \times \frac{3}{5}\right)$

i.e. $(0, -6)$

$\therefore$ Equation of SP is

$$y - 5 = \frac{6 - 5}{0 - 4\sqrt{3}}(x - 4\sqrt{3})$$

$$-4\sqrt{3y} + 20\sqrt{3} = x - 4\sqrt{3}$$

or $\quad x + 4\sqrt{3}y - 24\sqrt{3} = 0$

and equation of $S'P$ is

$$\therefore \quad y - 5 = \frac{-6 - 5}{0 - 4\sqrt{3}}(x - 4\sqrt{3})$$

$$\Rightarrow \quad -4\sqrt{3}y + 20\sqrt{3} = -11x + 44\sqrt{3}$$

or $\quad 11x - 4\sqrt{3}y - 24\sqrt{3} = 0$

Exercise for Session 1

1. The length of the major axis of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, is three times the length of minor axis, it eccentricity is

(a) $\frac{1}{\sqrt{2}}$ (b) $\frac{1}{\sqrt{3}}$ (c) $\frac{2\sqrt{2}}{3}$ (d) $\frac{2\sqrt{2}}{5}$

2. The equation $\frac{x^2}{10 - a} + \frac{y^2}{4 - a} = 1$, represents an ellipse, if

(a) $a < 4$ (b) $a > 4$ (c) $4 < a < 10$ (d) $a > 10$

3. The eccentricity of an ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, whose latusrectum is half of its major axis, is

(a) $\frac{1}{\sqrt{3}}$ (b) $\frac{1}{\sqrt{2}}$ (c) $\frac{\sqrt{3}}{2}$ (d) $\sqrt{\left(\frac{2}{3}\right)}$

4. If the eccentricity of an ellipse is $\frac{1}{\sqrt{2}}$, then its latusrectum is equal to its

(a) minor axis (b) semi minor axis (c) major axis (d) semi major axis

5. If the distance between the foci of an ellipse is equal to its minor axis, then its eccentricity is

(a) $\frac{1}{2}$ (b) $\frac{1}{\sqrt{2}}$ (c) $\frac{1}{3}$ (d) $\frac{1}{\sqrt{3}}$

6. The eccentric angle of a point on the ellipse $\frac{x^2}{6} + \frac{y^2}{2} = 1$, whose distance from the centre of ellipse is 2, is

(a) $-\frac{\pi}{4}$ (b) $\frac{\pi}{4}$ (c) $\frac{3\pi}{2}$ (d) $\frac{5\pi}{3}$

7. If $\tan\alpha \tan\beta = -\frac{a^2}{b^2}$, then the chord joining two points α and β on the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, will subtend a right angle at

(a) focus (b) centre (c) end of major axis (d) end of minor axis

8. If the eccentricity of the two ellipses $\frac{x^2}{169}+\frac{y^2}{25}=1$ and $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ are equal, then the value of a/b is

(a) $\frac{5}{13}$ (b) $\frac{6}{13}$

(c) $\frac{13}{5}$ (d) $\frac{13}{6}$

9. The ratio of the areas of triangle inscribed in ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, to that of triangle formed by the corresponding points on the auxiliary circle is $\frac{1}{2}$, then the eccentricity of the ellipse is

(a) $\frac{1}{2}$ (b) $\frac{\sqrt{3}}{2}$

(c) $\frac{1}{\sqrt{2}}$ (d) $\frac{1}{\sqrt{3}}$

10. If PSQ is a focal chord of the ellipse $16x^2+25y^2=400$ such that $SP=16$, then the length SQ is

(a) $\frac{2}{9}$ (b) $\frac{4}{9}$

(c) $\frac{8}{9}$ (d) $\frac{16}{9}$

11. Let P be a variable point on the ellipse $\frac{x^2}{25}+\frac{y^2}{16}=1$ with foci at S and S'. If A be the area of triangle PSS', then the maximum value of A is

(a) 12 sq units (b) 24 sq units

(c) 36 sq units (d) 48 sq units

12. If S and S' are the foci of an ellipse of major axis of length 10 units and P is any point on the ellipse such that the perimeter of triangle PSS' is 15 units, then the eccentricity of the ellipse is

(a) $\frac{1}{2}$ (b) $\frac{1}{4}$

(c) $\frac{7}{25}$ (d) $\frac{3}{4}$

13. Find the latusrectum, eccentricity, coordinates of the foci, coordinates of the vertices, the length of the axes and the centre of the ellipse

$4x^2+9y^2-8x-36y+4=0$

14. The distance between the foci of an ellipse is 10 and its latusrectum is 15 ; find its equation referred to its axes as axes of coordinates.

15. Find the equation of the ellipse whose axes are parallel to the coordinate axes having its centre at the point $(2,-3)$ one focus at $(3,-3)$ and one vertex at $(4,-3)$.

16. Find the equation of the ellipse whose foci are $(2,3)$, $(-2,3)$ and whose semi-minor axes is $\sqrt{5}$.

17. Show that the equation $(10x-5)^2+(10y-5)^2=(3x+4y-1)^2$ represents an ellipse, find the eccentricity of the ellipse.

18. Find the locus of the extremities of the latusrectum of the family of ellipses $b^2x^2+y^2=a^2b^2$ having a given major axes.

Session 2

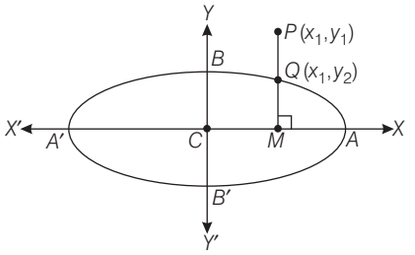
Position of a Point with Respect to an Ellipse, Intersection of a Line and an Ellipse, Equation of Tangent in Different Forms, Equations of Normals in Different Forms, Properties of Eccentric Angles of the Co-normal Points, Co-normal Points Lie on a Fixed Curve

Position of a Point with Respect to an Ellipse

Theorem : Prove that the point $P(x_1, y_1)$ lies outside, on, or inside the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ according as

$$\frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}-1>,=\text{or},<0$$

Proof : From point $P(x_1, y_1)$ draw perpendicular PM on AA' to meet the ellipse at $Q(x_1, y_2)$.



Since, $Q(x_1, y_2)$ lies on the ellipse

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$$

then, $$\frac{x_1^2}{a^2}+\frac{y_2^2}{b^2}=1$$

$$\Rightarrow \quad \frac{y_2^2}{b^2}=1-\frac{x_1^2}{a^2} \qquad ...(i)$$

Now, point P lies outside, on or inside the ellipse according as

$$PM>,=\text{or},<QM$$

$$\Rightarrow \quad y_1>,=\text{or},<y_2$$

$$\Rightarrow \quad \frac{y_1^2}{b^2}>,=\text{or},<\frac{y_2^2}{b^2}$$

$$\Rightarrow \quad \frac{y_1^2}{b^2}>,=\text{or},<1-\frac{x_1^2}{a^2} \qquad \text{[from Eq. (i)]}$$

$$\Rightarrow \quad \frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}>,=\text{or},<1,$$

or $$\frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}-1>,=\text{or},<0$$

Hence, the point $P(x_1, y_1)$ lies outside, on or inside the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ according as

$$\frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}-1>0,=\text{or},<0$$

Remark

Let $S=\frac{x^2}{a^2}+\frac{y^2}{b^2}-1$, then $S_1=\frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}-1$

The point (x_1, y_1) lies outside, on or inside the ellipse $S=0$ according as $S_1>,=\text{or}<0$.

Example 16 Find the position of the point $(4,-3)$ relative to the ellipse $5x^2+7y^2=140$.

Sol. The given ellipse can be written as $\frac{x^2}{28}+\frac{y^2}{20}-1=0$

Let $$S=\frac{x^2}{28}+\frac{y^2}{20}-1$$

$\therefore$ $$S_1=\frac{(4)^2}{28}+\frac{(-3)^2}{20}-1=\frac{3}{140}>0$$

So, the point $(4, -3)$ lies outside the ellipse $5x^2 + 7y^2 = 140$.

Example 17 Find the integral value of α for which the point $\left(7 - \frac{5\alpha}{4}, -\alpha\right)$ lies inside the ellipse $\frac{x^2}{25} + \frac{y^2}{16} = 1$.

Sol. Since, the point $\left(7 - \frac{5\alpha}{4}, -\alpha\right)$ lies inside the ellipse $\frac{x^2}{25} + \frac{y^2}{16} = 1$, then $\frac{1}{25}\left(7 - \frac{5\alpha}{4}\right)^2 + \frac{1}{16}(-\alpha)^2 - 1 < 0$

$$\Rightarrow \quad (28 - 5\alpha)^2 + 25\alpha^2 - 400 < 0$$

$$\Rightarrow \quad 50\alpha^2 - 280\alpha + 384 < 0$$

$$\Rightarrow \quad 25\alpha^2 - 140\alpha + 192 < 0$$

$$\Rightarrow \quad (5\alpha - 12)(5\alpha - 16) < 0$$

$$\therefore \quad \frac{12}{5} < \alpha < \frac{16}{5}$$

Hence, integral value of α is 3

Intersection of a Line and an Ellipse

Let the ellipse be $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ ...(i)

and the given line be $y = mx + c$ ...(ii)

Eliminating y from Eqs. (i) and (ii), then

$$\frac{x^2}{a^2} + \frac{(mx + c)^2}{b^2} = 1$$

$$\Rightarrow \quad (a^2m^2 + b^2)x^2 + 2mca^2x + c^2a^2 - a^2b^2 = 0 \quad \text{...(iii)}$$

Above equation being a quadratic in x gives two values of x. Shows that every straight line will cut the ellipse in two points may be real, coincident or imaginary according as

Discriminant of Eq. (iii) $>, =, < 0$

i.e. $4m^2c^2a^4 - 4(a^2m^2 + b^2)(c^2a^2 - a^2b^2) >, =, < 0$

or $-a^2b^2c^2 + a^4b^2m^2 + a^2b^4 >, =, < 0$

or $a^2m^2 + b^2 >, =, < c^2$ ...(iv)

Condition of Tangency : If the line Eq. (ii) touches the ellipse Eq. (i), then Eq. (iii) has equal roots.

$\therefore$ Discriminant of Eq. (iii) $= 0$

$$\Rightarrow \quad c^2 = a^2m^2 + b^2 \quad \text{or} \quad c = \pm\sqrt{(a^2m^2 + b^2)} \quad \text{...(v)}$$

so, the line $y = mx + c$ touches the ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad \text{if} \quad c^2 = a^2m^2 + b^2$$

(which is condition of tangency)

Substituting the value of c from Eq. (v) in Eq. (ii), then

$$y = mx \pm \sqrt{(a^2m^2 + b^2)}$$

Hence, the lines $y = mx \pm \sqrt{(a^2m^2 + b^2)}$ will always tangents to the ellipse.

Point of contact : Substituting $c = \pm\sqrt{(a^2m^2 + b^2)}$ in Eq. (iii), then

$$(a^2m^2 + b^2)x^2 \pm 2ma^2x\sqrt{(a^2m^2 + b^2)} + (a^2m^2 + b^2)a^2 - a^2b^2 = 0$$

or $(a^2m^2 + b^2)x^2 \pm 2ma^2x\sqrt{(a^2m^2 + b^2)} + a^4m^2 = 0$

or $\left(x\sqrt{(a^2m^2 + b^2)} \pm a^2m\right)^2 = 0$

$$\therefore \quad x = \pm\frac{a^2m}{\sqrt{(a^2m^2 + b^2)}} = \pm\frac{a^2m}{c}$$

From Eq. (i), $\frac{a^4m^2}{c^2} \cdot \frac{1}{a^2} + \frac{y^2}{b^2} = 1$

$$\Rightarrow \quad \frac{y^2}{b^2} = 1 - \frac{a^2m^2}{c^2} = \frac{c^2 - a^2m^2}{c^2} = \frac{b^2}{c^2}$$

$$y = \pm\frac{b^2}{c}$$

Hence, the point of contact is $\left(\pm\frac{a^2m}{c}, \pm\frac{b^2}{c}\right)$ this known as m-point on the ellipse.

Remark

If $m = 0$, then Eq. (iii) gives $b^2x^2 + c^2a^2 - a^2b^2 = 0$

or $b^2x^2 + (a^2m^2 + b^2)a^2 - a^2b^2 = 0$

$$\therefore \quad x = \pm\frac{a^2m}{b}$$

which gives two values of x.

Example 18 Prove that the straight line $lx + my + n = 0$ touches the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ if $a^2l^2 + b^2m^2 = n^2$.

Sol. The given line is

$$lx + my + n = 0$$

or $y = -\frac{l}{m}x - \frac{n}{m}$ ...(i)

Comparing this line with $y = Mx + c$

$$\therefore \quad M = -\frac{l}{m} \quad \text{and} \quad c = -\frac{n}{m}$$

The line Eq. (i) will touch the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ if

$$c^2 = a^2M^2 + b^2$$

$$\frac{n^2}{m^2} = \frac{a^2l^2}{m^2} + b^2$$

$$a^2l^2 + b^2m^2 = n^2$$

Example 19 ***Show that the line*** $x\cos\alpha + y\sin\alpha = p$ ***touches the ellipse*** $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ ***if*** $a^2\cos^2\alpha + b^2\sin^2\alpha = p^2$ ***and that point of contact is*** $\left(\frac{a^2\cos\alpha}{p}, \frac{b^2\sin\alpha}{p}\right)$.

Sol. The given line is $x\cos\alpha + y\sin\alpha = p$

$$y = -x\cot\alpha + p\,\text{cosec}\,\alpha$$

Comparing this line with $y = mx + c$

$\therefore$ $m = -\cot\alpha$ and $c = p\,\text{cosec}\,\alpha$

Hence, the given line touches the ellipse, then

$$c^2 = a^2m^2 + b^2$$

$\Rightarrow$ $p^2\,\text{cosec}^2\alpha = a^2\cot^2\alpha + b^2$

$\Rightarrow$ $p^2 = a^2\cos^2\alpha + b^2\sin^2\alpha$

and point of contact is $\left(-\frac{a^2m}{c}, \frac{b^2}{c}\right)$

i.e. $\left(-\frac{a^2(-\cot\alpha)}{p\,\text{cosec}\,\alpha}, \frac{b^2}{p\,\text{cosec}\,\alpha}\right)$

i.e. $\left(\frac{a^2\cos\alpha}{p}, \frac{b^2\sin\alpha}{p}\right)$

Example 20 For what value of λ does the line $y = x + \lambda$ touches the ellipse $9x^2 + 16y^2 = 144$.

Sol. $\because$ Equation of ellipse is

$$9x^2 + 16y^2 = 144 \quad \text{or} \quad \frac{x^2}{16}+\frac{y^2}{9}=1$$

Comparing this with $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$

then, we get $a^2 = 16$ and $b^2 = 9$

and comparing the line $y = x + \lambda$ with $y = mx + c$

$\therefore$ $m = 1$

and $c = \lambda$

If the line $y = x + \lambda$ touches the ellipse

$$9x^2 + 16y^2 = 144$$

then $c^2 = a^2m^2 + b^2$

$\Rightarrow$ $\lambda^2 = 16 \times 1^2 + 9$

$\Rightarrow$ $\lambda^2 = 25$

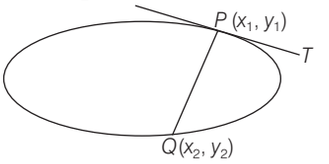
$\therefore$ $\lambda = \pm 5$

Equation of Tangent in Different Forms

1. Point Form

Theorem : The equation of tangent to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ at the point (x_1, y_1) is $\frac{xx_1}{a^2}+\frac{yy_1}{b^2}=1$

Proof : (By first Principal Method)



$\because$ Equation of ellipse is $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ ...(i)

Let $P \equiv (x_1, y_1)$ and $Q \equiv (x_2, y_2)$ be any two point on Eq. (i), then

$$\frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}=1 \quad \text{...(ii)}$$

and $$\frac{x_2^2}{a^2}+\frac{y_2^2}{b^2}=1 \quad \text{...(iii)}$$

Subtracting Eqs. (ii) from (iii), then

$$\frac{1}{a^2}(x_2^2 - x_1^2) + \frac{1}{b^2}(y_2^2 - y_1^2) = 0$$

$\Rightarrow$ $$\frac{(x_2 + x_1)(x_2 - x_1)}{a^2} + \frac{(y_2 + y_1)(y_2 - y_1)}{b^2} = 0$$

$\Rightarrow$ $$\frac{y_2 - y_1}{x_2 - x_1} = -\frac{b^2(x_1 + x_2)}{a^2(y_1 + y_2)} \quad \text{...(iv)}$$

Equation of PQ is

$$y - y_1 = \frac{y_2 - y_1}{x_2 - x_1}(x - x_1) \quad \text{...(v)}$$

From Eqs. (iv) and (v), then

$$y - y_1 = -\frac{b^2(x_1 + x_2)}{a^2(y_1 + y_2)}(x - x_1) \quad \text{...(vi)}$$

Now, for tangent at $P, Q \to P$ *i.e.*, $x_2 \to x_1$ and $y_2 \to y_1$, then Eq. (vi) becomes

$$y - y_1 = -\frac{b^2(2x_1)}{a^2(2y_1)}(x - x_1)$$

or $$\frac{yy_1 - y_1^2}{b^2} = -\left(\frac{xx_1 - x_1^2}{a^2}\right)$$

or $$\frac{xx_1}{a^2}+\frac{yy_1}{b^2} = \frac{x_1^2}{a^2}+\frac{y_1^2}{b^2} \text{ or } \frac{xx_1}{a^2}+\frac{yy_1}{b^2}=1 \quad [\text{from (ii)}]$$

which is required equation of tangent at (x_1, y_1).

Remark

The equation of tangent at (x_1, y_1) can be obtained by replacing x^2 by xx_1, y^2 by yy_1, x by $\frac{x + x_1}{2}$, y by $\frac{y + y_1}{2}$ and xy by $\frac{xy_1 + x_1y}{2}$.

This method is applicable only when the equation of ellipse is a polynomial of second degree in x and y.

2. Parametric form

Theorem : The equation of tangent to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ at the point $(a\cos\phi, b\sin\phi)$ is

$$\frac{x}{a}\cos\phi + \frac{y}{b}\sin\phi = 1$$

Proof : The equation of tangent to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ at the point (x_1, y_1) is $\frac{xx_1}{a^2} + \frac{yy_1}{b^2} = 1$ (by point form)

Replacing x_1 by $a\cos\phi$ and y_1 by $b\sin\phi$, then we get

$$\frac{x}{a}\cos\phi + \frac{y}{b}\sin\phi = 1$$

Remark

Point of intersection of tangent at 'θ' and 'ϕ' on the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is $\left(\frac{a\cos\left(\frac{\theta+\phi}{2}\right)}{\cos\left(\frac{\theta-\phi}{2}\right)}, \frac{b\sin\left(\frac{\theta+\phi}{2}\right)}{\cos\left(\frac{\theta-\phi}{2}\right)}\right)$

Remembering method : $\because$ Equation of chord joining $(a\cos\theta, b\sin\theta)$ and $(a\cos\phi, b\sin\phi)$ is

$$\frac{x}{a}\cos\left(\frac{\theta+\phi}{2}\right) + \frac{y}{b}\sin\left(\frac{\theta+\phi}{2}\right) = \cos\left(\frac{\theta-\phi}{2}\right)$$

$$\Rightarrow \quad \frac{x}{a}\left\{\frac{\cos\left(\frac{\theta+\phi}{2}\right)}{\cos\left(\frac{\theta-\phi}{2}\right)}\right\} + \frac{y}{b}\left\{\frac{\sin\left(\frac{\theta+\phi}{2}\right)}{\cos\left(\frac{\theta-\phi}{2}\right)}\right\} = 1$$

or $$\frac{x}{a^2}\left\{\frac{a\cos\left(\frac{\theta+\phi}{2}\right)}{\cos\left(\frac{\theta-\phi}{2}\right)}\right\} + \frac{y}{b^2}\left\{\frac{b\sin\left(\frac{\theta+\phi}{2}\right)}{\cos\left(\frac{\theta-\phi}{2}\right)}\right\} = 1$$

3. Slope form

Theorem : The equations of tangents of slope m to ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ are $y = mx \pm \sqrt{(a^2m^2 + b^2)}$ and the coordinates of the points of contact are

$$\left(\mp\frac{a^2m}{\sqrt{(a^2m^2 + b^2)}}, \pm\frac{b^2}{\sqrt{(a^2m^2 + b^2)}}\right)$$

Proof : Let $y = mx + c$ be a tangent to the ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1.$$

Then the equation $\frac{x^2}{a^2} + \frac{(mx + c)^2}{b^2} = 1$

$$\Rightarrow \quad x^2(a^2m^2 + b^2) + 2a^2mcx + a^2(c^2 - b^2) = 0 \qquad \text{...(i)}$$

must have equal roots

$$4a^4m^2c^2 - 4(a^2m^2 + b^2)a^2(c^2 - b^2) = 0$$

$$\{\because B^2 - 4AC = 0\}$$

$$\Rightarrow \quad a^2m^2c^2 - (a^2m^2 + b^2)(c^2 - b^2) = 0$$

$$\Rightarrow \quad a^2m^2c^2 - a^2m^2c^2 + a^2b^2m^2 - b^2c^2 + b^4 = 0$$

$$\Rightarrow \quad a^2b^2m^2 - b^2c^2 + b^4 = 0$$

$$\Rightarrow \quad c^2 = a^2m^2 + b^2$$

$$\therefore \quad c = \pm\sqrt{(a^2m^2 + b^2)}$$

Substituting this value of c in $y = mx + c$, we get

$$y = mx \pm \sqrt{(a^2m^2 + b^2)}$$

as the required equations of tangent of ellipse in terms of slope, putting $c = \pm\sqrt{(a^2m^2 + b^2)}$ in (i), we get

$$x^2(a^2m^2 + b^2) \pm 2a^2m\sqrt{(a^2m^2 + b^2)}\,x + a^4m^2 = 0$$

$$\Rightarrow \quad (\sqrt{(a^2m^2 + b^2)}\,x \pm a^2m)^2 = 0$$

$$\Rightarrow \quad x = \mp\frac{a^2m}{\sqrt{(a^2m^2 + b^2)}}$$

Substituting this value of x in

$$y = mx \pm \sqrt{a^2m^2 + b^2}$$

we obtained $$y = \pm\frac{b^2}{\sqrt{(a^2m^2 + b^2)}}$$

Thus, the coordinates of the points of contact are

$$\left(\mp\frac{a^2m}{\sqrt{(a^2m^2 + b^2)}}, \pm\frac{b^2}{\sqrt{(a^2m^2 + b^2)}}\right)$$

Example 21 If the line $3x + 4y = \sqrt{7}$ touches the ellipse $3x^2 + 4y^2 = 1$, then find the point of contact.

Sol. Let the given line touches the ellipse at point $P(x_1, y_1)$.

The equation of tangent at P is

$$3xx_1 + 4yy_1 = 1 \qquad \text{...(i)}$$

Comparing Eq. (i) with the given equation of line $3x + 4y = \sqrt{7}$, we get

$$\frac{3x_1}{3} = \frac{4y_1}{4} = \frac{1}{\sqrt{7}}$$

$$\therefore \quad x_1 = y_1 = \frac{1}{\sqrt{7}}$$

Hence, point of contact (x_1, y_1) is $\left(\frac{1}{\sqrt{7}}, \frac{1}{\sqrt{7}}\right)$.

Example 22 Find the equations of the tangents to the ellipse $3x^2 + 4y^2 = 12$ which are perpendicular to the line $y + 2x = 4$.

Sol. Let m be the slope of the tangent, since the tangent is perpendicular to the line $y + 2x = 4$.

$$\therefore \quad m \times -2 = -1$$

$$\Rightarrow \quad m = \frac{1}{2}$$

Since $3x^2 + 4y^2 = 12$

or $\frac{x^2}{4} + \frac{y^2}{3} = 1$

Comparing this with $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$

$$\therefore \quad a^2 = 4$$

and $b^2 = 3$

So the equations of the tangents are

$$y = \frac{1}{2}x \pm \sqrt{4 \times \frac{1}{4} + 3}$$

$$\Rightarrow \quad y = \frac{1}{2}x \pm 2$$

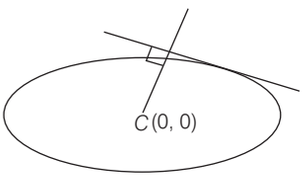
or $x - 2y \pm 4 = 0$

Example 23 Find the locus of the foot of the perpendicular drawn from centre upon any tangent to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$.

Sol. Any tangent of $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is

$$y = mx + \sqrt{(a^2m^2 + b^2)} \qquad \ldots(i)$$

Equation of the line perpendicular to Eq. (i) and passing through $(0, 0)$ is



$$y = -\frac{1}{m}x \text{ or } m = -\frac{x}{y} \qquad \ldots(ii)$$

Substituting the value of m from Eq. (ii) in Eq. (i), then

$$y = -\frac{x^2}{y} + \sqrt{\left(a^2\frac{x^2}{y^2} + b^2\right)}$$

$$\Rightarrow \quad (x^2 + y^2)^2 = a^2x^2 + b^2y^2$$

or changing to polars by putting $x = r\cos\theta$, $y = r\sin\theta$ it becomes

$$r^2 = a^2\cos^2\theta + b^2\sin^2\theta$$

Example 24 ***Find the point on the ellipse $16x^2 + 11y^2 = 256$, where the common tangent to it and the circle $x^2 + y^2 - 2x = 15$ touch.***

Sol. The given ellipse is $\frac{x^2}{16} + \frac{y^2}{(256/11)} = 1$

Equation of tangent to it at point $\left(4\cos\theta, \frac{16}{\sqrt{11}}\sin\theta\right)$ is

$$\frac{x}{4}\cos\theta + y\frac{\sqrt{11}}{16}\sin\theta = 1$$

It also touch the circle $(x-1)^2 + (y-0)^2 = 4^2$

Therefore,

$$\frac{\left|\frac{1}{4}\cos\theta - 1\right|}{\sqrt{\left(\frac{\cos^2\theta}{16} + \frac{11}{256}\sin^2\theta\right)}} = 4$$

$$\Rightarrow \quad |\cos\theta - 4| = \sqrt{(16\cos^2\theta + 11\sin^2\theta)}$$

or $4\cos^2\theta + 8\cos\theta - 5 = 0$

or $(2\cos\theta - 1)(2\cos\theta + 5) = 0$

or $\cos\theta = \frac{1}{2} \qquad \left(\because \cos\theta \neq -\frac{5}{2}\right)$

$$\therefore \quad \theta = \frac{\pi}{3}, \frac{5\pi}{3}$$

Therefore, points are $\left(2, \pm\frac{8\sqrt{3}}{11}\right)$.

Example 25 Find the maximum area of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ which touches the line $y = 3x + 2$.

Sol. $\because$ Line $y = 3x + 2$ touches ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$

Here, $m = 3$ and $c = 2$

Substituting in $c^2 = a^2m^2 + b^2$

or $4 = 9a^2 + b^2 \qquad \ldots(i)$

Now, $AM \geq GM$

$\Rightarrow \quad \frac{9a^2 + b^2}{2} \geq \sqrt{(9a^2)\, b^2} \quad \Rightarrow \quad \frac{9a^2 + b^2}{2} \geq 3ab$

$\Rightarrow \quad 2 \geq 3ab$ [from Eq. (i)]

or $\frac{2\pi}{3} \geq \pi\, ab$

or $\frac{2\pi}{3} \geq$ Area of ellipse

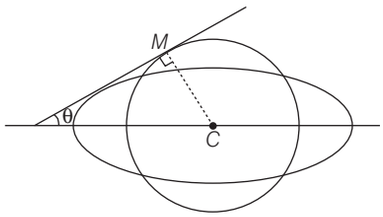
Therefore, the maximum area of the ellipse is $\frac{2\pi}{3}$.

Example 26 A circle of radius r is concentric with the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$. Prove that the common tangent is inclined to the major axis at an angle $\tan^{-1}\sqrt{\left(\frac{r^2 - b^2}{a^2 - r^2}\right)}$.

Sol. Equation of the circle of radius r and concentric with ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is

$$x^2 + y^2 = r^2 \qquad \ldots(i)$$

any tangent to ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is



$$y = mx + \sqrt{(a^2m^2 + b^2)} \qquad (\text{where } m = \tan\theta)$$

If it is a tangent to circle, then perpendicular from $(0, 0)$ is equal to radius r,

$\therefore \quad \frac{\sqrt{(a^2m^2 + b^2)}}{\sqrt{(m^2 + 1)}} = |\, r\, |$ or $a^2m^2 + b^2 = m^2r^2 + r^2$

$$(a^2 - r^2)\, m^2 = r^2 - b^2$$

$\therefore \quad m = \sqrt{\left(\frac{r^2 - b^2}{a^2 - r^2}\right)}$

$$\tan\theta = \sqrt{\left(\frac{r^2 - b^2}{a^2 - r^2}\right)}$$

$$\theta = \tan^{-1}\sqrt{\left(\frac{r^2 - b^2}{a^2 - r^2}\right)}$$

Example 27 Show that the product of the perpendiculars from the foci of any tangent to an ellipse is equal to the square of the semi minor axis, and the feet of a these perpendiculars lie on the auxiliary circle.

Sol. Let equation of ellipse be

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \qquad \ldots(i)$$

Equation of any tangent in term of slope (m) of (i) is

$$y = mx + \sqrt{(a^2m^2 + b^2)}$$

or $y - mx = \sqrt{a^2m^2 + b^2}$ ...(ii)

Equation of a line perpendicular to Eq. (ii) and passing through $S\,(ae, 0)$ is

$$y - 0 = -\frac{1}{m}(x - ae)$$

or $x + my = ae$ ...(iii)

The lines Eq. (ii) and Eq. (iii) will meet at the foot of perpendicular whose locus is obtained by eliminating the variable m between Eq. (ii) and Eq. (iii), then squaring and adding Eq. (ii) and Eq. (iii), we get

$$(y - mx)^2 + (x + my)^2 = a^2m^2 + b^2 + a^2e^2$$

$\Rightarrow \quad (1 + m^2)(x^2 + y^2) = a^2m^2 + b^2 + a^2 - b^2$

$\Rightarrow \quad (1 + m^2)(x^2 + y^2) = a^2(1 + m^2)$

or $x^2 + y^2 = a^2$

which is auxiliary circle of ellipse, similarly we can show that the other foot drawn from second focus also lies on $x^2 + y^2 = a^2$.

Again if p_1 and p_2 be perpendiculars from foci $S(ae, 0)$ and $S'(-ae, 0)$ on (ii), then

$$p_1 = \frac{|\sqrt{(a^2m^2 + b^2)} + mae|}{\sqrt{(1 + m^2)}}$$

and $p_2 = \frac{|\sqrt{(a^2m^2 + b^2)} - mae|}{\sqrt{(1 + m^2)}}$

$\therefore \quad p_1p_2 = \frac{|\, a^2m^2 + b^2 - a^2e^2m^2|}{(1 + m^2)}$

$$= \frac{|\, a^2m^2 + b^2 - (a^2 - b^2)\, m^2|}{(1 + m^2)}$$

$$= \frac{b^2(1 + m^2)}{(1 + m^2)}$$

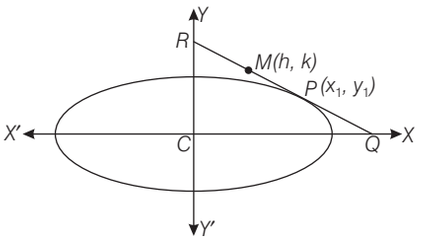
$$= b^2 = (\text{semi minor axis})^2$$

Example 28 ***Prove that the locus of mid-points of the portion of the tangents to the ellipse*** $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ ***intercepted between the axes is*** $a^2y^2+b^2x^2=4x^2y^2$ **.**

Sol. Let $P(x_1, y_1)$ be any point on the ellipse

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1 \qquad ...(i)$$

$\therefore$ Equation of tangent at (x_1, y_1) to (i) is $\frac{xx_1}{a^2}+\frac{yy_1}{b^2}=1$



This meet the coordinate axes at

$$Q\left(\frac{a^2}{x_1}, 0\right) \quad \text{and} \quad R\left(0, \frac{b^2}{y_1}\right)$$

Let $M(h, k)$ be the mid-point of QR then,

$$h=\frac{\frac{a^2}{x_1}+0}{2}, \quad k=\frac{0+\frac{b^2}{y_1}}{2}$$

$$\Rightarrow \qquad x_1=\frac{a^2}{2h}, y_1=\frac{b^2}{2k}$$

Since, (x_1, y_1) lies on Eq. (i)

$$\therefore \qquad \frac{\left(\frac{a^2}{2h}\right)^2}{a^2}+\frac{\left(\frac{b^2}{2k}\right)^2}{b^2}=1$$

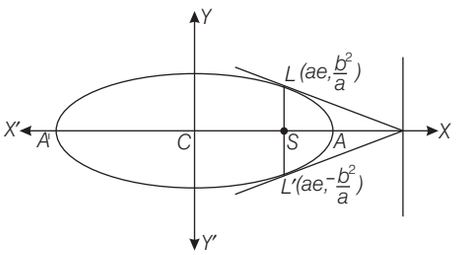
$$\Rightarrow \qquad \frac{a^2}{4h^2}+\frac{b^2}{4k^2}=1$$

$$\Rightarrow \qquad a^2k^2+b^2h^2=4h^2k^2$$

Hence, the locus of $M(h, k)$ is $a^2y^2+b^2x^2=4x^2y^2$

Example 29 Prove that the tangents at the extremities of latusrectum of an ellipse intersect on the corresponding directrix.

Sol. Let LSL' be a latusrectum of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$.



$\therefore$ The coordinates of L and L' are

$$\left(ae, \frac{b^2}{a}\right) \quad \text{and} \quad \left(ae, -\frac{b^2}{a}\right) \text{ respectively}$$

$\therefore$ Equation of tangent at $L\left(ae, \frac{b^2}{a}\right)$ is

$$\Rightarrow \qquad \frac{x(ae)}{a^2}+\frac{y\left(\frac{b^2}{a}\right)}{b^2}=1$$

$$\Rightarrow \qquad xe+y=a \qquad ...(i)$$

The equation of the tangent at $L'\left(ae, -\frac{b^2}{a}\right)$ is

$$\frac{x(ae)}{a^2}+\frac{y\left(-\frac{b^2}{a}\right)}{b^2}=1$$

$$\Rightarrow \qquad ex-y=a \qquad ...(ii)$$

Solving Eqs. (i) and (ii), we get

$$x=\frac{a}{e} \quad \text{and} \quad y=0$$

Thus, the tangents at L and L' intersect at $(a/e, 0)$ which is a point lying on the corresponding directrix i.e. $x=\frac{a}{e}$.

Equations of Normals in Different Forms

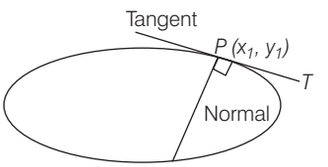
1. Point form

Theorem : The equation of normal at (x_1, y_1) to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ is

$$\frac{a^2x}{x_1}-\frac{b^2y}{y_1}=a^2-b^2$$

Proof : Since the equation of tangent to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ at (x_1, y_1) is

$$\frac{xx_1}{a^2}+\frac{yy_1}{b^2}=1$$



The slope of the tangent at $(x_1, y_1)=-\frac{b^2x_1}{a^2y_1}$

$\therefore$ Slope of Normals at $(x_1, y_1) = \dfrac{a^2 y_1}{b^2 x_1}$

Hence, the equation of normal at (x_1, y_1) is

$$y - y_1 = \frac{a^2 y_1}{b^2 x_1}(x - x_1)$$

or $$\frac{a^2 x}{x_1} - \frac{b^2 y}{y_1} = a^2 - b^2$$

Remark

The equation of normal at (x_1, y_1) can also be obtained by this method

$$\frac{x - x_1}{a'x_1 + hy_1 + g} = \frac{y - y_1}{hx_1 + b'y_1 + f} \quad \text{...(i)}$$

a', b', g, f, h are obtained by comparing the given ellipse with

$$a'x^2 + 2hxy + b'y^2 + 2gx + 2fy + c = 0 \quad \text{...(ii)}$$

The denominors of (i) can easily remembered by the first two rows of this determinant

i.e. $$\begin{vmatrix} a' & h & g \\ h & b' & f \end{vmatrix}$$

Since, first row, $a'(x_1) + h(y_1) + g(1)$

and second row, $h(x_1) + b'(y_1) + f(1)$

Here ellipse $$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

or $$\frac{x^2}{a^2} + \frac{y^2}{b^2} - 1 = 0 \quad \text{... (iii)}$$

Comparing Eqs. (ii) and (iii), then we get

$$a' = \frac{1}{a^2}, b' = \frac{1}{b^2}, g = 0, f = 0, h = 0$$

From, Eq. (i), equation of normal of Eq. (iii) at (x_1, y_1) is

$$\frac{x - x_1}{\frac{1}{a^2}x_1 + 0 + 0} = \frac{y - y_1}{0 + \frac{1}{b^2}y_1 + 0}$$

or $$\frac{a^2(x - x_1)}{x_1} = \frac{b^2(y - y_1)}{y_1}$$

or $$\frac{a^2 x}{x_1} - \frac{b^2 y}{y_1} = a^2 - b^2$$

2. Parametric form

Theorem : The equation of normal to the ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \text{ at } (a\cos\phi, b\sin\phi) \text{ is}$$

$$ax \sec\phi - by \operatorname{cosec}\phi = a^2 - b^2$$

Proof : Since, the equation of normal of the ellipse $\dfrac{x^2}{a^2} + \dfrac{y^2}{b^2} = 1$ at (x_1, y_1) is

$$\frac{a^2 x}{x_1} - \frac{b^2 y}{y_1} = a^2 - b^2 \quad \text{...(i)}$$

Replacing x_1 by $a\cos\phi$ and y_1 by $b\sin\phi$, then Eq.(i) becomes

$$\frac{a^2 x}{a\cos\phi} - \frac{b^2 y}{b\sin\phi} = a^2 - b^2$$

$$ax \sec\phi - by \operatorname{cosec}\phi = a^2 - b^2$$

is the equation of normal at $(a\cos\phi, b\sin\phi)$

3. Slope form

Theorem : The equations of the normals of slope m to the ellipse $\dfrac{x^2}{a^2} + \dfrac{y^2}{b^2} = 1$ are given by

$$y = mx \mp \frac{m(a^2 - b^2)}{\sqrt{(a^2 + b^2m^2)}}$$

at the points $\left(\pm \dfrac{a^2}{\sqrt{(a^2 + b^2m^2)}}, \pm \dfrac{mb^2}{\sqrt{(a^2 + b^2m^2)}} \right)$.

Proof : The equation of normal to the ellipse $\dfrac{x^2}{a^2} + \dfrac{y^2}{b^2} = 1$ at (x_1, y_1) is

$$\frac{a^2 x}{x_1} - \frac{b^2 y}{y_1} = a^2 - b^2 \quad \text{...(i)}$$

Since, 'm' is the slope of the normal, then

$$m = \frac{a^2 y_1}{b^2 x_1}$$

$$y_1 = \frac{b^2 x_1 m}{a^2} \quad \text{...(ii)}$$

Since, (x_1, y_1) lies on $\dfrac{x^2}{a^2} + \dfrac{y^2}{b^2} = 1$

$\therefore$ $$\frac{x_1^2}{a^2} + \frac{y_1^2}{b^2} = 1$$

or $$\frac{x_1^2}{a^2} + \frac{b^4 x_1^2 m^2}{a^4 b^2} = 1$$

or $$\frac{x_1^2}{a^2} + \frac{b^2 x_1^2 m^2}{a^4} = 1 \text{ or } x_1^2 = \frac{a^4}{(a^2 + b^2m^2)}$$

$\therefore$ $$x_1 = \pm \frac{a^2}{\sqrt{a^2 + b^2m^2}}$$

From Eq. (ii),

$$y_1 = \pm \frac{mb^2}{\sqrt{(a^2 + b^2m^2)}}$$

$\therefore$ Equation of normal in terms of slope is

$$y - \left(\pm \frac{mb^2}{\sqrt{a^2 + b^2m^2}} \right) = m \left(x - \left(\pm \frac{a^2}{\sqrt{a^2 + b^2m^2}} \right) \right)$$

$$\Rightarrow \quad y = mx \mp \frac{m(a^2 - b^2)}{\sqrt{(a^2 + b^2m^2)}} \qquad \text{...(iii)}$$

Thus $y = mx \pm \frac{m(a^2 - b^2)}{\sqrt{(a^2 + b^2m^2)}}$ is a normal to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, where m is the slope of the normal.

The coordinates of the point of contact are

$$\left(\pm \frac{a^2}{\sqrt{a^2 + b^2m^2}}, \pm \frac{mb^2}{\sqrt{a^2 + b^2m^2}} \right)$$

Comparing Eq. (iii) with,

$$y = mx + c$$

$$\therefore \quad c = \mp \frac{m(a^2 - b^2)}{\sqrt{(a^2 + b^2m^2)}}$$

or $$c^2 = \frac{m^2(a^2 - b^2)^2}{(a^2 + b^2m^2)}$$

which is condition of normality, when $y = mx + c$ is the normal of

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

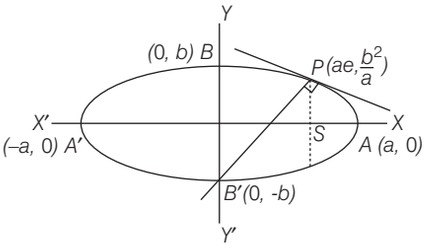
Example 30 *If the normal at an end of a latusrectum of an ellipse* $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ *passes through one extremity of the minor axis, show that the eccentricity of the ellipse is given by*

$$e^4 + e^2 - 1 = 0 \quad \textbf{or} \quad e^2 = \frac{\sqrt{5} - 1}{2}$$

Sol. The coordinates of an end of the latusrectum are $(ae, b^2/a)$. The equation of normal at $P(ae, b^2/a)$ is

$$\frac{a^2x}{ae} - \frac{b^2(y)}{b^2/a} = a^2 - b^2$$

or $$\frac{ax}{e} - ay = a^2 - b^2$$



It passes through one extremity of the minor axis whose coordinates are $(0, -b)$

$$\therefore \quad 0 + ab = a^2 - b^2$$

or $$(a^2b^2) = (a^2 - b^2)^2$$

or $$a^2a^2(1 - e^2) = (a^2e^2)^2$$

or $$1 - e^2 = e^4$$

or $$e^4 + e^2 - 1 = 0$$

or $$(e^2)^2 + e^2 - 1 = 0$$

$$\therefore \quad e^2 = \frac{-1 \pm \sqrt{1 + 4}}{2}$$

$$\Rightarrow \quad e^2 = \frac{\sqrt{5} - 1}{2} \qquad \text{(taking + ve sign)}$$

Example 31 Prove that the straight line $lx + my + n = 0$ is a normal to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ if $\frac{a^2}{l^2} + \frac{b^2}{m^2} = \frac{(a^2 - b^2)^2}{n^2}$.

Sol. The equation of any normal to $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is

$$ax \sec\phi - by \operatorname{cosec}\phi = a^2 - b^2 \qquad \text{... (i)}$$

The straight line $lx + my + n = 0$ will be a normal to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$

Therefore, Eq. (i) and $lx + my + n = 0$ represent the same line

$$\frac{a \sec\phi}{l} = \frac{-b \operatorname{cosec}\phi}{m} = \frac{a^2 - b^2}{-n}$$

$$\cos\phi = \frac{-na}{l(a^2 - b^2)}$$

and $$\sin\phi = \frac{nb}{m(a^2 - b^2)}$$

$\because$ $$\sin^2\phi + \cos^2\phi = 1$$

$$\therefore \quad \frac{n^2b^2}{m^2(a^2 - b^2)^2} + \frac{n^2a^2}{l^2(a^2 - b^2)^2} = 1$$

$$\Rightarrow \quad \frac{a^2}{l^2} + \frac{b^2}{m^2} = \frac{(a^2 - b^2)^2}{n^2}$$

Example 32 A normal inclined at an angle of 45° to x-axis of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ is drawn. It meets the major and minor axes in P and Q respectively. If C is the centre of the ellipse, prove that area of ΔCPQ is $\frac{(a^2-b^2)^2}{2(a^2+b^2)}$ sq units.

Sol. Let $R(a\cos\phi, b\sin\phi)$ be any point on the ellipse, then equation of normal at R is

$$ax\sec\phi - by\,\text{cosec}\,\phi = a^2 - b^2$$

or $$\frac{x}{\frac{\cos\phi\,(a^2-b^2)}{a}}+\frac{y}{\frac{-\sin\phi\,(a^2-b^2)}{b}}=1$$

If meets the major and minor axes at $P\left(\frac{(a^2-b^2)}{a}\cos\phi, 0\right)$ and $Q\left(0, -\frac{(a^2-b^2)}{b}\sin\phi\right)$ are respectively

$$\therefore \quad CP=\left(\frac{a^2-b^2}{a}\right)|\cos\phi|$$

and $$CQ=\left(\frac{a^2-b^2}{b}\right)|\sin\phi|$$

$$\therefore \text{ Area of } \Delta CPQ=\frac{1}{2}\times CP\times CQ$$

$$=\frac{(a^2-b^2)^2\,|\sin\phi\cos\phi|}{2ab} \quad \text{... (i)}$$

But slope of normal $=\frac{a}{b}\tan\phi=\tan 45°$ (given)

$$\frac{a}{b}\tan\phi=1$$

$$\tan\phi=\frac{b}{a}$$

$$\therefore \quad \sin 2\phi=\frac{2\tan\phi}{1+\tan^2\phi}=\frac{2ab}{a^2+b^2}$$

$$\therefore \text{ From Eq. (i), Area of } \Delta CPQ=\frac{(a^2-b^2)^2\left|\frac{\sin 2\phi}{2}\right|}{2ab}$$

$$=\frac{(a^2-b^2)^2\,\frac{ab}{(a^2+b^2)}}{2ab}$$

$$=\frac{(a^2-b^2)^2}{2(a^2+b^2)}\text{ sq units.}$$

Example 33 Any ordinate MP of an ellipse meets the auxiliary circle in Q. Prove that the locus of the point of intersection of the normals at P and Q is the circle $x^2+y^2=(a^2+b^2)^2$.

Sol. Let equation of ellipse is $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ its auxiliary circle is

$$x^2+y^2=a^2$$

Coordinates of P and Q are $(a\cos\phi, b\sin\phi)$ and $(a\cos\phi, a\sin\phi)$ respectively. Equation of normal at P to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ is

$$ax\sec\phi - by\,\text{cosec}\,\phi = a^2-b^2 \quad \text{...(i)}$$

and equation of normal at Q to the circle $x^2+y^2=a^2$ is

$$y=x\tan\phi \quad \text{...(ii)}$$

From Eq. (ii), $\tan\phi=\frac{y}{x}$

$$\therefore \quad \sin\phi=\frac{y}{\sqrt{(x^2+y^2)}} \quad \text{and} \quad \cos\phi=\frac{x}{\sqrt{(x^2+y^2)}}$$

or $$\text{cosec}\,\phi=\frac{\sqrt{(x^2+y^2)}}{y}$$

and $$\sec\phi=\frac{\sqrt{(x^2+y^2)}}{x} \quad \text{...(iii)}$$

Substituting the values of $\sec\phi$ and $\text{cosec}\,\phi$ from Eq. (iii) in Eq. (i)

$$\therefore \quad ax\times\frac{\sqrt{(x^2+y^2)}}{x}-by\times\frac{\sqrt{(x^2+y^2)}}{y}=a^2-b^2$$

or $$(a-b)\sqrt{(x^2+y^2)}=(a+b)(a-b)$$

or $$\sqrt{x^2+y^2}=a+b$$

$$\therefore \quad x^2+y^2=(a+b)^2$$

which is required locus.

Properties of Eccentric Angles of the Co-normal Points

1. **In general, four normals can be drawn to an ellipse from any point and if $\alpha, \beta, \gamma, \delta$ the eccentric angles of these four co-normal points, then $\alpha+\beta+\gamma+\delta$ is an odd multiple of π.**

   Let $Q(h, k)$ be any given point and let $P(a\cos\phi, b\sin\phi)$ be any point on the ellipse

   $$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$$

   Equation of normal at $P(a\cos\phi, b\sin\phi)$ is

   $$ax\sec\phi - by\,\text{cosec}\,\phi = a^2-b^2$$

it passes through $Q(h, k)$

$$\therefore \quad ah\sec\phi - bk\,\text{cosec}\,\phi = a^2 - b^2$$

or
$$\frac{ah}{\cos\phi} - \frac{bk}{\sin\phi} = a^2 - b^2 \qquad ...(i)$$

or
$$\frac{ah}{\left(\frac{1-\tan^2(\phi/2)}{1+\tan^2(\phi/2)}\right)} - \frac{bk}{\left(\frac{2\tan(\phi/2)}{1+\tan^2(\phi/2)}\right)} = a^2 - b^2 \qquad ...(ii)$$

Let $\tan\phi/2 = t$

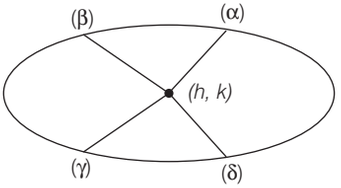
then, Eq. (ii) reduced to

$$bkt^4 + 2\{ah + (a^2 - b^2)\}t^3 + 2\{ah - (a^2 - b^2)\}t - bk = 0 \qquad ... (iii)$$

Which is a fourth degree equation in t, hence four normals can be drawn to an ellipse from any point.

Consequently, it has four values of ϕ say $\alpha, \beta, \gamma, \delta$ ($\because t = \tan\phi/2$).

Now,
$$\tan\left(\frac{\alpha}{2} + \frac{\beta}{2} + \frac{\gamma}{2} + \frac{\delta}{2}\right) = \frac{S_1 - S_3}{1 - S_2 + S_4}$$



$$= \frac{\frac{-2\{ah + (a^2 - b^2)\}}{bk} + \frac{2\{(ah - (a^2 - b^2)\}}{bk}}{1 - 0 - 1}$$

$$= \infty \qquad \text{(From trigonometry)} \qquad (\because a \neq b)$$

or
$$\cot\left(\frac{\alpha}{2} + \frac{\beta}{2} + \frac{\gamma}{2} + \frac{\delta}{2}\right) = 0$$

or
$$\frac{\alpha}{2} + \frac{\beta}{2} + \frac{\gamma}{2} + \frac{\delta}{2} = \text{an odd multiple of } \pi/2$$

$$\Rightarrow \quad \alpha + \beta + \gamma + \delta = \text{an odd multiple of } \pi$$

Aliter :

Let
$$z = e^{i\phi} = \cos\phi + i\sin\phi$$

$$\therefore \quad \frac{1}{z} = e^{-i\phi} = \cos\phi - i\sin\phi$$

$$\therefore \quad \cos\phi = \frac{z + \frac{1}{z}}{2} = \frac{z^2 + 1}{2z}$$

and
$$\sin\phi = \frac{z - \frac{1}{z}}{2i} = \frac{z^2 - 1}{2iz}$$

Now, Eq. (i), reduces to

$$\frac{ah}{\left(\frac{z^2+1}{2z}\right)} - \frac{bk}{\left(\frac{z^2-1}{2iz}\right)} = a^2 - b^2$$

$$\Rightarrow \quad (a^2 - b^2)z^4 - 2(ah - ibk)z^3 + 2(ah + ibk)z - (a^2 - b^2) = 0 \qquad ...(iv)$$

Consequently $z = e^{i\phi}$

gives four values of ϕ, say $\alpha, \beta, \gamma, \delta$ (Here, sum of four angles)

$$\therefore \quad z_1 . z_2 . z_3 . z_4 = -1$$

$$\Rightarrow \quad e^{i\alpha} \cdot e^{i\beta} \cdot e^{i\gamma} \cdot e^{i\delta} = -1$$

$$\Rightarrow \quad e^{i(\alpha+\beta+\gamma+\delta)} = -1$$

$$\cos(\alpha + \beta + \gamma + \delta) + i\sin(\alpha + \beta + \gamma + \delta) = -1$$

or
$$\cos(\alpha + \beta + \gamma + \delta) = -1$$

and
$$\sin(\alpha + \beta + \gamma + \delta) = 0$$

$$\alpha + \beta + \gamma + \delta = (2n + 1)\pi$$

and
$$\alpha + \beta + \gamma + \delta = r\pi$$

where, $n\, r, \in I$

Hence, $\alpha + \beta + \gamma + \delta$ = odd multiple of π

2. If α, β, γ are the eccentric angles of three points on the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, the normals at which are concurrent, then

$\sin(\alpha + \beta) + \sin(\beta + \gamma) + \sin(\gamma + \alpha) = 0$

Here, in each term sum of two eccentric angles

$\therefore$ From Eq. (iv),

$$\Sigma z_1 z_2 = 0$$

or
$$z_1z_2 + z_1z_3 + z_1z_4 + z_2z_3 + z_2z_4 + z_3z_4 = 0$$

$$\Rightarrow \quad e^{i(\alpha+\beta)} + e^{i(\alpha+\gamma)} + e^{i(\alpha+\delta)} + e^{i(\beta+\gamma)} + e^{i(\beta+\delta)} + e^{i(\gamma+\delta)} = 0$$

$$\Rightarrow \quad [\cos(\alpha + \beta) + \cos(\alpha + \gamma) + \cos(\alpha + \delta) + \cos(\beta + \gamma) + \cos(\beta + \delta) + \cos(\gamma + \delta)] + i[(\sin(\alpha + \beta) + \sin(\alpha + \gamma) + \sin(\alpha + \delta) + \sin(\beta + \gamma) + \sin(\beta + \delta) + \sin(\gamma + \delta)] = 0$$

Comparing the imaginary part, then

$$\sin(\alpha + \beta) + \sin(\alpha + \gamma) + \sin(\alpha + \delta) + \sin(\beta + \gamma) + \sin(\beta + \delta) + \sin(\gamma + \delta) = 0 \qquad ...(v)$$

Since, from property Eq. (i)

$$\alpha + \beta + \gamma + \delta = \text{odd multiple of } \pi$$

$$(\alpha + \delta) = \text{odd multiple of } \pi - (\beta + \gamma)$$

$$(\beta + \delta) = \text{odd multiple of } \pi - (\alpha + \gamma)$$

$$(\gamma+\delta)=\text{odd multiple of }\pi-(\alpha+\beta)$$

$$\left.\begin{aligned}\sin(\alpha+\delta)&=\sin(\beta+\gamma)\\ \sin(\beta+\delta)&=\sin(\alpha+\gamma)\\ \sin(\gamma+\delta)&=\sin(\alpha+\beta)\end{aligned}\right\}$$

$\{\because \sin(n\pi-\alpha)=\sin\alpha, \text{ if } n \text{ is integer}\}$ ...(vi)

From Eqs. (v) and (vi), we get

$$2\sin(\alpha+\beta)+2\sin(\beta+\gamma)+2\sin(\gamma+\alpha)=0$$

Hence, $\sin(\alpha+\beta)+\sin(\beta+\gamma)+\sin(\gamma+\alpha)=0$

Aliter :

From Eq. (iii), $\Sigma t_1t_2=0$ ...(vii)

and $t_1t_2t_3t_4=-1$ ...(viii)

Now, $\Sigma t_1t_2=0$

$$\Rightarrow \quad t_1t_2+t_2t_3+t_3t_1=-t_4(t_1+t_2+t_3)$$

$$\Rightarrow \quad t_1t_2+t_2t_3+t_3t_1=\frac{t_1+t_2+t_3}{t_1t_2t_3} \quad \{\text{from (viii)}\}$$

$$\Rightarrow \quad t_1t_2+t_2t_3+t_3t_1=\frac{1}{t_2t_3}+\frac{1}{t_3t_1}+\frac{1}{t_1t_2}$$

$$\Rightarrow \quad \tan\frac{\alpha}{2}\tan\frac{\beta}{2}+\tan\frac{\beta}{2}\tan\frac{\gamma}{2}+\tan\frac{\gamma}{2}\tan\frac{\alpha}{2}$$

$$=\cot\frac{\beta}{2}\cot\frac{\gamma}{2}+\cot\frac{\gamma}{2}\cot\frac{\alpha}{2}+\cot\frac{\alpha}{2}\cot\frac{\beta}{2}$$

$$\Rightarrow \sum\left(\tan\frac{\alpha}{2}\tan\frac{\beta}{2}-\cot\frac{\alpha}{2}\cot\frac{\beta}{2}\right)=0$$

$$\Rightarrow \sum\left(\frac{\sin^2(\alpha/2)\sin^2(\beta/2)-\cos^2(\alpha/2)\cos^2(\beta/2)}{\sin(\alpha/2)\sin(\beta/2)\cos(\alpha/2)\cos(\beta/2)}\right)=0$$

$$\Rightarrow \sum -4\left(\frac{\{\cos(\alpha/2)\cos(\beta/2)+\sin(\alpha/2)\sin(\beta/2)\}\{\cos(\alpha/2)\cos(\beta/2)-\sin(\alpha/2)\sin(\beta/2)\}}{\sin\alpha\sin\beta}\right)=0$$

$$\Rightarrow \quad \sum -4\left(\frac{\cos\left(\frac{\alpha-\beta}{2}\right)\cos\left(\frac{\alpha+\beta}{2}\right)}{\sin\alpha\sin\beta}\right)=0$$

$$\Rightarrow \quad \sum -2\frac{[\cos\alpha+\cos\beta]}{\sin\alpha\sin\beta}=0$$

$$\Rightarrow \quad \sum\frac{\sin\gamma(\cos\alpha+\cos\beta)}{\sin\alpha\sin\beta\sin\gamma}=0$$

$$\Rightarrow \quad \sum\sin\gamma(\cos\alpha+\cos\beta)=0$$

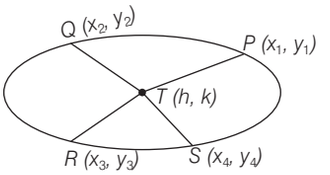
$$\Rightarrow \quad \sin\gamma(\cos\alpha+\cos\beta)+\sin\alpha(\cos\beta+\cos\gamma)+\sin\beta(\cos\gamma+\cos\alpha)=0$$

$$\Rightarrow \quad \sin(\alpha+\beta)+\sin(\beta+\gamma)+\sin(\gamma+\alpha)=0$$

Co-normal Points Lie on a Fixed Curve

Let $P(x_1,y_1)$, $Q(x_2,y_2)$, $R(x_3,y_3)$ and $T(x_4,y_4)$ be conormal points so that normal drawn from them meet in $T(h,k)$.

Then, equation of normal at $P(x_1,y_1)$ is



$$\frac{a^2x}{x_1}-\frac{b^2y}{y_1}=a^2-b^2$$

or $(a^2-b^2)x_1y_1+b^2yx_1-a^2xy_1=0$

but the point $T(h,k)$ lies on it

$\therefore \quad (a^2-b^2)x_1y_1+b^2kx_1-a^2hy_1=0$

Similarly, for points Q, R and S are

$$(a^2-b^2)x_2y_2+b^2kx_2-a^2hy_2=0$$

$$(a^2-b^2)x_3y_3+b^2kx_3-a^2hy_3=0$$

and $(a^2-b^2)x_4y_4+b^2kx_4-a^2hy_4=0$

Hence, P, Q, R, S all lie on the curve

$$(a^2-b^2)xy+b^2kx-a^2hy=0$$

This curve is called **Apollonian rectangular hyperbola**.

Remark

The feet of the normals from any fixed point to the ellipse lie at the intersections of the **Apollonian rectangular hyperbola** with the ellipse.

Exercise for Session 2

1. The number of values of c such that the straight line $y = 4x + c$ touches the curve $\frac{x^2}{4} + y^2 = 1$, is

(a) 0 (b) 1 (c) 2 (d) infinite

2. If any tangent to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ cuts off intercepts of length h and k on the axes, then $\frac{a^2}{h^2} + \frac{b^2}{k^2}$ is equal to

(a) -1 (b) 0 (c) 1 (d) None of these

3. The equations of the tangents to the ellipse $3x^2 + y^2 = 3$ making equal intercepts on the axes are

(a) $y = \pm x \pm 2$ (b) $y = \pm x \pm 4$ (c) $y = \pm x \pm \sqrt{30}$ (d) $y = \pm x \pm \sqrt{35}$

4. If $\frac{x}{a} + \frac{y}{b} = \sqrt{2}$ touches the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, then its, eccentric angle θ is equal to

(a) 0 (b) 45° (c) 60° (d) 90°

5. The number of values of $\theta \in [0, 2\pi]$ for which the line $2x \cos\theta + 3y \sin\theta = 6$ touches the ellipse $4x^2 + 9y^2 = 36$ is

(a) 1 (b) 2 (c) 4 (d) infinite

6. The common tangent of $x^2 + y^2 = 4$ and $2x^2 + y^2 = 2$ is

(a) $x + y + 4 = 0$ (b) $x - y + 7 = 0$ (c) $2x + 3y + 8 = 0$ (d) None of these

7. If the normal at any point P on the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ meets the axes in G and g respectively, then $PG \cdot Pg =$

(a) $a : b$ (b) $a^2 : b^2$ (c) $b : a$ (d) $b^2 : a^2$

8. Number of distinct normal lines that can be drawn to the ellipse $\frac{x^2}{169} + \frac{y^2}{25} = 1$, from the point $(0, 6)$ is

(a) one (b) two (c) three (d) four

9. If a tangent of slope 2 of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, is normal to the circle $x^2 + y^2 + 4x + 1 = 0$, then the maximum value of ab is

(a) 4 (b) 2 (c) 1 (d) None of these

10. If the normal at the point $P(\theta)$ to the ellipse $\frac{x^2}{14} + \frac{y^2}{5} = 1$, intersect it again at the point $Q(2\theta)$, then $\cos\theta$ is equal to

(a) $\frac{2}{3}$ (b) $-\frac{2}{3}$ (c) $\frac{3}{2}$ (d) $-\frac{3}{2}$

11. The line $5x - 3y = 8\sqrt{2}$ is a normal to the ellipse $\frac{x^2}{25} + \frac{y^2}{9} = 1$. If '$\theta$' be eccentric angle of the foot of this normal, then 'θ' is equal to

(a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{2}$

12. If the tangent drawn at point $(\lambda^2, 2\lambda)$ on the parabola $y^2 = 4x$ is same as the normal drawn at a point $(\sqrt{5}\cos\theta, 2\sin\theta)$ on the ellipse $4x^2 + 5y^2 = 20$. Find the values of λ and θ.

13. If the normal at any point P of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, meets the major and minor axes in G and H respectively and C in the centre of the ellipse, then prove that

$$a^2 (CG)^2 + b^2 (CH)^2 = (a^2 - b^2)^2$$

14. If the normal at the point $P(\theta)$ to the ellipse $5x^2 + 14y^2 = 70$ intersects it again at the point $Q(2\theta)$, show that $\cos\theta = -\frac{2}{3}$.

15. The tangent and normal at any point P of an ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ cut its major axis in point Q and R respectively. If $QR = a$ prove that the eccentric angle of the point P is given by

$$e^2 \cos^2\phi + \cos\phi - 1 = 0$$

Session 3

Pair of Tangents, Chord of Contact, Chord Bisected at a Given Point, Diameter, Conjugate Diameters, Equi-Conjugate Diameters, Director Circle, Sub-Tangent and Sub-Normal, Concyclic Points, Some Standard Properties of the Ellipse, Reflection Property of an Ellipse, Equation of an Ellipse Referred to Two Perpendicular Lines

Pair of Tangents

Theorem : The combined equation of the pair of tangents drawn from a point (x_1, y_1) to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ is

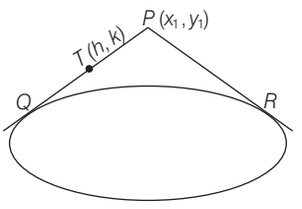
$$\left(\frac{x^2}{a^2}+\frac{y^2}{b^2}-1\right)\left(\frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}-1\right)=\left(\frac{xx_1}{a^2}+\frac{yy_1}{b^2}-1\right)^2$$

or $$SS_1 = T^2$$

where $$S=\frac{x^2}{a^2}+\frac{y^2}{b^2}-1\,;\, S_1=\frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}-1$$

and $$T=\frac{xx_1}{a^2}+\frac{yy_1}{b^2}-1$$

Proof : Let $T(h, k)$ be any point on the pair of tangents PQ or PR drawn from any external point $P(x_1, y_1)$ to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$



$\therefore$ Equation of PT is

$$y-y_1=\frac{k-y_1}{h-x_1}(x-x_1)$$

or $$y=\left(\frac{k-y_1}{h-x_1}\right)x+\left(\frac{hy_1-kx_1}{h-x_1}\right)$$

which is the tangent to the ellipse

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$$

$\therefore$ $$c^2=a^2m^2+b^2$$

or $$\left(\frac{hy_1-kx_1}{h-x_1}\right)^2=a^2\left(\frac{k-y_1}{h-x_1}\right)^2+b^2$$

$\Rightarrow$ $$(hy_1-kx_1)^2=a^2(k-y_1)^2+b^2(h-x_1)^2$$

Hence, locus of (h, k) is

$$(xy_1-x_1y)^2=a^2(y-y_1)^2+b^2(x-x_1)^2$$

or $$(xy_1-x_1y)^2=(b^2x^2+a^2y^2)+(b^2x_1^2+a^2y_1^2)-2(b^2xx_1+a^2yy_1)$$

or $$\left(\frac{xy_1-x_1y}{ab}\right)^2=\left(\frac{x^2}{a^2}+\frac{y^2}{b^2}\right)+\left(\frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}\right)-2\left(\frac{xx_1}{a^2}+\frac{yy_1}{b^2}\right)$$

or $$\left(\frac{xy_1-x_1y}{ab}\right)^2-\left(\frac{x^2}{a^2}+\frac{y^2}{b^2}\right)-\left(\frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}\right)+\left(\frac{xx_1}{a^2}+\frac{yy_1}{b^2}\right)^2$$

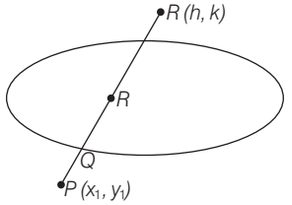
$$= \left(\frac{xx_1}{a^2} + \frac{yy_1}{b^2}\right)^2 + 1 - 2\left(\frac{xx_1}{a^2} + \frac{yy_1}{b^2}\right)$$

or $$\left(\frac{x^2}{a^2} + \frac{y^2}{b^2} - 1\right)\left(\frac{x_1^2}{a^2} + \frac{y_1^2}{b^2} - 1\right) = \left(\frac{xx_1}{a^2} + \frac{yy_1}{b^2} - 1\right)^2$$

or $$SS_1 = T^2$$

Aliter : Let the ellipse be $$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad \text{...(i)}$$

Let $P(x_1, y_1)$ be any point outside the ellipse let a chord of the ellipse through the point $P(x_1, y_1)$ cut the ellipse at Q and let $R(h, k)$ be any arbitrary point on the line PQ (R inside or outside). Let Q divides PR in the ratio $\lambda : 1$ then coordinates of Q is



$$\left(\frac{\lambda h + x_1}{\lambda + 1}, \frac{\lambda k + y_1}{\lambda + 1}\right) \qquad (\because PQ : QR = \lambda : 1)$$

since Q lies on ellipse Eq. (i), then

$$\frac{1}{a^2}\left(\frac{\lambda h + x_1}{\lambda + 1}\right)^2 + \frac{1}{b^2}\left(\frac{\lambda k + y_1}{\lambda + 1}\right)^2 = 1$$

$$\Rightarrow \quad b^2(\lambda h + x_1)^2 + a^2(\lambda k + y_1)^2 = a^2b^2(\lambda + 1)^2$$

$$\Rightarrow \quad (a^2k^2 + b^2h^2 - a^2b^2)\lambda^2 + 2$$

$$(hx_1b^2 + ky_1a^2 - a^2b^2)\lambda + (b^2x_1^2 + a^2y_1^2 - a^2b^2) = 0 \quad \text{...(ii)}$$

Line PR will become tangent to ellipse Eq. (i) then roots of Eq. (ii) are equal

$$\therefore \quad 4(hx_1b^2 + ky_1a^2 - a^2b^2)^2$$

$$- 4(a^2k^2 + b^2h^2 - a^2b^2)(b^2x_1^2 + a^2y_1^2 - a^2b^2) = 0$$

Dividing by $4a^4b^4$

$$\therefore \quad \left(\frac{hx_1}{a^2} + \frac{ky_1}{b^2} - 1\right)^2 = \left(\frac{k^2}{b^2} + \frac{h^2}{a^2} - 1\right)\left(\frac{x_1^2}{a^2} + \frac{y_1^2}{b^2} - 1\right)$$

Hence, locus of $R(h, k)$ i.e. equation of pair of tangents from $P(x_1, y_1)$ is

$$\left(\frac{xx_1}{a^2} + \frac{yy_1}{b^2} - 1\right)^2 = \left(\frac{x^2}{a^2} + \frac{y^2}{b^2} - 1\right)\left(\frac{x_1^2}{a^2} + \frac{y_1^2}{b^2} - 1\right)$$

i.e. $$T^2 = SS_1 \quad \text{or} \quad SS_1 = T^2$$

Remark

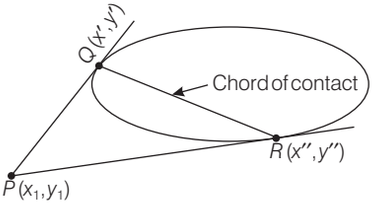
$S = 0$ is the equation of the curve, S_1 is obtained from S by replacing x by x_1 and y by y_1 and $T = 0$ is the equation of tangent at (x_1, y_1) to $S = 0$

Chord of Contact

Theorem : The equation of chord of contact of tangents drawn from a point (x_1, y_1) to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is

$$\frac{xx_1}{a^2} + \frac{yy_1}{b^2} = 1$$

Proof : Let PQ and PR be the tangents drawn from a point $P(x_1, y_1)$ to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ such that



$$Q \equiv (x', y') \quad \text{and} \quad R \equiv (x'', y'')$$

are the points of contacts of these tangents the chord QR is called chord of contact of the ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

Equations of tangents at $Q(x', y')$ and $R(x'', y'')$ are

$$\frac{xx'}{a^2} + \frac{yy'}{b^2} = 1$$

and $$\frac{xx''}{a^2} + \frac{yy''}{b^2} = 1, \text{ respectively}$$

These tangents pass through $P(x_1, y_1)$ therefore,

$$\frac{x'x_1}{a^2} + \frac{y'y_1}{b^2} = 1 \quad \text{and} \quad \frac{x''x_1}{a^2} + \frac{y''y_1}{b^2} = 1$$

$$\Rightarrow \quad (x', y') \text{ and } (x'', y'') \text{ lie on } \frac{xx_1}{a^2} + \frac{yy_1}{b^2} = 1$$

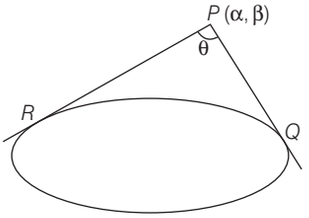
Hence, the equation QR is $\frac{xx_1}{a^2} + \frac{yy_1}{b^2} = 1$

which is same as the equation of tangent but position of point differ.

Example 34 Find the locus of the points of the intersection of tangents to ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ which make an angle θ .

Sol. Given ellipse is $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ ...(i)

Equation of any tangent to ellipse Eq. (i) in terms of slope (m) is $y=mx+\sqrt{(a^2m^2+b^2)}$



Since, its passes through $P(\alpha,\beta)$ then

$$\beta=m\alpha+\sqrt{(a^2m^2+b^2)}$$

$$\Rightarrow \quad (\beta-m\alpha)=\sqrt{(a^2m^2+b^2)}$$

$$\Rightarrow \quad (\beta-m\alpha)^2=a^2m^2+b^2$$

$$\Rightarrow \quad m^2(a^2-\alpha^2)+2\alpha\beta m+(b^2-\beta^2)=0 \qquad ...(ii)$$

Eq. (ii) being a quadratic equation in m.

Let roots of Eq. (ii) are m_1 and m_2, then

$$\therefore \quad m_1+m_2=-\frac{2\alpha\beta}{(a^2-\alpha^2)},\ m_1m_2=\frac{b^2-\beta^2}{a^2-\alpha^2}$$

$$\therefore \quad (m_1-m_2)=\sqrt{(m_1+m_2)^2-4m_1m_2}$$

$$=\sqrt{\frac{4\alpha^2\beta^2}{(a^2-\alpha^2)^2}-\frac{4(b^2-\beta^2)}{(a^2-\alpha^2)}}$$

$$=\sqrt{\frac{4\alpha^2\beta^2-4(b^2-\beta^2)(a^2-\alpha^2)}{(a^2-\alpha^2)^2}}$$

$$=\sqrt{\frac{4\{\alpha^2\beta^2-a^2b^2+b^2\alpha^2+a^2\beta^2-\alpha^2\beta^2\}}{(a^2-\alpha^2)^2}}$$

$$=\frac{2}{|(a^2-\alpha^2)|}\sqrt{(a^2\beta^2+b^2\alpha^2-a^2b^2)}$$

$\because$ θ be the angle between these two tangents, then

$$\tan\theta=\left|\frac{m_1-m_2}{1+m_1m_2}\right|$$

$$=\left|\frac{\frac{2}{(a^2-\alpha^2)}\sqrt{(a^2\beta^2+b^2\alpha^2-a^2b^2)}}{\left(1+\frac{b^2-\beta^2}{a^2-\alpha^2}\right)}\right|$$

$$\tan\theta=\left|\frac{2\sqrt{(a^2\beta^2+b^2\alpha^2-a^2b^2)}}{a^2+b^2-\alpha^2-\beta^2}\right|$$

or $\quad (a^2+b^2-\alpha^2-\beta^2)^2\tan^2\theta=4\quad(a^2\beta^2+b^2\alpha^2-a^2b^2)$

$\Rightarrow \quad (\alpha^2+\beta^2-a^2-b^2)^2\tan^2\theta=4\quad(b^2\alpha^2+a^2\beta^2-a^2b^2)$

$\therefore$ Locus of $P(\alpha,\beta)$ is

$$(x^2+y^2-a^2-b^2)^2\tan^2\theta=4\quad(b^2x^2+a^2y^2-a^2b^2)$$

Example 35 ***Prove that the chord of contact of tangents drawn from the point*** (h,k) ***to the ellipse*** $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ ***will subtend a right angle at the centre, if*** $\frac{h^2}{a^4}+\frac{k^2}{b^4}=\frac{1}{a^2}+\frac{1}{b^2}$***. Also, find the locus of*** (h,k) **.**

Sol. The equation of chord of contact of tangents drawn from $P(h,k)$ to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ is $\frac{hx}{a^2}+\frac{ky}{b^2}=1$ ...(i)

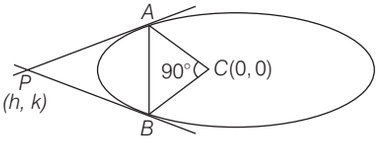
The equation of the straight lines CA and CB is obtained by making homogeneous ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ with the help of Eq. (i)

$$\therefore \quad \frac{x^2}{a^2}+\frac{y^2}{b^2}=\left(\frac{hx}{a^2}+\frac{ky}{b^2}\right)^2$$

$$\Rightarrow \quad \left(\frac{k^2}{a^4}-\frac{1}{a^2}\right)x^2+\left(\frac{k^2}{b^4}-\frac{1}{b^2}\right)y^2+\frac{2hk}{a^2b^2}xy=0 \qquad ...(ii)$$

But given $\angle ACB=90°$

$\therefore$ Coefficient of x^2 + Coefficient of $y^2=0$



$$\Rightarrow \quad \frac{h^2}{a^4}-\frac{1}{a^2}+\frac{k^2}{b^4}-\frac{1}{b^2}=0$$

$$\Rightarrow \quad \frac{h^2}{a^4}+\frac{k^2}{b^4}=\frac{1}{a^2}+\frac{1}{b^2}$$

Hence, locus of (h,k) is

$$\frac{x^2}{a^4}+\frac{y^2}{b^4}=\frac{1}{a^2}+\frac{1}{b^2}$$

Chord Bisected at a Given Point

Theorem : The equation of a chord of the ellipse

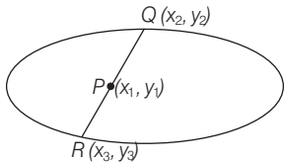
$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$$

bisected at the point (x_1,y_1) is given by

$$\frac{xx_1}{a^2}+\frac{yy_1}{b^2}-1=\frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}-1$$

or $$T=S_1$$

Proof : Let $Q\equiv(x_2,y_2)$ and $R\equiv(x_3,y_3)$ be the end points of a chord QR of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ and let $P\equiv(x_1,y_1)$ be its mid point.



Now, $Q \equiv (x_2, y_2)$ and $R \equiv (x_3, y_3)$ lie on $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, then

$$\frac{x_2^2}{a^2} + \frac{y_2^2}{b^2} = 1 \quad \text{...(i)}$$

and $$\frac{x_3^2}{a^2} + \frac{y_3^2}{b^2} = 1 \quad \text{...(ii)}$$

Subtracting Eq. (ii) from Eq. (i),

$$\therefore \quad \frac{1}{a^2}(x_2^2 - x_3^2) + \frac{1}{b^2}(y_2^2 - y_3^2) = 0$$

$$\Rightarrow \quad \frac{(x_2 + x_3)(x_2 - x_3)}{a^2} + \frac{(y_2 + y_3)(y_2 - y_3)}{b^2} = 0$$

$$\Rightarrow \quad \frac{y_2 - y_3}{x_2 - x_3} = -\frac{b^2(x_2 + x_3)}{a^2(y_2 + y_3)} = -\frac{b^2}{a^2} \cdot \frac{2x_1}{2y_1}$$

$$\left(\because x_1 = \frac{x_2 + x_3}{2} \text{ and } y_1 = \frac{y_2 + y_3}{2} \right)$$

$$= -\frac{b^2 x_1}{a^2 y_1} \quad \text{...(iii)}$$

$\therefore$ Equation of QR is

$$y - y_1 = \frac{y_2 - y_3}{x_2 - x_3}(x - x_1)$$

$$\Rightarrow \quad y - y_1 = -\frac{b^2 x_1}{a^2 y_1}(x - x_1) \quad \text{[from Eq. (iii)]}$$

$$\Rightarrow \quad \frac{yy_1}{b^2} - \frac{y_1^2}{b^2} = -\frac{xx_1}{a^2} + \frac{x_1^2}{a^2}$$

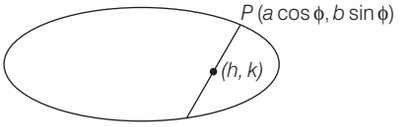
$$\Rightarrow \quad \frac{xx_1}{a^2} + \frac{yy_1}{b^2} - 1 = \frac{x_1^2}{a^2} + \frac{y_1^2}{b^2} - 1 \text{ or } T = S_1$$

where, $$T = \frac{xx_1}{a^2} + \frac{yy_1}{b^2} - 1$$

and $$S_1 = \frac{x_1^2}{a^2} + \frac{y_1^2}{b^2} - 1$$

Example 36 Prove that the locus of the middle points of normal chords of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is the curve $\left(\frac{x^2}{a^2} + \frac{y^2}{b^2}\right)^2 \left(\frac{a^6}{x^2} + \frac{b^6}{y^2}\right) = (a^2 - b^2)^2$.

Sol. Let (h, k) be the middle point of any chord of an ellipse, then its equation is $T = S_1$



or $$\frac{xh}{a^2} + \frac{yk}{b^2} - 1 = \frac{h^2}{a^2} + \frac{k^2}{b^2} - 1 \text{ or } \frac{xh}{a^2} + \frac{yk}{b^2} = \frac{h^2}{a^2} + \frac{k^2}{b^2} \quad \text{...(i)}$$

If Eq. (i) is a normal chords, then it must be of the form

$$ax \sec \phi - by \operatorname{cosec} \phi = a^2 - b^2 \quad \text{...(ii)}$$

Thus, the Eqs. (i) and (ii) represents the same normal chord of the ellipse with its middle point (h, k).

Hence, they are identical and comparing their co-efficients,

we get $$\frac{h/a^2}{a\sec \phi} = \frac{k/b^2}{-b \operatorname{cosec} \phi} = \frac{\frac{h^2}{a^2} + \frac{k^2}{b^2}}{(a^2 - b^2)}$$

$$\Rightarrow \quad \cos \phi = \frac{a^3}{h} \frac{\left(\frac{h^2}{a^2} + \frac{k^2}{b^2}\right)}{(a^2 - b^2)} \quad \text{...(iii)}$$

and $$\sin \phi = -\frac{b^3}{k} \frac{\left(\frac{h^2}{a^2} + \frac{k^2}{b^2}\right)}{(a^2 - b^2)} \quad \text{...(iv)}$$

Squaring and adding Eqs. (iii) and (iv), then

$$\cos^2 \phi + \sin^2 \phi = \frac{\left(\frac{a^6}{h^2} + \frac{b^6}{k^2}\right)\left(\frac{h^2}{a^2} + \frac{k^2}{b^2}\right)^2}{(a^2 - b^2)^2}$$

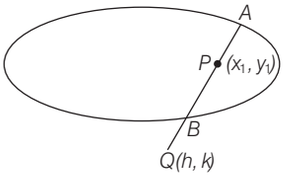
$$\Rightarrow \quad 1 = \frac{\left(\frac{a^6}{h^2} + \frac{b^6}{k^2}\right)\left(\frac{h^2}{a^2} + \frac{k^2}{b^2}\right)^2}{(a^2 - b^2)^2}$$

$$\Rightarrow \quad \left(\frac{h^2}{a^2} + \frac{k^2}{b^2}\right)^2 \left(\frac{a^6}{h^2} + \frac{b^6}{k^2}\right) = (a^2 - b^2)^2$$

Hence, locus of (h, k) is $\left(\frac{x^2}{a^2} + \frac{y^2}{b^2}\right)^2 \left(\frac{a^6}{x^2} + \frac{b^6}{y^2}\right) = (a^2 - b^2)^2$

Example 37 Show that the locus of the middle points of chords of an ellipse which pass through a fixed point, is another ellipse

Sol. Let $P(x_1, y_1)$ be the middle point of any chord AB of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, then equation of chord AB is



$$T = S_1$$

$$\Rightarrow \quad \frac{xx_1}{a^2} + \frac{yy_1}{b^2} - 1 = \frac{x_1^2}{a^2} + \frac{y_1^2}{b^2} - 1$$

$$\Rightarrow \quad \frac{xx_1}{a^2} + \frac{yy_1}{b^2} = \frac{x_1^2}{a^2} + \frac{y_1^2}{b^2} \qquad \text{... (i)}$$

But it passes through a fixed point $Q(h, k)$ its coordinates must satisfy Eq. (i),

$$\therefore \quad \frac{hx_1}{a^2} + \frac{ky_1}{b^2} = \frac{x_1^2}{a^2} + \frac{y_1^2}{b^2}$$

This can be re-written as

$$\frac{\left(x_1 - \frac{h}{2}\right)^2}{a^2} + \frac{\left(y_1 - \frac{k}{2}\right)^2}{b^2} = \frac{1}{4}\left(\frac{h^2}{a^2} + \frac{k^2}{b^2}\right)$$

Hence, locus of $P(x_1, y_1)$ is

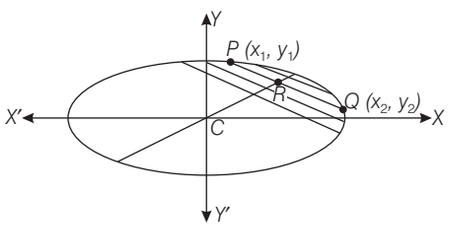
$$\frac{\left(x - \frac{h}{2}\right)^2}{a^2} + \frac{\left(y - \frac{k}{2}\right)^2}{b^2} = \frac{1}{4}\left(\frac{h^2}{a^2} + \frac{k^2}{b^2}\right)$$

Its obviously an ellipse with centre at $\left(\frac{h}{2}, \frac{k}{2}\right)$ and axes parallel to coordinates axes.

Diameter

The locus of the middle points of a system of parallel chords of an ellipse is called a diameter and the point where the diameter intersects the ellipse is called the vertex of the diameter.

Let $y = mx + c$ be system of parallel chords to $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ for different chords c varies, m remains constant.



Let the extremities of any chord PQ of the set be $P(x_1, y_1)$ and $Q(x_2, y_2)$ and let its middle point be $R(h, k)$, then solving equations.

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \text{ and } y = mx + c$$

$$\therefore \quad \frac{x^2}{a^2} + \frac{(mx + c)^2}{b^2} = 1$$

$$\Rightarrow \quad (a^2m^2 + b^2)\, x^2 + 2mca^2 x + a^2\,(c^2 - b^2) = 0$$

Since, x_1 and x_2 be the roots of this equation, then

$$x_1 + x_2 = -\frac{2mca^2}{a^2m^2 + b^2} \qquad \text{...(i)}$$

Since, (h, k) be the middle point of QR, then

$$h = \frac{x_1 + x_2}{2}$$

then, from Eq. (i),

$$2h = -\frac{2mca^2}{a^2m^2 + b^2}$$

$$\Rightarrow \quad h = -\frac{mca^2}{a^2m^2 + b^2} \qquad \text{...(ii)}$$

but (h, k) lies on $y = mx + c$

$$\therefore \quad k = mh + c, \;\; c = k - mh \qquad \text{...(iii)}$$

From Eqs. (ii) and (iii), then , $h = -\frac{ma^2\,(k - mh)}{a^2m^2 + b^2}$

$$\Rightarrow \quad a^2m^2h + b^2h = -mka^2 + m^2a^2h$$

$$\Rightarrow \quad b^2h = -mka^2 \text{ or } k = -\frac{b^2h}{a^2m}$$

Hence, locus of $R(h, k)$ is $y = -\frac{b^2x}{a^2m}$

which is diameter of the ellipse passing through $(0, 0)$.

Aliter : Let (h, k) be the middle point of the chord $y = mx + c$ of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, then

$$T = S_1$$

$$\Rightarrow \quad \frac{xh}{a^2} + \frac{ky}{b^2} = \frac{h^2}{a^2} + \frac{k^2}{b^2}$$

$$\therefore \quad \text{Slope} = -\frac{b^2h}{a^2k} = m$$

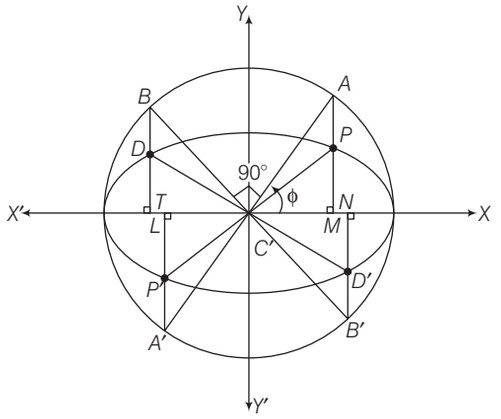
$$\Rightarrow \quad k = -\frac{b^2h}{a^2m}$$

Hence, locus of the mid-point is

$$y = -\frac{b^2x}{a^2m}$$

Conjugate Diameters

Two diameters are said to be *conjugate* when each bisects all chords parallel to the other. If $y = mx$ and $y = m_1x$ be two conjugate diameters of an ellipse, then $mm_1 = \frac{b^2}{a^2}$.



Conjugate diameters of circle i.e. AA' and BB' are perpendicular to each other. Hence, conjugate diameters of ellipse are PP' and DD'.

Hence, angle between conjugate diameters of ellipse $\neq 90°$.

Now the co-ordinates of the four extremities of two conjugate diameters are

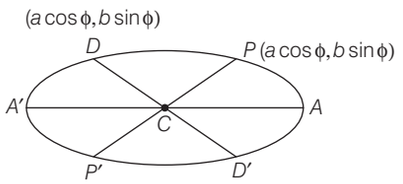
$$\boldsymbol{P\ (a\cos\phi,\ b\sin\phi),\ P'\ (-a\cos\phi, -b\sin\phi),}$$

$$\boldsymbol{D\ (-a\sin\phi,\ b\cos\phi),\ \ D'\ (a\sin\phi, -b\cos\phi)}$$

Properties of Conjugate Diameters

Prop. 1 : *The eccentric angles of the ends of a pair of conjugate diameters of an ellipse differ by a right angle.*

Let PCP' and DCD' be two conjugate diameters of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ and let the eccentric angles of the



extremities P and D be ϕ and ϕ' respectively. Then, the co-ordinates of P and D are $(a\cos\phi, b\sin\phi)$ and $(a\cos\phi', b\sin\phi')$ respectively.

Now $m_1 =$ slope of $CP = \frac{b}{a}\tan\phi$

and $m_2 =$ slope of $CD = \frac{b}{a}\tan\phi'$

since, the diameters PCP' and DCD' are conjugate diameters.

$$\therefore \qquad m_1 m_2 = -\frac{b^2}{a^2}$$

$$\Rightarrow \qquad \frac{b^2}{a^2}\tan\phi\tan\phi' = -\frac{b^2}{a^2}$$

$$\Rightarrow \qquad \tan\phi\tan\phi' = -1$$

$$\Rightarrow \qquad \tan\phi = -\cot\phi' = \tan\left(\frac{\pi}{2}+\phi'\right)$$

$$\Rightarrow \qquad \phi = \frac{\pi}{2}+\phi' \ \Rightarrow\ \phi-\phi' = \frac{\pi}{2}$$

Prop. 2 : *The sum of the squares of any two conjugate semi diameters of an ellipse is constant and equal to the sum of the squares of the semi-axes of the ellipse* i.e.

$$CP^2 + CD^2 = a^2 + b^2$$

Let CP and CD be two conjugate semi-diameters of an ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ and let eccentric angle of P is ϕ. The eccentric angle of D is $\frac{\pi}{2}+\phi$. So the coordinates of P and D are

$$(a\cos\phi, b\sin\phi) \quad \text{and} \quad \left(a\cos\left(\frac{\pi}{2}+\phi\right), b\sin\left(\frac{\pi}{2}+\phi\right)\right)$$

i.e. $(-a\sin\phi, b\cos\phi)$ respectively

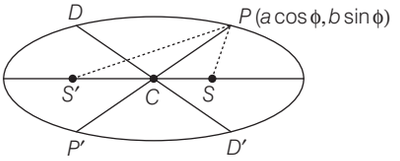
$$\therefore \qquad CP^2 + CD^2 = (a^2\cos^2\phi + b^2\sin^2\phi) + (a^2\sin^2\phi + b^2\cos^2\phi)$$

$$= a^2 + b^2$$

Prop. 3 : *The product of the focal distances of a point on an ellipse is equal to the square of the semi diameter which is conjugate to the diameter through the point.*

Let PCP' and DCD' be the conjugate diameters of an ellipse and let the eccentric angle of P is ϕ then coordinates of P is $(a\cos\phi, b\sin\phi)$

$\therefore$ Coordinates of D is $(-a\sin\phi, b\cos\phi)$



Let S and S' be two foci of the ellipse. Then

$$SP\cdot S'P = (a-ae\cos\phi)\cdot(a+ae\cos\phi)$$

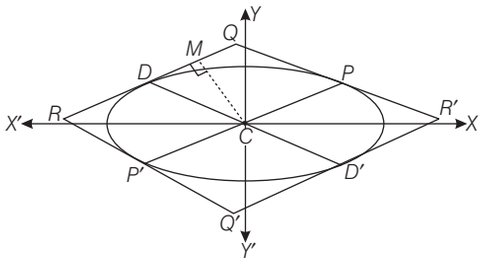
$$= a^2 - a^2e^2\cos^2\phi$$

$$= a^2 - (a^2-b^2)\cos^2\phi \quad \{\because b^2 = a^2(1-e^2)\}$$

$$= a^2\sin^2\phi + b^2\cos^2\phi = CD^2$$

$$\{\therefore a^2 - b^2 = a^2e^2\}$$

Prop. 4 : *The tangents at the extremities of a pair of conjugate diameters form a parallelogram whose area is constant and equal to product of the axes.*



Let PCP' and DCD' be a pair of conjugate diameters of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$. Let the eccentric angle of P be ϕ. Then the eccentric angle of D is $\left(\frac{\pi}{2}+\phi\right)$ so the coordinates of P and D are

$$(a\cos\phi, b\sin\phi) \text{ and } \left(a\cos\left(\frac{\pi}{2}+\phi\right), b\sin\left(\frac{\pi}{2}+\phi\right)\right)$$

i.e. $(-a\sin\phi, b\cos\phi)$

Similarly the coordinates of P' and D' are

$(-a\cos\phi, -b\sin\phi)$ and $(a\sin\phi, -b\cos\phi)$ respectively.

Equation of tangents at P, D, P' and D' are respectively.

$$\frac{x}{a}\cos\phi+\frac{y}{b}\sin\phi=1, -\frac{x}{a}\sin\phi+\frac{y}{b}\cos\phi=1,$$

$$-\frac{x}{a}\cos\phi-\frac{y}{b}\sin\phi=1$$

and $\frac{x}{a}\sin\phi-\frac{y}{b}\cos\phi=1$

Clearly the tangents at P and P' are parallel. Also, the tangents at D and D' are parallel. Hence, the tangents at P, D, P', D' form a parallelogram.

Area of parallelogram $QRQ'R' = 4$ (the area of parallelogram $QDCP$)

$$= 4\cdot|QD|\cdot\{\perp \text{ from } C \text{ on } QD\}$$

$$= 4\cdot|CP|\cdot\{\perp \text{ from } C \text{ on } QD\} \quad \ldots(i)$$

Now $|CP| = \sqrt{(a^2\cos^2\phi + b^2\sin^2\phi)}$

$\because$ tangent at D is $-\frac{x}{a}\sin\phi+\frac{y}{b}\cos\phi=1$

$\therefore$ $\perp$ from C on

$$QD = \frac{1}{\sqrt{\frac{\sin^2\phi}{a^2}+\frac{\cos^2\phi}{b^2}}} = \frac{ab}{\sqrt{a^2\cos^2\phi+b^2\sin^2\phi}}$$

Now from Eq. (i),

Area of parallelogram $QRQ'R'$

$$= 4\times\sqrt{(a^2\cos^2\phi+b^2\sin^2\phi)}\times\frac{ab}{\sqrt{a^2\cos^2\phi+b^2\sin^2\phi)}}$$

$$= 4ab\,(=\text{constant}) = (2a)\,(2b)$$

= Area of rectangle contained under major and minor axes.

Prop. 5 : *The polar of any point with respect to ellipse is parallel to the diameter to the one on which the point lies. Hence obtain the equation of the chord whose mid-point is* (h, k).

Let (h, k) be the point on the diameter $y = m_1 x$

$\therefore$ $m_1 = k/h$

any diameter conjugate to it is $y = m_2 x$

but $m_1 m_2 = -\frac{b^2}{a^2} \Rightarrow \frac{k}{h}m_2 = -\frac{b^2}{a^2}$

$\therefore$ $m_2 = -\frac{b^2 h}{a^2 k}$

Polar of (h, k) is $\frac{hx}{a^2}+\frac{ky}{b^2}=1$ ...(i)

Its slope is $-\frac{b^2 h}{a^2 k} = m_2$ and hence parallel.

Now, equation of chord parallel to the Eq. (i) is

$$\frac{hx}{a^2}+\frac{ky}{b^2}=\lambda \quad \ldots(ii)$$

It is passes through points (h, k)

$\therefore$ $\lambda = \frac{h^2}{a^2}+\frac{k^2}{b^2}$ ... (iii)

From Eqs. (ii) and (iii), $\frac{hx}{a^2}+\frac{ky}{b^2}=\frac{h^2}{a^2}+\frac{k^2}{b^2}$

i.e. $T = S_1$

which is the equation of chord of the ellipse, if mid-points is (h, k).

Equi-Conjugate Diameters

Two conjugate diameters are called *equi-conjugate* if their lengths are equal. In such cases therefore.

$$(CP)^2 = (CD)^2$$

$\therefore$ $a^2\cos^2\phi + b^2\sin^2\phi = a^2\sin^2\phi + b^2\cos^2\phi$

$\Rightarrow$ $(a^2\cos^2\phi - \sin^2\phi) - b^2(\cos^2\phi - \sin^2\phi) = 0$

$$\Rightarrow \quad (a^2 - b^2)\cos 2\phi = 0$$

$$\because \quad (a^2 - b^2) \neq 0$$

$$\therefore \quad \cos 2\phi = 0$$

$$\therefore \quad \phi = \frac{\pi}{4} \text{ or } \frac{3\pi}{4}$$

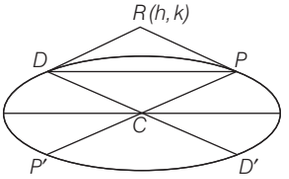
$$\therefore \quad (CP) = (CD) = \sqrt{\frac{(a^2 + b^2)}{2}}$$

Example 38 Show that the tangents at the ends of conjugate diameters of the ellipse $x^2/a^2 + y^2/b^2 = 1$ intersect on the ellipse $x^2/a^2 + y^2/b^2 = 2$.

Or

Prove that the locus of the poles of the line joining the extremities of two conjugate diameters is the ellipse $x^2/a^2 + y^2/b^2 = 2$.

Sol. Let CP and CD be two semi-conjugate diameters, so that if eccentric angle of P is ϕ then eccentric angle of D is $\frac{\pi}{2} + \phi$



$\therefore$ Coordinates of P and D are

$(a\cos\phi, b\sin\phi)$ and $\left(a\cos\left(\frac{\pi}{2} + \phi\right), b\sin\left(\frac{\pi}{2} + \phi\right)\right)$

respectively

$\therefore$ Equation of (PD) is

$$\frac{x}{a}\cos\left(\frac{\phi + \frac{\pi}{2} + \phi}{2}\right) + \frac{y}{b}\sin\left(\frac{\phi + \frac{\pi}{2} + \phi}{2}\right) = \cos\left(\frac{\frac{\pi}{2} + \phi - \phi}{2}\right)$$

$$\Rightarrow \quad \frac{x}{a}\cos\left(\frac{\pi}{4} + \phi\right) + \frac{y}{b}\sin\left(\frac{\pi}{4} + \phi\right) = \frac{1}{\sqrt{2}} \qquad \ldots(i)$$

If its pole or point of intersection of tangents at its extremities be (h, k), then its equation is the same as that of the polar or the chord of contact of (h, k).

i.e. $$\frac{hx}{a^2} + \frac{ky}{b^2} = 1 \qquad \ldots(ii)$$

Since, Eqs. (i) and (ii) are identical, comparing

$$\frac{h}{a\cos\left(\frac{\pi}{4} + \phi\right)} = \frac{k}{b\sin\left(\frac{\pi}{4} + \phi\right)} = \sqrt{2}$$

or $$\sqrt{2}\cos\left(\frac{\pi}{4} + \phi\right) = \frac{h}{a} \qquad \ldots(iii)$$

or $$\sqrt{2}\sin\left(\frac{\pi}{4} + \phi\right) = \frac{k}{b} \qquad \ldots(iv)$$

Squaring and adding Eqs. (iii) and (iv), then

$$\frac{h^2}{a^2} + \frac{k^2}{b^2} = 2\left(\cos^2\left(\frac{\pi}{4} + \phi\right) + \sin^2\left(\frac{\pi}{4} + \phi\right)\right)$$

$$\therefore \quad \frac{h^2}{a^2} + \frac{k^2}{b^2} = 2$$

Hence, locus of (h, k) is $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 2$

Aliter : Equation of tangents at P and D are

$$\frac{x}{a}\cos\phi + \frac{y}{b}\sin\phi = 1 \qquad \ldots(i)$$

and $$\frac{x}{a}\cos\left(\frac{\pi}{2} + \phi\right) + \frac{y}{b}\sin\left(\frac{\pi}{2} + \phi\right) = 1$$

i.e. $$-\frac{x}{a}\sin\phi + \frac{y}{b}\cos\phi = 1 \qquad \ldots(ii)$$

Squaring and adding Eqs. (i) and (ii), we get

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 2$$

which is required locus.

Example 39 If $x\cos\alpha + y\sin\alpha = p$ is a chord joining the ends P and D of conjugate semi-diameters, of the ellipse then prove that $a^2\cos^2\alpha + b^2\sin^2\alpha = 2p^2$ and hence or otherwise deduce that the line PD always touches a similar ellipse.

Sol. Let equation of ellipse be $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, eccentric angle of P is ϕ, then eccentric angle of D is $\frac{\pi}{2} + \phi$

$\therefore$ Coordinates of P and D are

$(a\cos\phi, b\sin\phi)$ and $\left(a\cos\left(\frac{\pi}{2} + \phi\right), b\sin\left(\frac{\pi}{2} + \phi\right)\right)$

$\therefore$ Equation of PD is

$$\frac{x}{a}\cos\left(\frac{\phi + \frac{\pi}{2} + \phi}{2}\right) + \frac{y}{b}\sin\left(\frac{\phi + \frac{\pi}{2} + \phi}{2}\right) = \cos\left(\frac{\frac{\pi}{2} + \phi - \phi}{2}\right)$$

$$\Rightarrow \quad \frac{x}{a}\cos\left(\frac{\pi}{4} + \phi\right) + \frac{y}{b}\sin\left(\frac{\pi}{4} + \phi\right) = \frac{1}{\sqrt{2}} \qquad \ldots(i)$$

If it is same as $x\cos\alpha + y\sin\alpha = p$ $\qquad \ldots(ii)$

then on comparing, we get

$$\frac{\cos\left(\frac{\pi}{4} + \phi\right)}{a\cos\alpha} = \frac{\sin\left(\frac{\pi}{4} + \phi\right)}{b\sin\alpha} = \frac{1}{p\sqrt{2}}$$

or $a\cos\alpha = p\sqrt{2}\cos\left(\frac{\pi}{4}+\phi\right)$ ...(iii)

and $b\sin\alpha = p\sqrt{2}\sin\left(\frac{\pi}{4}+\phi\right)$ ...(iv)

Squaring and adding Eq. (iii) and (iv), we get

$$a^2\cos^2\alpha + b^2\sin^2\alpha = (p\sqrt{2})^2 \left\{\cos^2\left(\frac{\pi}{4}+\phi\right)+\sin^2\left(\frac{\pi}{4}+\phi\right)\right\}$$

$\Rightarrow$ $a^2\cos^2\alpha + b^2\sin^2\alpha = 2p^2$

Again, line Eq. (i) can be written as

$$\frac{x}{a/\sqrt{2}}\cos\theta + \frac{y}{b/\sqrt{2}}\sin\theta = 1,$$

where $\theta = \frac{\pi}{4}+\phi$

which is clearly a tangent to the ellipse

$$\frac{x^2}{(a/\sqrt{2})^2}+\frac{y^2}{(b\sqrt{2})^2}=1 \text{ or } \frac{x^2}{a^2}+\frac{y^2}{b^2}=\frac{1}{2} \quad ...(v)$$

If e' be its eccentricity, then

$$(b/\sqrt{2})^2 = (a/\sqrt{2})^2(1-e'^2)$$

$\Rightarrow$ $b^2 = a^2(1-e'^2)$

but $b^2 = a^2(1-e^2)$

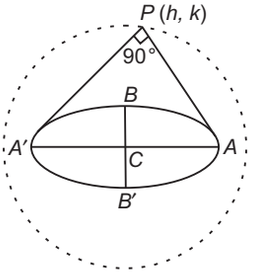
$\therefore$ $e = e'$

Hence, ellipse (v) is a similar ellipse.

Director Circle

The locus of the point of intersection of the tangents to an ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ which are perpendicular to each other is called director circle.

Let any tangent in terms of slope of ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ is



$$y = mx + \sqrt{(a^2m^2+b^2)}$$

It is passes through (h, k)

$\therefore$ $k = mh + \sqrt{(a^2m^2+b^2)}$

or $(k-mh)^2 = a^2m^2 + b^2$

$\Rightarrow$ $k^2 + m^2h^2 - 2mhk = a^2m^2 + b^2$

$\Rightarrow$ $m^2(h^2-a^2) - 2hkm + k^2 - b^2 = 0$

It is quadratic equation in m let slope of two tangents are m_1 and m_2

$\therefore$ $m_1m_2 = \frac{k^2-b^2}{h^2-a^2}$

$$-1 = \frac{k^2-b^2}{h^2-a^2}$$

($\because$ tangents are perpendicular)

$\Rightarrow$ $-h^2 + a^2 = k^2 - b^2$

or $h^2 + k^2 = a^2 + b^2$

Hence, locus of $P(h, k)$ is

$$\boldsymbol{x^2 + y^2 = a^2 + b^2}$$

Aliter :

If any tangent $y = mx + \sqrt{(a^2m^2+b^2)}$ ...(i)

and $y = -\frac{x}{m} + \sqrt{\left\{a^2\left(-\frac{1}{m}\right)^2 + b^2\right\}}$ ...(ii)

touch the ellipse and intersect at right angles.

From Eq. (i),

$$y - mx = \sqrt{(a^2m^2+b^2)} \quad ...(iii)$$

Eq. (ii) can be re-written as

$$x + my = \sqrt{(a^2+b^2m^2)} \quad ...(iv)$$

Squaring and adding Eqs. (iii) and (iv), then

$$(y-mx)^2 + (x+my)^2 = a^2m^2 + b^2 + a^2 + b^2m^2$$

$\Rightarrow$ $(1+m^2)(x^2+y^2) = (1+m^2)(a^2+b^2)$

Hence, $x^2 + y^2 = a^2 + b^2$ is the **director circle** of the ellipse.

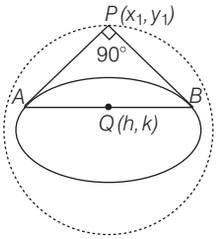
Example 40 ***Tangents at right angles are drawn to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$. Show that the locus of the middle points of the chord of contact is the curve***

$$\left(\frac{x^2}{a^2}+\frac{y^2}{b^2}\right)^2 = \frac{x^2+y^2}{a^2+b^2}$$

Sol. Let $Q(h, k)$ be the middle point of the chord of contact

$\therefore$ Equation of chord AB whose mid point $Q(h, k)$ is

$T = S_1$



$$\frac{hx}{a^2} + \frac{ky}{b^2} = \frac{h^2}{a^2} + \frac{k^2}{b^2} \quad \text{...(i)}$$

and equation of chord of contact AB with respect to $P(x_1, y_1)$ is

$$\frac{xx_1}{a^2} + \frac{yy_1}{b^2} = 1 \quad \text{...(ii)}$$

the Eqs. (i) and (ii) are identical, hence comparing their coefficient, we get

$$\frac{x_1}{h} = \frac{y_1}{k} = \frac{1}{\left(\frac{h^2}{a^2} + \frac{k^2}{b^2}\right)}$$

$$\therefore \quad x_1 = \frac{h}{\left(\frac{h^2}{a^2} + \frac{k^2}{b^2}\right)} \quad \text{...(iii)}$$

and $$y_1 = \frac{k}{\left(\frac{h^2}{a^2} + \frac{k^2}{b^2}\right)} \quad \text{...(iv)}$$

Since tangents are at right angles, then the point (x_1, y_1) must lie on the director circle $x^2 + y^2 = a^2 + b^2$ of the ellipse

$$x_1^2 + y_1^2 = a^2 + b^2$$

$$\frac{h^2}{\left(\frac{h^2}{a^2} + \frac{k^2}{b^2}\right)^2} + \frac{k^2}{\left(\frac{h^2}{a^2} + \frac{k^2}{b^2}\right)^2} = a^2 + b^2$$

[from Eqs. (iii) and (iv)]

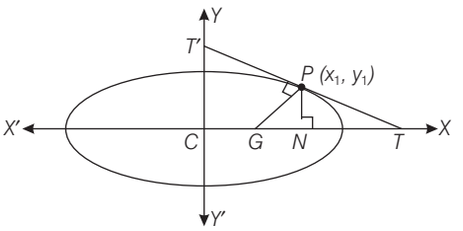
$$\therefore \quad \left(\frac{h^2}{a^2} + \frac{k^2}{b^2}\right)^2 = \frac{h^2 + k^2}{a^2 + b^2}$$

Hence, locus of mid-point $Q(h, k)$ is $\left(\frac{x^2}{a^2} + \frac{y^2}{b^2}\right)^2 = \frac{x^2 + y^2}{a^2 + b^2}$

Sub-Tangent and Sub-Normal

Let the tangent and normal at $P(x_1, y_1)$ meet the axes at T and G respectively.

Equation of tangent at $P(x_1, y_1)$ to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is



$$\frac{xx_1}{a^2} + \frac{yy_1}{b^2} = 1 \quad \text{...(i)}$$

$\because$ T lies on X-axis.

Put $y = 0$ in Eq. (i) $\Rightarrow x = CT$

$$\therefore \quad CT = \frac{a^2}{x_1} \text{ and } CN = x_1$$

and **length of sub-tangent** $NT = CT - CN = \frac{a^2}{x_1} - x_1$

Equation of normal at $P(x_1, y_1)$ to the ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \text{ is}$$

$$\frac{x - x_1}{x_1 / a^2} = \frac{y - y_1}{y_1 / b^2} \quad \text{...(ii)}$$

$\because$ G lies on X-axis. Put $y = 0$ in Eq. (ii)

$$\Rightarrow \quad x = CG$$

$$\therefore \quad CG = x_1 - \frac{b^2}{a^2} x_1$$

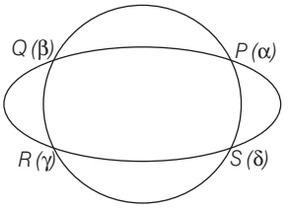
$\therefore$ **Length of sub-normal**

$$GN = CN - CG = x_1 - \left(x_1 - \frac{b^2}{a^2} x_1\right)$$

$$= \frac{b^2}{a^2} x_1 = (1 - e^2)\, x_1$$

Concyclic Points

Any circle intersects an ellipse in two or four real points. They are called concyclic points and the sum of their eccentric angles is an even multiple of π. If $\alpha, \beta, \gamma, \delta$ be the eccentric angles of the four concyclic points on an ellipse, then prove that $\alpha + \beta + \gamma + \delta = 2n\pi$ where n is any integer.



Let the given circle be

$$x^2 + y^2 + 2gx + 2fy + c = 0 \quad ...(i)$$

and the given ellipse be

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad ...(ii)$$

Let $(a\cos\phi, b\sin\phi)$ be a point of intersection of Eqs. (i) and (ii).

As it lies on the circle Eq. (i).

$$\therefore \quad a^2\cos^2\phi + b^2\sin^2\phi + 2ga\cos\phi + 2fb\sin\phi + c = 0 \quad ...(iii)$$

$$\text{or} \quad a^2\left(\frac{1-\tan^2(\phi/2)}{1+\tan^2(\phi/2)}\right)^2 + b^2\left(\frac{2\tan(\phi/2)}{1+\tan^2(\phi/2)}\right)^2 + 2ga\left(\frac{1-\tan^2(\phi/2)}{1+\tan^2(\phi/2)}\right) + 2fb\left(\frac{2\tan(\phi/2)}{1+\tan^2(\phi/2)}\right) + c = 0 \quad ...(iv)$$

Put $\tan(\phi/2) = t$

$\therefore$ Eq. (iv) reduces to

$$a^2\left(\frac{1-t^2}{1+t^2}\right)^2 + b^2\left(\frac{2t}{1+t^2}\right)^2 + 2ga\left(\frac{1-t^2}{1+t^2}\right) + 2fb\left(\frac{2t}{1+t^2}\right) + c = 0$$

$$\text{or} \quad (a^2 - 2ga + c)t^4 + 4bf\,t^3 + (4b^2 - 2a^2 + 2c)\,t^2 + 4bft + (a^2 + 2ga + c) = 0 \quad ...(v)$$

which is biquadratic equation in t.

i.e. it has four values of t

$$t = \tan(\phi/2)$$

Since, four values of eccentric angles are $\alpha, \beta, \gamma, \delta$

$$\therefore \quad \tan\left(\frac{\alpha}{2} + \frac{\beta}{2} + \frac{\gamma}{2} + \frac{\delta}{2}\right) = \frac{S_1 - S_3}{1 - S_2 + S_4} = \frac{\Sigma t_1 - \Sigma t_1 t_2 t_3}{1 - \Sigma t_1 t_2 + t_1 t_2 t_3 t_4} = 0$$

$$\Rightarrow \quad \frac{1}{2}(\alpha + \beta + \gamma + \delta) = n\pi$$

$\therefore \quad \alpha + \beta + \gamma + \delta = 2n\pi$, when n is any integer.

Aliter : Let P, Q, R, S be four concyclic points on an ellipse, whose eccentric angles $\alpha, \beta, \gamma, \delta$ respectively.

Then equation of the chords PQ and RS are (Take any two chords)

$$\frac{x}{a}\cos\left(\frac{\alpha+\beta}{2}\right) + \frac{y}{b}\sin\left(\frac{\alpha+\beta}{2}\right) - \cos\left(\frac{\alpha-\beta}{2}\right) = 0$$

and

$$\frac{x}{a}\cos\left(\frac{\gamma+\delta}{2}\right) + \frac{y}{b}\sin\left(\frac{\gamma+\delta}{2}\right) - \cos\left(\frac{\gamma-\delta}{2}\right) = 0$$

Now, the equation of any curve passing through P, Q, R and S is given by

$$\left(\frac{x^2}{a^2} + \frac{y^2}{b^2} - 1\right) + \lambda \left(\frac{x}{a}\cos\left(\frac{\alpha+\beta}{2}\right) + \frac{y}{b}\sin\left(\frac{\alpha+\beta}{2}\right) - \cos\left(\frac{\alpha-\beta}{2}\right)\right) \times \left(\frac{x}{a}\cos\left(\frac{\gamma+\delta}{2}\right) + \frac{y}{b}\sin\left(\frac{\gamma+\delta}{2}\right) - \cos\left(\frac{\gamma-\delta}{2}\right)\right) = 0$$

But the given points are concyclic. Hence this equation will represent a circle, if co-efficient of x^2 = co-efficient y^2. and co-efficient of $xy = 0$

Now equation of the co-efficient of $xy = 0$

$$\cos\left(\frac{\alpha+\beta}{2}\right)\sin\left(\frac{\gamma+\delta}{2}\right) + \sin\left(\frac{\alpha+\beta}{2}\right)\cos\left(\frac{\gamma+\delta}{2}\right) = 0$$

$$\text{or} \quad \sin\left(\frac{\alpha+\beta+\gamma+\delta}{2}\right) = 0 = \sin n\pi$$

$$\therefore \quad \frac{1}{2}(\alpha+\beta+\gamma+\delta) = n\pi \quad \text{or} \quad \alpha+\beta+\gamma+\delta = 2n\pi$$

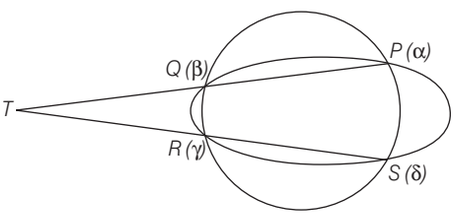
where, n is any integer.

Hence, the sum of eccentric angles of four concylic points on an ellipse is always an even multiple of π

Corollary 1 : *Prove that the common chords of a circle and an ellipse are equally inclined to the axes of the ellipse.*

If the point of intersection of chords PQ and RS is T, then equation of chord PQ is

$$\frac{x}{a}\cos\left(\frac{\alpha+\beta}{2}\right) + \frac{y}{b}\sin\left(\frac{\alpha+\beta}{2}\right) = \cos\left(\frac{\alpha-\beta}{2}\right)$$



$$\therefore \text{ Slope of } PQ = -\frac{b}{a}\cot\left(\frac{\alpha+\beta}{2}\right) = -\frac{b}{a}\cot\left(n\pi - \frac{\gamma+\delta}{2}\right) \quad (\because \alpha+\beta+\gamma+\delta = 2n\pi) = \frac{b}{a}\cot\left(\frac{\gamma+\delta}{2}\right) = -(\text{slope of } RS)$$

Hence, PQ and RS are equally inclined to the axis of x.

Corollary 2 : *Find the centre of the circle passing through the three points on an ellipse whose eccentric angles are* α, β, γ.

Let the point of intersection of ellipse

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1 \qquad ...(i)$$

and circle $x^2+y^2+2gx+2fy+c=0$ ...(ii)

be $\alpha, \beta, \gamma, \delta$

$\therefore \quad \alpha+\beta+\gamma+\delta=2n\pi$ (where n is an integer)

Let ϕ be any point on Eq. (i)

$\therefore \quad x=a\cos\phi, y=b\sin\phi$

This point also lie on Eq. (ii)

$\therefore \quad a^2\cos^2\phi+b^2\sin^2\phi+2ga\cos\phi+2fb\sin\phi+c=0$...(iii)

$\Rightarrow \quad \{(a^2-b^2)\cos^2\phi+2ga\cos\phi+(b^2+c)\}^2=4f^2b^2(1-\cos^2\phi)$

$\Rightarrow (a^2-b^2)^2\cos^4\phi+4ga(a^2-b)\cos^3\phi+\{2(a^2-b^2)(b^2+c)+4g^2a^2+4f^2b^2\}\cos^2\phi+4ga(b^2+c)\cos\phi+\{b^2+c^2-4f^2b^2\}=0$

This is a fourth degree equation in $\cos\phi$.

It has four roots (i.e. $\cos\alpha, \cos\beta, \cos\gamma, \cos\delta$)

$$\therefore \quad \cos\alpha+\cos\beta+\cos\gamma+\cos\delta=-\frac{4ga}{(a^2-b^2)} \qquad ...(iv)$$

Similarly changing Eq. (iii) in $\sin\phi$, we get

$$\sin\alpha+\sin\beta+\sin\gamma+\sin\delta=-\frac{4fb}{b^2-a^2} \qquad ...(v)$$

$\because \quad \alpha+\beta+\gamma+\delta=2n\pi$

$\therefore \quad \delta=2n\pi-(\alpha+\beta+\gamma)$

$\therefore \quad \sin\delta=-\{\sin(\alpha+\beta+\gamma)\}$ and $\cos\delta=\cos(\alpha+\beta+\gamma)$

then, from Eqs. (iv) and (v), we get

$$-g=\left(\frac{a^2-b^2}{4a}\right)\{\cos\alpha+\cos\beta+\cos\gamma+\cos(\alpha+\beta+\gamma)\}$$

and $$-f=\left(\frac{b^2-a^2}{4b}\right)\{\sin\alpha+\sin\beta+\sin\gamma-\sin(\alpha+\beta+\gamma)\}$$

which give co-ordinate of centre of circle through α, β and γ.

Corollary 3 : *$P'CP$ and $D'CD$ are conjugate diameters of an ellipse and α is the eccentric angle of P. Prove that the eccentric angle of the point where the circle through P, P', D again cuts the ellipse is* $\frac{\pi}{2}-3\alpha$.

The eccentric angles of P, P' and D are $\alpha, \pi+\alpha, \frac{\pi}{2}+\alpha$ respectively. Let β be the eccentric angle of the fourth point.

As above

$$\alpha+(\pi+\alpha)+\left(\frac{\pi}{2}+\alpha\right)+\beta=2n\pi$$

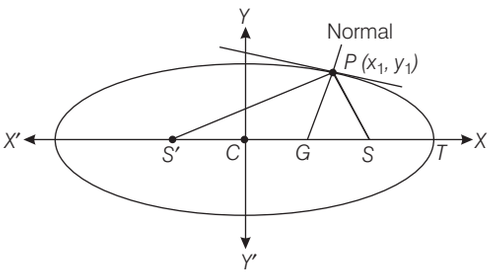
$$\therefore \quad \beta=2n\pi-\left(\frac{3\pi}{2}+3\alpha\right)=\frac{\pi}{2}-3\alpha \qquad (\text{for } n=1)$$

Note

Any other values of n gives the same point on the ellipse.

Some Standard Properties of the Ellipse

(i) If S be the focus and G be the point where the normal at P meets the axis of an ellipse, then $SG=e\cdot SP$ and the tangent and normal at P bisects the external and internal angles between the focal distances of P.



Let P be any point on the ellipse

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$$

$\therefore$ Equation of normals PG is

$$(x-x_1)\frac{a^2}{x_1}=(y-y_1)\frac{b^2}{y_1}$$

Putting $y=0$. For the point G, we have

$$(x-x_1)\frac{a^2}{x_1}=-b^2$$

$$\therefore x=CG=\left(\frac{a^2-b^2}{a^2}\right)x_1=\frac{a^2e^2}{a^2}x_1=e^2x_1$$

$$\therefore \quad SG=CS-CG=ae-e^2x_1=e(a-ex_1)$$

$$=eSP$$

Similarly $S'G=eS'P$

$$\therefore \quad \frac{SG}{S'G}=\frac{eSP}{eS'P}=\frac{SP}{S'P}$$

$\therefore$ The normal PG bisects the internal $\angle SPS'$ between the focal distances but tangent and normal are at right angles, the tangent PT bisects the external angle SPL between them.

(ii) The locus of the feet of the perpendiculars from the foci on any tangent to an ellipse is the auxiliary circle.

The equation of any tangent in terms slope (m) of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ is

$$y = mx \pm \sqrt{(a^2m^2 + b^2)}$$

or $$y - mx = \sqrt{(a^2m^2 + b^2)} \quad \text{...(i)}$$

Equation of perpendicular line of Eq. (i) and passes through $(\pm ae, 0)$ is

$$my + x = \pm ae \quad \text{...(ii)}$$

The locus of the point of intersection of the line given by Eqs. (i) and (ii) can be obtained by eliminating m between them, squaring and adding Eqs. (i) and (ii), we get

$$y^2(1+m^2) + x^2(1+m^2) = a^2m^2 + b^2 + a^2e^2$$

$$\Rightarrow \quad (1+m^2)(x^2+y^2) = a^2m^2 + a^2$$

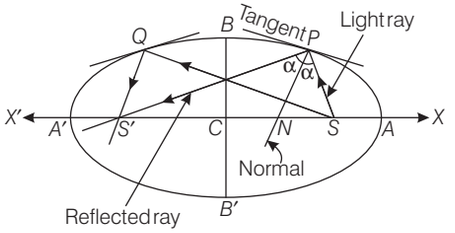
$$= a^2(1+m^2)$$

or $$x^2 + y^2 = a^2$$

which is the equation of the auxiliary circle of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$.

Reflection Property of an Ellipse

If an incoming light ray passes through on focus (S) strike the concave side of the ellipse, then it will get reflected towards other focus (S').



and $$\angle SPS' = \angle SQS'$$

Example 41 A ray emanating from the point $(-3, 0)$ is incident on the ellipse $16x^2 + 25y^2 = 400$ at the point P with ordinate 4. Find the equation of the reflected ray after first reflection.

Sol. For point P, y-coordinate = 4

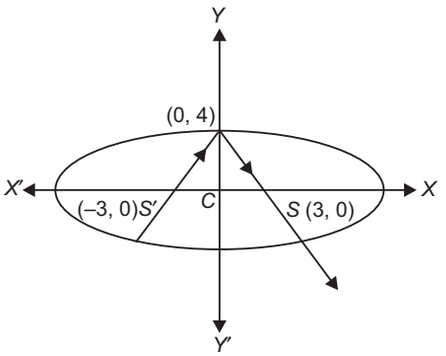
$\because$ Given ellipse is $16x^2 + 25y^2 = 400$

$$16x^2 + 25(4)^2 = 400$$

Coordinate of P is $(0, 4)$

$$e^2 = 1 - \frac{16}{25} = \frac{9}{25}$$

$$e = \frac{3}{5}$$



foci $(\pm ae, 0)$ i.e. $(\pm 3, 0)$

Equation of reflected ray (i.e. PS) is

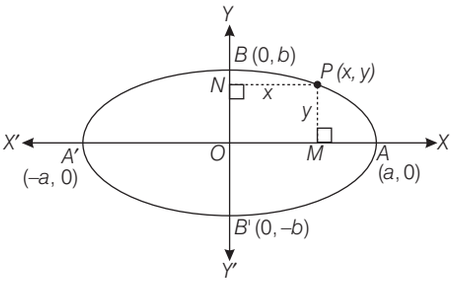
$$\frac{x}{3} + \frac{y}{4} = 1 \text{ or } 4x + 3y = 12.$$

Equation of an Ellipse Referred to Two Perpendicular Lines

Let $P(x, y)$ be any point on the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$

then, $$y = PM, x = PN$$

$\therefore$ $$\frac{(PN)^2}{a^2} + \frac{(PM)^2}{b^2} = 1$$

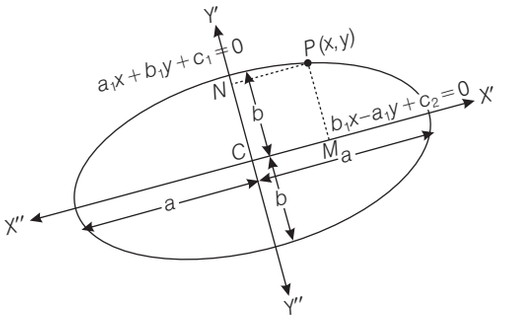


suppose if axes along the lines

$$a_1x + b_1y + c_1 = 0 \quad \text{and} \quad b_1x - a_1y + c_2 = 0$$

then
$$PN = \frac{|a_1x + b_1y + c_1|}{\sqrt{(a_1^2 + b_1^2)}}$$

$$PM = \frac{|b_1x - a_1y + c_2|}{\sqrt{(b_1^2 + a_1^2)}}$$



then, equation of ellipse is

$$\frac{\left\{\dfrac{a_1x + b_1y + c_1}{\sqrt{(a_1^2 + b_1^2)}}\right\}^2}{a^2} + \frac{\left\{\dfrac{b_1x - a_1y + c_2}{\sqrt{(b_1^2 + a_1^2)}}\right\}^2}{b^2} = 1$$

Centre : Is the point of intersection of $a_1x + b_1y + c_1 = 0$ and $b_1x - a_1y + c_2 = 0$

Equations of Major and Minor Axes :

(i) If $a > b$, then major axis lies along $b_1x - a_1y + c_2 = 0$ and minor axis lies along $a_1x + b_1y + c_1 = 0$.

(ii) If $a < b$, then major axis lies along $a_1x + b_1y + c_1 = 0$ and minor axis lies along $b_1x - a_1y + c_2 = 0$

Eccentricity :

(i) If $a > b, b^2 = a^2(1 - e^2)$ (ii) If $a < b, a^2 = b^2(1 - e^2)$

Foci :

(i) If $a > b$

$$\frac{a_1x + b_1y + c_1}{\sqrt{(a_1^2 + b_1^2)}} = \pm ae, \frac{b_1x - a_1y + c_2}{\sqrt{(b_1^2 + a_1^2)}} = 0$$

we get after solving (x, y)

(ii) If $a < b$

$$\frac{a_1x + b_1y + c_1}{\sqrt{a_1^2 + b_1^2}} = 0, \frac{b_1x - a_1y + c_2}{\sqrt{b_1^2 + a_1^2}} = \pm be$$

we get after solving (x, y)

Directrices :

(i) If $a > b$,

$$\frac{a_1x + b_1y + c_1}{\sqrt{(a_1^2 + b_1^2)}} = \pm \frac{a}{e}$$

(ii) If $a < b$,

$$\frac{b_1x - a_1y + c_2}{\sqrt{(a_1^2 + b_1^2)}} = \pm \frac{b}{e}$$

Example 42 *Determine the equations of major and minor axes of the ellipse*

$$4(x - 2y + 1)^2 + 9(2x + y + 2)^2 = 25$$

Also, find its centre, length of the latusrectum and eccentricity.

Sol. The equation of the ellipse can be written as

$$4 \times 5\left(\frac{x - 2y + 1}{\sqrt{5}}\right)^2 + 9 \times 5\left(\frac{2x + y + 2}{\sqrt{5}}\right)^2 = 25$$

or
$$\frac{\left(\dfrac{x - 2y + 1}{\sqrt{5}}\right)^2}{(5/4)} + \frac{\left(\dfrac{2x + y + 2}{\sqrt{5}}\right)^2}{(5/9)} = 1$$

or
$$\frac{X^2}{a^2} + \frac{Y^2}{b^2} = 1$$

Here $a > b$

$\therefore$ **Equation of major axis is** $Y = 0$

i.e. $2x + y + 2 = 0$

and **Equation of minor axis is** $X = 0$

i.e. $x - 2y + 1 = 0$

Centre : $X = 0, Y = 0$

$\Rightarrow$ $x - 2y + 1 = 0, 2x + y + 2 = 0$

we get $x = -1, y = 0$

$\therefore$ Centre is $(-1, 0)$

Length of latusrectum $= \frac{2b^2}{a} = \frac{2 \times 5/9}{5/4} = \frac{8}{9}$

Eccentricity : $b^2 = a^2(1 - e^2)$

$\Rightarrow$ $\frac{5}{9} = \frac{5}{4}(1 - e^2)$

$\Rightarrow$ $\frac{4}{9} = 1 - e^2$

$\Rightarrow$ $e^2 = \frac{5}{9}$

$\therefore$ $e = \frac{\sqrt{5}}{3}$

Exercise for Session 3

1. The angle between the pair of tangents drawn from the point (1, 2) to the ellipse $3x^2 + 2y^2 = 5$ is

(a) $\tan^{-1}\left(\frac{12}{5}\right)$ (b) $\tan^{-1}\left(\frac{6}{\sqrt{5}}\right)$ (c) $\tan^{-1}\left(\frac{12}{\sqrt{5}}\right)$ (d) $\tan^{-1}(12\sqrt{5})$

2. If chords of contact of tangents from two points (x_1, y_1) and (x_2, y_2) to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ are at right angles, then $\frac{x_1x_2}{y_1y_2}$ is equal to

(a) $\frac{a^2}{b^2}$ (b) $-\frac{b^2}{a^2}$ (c) $-\frac{a^4}{b^4}$ (d) $-\frac{b^4}{a^4}$

3. From the point $(\lambda, 3)$ tangents are drawn to $\frac{x^2}{9} + \frac{y^2}{4} = 1$ and are perpendicular to each other than λ is

(a) $\pm$ 1 (b) $\pm$ 2 (c) $\pm$ 3 (d) $\pm$ 4

4. The eccentric angle of one end of a diameter of $x^2 + 3y^2 = 3$ is $\pi/6$, then the eccentric angle of the other end will be

(a) $\frac{5\pi}{6}$ (b) $-\frac{5\pi}{6}$ (c) $-\frac{2\pi}{3}$ (d) $\frac{2\pi}{3}$

5. The locus of the mid-points of a focal chord of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is

(a) $\frac{x^2}{a^2} + \frac{y^2}{b^2} = \frac{ex}{a}$ (b) $\frac{x^2}{a^2} - \frac{y^2}{b^2} = \frac{ex}{a}$ (c) $x^2 + y^2 = a^2 + b^2$ (d) $x^2 - y^2 = a^2 + b^2$

6. The centre of the ellipse $\frac{(x + y - 2)^2}{9} + \frac{(x - y)^2}{16} = 1$ is

(a) (0, 0) (b) (1, 0) (c) (0, 1) (d) (1, 1)

7. The locus of the point of intersection of two perpendicular tangents of the ellipse $\frac{x^2}{9} + \frac{y^2}{4} = 1$ is

(a) $x^2 + y^2 = 4$ (b) $x^2 + y^2 = 9$ (c) $x^2 + y^2 = 13$ (d) $x^2 + y^2 = 5$

8. The area of the parallelogram inscribed in the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ whose diagonals are the conjugate diameters of the ellipse is given by

(a) $2ab$ (b) $3ab$ (c) $4ab$ (d) $5ab$

9. Find the locus of the vertices of equilateral triangle circumscribing the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$.

10. A tangent to the ellipse $x^2 + 4y^2 = 4$ meets the ellipse $x^2 + 2y^2 = 6$ at P and Q. Prove that the tangents at P and Q of the ellipse $x^2 + 2y^2 = 6$ are at right angles.

11. Find the locus of the mid-point of chords of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 (a > b)$ passing through the point $(2a, 0)$.

12. Find the locus of the point the chord of contact of tangents from which to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, touches the circle $x^2 + y^2 = c^2$.

13. Find the centre and eccentricity of the ellipse

$$4(x - 2y + 1)^2 + 9(2x + y + 2)^2 = 5$$

14. A ray emanating from the point $(0, -\sqrt{5})$ is incident on the ellipse $9x^2 + 4y^2 = 36$ at the point P with abscissa 2. Find the equation of the reflected ray after first reflection.

Shortcuts and Important Results to Remember

1 If S and S' are foci and P be a point, then

(a) If $|SP| + |S'P| > |SS'|$, then the locus of P is an ellipse.

(b) If $|SP| + |S'P| = |SS'|$, then the locus of P is a straight line.

(c) If $|SP| + |S'P| < |SS'|$, then the locus of P is an empty set.

2 If the ellipses $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1, \frac{x^2}{\alpha^2} + \frac{y^2}{\beta^2} = 1$ and $\frac{x^2}{\theta^2} + \frac{y^2}{\phi^2} = 1$ have a common tangent, then $\begin{vmatrix} a^2 & b^2 & 1 \\ \alpha^2 & \beta^2 & 1 \\ \theta^2 & \phi^2 & 1 \end{vmatrix} = 0$

3 Area of the quadrilateral formed by the common tangents of the circle $x^2 + y^2 = c^2$ and the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$; $c \in (a, b)$ is $\frac{2c^2|a^2 - b^2|}{\sqrt{(a^2 - c^2)(c^2 - b^2)}}$

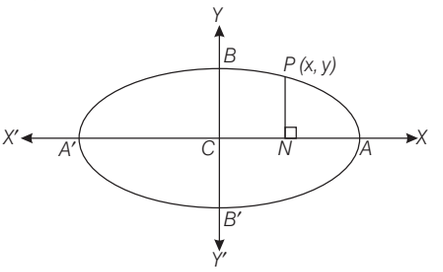
4 The product of the two perpendicular distances from the foci on any tangent of an ellipse is b^2.

5 If the normals at the point $P(x_1, y_1); Q(x_2, y_2)$ and $R(x_3, y_3)$ on the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ are concurrent, then

$\begin{vmatrix} x_1 & y_1 & x_1y_1 \\ x_2 & y_2 & x_2y_2 \\ x_3 & y_3 & x_3y_3 \end{vmatrix} = 0$ and if points $P(\alpha), Q(\beta)$ and $R(\gamma)$, then

$\begin{vmatrix} \sec\alpha & \operatorname{cosec}\alpha & 1 \\ \sec\beta & \operatorname{cosec}\beta & 1 \\ \sec\gamma & \operatorname{cosec}\gamma & 1 \end{vmatrix} = 0$

6 If ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, then

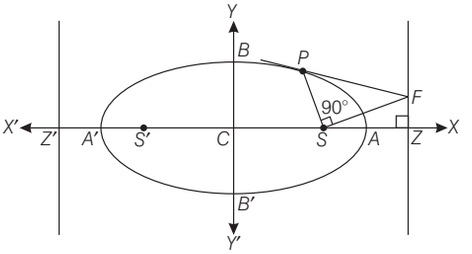


$(PN)^2 : AN \cdot A'N = (BC)^2 : (AC)^2$

7 If α and β are the eccentric angles of extremittes of a focal chord of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, then $\tan(\alpha/2).\tan(\beta/2) = \frac{e-1}{e+1}$ or $\frac{e+1}{e-1}$ according as focus (ae, 0) or $(-ae, 0)$.

8 If the tangent at P on an ellipse meets the directrix in F; then the PF will subtend a right angle at the corresponding focus.

i.e. $\angle PSF = \pi/2$



JEE Type Solved Examples :
Single Option Correct Type Questions

▪ This section contains **10 multiple choice examples.** Each example has four choices (a), (b), (c) and (d) out of which **ONLY ONE** is correct.

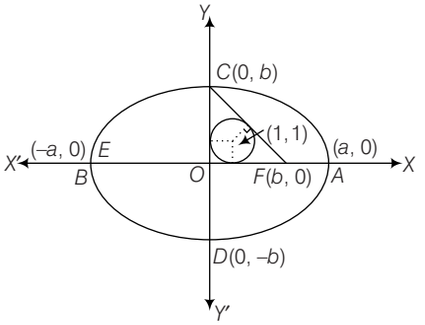
● ***Ex. 1*** *Point 'O' is the centre of the ellipse with major axis AB and minor axis CD. Point F is one focus of the ellipse. If OF = 6 and the diameter of the inscribed circle of triangle OCF is 2, then the product (AB) (CD) is equal to*

(a) 52 (b) 56 (c) 78 (d) None of these

Sol. (b) ∵ Diameter of the inscribed circle of triangle OCF is 2.

$\therefore$ Radius $= 1$

Centre of the circle is (1, 1) and equation of CF is $\frac{x}{6}+\frac{y}{b}=1$



Now, length of perpendicular from (1, 1) on $CF = 1$ (radius)

$$\Rightarrow \quad \frac{\left|\frac{1}{6}+\frac{1}{b}-1\right|}{\sqrt{\left(\frac{1}{36}+\frac{1}{b^2}\right)}}=1 \quad \text{or} \quad -\left(\frac{1}{b}-\frac{5}{6}\right)=\sqrt{\left(\frac{1}{36}+\frac{1}{b^2}\right)}$$

$$\Rightarrow \quad \left(\frac{5}{6}-\frac{1}{b}\right)=\sqrt{\left(\frac{1}{36}+\frac{1}{b^2}\right)}$$

On squaring both sides, then $\left(\frac{5}{6}-\frac{1}{b}\right)^2=\frac{1}{36}+\frac{1}{b^2}$

$$\Rightarrow \quad \frac{25}{36}+\frac{1}{b^2}-\frac{5}{3b}=\frac{1}{36}+\frac{1}{b^2}$$

$$\Rightarrow \quad \frac{5}{3b}=\frac{24}{36}=\frac{2}{3}$$

$$\therefore \quad b=\frac{5}{2}$$

Also, $b^2=a^2(1-e^2)$

$b^2=a^2-(ae)^2$

$$\Rightarrow \quad a^2=b^2+(ae)^2=\frac{25}{4}+36 \qquad [\because ae=6]$$

$$\Rightarrow \quad a=\frac{13}{2}$$

Hence, $(AB)(CD)=(2a)(2b)=13\times 5=65$

● ***Ex. 2*** *Let P_i and P_i' be the feet of the perpendiculars drawn from the foci S and S′ on a tangent T_i to an ellipse whose length of semi-major axis is 20. If* $\sum_{i=1}^{10}(SP_i)(S'P_i')=2560$, *then the value of eccentricity is*

(a) $\frac{1}{5}$ (b) $\frac{2}{5}$

(c) $\frac{3}{5}$ (d) $\frac{4}{5}$

Sol. (c) $\therefore$ Product of length of perpendiculars from foci on a tangent to an ellipse $= b^2$

$$\therefore \quad (SP_1)(S'P_1)=(SP_2)(S'P_2)=\ldots=(SP_{10})(S'P_{10}')=b^2$$

Given $\sum_{i=1}^{10}(SP_i)(S'P_i')=2560$

$$\Rightarrow \quad 10b^2=2560 \quad \text{or} \quad b^2=256$$

$$\text{or} \quad b=16$$

and $b^2=a^2(1-e^2)$

$$\Rightarrow \quad (16)^2=(20)^2(1-e^2)$$

$$\text{or} \quad 1-e^2=\frac{16}{25}$$

$$\text{or} \quad e^2=\frac{9}{25} \quad \text{or} \quad e=\frac{3}{5}$$

● ***Ex. 3*** *Coordinates of the vertices B and C of a ΔABC are (2, 0) and (8, 0) respectively. The vertex A is varing in such a way that* $4\tan\left(\frac{B}{2}\right).\tan\left(\frac{C}{2}\right)=1$. *Then, the locus of A is*

(a) $\frac{(x-5)^2}{25}+\frac{y^2}{16}=1$ (b) $\frac{(x-5)^2}{16}+\frac{y^2}{9}=1$

(c) $\frac{(x-5)^2}{25}+\frac{y^2}{9}=1$ (d) $\frac{(x-5)^2}{16}+\frac{y^2}{25}=1$

Sol. (a) ∵ $4\tan\left(\frac{B}{2}\right)\cdot\tan\left(\frac{C}{2}\right)=1$

$$\Rightarrow \quad 4\times\sqrt{\frac{(s-c)(s-a)}{s(s-b)}}\times\sqrt{\frac{(s-a)(s-b)}{s(s-c)}}=1$$

$$\Rightarrow \quad \frac{s-a}{s}=\frac{1}{4}$$

$$\Rightarrow \quad 3s=4a$$

$$\Rightarrow \quad 3\left(\frac{a+b+c}{2}\right)=4a$$

$$\text{or} \quad b+c=\frac{5a}{3}=10=2a_1 \quad , \qquad [\because a=BC=6]$$

Since, the sum of distances of A from two given fixed points B and C is always 10.

Here, B and C are foci.

$\therefore$ Centre $(5, 0)$ and distance between foci $= 6$

$\Rightarrow \quad 2a_1 e = 6$

$\Rightarrow \quad e = \frac{6}{10} = \frac{3}{5} \quad [\because a_1 = 5]$

and $\quad b^2 = a_1^2(1 - e^2) = 25\left(1 - \frac{9}{25}\right) = 16$ or $b = 4$

$\because$ A lies on the ellipse

$\therefore$ Locus of A is

$$\frac{(x-5)^2}{(5)^2} + \frac{(y-0)^2}{(4)^2} = 1$$

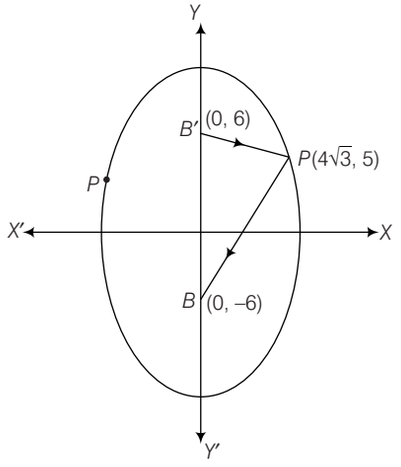
or $$\frac{(x-5)^2}{25} + \frac{y^2}{16} = 1$$

● **Ex. 4** *A ray emanating from the point* $(0, 6)$ *is incident on the ellipse* $25x^2 + 16y^2 = 1600$ *at the point P with ordinate S. After reflection, ray cuts the Y-axis at B. The length of PB is*

(a) 5 (b) 7 (c) 12 (d) 13

Sol. (d) $\because$ Ellipse is $25x^2 + 16y^2 = 1600$

or $$\frac{x^2}{8^2} + \frac{y^2}{10^2} = 1$$



Coordinating foci an $\left(0, \pm\sqrt{(10^2 - 8^2)}\right)$

i.e. $\quad (0, \pm 6)$

Let coordinates of P are $(\lambda, 5)$

$\therefore \quad \frac{\lambda^2}{8^2} + \frac{5^2}{10^2} = 1$

$\Rightarrow \quad \lambda = \pm 4\sqrt{3}$

$\therefore$ $P \equiv (\pm 4\sqrt{3}, 5)$ (lie in I or II quadrants)

According to reflection property, a ray passing through focus $B'(0, 6)$ will passing through $B(0, -6)$ (other focus). If P lies in I quadrant, then

$$PB = \sqrt{48 + (5+6)^2} = \sqrt{169} = 13$$

● **Ex. 5** *If the ellipse* $\frac{x^2}{4} + y^2 = 1$ *meets the ellipse* $x^2 + \frac{y^2}{a^2} = 1$ *in four distinct points and* $a = b^2 - 5b + 7$, *then b belongs to*

(a) $(1, 4)$ (b) $(-\infty, 2) \cup (3, \infty)$

(c) $(2, 3)$ (d) None of these

Sol. (b) The ellipse $\frac{x^2}{1^2} + \frac{y^2}{a^2} = 1$ will intersect in four distinct points with ellipse $\frac{x^2}{4} + \frac{y^2}{1} = 1$, where $a^2 > 1$

$\Rightarrow \quad a > 1 \quad [\because$ a always positive$]$

Now, $\quad a = b^2 - 5b + 7$

$\Rightarrow \quad b^2 - 5b + 7 > 1$

or $\quad b^2 - 5b + 6 > 0$

or $\quad (b-2)(b-3) > 0$

or $\quad b \in (-\infty, 2) \cup (3, \infty)$

● **Ex. 6** *The normal at a variable point P on an ellipse* $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ *of eccentricity e meets the axes of the ellipse in Q and R, then the locus of the mid-point of QR is a conic with eccentricity e′ such that*

(a) e' is independent of e (b) $e' = 1$

(c) $e' = e$ (d) $e' = \frac{1}{e}$

Sol. (c) Normal at $P(a\cos\theta, b\sin\theta)$ is

$$ax\sec\theta - by\,\mathrm{cosec}\,\theta = a^2 - b^2 \quad (\text{let } a > b)$$

It meets the axes at

$$Q\left(\frac{(a^2-b^2)}{a}\cos\theta,\ 0\right) \text{ and } R\left(0, -\frac{(a^2-b^2)}{b}\sin\theta\right)$$

Let mid-point of QR is $T(x, y)$, then

$$2x = \frac{(a^2-b^2)}{a}\cos\theta$$

or $\quad 2ax = (a^2 - b^2)\cos\theta \quad$ ...(i)

and $\quad 2y = -\frac{(a^2-b^2)}{b}\sin\theta$

or $\quad 2by = -(a^2 - b^2)\sin\theta \quad$ ...(ii)

On squaring and adding Eq. (i) and Eq.(ii), we get

$$4a^2x^2 + 4b^2y^2 = (a^2 - b^2)^2$$

$$\Rightarrow \quad \frac{x^2}{\left(\frac{a^2-b^2}{2a}\right)^2} + \frac{y^2}{\left(\frac{a^2-b^2}{2b}\right)^2} = 1$$

which is an ellipse, having eccentricity e', then

Let $\quad A = \frac{a^2-b^2}{2a},\ B = \frac{a^2-b^2}{2b}$

$$A^2 = B^2(1-e'^2) \qquad [\because B > A]$$

$$\Rightarrow \quad e'^2 = 1 - \frac{A^2}{B^2} = 1 - \frac{b^2}{a^2} = e^2$$

$$\therefore \quad e' = e$$

● ***Ex. 7*** *If the curves* $\frac{x^2}{4} + y^2 = 1$ *and* $\frac{x^2}{a^2} + y^2 = 1$ *for a suitable value of a cut on four concyclic points, the equation of the circle passing through these four points is*

(a) $x^2 + y^2 = 8$ (b) $x^2 + y^2 = 4$

(c) $x^2 + y^2 = 2$ (d) $x^2 + y^2 = 1$

Sol. (d) The equation of conic through the point of intersection of given two ellipses is

$$\left(\frac{x^2}{4} + y^2 - 1\right) + \lambda\left(\frac{x^2}{a^2} + y^2 - 1\right) = 0$$

or $$x^2\left(\frac{1}{4} + \frac{\lambda}{a^2}\right) + y^2(1+\lambda) = (1+\lambda)$$

or $$x^2\left(\frac{a^2 + 4\lambda}{4a^2(1+\lambda)}\right) + y^2 = 1$$

for circle $$\frac{a^2 + 4\lambda}{4a^2(1+\lambda)} = 1$$

$$\Rightarrow \quad \lambda = -\frac{3a^2}{4(a^2-1)}$$

Therefore, the circle is $x^2 + y^2 = 1$

● ***Ex. 8*** *If p is the length of perpendicular drawn from the origin to any normal to the ellipse* $\frac{x^2}{25} + \frac{y^2}{16} = 1$, *then the maximum value of p is*

(a) 5 (b) 4

(c) 2 (d) 1

Sol. (d) The equation of any normal at $(5\cos\theta, 4\sin\theta)$ to the ellipse $\frac{x^2}{25} + \frac{y^2}{16} = 1$ is

$$5x\sec\theta - 4y\,\mathrm{cosec}\,\theta = 9$$

$$\therefore \quad p = \frac{|0-0-9|}{\sqrt{(25\sec^2\theta + 16\,\mathrm{cosec}^2\theta)}} = \frac{9}{\sqrt{(25\tan^2\theta + 16\cot^2\theta + 41)}}$$

Now, AM ≥ GM

$$\Rightarrow \quad \frac{25\tan^2\theta + 16\cot^2\theta}{2} \geq \sqrt{25\times 16} = 20$$

$$\therefore \quad 25\tan^2\theta + 16\cot^2\theta \geq 40$$

$$\Rightarrow \quad 25\tan^2\theta + 16\cot^2\theta + 41 \geq 81$$

or $$\frac{9}{\sqrt{(25\tan^2\theta + 16\cot^2\theta + 41)}} \leq 1$$

$$\Rightarrow \quad p \leq 1$$

Thus, maximum value of p is 1.

● ***Ex. 9*** *If* $f(x)$ *is a decreasing function, then the set of values of 'k', for which the major axis of the ellipse* $\frac{x^2}{f(k^2+2k+5)} + \frac{y^2}{f(k+11)} = 1$ *is the X-axis, is*

(a) $k \in (-2, 3)$

(b) $k \in (-3, 2)$

(c) $k \in (-\infty, -3) \cup (2, \infty)$

(d) $k \in (-\infty, -2) \cup (3, \infty)$

Sol. (b) $\because$ $f(x)$ is a decreasing function and for major axis to be X-axis.

$$\therefore \quad f(k^2+2k+5) > (f(k+11)$$

$$\Rightarrow \quad k^2 + 2k + 5 < k + 11$$

or $$k^2 + k - 6 < 0$$

or $$(k+3)(k-2) < 0$$

or $$k \in (-3, 2)$$

● ***Ex. 10*** *If a tangent of slope 2 of the ellipse* $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ *is normal to the circle* $x^2 + y^2 + 4x + 1 = 0$, *then the maximum value of ab is*

(a) 1 (b) 2

(c) 4 (d) 8

Sol. (c) Equation of tangent is $y = 2x + \sqrt{(4a^2 + b^{2)}}$

This is normal to the circle

$$x^2 + y^2 + 4x + 1 = 0$$

This tangent passes through $(-2, 0)$, then

$$0 = -4 + \sqrt{(4a^2 + b^2)}$$

$$\Rightarrow \quad 4a^2 + b^2 = 16$$

$$\because \quad AM \geq GM$$

$$\therefore \quad \frac{4a^2 + b^2}{2} \quad \sqrt{(4a^2)(b^2)}$$

$$\Rightarrow \quad \frac{16}{2} \geq 2ab$$

or $$ab \leq 4$$

Hence, maximum value of ab is 4.

JEE Type Solved Examples :
More than One Correct Option Type Questions

■ This section contains **5 multiple choice examples.** Each example has four choices (a), (b), (c) and (d) out of which **MORE THAN ONE** may be correct.

● ***Ex. 11*** *Extremities of the latusrectum of the ellipse* $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1 (a>b)$ *having a given major axis* $2a$ *lies on*

(a) $x^2 = a(a-y)$ (b) $x^2 = a(a+y)$

(c) $y^2 = a(a+x)$ (d) $y^2 = a(a-x)$

Sol. (a, b) $\because$ Extremities of the latusrectum are $\left(ae, \pm\frac{b^2}{a}\right)$

Let $x = \pm ae$ and $y = \pm\frac{b^2}{a}$

or $x^2 = a^2e^2$ and $b^2 = \pm ay$

or $x^2 = a^2 - b^2$ and $b^2 = \pm ay$

$\therefore$ $x^2 = a^2 \pm ay$ or $x^2 = a(a \pm y)$

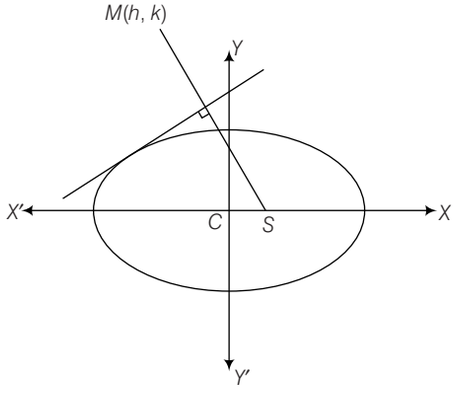
● ***Ex. 12*** *The locus of the image of the focus of the ellipse* $\frac{x^2}{25}+\frac{y^2}{9}=1$, *with respect to any of the tangent to the ellipse is*

(a) $(x+4)^2 + y^2 = 100$ (b) $(x+2)^2 + y^2 = 50$

(c) $(x-4)^2 + y^2 = 100$ (d) $(x-2)^2 + y^2 = 50$

Sol. (a, c) Let $M(h, k)$ be the image SM cuts a tangent at a point which lies on the auxiliary circle of the ellipse, therefore

$\left(\frac{h \pm 4}{2}\right)^2 + \frac{k^2}{4} = (5)^2$ [$\because$ foci of the given ellipse are $(\pm 4, 0)$]



or $(h \pm 4)^2 + k^2 = 100$

Hence, the locus is $(x \pm 4)^2 + y^2 = 100$

● ***Ex. 13*** *A tangent to the ellipse* $4x^2 + 9y^2 = 36$ *is cut by the tangent at the extremities of the major axis at* T *and* T'. *The circle* TT' *as diameter passes through the point*

(a) $(-\sqrt{5}, 0)$ (b) $(\sqrt{5}, 0)$

(c) $(\sqrt{3}, 0)$ (d) $(-\sqrt{3}, 0)$

Sol. (a, b) Given equation of the ellipse is $4x^2 + 9y^2 = 36$

i.e., $\frac{x^2}{9}+\frac{y^2}{4}=1$ ...(i)

The equation of tangent at $(3\cos\theta, 2\sin\theta)$ is

$$\frac{x}{3}\cos\theta + \frac{y}{2}\sin\theta = 1$$

which meets the tangent at $x = 3$ and $x = -3$ at the extremities of major axis

$$T \equiv \left(3, \frac{2(1-\cos\theta)}{\sin\theta}\right)$$

and $$T' \equiv \left(-3, \frac{2(1+\cos\theta)}{\sin\theta}\right)$$

$\therefore$ Equation of circle on TT' as diameter is

$$(x-3)(x+3) + \left(y - \frac{2(1-\cos\theta)}{\sin\theta}\right)\left(y - \frac{2(1+\cos\theta)}{\sin\theta}\right) = 0$$

$\Rightarrow$ $$x^2 + y^2 - \frac{4}{\sin\theta}\cdot y - 5 = 0$$

or $$(x^2 + y^2 - 5) - \frac{4}{\sin\theta}y = 0$$ ...(ii)

Clearly Eq. (ii), passes through point of intersection of

$$x^2 + y^2 - 5 = 0 \text{ and } y = 0 \text{ i.e., } (\pm\sqrt{5}, 0)$$

● ***Ex. 14*** *Consider the ellipse* $\frac{x^2}{\tan^2\alpha}+\frac{y^2}{\sec^2\alpha}=1$, *where* $\alpha \in (0, \pi/2)$. *Which of the following quantities would vary as* α *varies?*

(a) degree of flatness (b) ordinate of the vertex

(c) coordinate of the foci (d) length of latusrectum

Sol. (a, b, d) In $\alpha \in (0, \pi/2)$

$$\sec^2\alpha > \tan^2\alpha$$

$\therefore$ Coordinates of foci $(0, \pm\sqrt{(\sec^2\alpha + \tan^2\alpha)})$ i.e., $(0, \pm 1)$ which is independent of α.

Vertices are $(0, \pm\sec\alpha)$ and latusrectum

$$= \frac{2a^2}{b} = \frac{2\tan^2\alpha}{\sec\alpha}$$

$\because$ $\alpha \in (0, \pi/2)$

$\Rightarrow$ $\tan\alpha \in (0, \infty)$ and $\sec\alpha \in (1, \infty)$

Hence, $\alpha \propto$ degree of flatness.

● ***Ex. 15*** *Let $A(\theta)$ and $B(\phi)$ be the extremities of a chord of an ellipse. If the slope of AB is equal to the slope of the tangent at a point $C(\alpha)$ on the ellipse, then the value of α is*

(a) $\frac{\theta+\phi}{2}$ (b) $\frac{\theta-\phi}{2}$

(c) $\frac{\theta+\phi}{2}+\pi$ (d) $\frac{\theta+\phi}{2}-\pi$

Sol. (a. c) $\because$ Slope of AB = Slope of tangent at C

$$\Rightarrow \left(\frac{b\sin\phi - b\sin\theta}{a\cos\phi - a\cos\theta}\right) = -\frac{b}{a}\frac{\cos\alpha}{\sin\alpha}$$

$$\Rightarrow \frac{b.2\cos\left(\frac{\theta+\phi}{2}\right).\sin\left(\frac{\phi-\theta}{2}\right)}{-a.2\sin\left(\frac{\theta+\phi}{2}\right).\sin\left(\frac{\phi-\theta}{2}\right)} = -\frac{b}{a}\cot\alpha$$

$$\therefore \tan\alpha = \tan\left(\frac{\theta+\phi}{2}\right)$$

$$\Rightarrow \alpha = n\pi + \left(\frac{\theta+\phi}{2}\right), n \in I$$

JEE Type Solved Examples : Paragraph Based Questions

■ This section contains **2 solved Paragraphs** based upon each of the Paragraph **3 multiple choice** questions have to be answered. Each of these questions has four choices (a), (b), (c) and (d) out of which **ONLY ONE** is correct.

Paragraph I

(Q. Nos. 16 to 18)

A sequence of ellipses $E_1, E_2, E_3, \ldots, E_n$ is constructed as follows : Ellipse E_n is drawn so as to touch ellipse E_{n-1} as the extremities of the major axis of E_{n-1} and to have its foci at the extremities of the mirror axis of E_{n-1}.

16. If E_n is independent of n, then the eccentricity of ellipse E_{n-2} is

(a) $\left(\frac{3-\sqrt{5}}{2}\right)$ (b) $\left(\frac{\sqrt{5}-1}{2}\right)$

(c) $\left(\frac{2-\sqrt{3}}{2}\right)$ (d) $\left(\frac{\sqrt{3}-1}{2}\right)$

17. If eccentricity of ellipse E_n is e_n, then the locus of (e_n^2, e_{n-1}^2) is

(a) a parabola (b) an ellipse

(c) a hyperbola (d) a rectangular hyperbola

18. If equation of ellipse E_1 is $\frac{x^2}{9}+\frac{y^2}{16}=1$, then the equation of ellipse E_3 is

(a) $\frac{x^2}{9}+\frac{y^2}{16}=1$ (b) $\frac{x^2}{25}+\frac{y^2}{49}=1$

(c) $\frac{x^2}{25}+\frac{y^2}{41}=1$ (d) $\frac{x^2}{16}+\frac{y^2}{25}=1$

Sol.

16. (b) If $E_n : \frac{x^2}{a_n^2}+\frac{y^2}{b_n^2}=1$ and eccentricity of E_n is e_n

If $a_n > b_n$

Then, $b_n^2 = a_n^2(1-e_n^2)$ ...(i)

According to the question, $b_n = b_{n-1}$ ...(ii)

and $a_{n-1} = a_n e_n$ ...(iii)

For ellipse E_{n-1}, $a^2_{n-1} = b^2_{n-1}(1-e^2_{n-1})$ ...(iv)

From Eqs. (i) and (ii), we get $b^2_{n-1} = a_n^2(1-e_n^2)$ ...(v)

Substituting the values of a_{n-1} and b^2_{n-1} from Eqs. (iii) and (v) in Eq. (iv), then

$$a_n^2 e_n^2 = a_n^2(1-e_n^2)(1-e^2_{n-1})$$

$$\Rightarrow e_n^2 = (1-e_n^2)(1-e^2_{n-1}) \quad \text{...(vi)}$$

$\because$ E_n is independent of n

$\therefore$ $e_n = e_{n-1} = e$ [say]

From Eq. (vi), we get

$$e^2 = (1-e^2)^2$$

$$\Rightarrow e^4 - 3e^2 + 1 = 0$$

$$\therefore e^2 = \frac{3\pm\sqrt{5}}{2} = \frac{6\pm 2\sqrt{5}}{4} = \left(\frac{\sqrt{5}\pm 1}{2}\right)^2$$

$$\therefore e = \frac{\sqrt{5}-1}{2} \quad [\because 0 < e < 1]$$

17. (d) From Eq. (vi), $e_n^2 = (1-e_n^2)(1-e^2_{n-1})$

Locus of (e_n^2, e^2_{n-1}) is

$$x = (1-x)(1-y)$$

$$\Rightarrow xy - 2x - y + 1 = 0$$

Here, $a=0, b=0, c=1,$

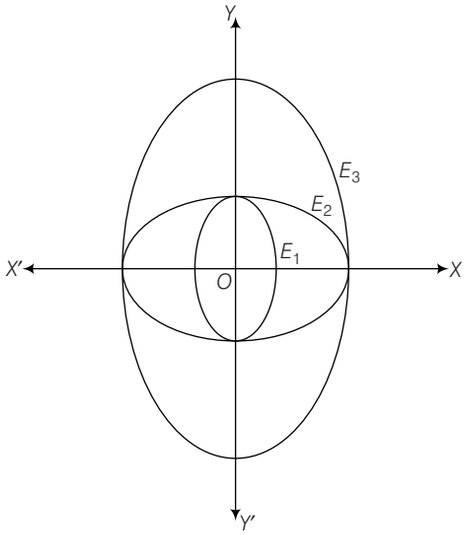
$$f = -\frac{1}{2}, g = -1, h = \frac{1}{2}$$

$$\therefore \Delta = 0 + 2\times -\frac{1}{2}\times -1\times\frac{1}{2} - 0 - 0 - 1\times\frac{1}{4} = \frac{1}{4} \neq 0$$

and $h^2 > ab, a+b=0$

$\Rightarrow$ rectangular hyperbola.

18. (c) From Eq. (vi), $e_n = \sqrt{\left(\frac{1-e_{n-1}^2}{2-e_{n-1}^2}\right)}$ ...(vii)



$\because \quad E_1 \equiv \frac{x^2}{9} + \frac{y^2}{16} = 1$

$\therefore \quad a_1 = 3, b_1 = 4$ and $9 = 16(1 - e_1^2)$

$\therefore \quad e_1 = \frac{\sqrt{7}}{4}$

From Eq. (vii), $e_2 = \sqrt{\left(\frac{1-e_1^2}{2-e_1^2}\right)} = \sqrt{\left(\frac{1-\frac{7}{16}}{2-\frac{7}{16}}\right)} = \frac{3}{5}$

and then, $e_3 = \sqrt{\left(\frac{1-\frac{9}{25}}{2-\frac{9}{25}}\right)} = \frac{4}{\sqrt{41}}$

Also, $a_1 = a_2 e_2$ and $b_1 = b_2$

$\therefore \quad b_2 = 4 = b_3 e_3 \Rightarrow b_3 = \sqrt{41}$

and $a_3^2 = b_3^2(1 - e_3^2) = 41\left(1 - \frac{16}{41}\right) = 25$

$\therefore$ Ellipse E_3 is $\frac{x^2}{25} + \frac{y^2}{41} = 1$

Paragraph II

(Q. Nos. 19 to 21)

Consider an ellipse $E : \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, *centred at point 'O' and having AB and CD as its major and minor axes respectively if* S_1 *be one of the focus of the ellipse, radius of incircle of* ΔOCS_1 *be 1 unit and* $OS_1 = 6$ *units.*

19. If area of ellipse (E) is Δ sq unit, then the value of 4Δ is

(a) 63π (b) 64π (c) 65π (d) 66π

20. If perimeter of ΔOCS_1 is p units, then the value of p is

(a) 10 (b) 15 (c) 20 (d) 25

21. The equation of the director circle of (E) is

(a) $x^2 + y^2 = 48.5$ (b) $x^2 + y^2 = 97$

(c) $x^2 + y^2 = \sqrt{48.5}$ (d) $x^2 + y^2 = \sqrt{97}$

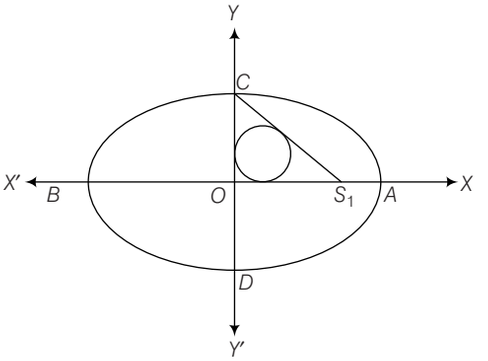
Sol.

$\because \quad OS_1 = ae = 6, OC = b$

$\therefore \quad CS_1 = \sqrt{(OS_1)^2 + (OC)^2} = \sqrt{(a^2e^2 + b^2)} = a$

Area of $\Delta OCS_1 = \frac{1}{2} \times (OS_1) \times (OC) = \frac{1}{2} \times 6 \times b = 3b$

and semi-perimeter of $\Delta OCS_1 = \frac{1}{2}(OS_1 + OC + CS_1) = \frac{1}{2}(6 + a + b)$



$\because$ In radius of $\Delta OCS_1 = 1$

$\therefore \quad \frac{3b}{\frac{1}{2}(6 + a + b)} = 1$

$\Rightarrow \quad b = \frac{1}{5}(6 + a)$ ...(i)

Also, $b^2 = a^2(1 - e^2) = a^2 - 36$ ...(ii)

From Eqs. (i) and (ii), we get

$$\frac{1}{25}(6 + a)^2 = a^2 - 36$$

$\Rightarrow \quad 2a^2 - a - 78 = 0$

or $a = \frac{13}{2}, -6$

19. (c) $\therefore \quad a = \frac{13}{2}$ and $b = \frac{5}{2}$ [from Eq. (i)]

$\because \quad \Delta = \pi ab = \pi \times \frac{13}{2} \times \frac{5}{2}$

$\therefore \quad 4\Delta = 65\pi$

20. (b) $p = (OS_1 + OC + CS_1) = 6 + b + a$

$$= 6 + \frac{5}{2} + \frac{13}{2} = 15$$

21. (a) Equation of director circle of E is

$$x^2 + y^2 = a^2 + b^2$$

$$= \frac{169 + 25}{4} = 48.5$$

JEE Type Solved Examples :
Single Integer Answer Type Questions

■ This section contains **2 examples.** The answer to each example is a **single digit integer**, ranging from 0 to 9 (both inclusive).

● ***Ex. 22*** *If the normals at the four points* $(x_1, y_1), (x_2, y_2)$, (x_3, y_3) *and* (x_4, y_4) *on the ellipse* $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ *are concurrent, then the value of* $\left(\sum_{i=1}^{4} x_i\right)\left(\sum_{i=1}^{4}\frac{1}{x_i}\right)$ *is*

Sol. **(4)** Let point of concurrent is (h, k).

Equation of normal at (x', y') is

$$\frac{x-x'}{x'a^2}=\frac{y-y'}{y'b^2}$$

It is passes through (h, k), then

$$y'^2\{a^2(h-x')+b^2x'^2\}=b^4k^2x'^2 \qquad ...(i)$$

But $$\frac{x'^2}{a^2}+\frac{y'^2}{b^2}=1 \text{ or } y'^2=\frac{b^2}{a^2}(a^2-x'^2) \qquad ...(ii)$$

Value of y'^2 from Eq. (ii), putting in Eq. (i), we get

$$\frac{b^2}{a^2}(a^2-x'^2)\{a^2h+(b^2-a^2)x'\}^2=b^4k^2x'^2$$

$$\Rightarrow \quad \frac{b^2}{a^2}(a^2-x'^2)\{a^4h^2+(b^2-a^2)^2x'^2+2a^2hx'(b^2-a^2)\}$$

$$=b^4k^2x'^2$$

Arranging above as a fourth degree equation in x', we get

$$\Rightarrow \quad -(a^2-b^2)^2x'^4+2ha^2(a^2-b^2)x'^3+x'^2(\ldots)$$

$$-2a^4h(a^2-b^2)x'+a^6h^2=0$$

above equation being of fourth degree in x', therefore roots of the above equation are x_1, x_2, x_3, x_4, then

$$(x_1+x_2+x_3+x_4)=-\frac{2ha^2(a^2-b^2)}{-(a^2-b^2)^2}=\frac{2ha^2}{(a^2-b^2)} \qquad ...(iii)$$

$$\left(\frac{1}{x_1}+\frac{1}{x_2}+\frac{1}{x_3}+\frac{1}{x_4}\right)=\frac{\Sigma x_1x_2x_3}{x_1\cdot x_2\cdot x_3\cdot x_4}$$

$$=\frac{\frac{2a^4h(a^2-b^2)}{-(a^2-b^2)^2}}{\frac{a^6h^2}{-(a^2-b^2)^2}}=\frac{2(a^2-b^2)}{a^2h} \qquad ...(iv)$$

Multiplying Eqs. (iii) and (iv), we get

$$(x_1+x_2+x_3+x_4)\left(\frac{1}{x_1}+\frac{1}{x_2}+\frac{1}{x_3}+\frac{1}{x_4}\right)=4$$

or $$\left(\sum_{i=1}^{4}x_i\right)\left(\sum_{i=1}^{4}\frac{1}{x_i}\right)=4$$

● ***Ex. 23*** *If* $x, y \in R$, *satisfies the equation* $\frac{(x-4)^2}{4}+\frac{y^2}{9}=1$, *then the difference between the largest and the smallest value of the expression* $\frac{x^2}{4}+\frac{y^2}{9}$ *is*

Sol. **(8)** Parametric coordinates on $\frac{(x-4)^2}{4}+\frac{y^2}{9}=1$ are

$(4+2\cos\theta, 3\sin\theta)$

Now, let $$E=\frac{x^2}{4}+\frac{y^2}{9}$$

$$=\frac{(4+2\cos\theta)^2}{4}+\frac{(3\sin\theta)^2}{9}$$

$$=(2+\cos\theta)^2+\sin^2\theta$$

$$=4+4\cos\theta+\cos^2\theta+\sin^2\theta$$

$$=5+4\cos\theta$$

$\therefore$ $E_{max}=5+4(1)=9$ $\quad (\because -1\le\cos\theta\le 1)$

and $E_{min}=5+4(-1)=1$

Hence, $E_{max}-E_{min}=9-1=8$

JEE Type Solved Examples : Matching Type Questions

■ This section contains **only one example**. This example has four statements (A, B, C and D) given in **Column I** and four statements (p, q, r and s) in **Column II.** Any given statement in **Column I** can have correct matching with one or more statement(s) given in **Column II.**

● ***Ex. 24*** *Match the following*

	Column I	Column II
A.	Let $f(x)=\begin{cases} a^x, & x<2 \\ 8, & x=2 \\ \dfrac{b(x^2-b^2)}{(x-2)}, & x>2 \end{cases}$ If f is continuous at $x=2$, then the locus of the pair of perpendicular tangents to the ellipse $\dfrac{x^2}{a^2}+\dfrac{y^2}{b^2}=1$ is $x^2+y^2=r^2$, then r^2 is divisible by	(p) 3
B.	If the ellipse $\dfrac{(x-h)^2}{M}+\dfrac{(y-k)^2}{N}=1$ has major axis on the line $y=2$, minor-axis on the line $x=-1$, major axis has length 10 and minor axis has length 4. Then, $h+k+M+N$ is divisible by	(q) 4
C.	If PQ is a focal chord of ellipse $\dfrac{x^2}{25}+\dfrac{y^2}{16}=1$, which passes through $S(3,0)$ and $PS=2$, then length of PQ is divisible by	(r) 5
D.	A tangent to the ellipse $\dfrac{x^2}{27}+\dfrac{y^2}{48}=1$ having slope $\left(-\dfrac{4}{3}\right)$ cuts the x and y-axis at the points A and B respectively. If O is the origin, then area of ΔOAB is divisible by	(s) 6

Sol. (A) → (p, q, s); (B) → (p, r, s); (C) → (r); (D) → (p, q, s)

(A) $\underset{x\to 2^-}{Lt} f(x)=\underset{x\to 2^+}{Lt} f(x)=f(2)$

$\Rightarrow \underset{h\to 0}{Lt}\, a^{2-h}=\underset{h\to 0}{Lt}\dfrac{b((2+h)^2-b^2)}{2+h-2}=8$

$\Rightarrow a^2=b\underset{h\to 0}{Lt}\dfrac{(2+h)^2-b^2}{h}=8$

at $h\to 0,(2+h)^2-b^2\to 0$

$\therefore b^2=4$ and $a^2=8$

$\therefore$ Locus of the pair of perpendicular tangents to the ellipse

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$$

$\therefore$ Required locus is

$$x^2+y^2=a^2+b^2=8+`4=12$$

$\Rightarrow r^2=12$

(B) $\because$ Major axis on the line $y=2$ and minor axis on the line $x=-1$

$\therefore$ Centre of ellipse is $(-1,2)$

$\Rightarrow h=-1, k=2$

Also, $2a=10$ and $2b=4$

$\therefore M=a^2=25$

and $N=b^2=4$

Now, $h+k+M+N=-1+2+25+4=30$

(C) Here, $a=5, b=4$

$\because b^2=a^2(1-e^2) \Rightarrow 16=25(1-e^2)$

$\therefore e=\dfrac{3}{5}$

Foci $(\pm 3, 0)$

Here, $SA=2$ [A and A' are vertices]

Also gives $PS=2$

$\therefore$ P coincides with A and Q coincides with A'

$\therefore PQ=2a=10$

(D) Let $(\sqrt{27}\cos\theta, \sqrt{48}\sin\theta)$ be a point on the ellipse $\dfrac{x^2}{27}+\dfrac{y^2}{48}=1$

$\therefore$ Equation of tangent at $(\sqrt{27}\cos\theta, \sqrt{48}\sin\theta)$ is

$$\frac{x\cos\theta}{\sqrt{27}}+\frac{y\sin\theta}{\sqrt{48}}=1$$

$\therefore$ slope $=-\dfrac{\sqrt{48}}{\sqrt{27}}\cdot\dfrac{\cos\theta}{\sin\theta}=-\dfrac{4}{3}$ [given]

$\therefore \tan\theta=1$

$\Rightarrow \theta=\dfrac{\pi}{4}$

$\therefore$ Equation of tangent is $\dfrac{x}{\sqrt{54}}+\dfrac{y}{\sqrt{96}}=1$

$\therefore$ Area of triangle $=\dfrac{1}{2}\times 3\sqrt{6}\times 4\sqrt{6}=36$

JEE Type Solved Examples :
Statement I and II Type Questions

■ **Directions** (Ex. Nos. 25 and 26) are Assertion. Reason type examples. Each of these examples contains two statements.

Statement I (Assertion) and **Statement II** (Reason)

Each of these example also has four alternative choices, only one of which is the correct answer. You have to select the correct choice as given below.

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for statement I

(b) Statement I is true, Statement II is true, Statement II is not a correct explanation for Statement I

(c) Statement I is true, Statement II is flase

(d) Statement I is false, Statement II is true

● ***Ex. 25*** **Statement I** *Feet of perpendiculars drawn from foci of an ellipse* $4x^2 + y^2 = 16$ *on the line* $2\sqrt{3}x + y = 8$ *lie on the circle* $x^2 + y^2 = 16$.

Statement II *If perpendiculars are drawn from foci of an ellipse to its any tangent, the feet of these perpendiculars lie on director circle of the ellipse.*

Sol. (c) Simultaneously solving the equations of ellipse and the given line, we get

$$4x^2 + (8 - 2\sqrt{3}x)^2 = 16$$

$$\Rightarrow \quad x^2 + (4 - \sqrt{3}x)^2 = 4$$

$$\Rightarrow \quad 4x^2 - 8\sqrt{3}\,x + 12 = 0$$

$$\text{or} \quad x^2 - 2\sqrt{3}x + 3 = 0$$

$$\text{or} \quad (x - \sqrt{3})^2 = 0$$

$\therefore\ 2\sqrt{3}x + y = 8$ is a tangent to the ellipse, the auxiliary circle is $x^2 + y^2 = 16$.

Hence, Statement I is true and Statement II is false.

● ***Ex. 26*** **Statement II** *The condition on a and b for which two distinct chords of the ellipse* $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 2$ *passing through* $(a, -b)$ *are bisected by the line* $x + y = b$ *is* $a^2 + 6ab - 7b^2 > 0$.

Statement II *Equation of chord of the ellipse* $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ *whose mid-point* (x_1, y_1) *is* $T = S_1$

Sol. (a) Let $(\lambda, b - \lambda)$ is a point on the line $x + y = b$, then equation of chord whose mid-point $(\lambda, b - \lambda)$ is $T = S_1$

$$\text{or} \quad \frac{\lambda x}{2a^2} + \frac{(b-\lambda)y}{2b^2} - 1 = \frac{\lambda^2}{2a^2} + \frac{(b-\lambda)^2}{2b^2} - 1 \qquad \ldots(i)$$

$(a, -b)$ lies on Eq. (i), then

$$\frac{\lambda a}{2a^2} - \frac{b(b-\lambda)}{2b^2} = \frac{\lambda^2}{2a^2} + \frac{(b-\lambda)^2}{2b^2}$$

$$\Rightarrow \quad \lambda^2(a^2 + b^2) - ab\lambda(3a + b) + 2a^2b^2 = 0$$

For two distinct chords $D > 0$

$$\Rightarrow \quad a^2b^2(3a + b)^2 - 8a^2b^2(a^2 + b^2) > 0$$

$$\Rightarrow \quad a^2 + 6ab - 7b^2 > 0$$

Hence, both Statements are true and Statement II is correct explanation for Statement I.

Subjective Type Questions

■ In this section, there are **12 subjective solved examples.**

● ***Ex. 27*** *Find the locus of the centroid of an equilateral triangle inscribed in the ellipse*

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1.$$

Sol. Let the vertices of the equilateral triangle P, Q and R and whose eccentric angles are α, β and γ.

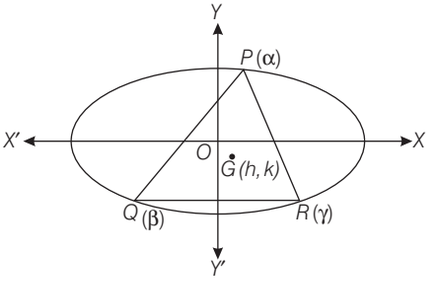
Let the centroid of ΔPQR be (h, k) then

$$h = \frac{a}{3}(\cos\alpha + \cos\beta + \cos\gamma) \qquad \ldots(i)$$

$$\text{and} \quad k = \frac{b}{3}(\sin\alpha + \sin\beta + \sin\gamma) \qquad \ldots(ii)$$

$\because\ \Delta PQR$ is equilateral.

$\therefore$ Centroid of the ΔPQR is same as the circumcentre.



$\because$ Circumcentre of ΔPQR be

$$h=\frac{(a^2-b^2)}{4a}\{\cos\alpha+\cos\beta+\cos\gamma+\cos(\alpha+\beta+\gamma)\}$$

$$\left.\begin{matrix}\text{Concyclic points}\\ \text{Coro : 2}\end{matrix}\right\}$$

$$k=\frac{(b^2-a^2)}{4b}\{\sin\alpha+\sin\beta+\sin\gamma-\sin(\alpha+\beta+\gamma)\}$$

Using Eqs. (i) and (ii), then

$$\cos(\alpha+\beta+\gamma)=h\left(\frac{4a}{a^2-b^2}-\frac{3}{a}\right)=\frac{h(a^2+3b^2)}{a(a^2-b^2)} \quad ...(iii)$$

and $$\sin(\alpha+\beta+\gamma)=\frac{(3a^2+b^2)k}{b(a^2-b^2)} \quad ...(iv)$$

Squaring and adding Eqs. (iii) and (iv), we get

$$\therefore \quad I=\frac{(a^2+3b^2)^2}{a^2(a^2-b^2)^2}h^2+\frac{(3a^2+b^2)^2}{b^2(a^2-b^2)^2}k^2$$

Hence, locus of (h,k) is

$$\frac{(a^2+3b^2)^2}{a^2}x^2+\frac{(3a^2+b^2)^2}{b^2}y^2=(a^2-b^2)^2.$$

● ***Ex. 28*** *If the normals to* $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ *at the ends of the chords* $lx+my=1$ *and* $l'x+m'y=1$ *be concurrent; show that* $a^2ll'=b^2mm'=-1$.

Sol. Let these normals meet in (h,k), then their feet lie on the curve

$$b^2x(k-y)+a^2y(x-h)=0$$

$$\Rightarrow \quad (a^2-b^2)xy+b^2kx-a^2hy=0$$

$\therefore$ The locus passes through the points where the lines

$$lx+my-1=0 \quad \text{and} \quad l'x+m'y-1=0$$

meet the given ellipse,

$$\left(\frac{x^2}{a^2}+\frac{y^2}{b^2}-1\right)-\lambda(lx+my-1)(l'x+m'y-1)$$

$$\equiv(a^2-b^2)xy+b^2kx-a^2hy$$

Comparing the co-efficients of x^2, y^2 and constant terms.

$$\frac{1}{a^2}-\lambda ll'=0, \frac{1}{b^2}-\lambda mm'=0, -1-\lambda=0$$

$$\therefore \quad \frac{1}{a^2}+ll'=0 \quad \text{and} \quad \frac{1}{b^2}+mm'=0 \qquad (\because \lambda=-1)$$

$$\therefore \quad a^2ll'=b^2mm'=-1$$

● ***Ex. 29*** *An ellipse slides between two straight lines at right angles to each other. Show that the locus of its centre is a circle.*

Sol. Let the length of major and minor axes of an ellipse are $2a$ and $2b$ and if the centre of the ellipse be $C(h,k)$

If $S(x_1,y_1)$ and $S'(x_2,y_2)$ be two foci of the ellipse, then

$$SS'=2ae$$

$$\Rightarrow (x_1-x_2)^2+(y_1-y_2)^2=4a^2e^2$$

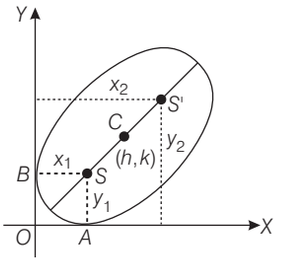
$$\Rightarrow (x_1+x_2)^2-4x_1x_2+(y_1+y_2)^2$$

$$-4y_1y_2=4(a^2-b^2)$$

$$\Rightarrow$$

$$(2h)^2+(2k)^2-4(x_1x_2+y_1y_2)$$

$$=4(a^2-b^2) \quad ...(i)$$



Since, the ellipse always slides between the two fixed lines OX and OY, they are always tangents to it. Therefore y_1, y_2 and x_1, x_2 are perpendicular distances of the foci from their tangents whose product are always b^2.

Hence, $$x_1x_2=y_1y_2=6^2$$

$\Rightarrow$ Eq. (i) becomes

$$4h^2+4k^2-8b^2=4(a^2-b^2)$$

$$\Rightarrow \quad h^2+k^2=a^2+b^2$$

$\therefore$ Locus of the centre (h,k) is the circle

$$x^2+y^2=a^2+b^2$$

● ***Ex. 30*** *Triangles are formed by pairs of tangents drawn from any point on the ellipse* $a^2x^2+b^2y^2=(a^2+b^2)^2$ *to the ellipse* $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, *and the chord of contact. Show that the orthocentre of each such triangles lies on the ellipse.*

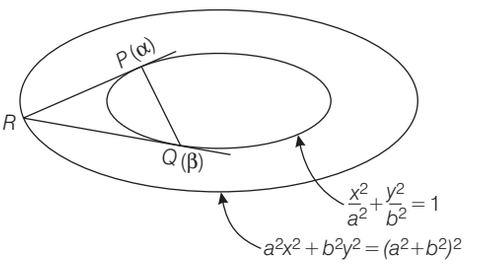
Sol. Let the coordinates of P and Q on the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ are

$$P\equiv(a\cos\alpha, b\sin\alpha) \quad \text{and} \quad Q=(a\cos\beta, b\sin\beta)$$

Equation of tangents at P and Q are

$$\frac{x}{a}\cos\alpha+\frac{y}{b}\sin\alpha=1 \quad ...(i)$$

and $$\frac{x}{a}\cos\beta+\frac{y}{b}\sin\beta=1 \quad ...(ii)$$



Point of intersection of Eqs. (i) and (ii) are

$$R\left\{a\frac{\cos\left(\frac{\alpha+\beta}{2}\right)}{\cos\left(\frac{\alpha-\beta}{2}\right)}, b\frac{\sin\left(\frac{\alpha+\beta}{2}\right)}{\cos\left(\frac{\alpha-\beta}{2}\right)}\right\}$$

This point R lies on the ellipse

$$a^2x^2 + b^2y^2 = (a^2 + b^2)^2$$

$$\Rightarrow \quad a^4\cos^2\left(\frac{\alpha+\beta}{2}\right) + b^4\sin^2\left(\frac{\alpha+\beta}{2}\right) = (a^2+b^2)^2\cos^2\left(\frac{\alpha-\beta}{2}\right) \quad ...(iii)$$

The equation of the line of perpendicular from Q on the tangent at P is

$$a\sin\alpha(x - a\cos\beta) - b\cos\alpha(y - b\sin\beta) = 0 \quad ...(iv)$$

Similarly the equation to other perpendicular will be

$$a\sin\beta(x - a\cos\beta) - b\cos\beta(y - b\sin\alpha) = 0 \quad ...(v)$$

On solving Eqs. (iv) and (v), we get

$$x = \frac{a^3}{a^2+b^2}\cdot\frac{\cos\left(\frac{\alpha+\beta}{2}\right)}{\cos\left(\frac{\alpha-\beta}{2}\right)} \quad \text{and} \quad y = \frac{b^3}{a^2+b^2}\cdot\frac{\sin\left(\frac{\alpha+\beta}{2}\right)}{\cos\left(\frac{\alpha-\beta}{2}\right)}$$

Since, this orthocentre lies on ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

then, $a^4\cos^2\left(\frac{\alpha+\beta}{2}\right) + b^4\sin^2\left(\frac{\alpha+\beta}{2}\right) = (a^2+b^2)^2\cos^2\left(\frac{\alpha-\beta}{2}\right)$ ...(vi)

which is true by Eq. (iii).

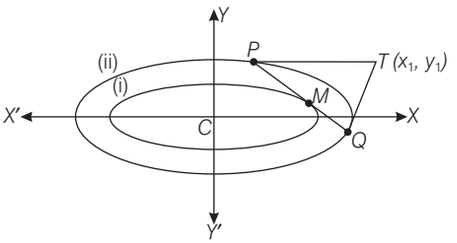
Hence, the orthocentre of the triangle lies on the ellipse.

● ***Ex. 31*** *Show that the tangents drawn at those points of the ellipse* $\frac{x^2}{a} + \frac{y^2}{b} = (a+b)$, *where it is cut by any tangent to* $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, *intersect at right angles.*

Sol. The given ellipses, are

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad ...(i)$$

$$\frac{x^2}{a(a+b)} + \frac{y^2}{b(a+b)} = 1 \quad ...(ii)$$



Chord of contact of (x_1, y_1) w.r.t ellipse (ii) is

$$\frac{xx_1}{a(a+b)} + \frac{yy_1}{b(a+b)} = 1 \quad ...(iii)$$

or $$lx + my = n \quad \text{(say)}$$

If it touches $$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

then $$a^2l^2 + b^2m^2 = n^2 \quad \text{[from corollary]}$$

$$\Rightarrow \quad \frac{a^2x_1^2}{a^2(a+b)^2} + \frac{b^2y_1^2}{b^2(a+b)^2} = 1$$

$$\Rightarrow \quad x_1^2 + y_1^2 = (a+b)^2$$

Locus of $T(x_1, y_1)$ is $x^2 + y^2 = (a+b)^2$

$$= a(a+b) + b(a+b)$$

which is the director circle of (ii).

Hence, PT and TQ are intersect at right angle.

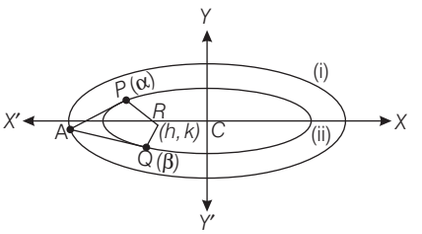
● ***Ex. 32*** *From any point on the conic* $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 4$, *tangents are drawn to the conic* $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$. *Prove that the normals at the points of contact meet on the conic*

$$a^2x^2 + b^2y^2 = \frac{1}{4}(a^2 - b^2)^2.$$

Sol. Equations of concentric ellipses are

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 4 \quad ...(i)$$

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad ...(ii)$$



Let points $P(a\cos\alpha, b\sin\alpha)$ and $Q(a\cos\beta, b\sin\beta)$ on the ellipse (ii). Equation of tangents at P and Q are

$$\frac{x}{a}\cos\alpha + \frac{y}{b}\sin\alpha = 1 \quad ...(iii)$$

and $$\frac{x}{a}\cos\beta + \frac{y}{b}\sin\beta = 1 \quad ...(iv)$$

Point of intersection of Eqs. (iii) and (iv) is

$$A\left\{\frac{a\cos\left(\frac{\alpha+\beta}{2}\right)}{\cos\left(\frac{\alpha-\beta}{2}\right)}, \frac{b\sin\left(\frac{\alpha+\beta}{2}\right)}{\cos\left(\frac{\alpha-\beta}{2}\right)}\right\}$$

this point A satisfy Eq.(i)

$$\therefore \quad \frac{\cos^2\left(\frac{\alpha+\beta}{2}\right)}{\cos^2\left(\frac{\alpha-\beta}{2}\right)} + \frac{\sin^2\left(\frac{\alpha+\beta}{2}\right)}{\cos^2\left(\frac{\alpha-\beta}{2}\right)} = 4$$

$$\Rightarrow \quad 1 = 4\cos^2\left(\frac{\alpha-\beta}{2}\right), \frac{1}{2}$$

$$= 1 + \cos(\alpha-\beta)$$

$$\therefore \quad \cos(\alpha-\beta) = -\frac{1}{2} \qquad ...(v)$$

Equations of normals PR and QR are

$$ax\sec\alpha - by\,\text{cosec}\,\alpha = a^2 - b^2$$

and $$ax\sec\beta - by\,\text{cosec}\,\beta = (a^2 - b^2)$$

or $$ax\sin\alpha - by\cos\alpha = (a^2-b^2)\sin\alpha\cos\alpha \qquad ...(vi)$$

$$ax\sin\beta - by\cos\beta = (a^2-b^2)\sin\beta\cos\beta \qquad ...(vii)$$

Multiplying Eq. (vi) by $\cos\beta$ and (vii) by $\cos\alpha$ and subtracting, we get

$$ax\sin(\alpha-\beta) = (a^2-b^2)\cos\alpha\cos\beta(\sin\alpha - \sin\beta)$$

$$\frac{ax}{a^2-b^2} = \frac{\cos\alpha\cos\beta\cdot 2\cos\left(\frac{\alpha+\beta}{2}\right)\sin\left(\frac{\alpha-\beta}{2}\right)}{2\sin\left(\frac{\alpha-\beta}{2}\right)\cos\left(\frac{\alpha-\beta}{2}\right)}$$

$$= \frac{\cos\alpha\cos\beta\cos\left(\frac{\alpha+\beta}{2}\right)}{\cos\left(\frac{\alpha-\beta}{2}\right)}$$

$$= \pm 2\cos\alpha\cos\beta\cos\left(\frac{\alpha+\beta}{2}\right) \qquad \text{[From (v)]}$$

$$= \pm\cos\left(\frac{\alpha+\beta}{2}\right)[\cos(\alpha+\beta) + \cos(\alpha-\beta)]$$

$$\frac{ax}{a^2-b^2} = \pm\cos\left(\frac{\alpha+\beta}{2}\right)\left\{\cos(\alpha+\beta) - \frac{1}{2}\right\} \qquad \text{[Using (v)]}$$

$$\Rightarrow \quad \frac{a^2x^2}{(a^2-b^2)^2} = \cos^2\left(\frac{\alpha+\beta}{2}\right)\left[\cos(\alpha+\beta) - \frac{1}{2}\right]^2$$

Similarly, $$\frac{b^2y^2}{(a^2-b^2)^2} = \sin^2\left(\frac{\alpha+\beta}{2}\right)\left[\cos(\alpha+\beta) + \frac{1}{2}\right]^2$$

$$\therefore \quad \frac{a^2x^2}{(a^2-b^2)^2} + \frac{b^2y^2}{(a^2-b^2)^2}$$

$$= \cos^2(\alpha+\beta) + \frac{1}{4} - \cos^2(\alpha+\beta)$$

Hence, required locus is

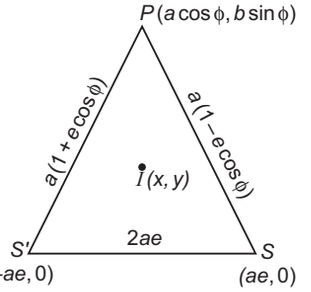
$$a^2x^2 + b^2y^2 = \frac{1}{4}(a^2-b^2)^2$$

● ***Ex. 33*** *A variable point P on an ellipse of eccentricity e, is joined to its foci S, S′ prove that the locus of the incentre of the triangle PSS′ is an ellipse whose eccentricity is* $\sqrt{\left(\frac{2e}{1+e}\right)}$.

Sol. Let the given ellipse be

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

Let the coordinates of P are $(a\cos\phi, b\sin\phi)$



By hypothesis,

$$b^2 = a^2(1-e^2) \text{ and } S(ae, 0), S'(-ae, 0)$$

$\therefore$ SP = focal distance of the point P

$$= a - ae\cos\phi \text{ and } S'P = a + ae\cos\phi$$

Also $SS' = 2ae$

If (x, y) be the incentre of the $\Delta PSS'$, then

$$\therefore \quad x = \frac{(2ae)\,a\cos\phi + a(1-e\cos\phi)(-ae) + 1(1+e\cos\phi)\,ae}{2ae + a(1-e\cos\phi) + a(1+e\cos\phi)}$$

$$x = ae\cos\phi \qquad ...(i)$$

and $$y = \frac{2ae(b\sin\phi) + a(1+e\cos\phi)\cdot 0 + a(1-e\cos\phi)\cdot 0}{2ae + a(1-e\cos\phi) + a(1+e\cos\phi)},$$

$$\Rightarrow \quad y = \frac{eb\sin\phi}{(e+1)} \qquad ...(ii)$$

Eliminating ϕ from Eqs. (i) and (ii), we get

$$\frac{x^2}{a^2e^2} + \frac{y^2}{\left[\frac{be}{e+1}\right]^2} = 1$$

which represents an ellipse.

Let e_1 be its eccentricity.

$$\therefore \quad \frac{b^2e^2}{(e+1)^2} = a^2e^2(1-e_1^2) \;\Rightarrow\; e_1^2 = 1 - \frac{b^2}{a^2(e+1)^2}$$

$$= 1 - \frac{1-e^2}{(e+1)^2} = 1 - \frac{1-e}{1+e} = \frac{2e}{1+e} \;\Rightarrow\; e_1 = \sqrt{\left(\frac{2e}{1+e}\right)}$$

● ***Ex. 34*** *Prove that the eccentricity of the ellipse* $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ *is given by* $2\cot\omega = \frac{e^2\sin 2\theta}{\sqrt{(1-e^2)}}$ *where,* ω *is one of the angles between the normals at the points whose eccentric angles are* θ *and* $\frac{\pi}{2} + \theta$.

Sol. The equation of the normals at two given points θ and $\frac{\pi}{2} + \theta$ are

$$ax\sec\theta - by\,\text{cosec}\,\theta = a^2 - b^2 \qquad ...(i)$$

and $$ax\sec\left(\frac{\pi}{2}+\theta\right) - by\,\text{cosec}\left(\frac{\pi}{2}+\theta\right) = a^2 - b^2 \qquad ...(ii)$$

their slopes are $m_1 = \frac{a}{b}\tan\theta$ and $m_2 = -\frac{a}{b}\cot\theta$

$$\therefore \quad \tan\omega = \frac{m_2 - m_1}{1 + m_2 m_1} = \frac{-\frac{a}{b}(\cot\theta + \tan\theta)}{\left(1 - \frac{a^2}{b^2}\right)} = \frac{2ab}{(a^2 - b^2)\sin 2\theta}$$

$$\Rightarrow \quad 2\cot\omega = \frac{(a^2 - b^2)\sin 2\theta}{ab} = \frac{a^2 e^2}{a \cdot a\sqrt{1 - e^2}}\sin 2\theta$$

$$\therefore \quad \frac{2\cot\omega}{\sin 2\theta} = \frac{e^2}{\sqrt{(1 - e^2)}}$$

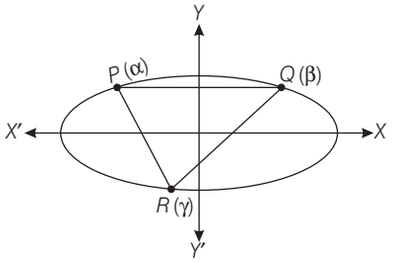
● ***Ex. 35*** *Show that the area of the triangle inscribed in an ellipse is*

$$\left[2ab\sin\left(\frac{\beta - \gamma}{2}\right)\sin\left(\frac{\gamma - \alpha}{2}\right)\sin\left(\frac{\alpha - \beta}{2}\right)\right],$$

where α, β, γ are the eccentric angles of the vertices and hence find the condition that the area of a triangle inscribed in an ellipse may be maximum.

Sol. The vertices of the triangle PQR are

$$P \equiv (a\cos\alpha, b\sin\alpha)$$
$$Q \equiv (a\cos\beta, b\sin\beta)$$
$$R \equiv (a\cos\gamma, b\sin\gamma)$$



$$\therefore \text{ Area of } \Delta PQR = \frac{1}{2}\begin{vmatrix} a\cos\alpha & b\sin\alpha & 1 \\ a\cos\beta & b\sin\beta & 1 \\ a\cos\gamma & b\sin\gamma & 1 \end{vmatrix} = \frac{ab}{2}\begin{vmatrix} \cos\alpha & \sin\alpha & 1 \\ \cos\beta & \sin\beta & 1 \\ \cos\gamma & \sin\gamma & 1 \end{vmatrix}$$

$$= \frac{ab}{2}[\sin(\gamma - \beta) + \sin(\alpha - \gamma) + \sin(\beta - \alpha)]$$

$$= \frac{ab}{2}\left\{2\sin\left(\frac{\alpha - \beta}{2}\right)\cos\left(\frac{2\gamma - \alpha - \beta}{2}\right) - 2\sin\left(\frac{\alpha - \beta}{2}\right)\cos\left(\frac{\alpha - \beta}{2}\right)\right\}$$

$$= ab\sin\left(\frac{\alpha - \beta}{2}\right)\left[\cos\left(\frac{2\gamma - \alpha - \beta}{2}\right) - \cos\left(\frac{\alpha - \beta}{2}\right)\right]$$

$$= 2ab\sin\left(\frac{\alpha - \beta}{2}\right)\sin\left(\frac{\gamma - \beta}{2}\right)\sin\left(\frac{\alpha - \gamma}{2}\right)$$

$$\therefore \text{ Area of } \Delta PQR = 2ab\sin\left(\frac{\alpha - \beta}{2}\right)\sin\left(\frac{\beta - \gamma}{2}\right)\sin\left(\frac{\gamma - \alpha}{2}\right) \quad \ldots(i)$$

If P_1, Q_1, R_1 be the points upon the auxiliary circle corresponding to points P, Q, R, then

$$\text{Area of } \Delta P_1Q_1R_1 = 2a^2\sin\left(\frac{\alpha - \beta}{2}\right)\sin\left(\frac{\beta - \gamma}{2}\right)\sin\left(\frac{\gamma - \alpha}{2}\right)$$

{taking $b = a$ in Eq. (i)}

$$\therefore \quad \frac{\text{Area of } \Delta PQR}{\text{Area of } \Delta P_1Q_1R_1} = \frac{b}{a}$$

$$\therefore \quad (\text{Area of } \Delta PQR) = \left(\frac{b}{a}\right)\text{Area of } (\Delta P_1Q_1R_1)$$

$\therefore$ Area of ΔPQR is the greatest when area of $\Delta P_1Q_1R_1$ be the greatest and hence $\Delta P_1Q_1R_1$ must be equilateral

$$\therefore \quad \alpha - \beta = \beta - \gamma = \gamma - \alpha = \frac{2\pi}{3}$$

$\therefore$ The eccentric angles of P, Q, R will be

$$\alpha, \alpha + \frac{2\pi}{3}, \alpha + \frac{4\pi}{3}$$

● ***Ex. 36*** *Let ABC be an equilateral triangle inscribed in the circle $x^2 + y^2 = a^2$ suppose perpendiculars form A, B, C to the major axis of the ellipse*

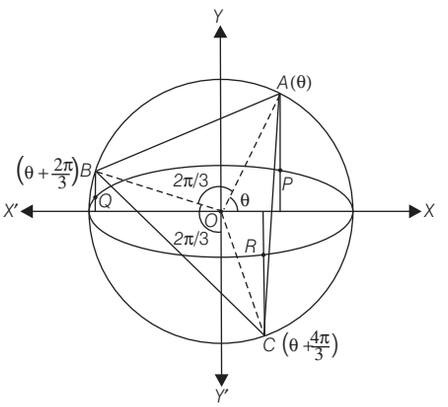
$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \qquad (a > b)$$

meet the ellipse respectively at P, Q, R so that P, Q, R lie on the same side of the major axis as A, B, C respectively. Prove that the normal to the ellipse drawn at the points P, Q and R are concurrent.

Sol. Equation of normal at $P(a\cos\theta, b\sin\theta)$ is

$$ax\sec\theta - by\,\text{cosec}\,\theta = (a^2 - b^2)$$

or $$ax\sin\theta - by\cos\theta = \frac{1}{2}(a^2 - b^2)\sin 2\theta \quad \ldots(i)$$



Similarly, the other normals

$$ax\sin\left(\theta + \frac{2\pi}{3}\right) - by\cos\left(\theta + \frac{2\pi}{3}\right)$$

$$= \frac{1}{2}(a^2 - b^2)\sin\left(2\theta + \frac{4\pi}{3}\right) \quad \ldots(ii)$$

and $$ax\sin\left(\theta + \frac{4\pi}{3}\right) - by\cos\left(\theta + \frac{4\pi}{3}\right)$$

$$= \frac{1}{2}(a^2 - b^2)\sin\left(2\theta + \frac{8\pi}{3}\right) \quad \ldots(iii)$$

$$\because \quad \sin\left(\theta + \frac{4\pi}{3}\right) = \sin\left(\theta - \frac{2\pi}{3}\right), \cos\left(\theta + \frac{4\pi}{3}\right) = \cos\left(\theta - \frac{2\pi}{3}\right)$$

and $$\sin\left(2\theta + \frac{8\pi}{3}\right) = \sin\left(2\theta - \frac{4\pi}{3}\right)$$

Further the three normals are concurrent, then

$$\begin{vmatrix} \sin\theta & \cos\theta & \sin 2\theta \\ \sin\left(\theta+\frac{2\pi}{3}\right) & \cos\left(\theta+\frac{2\pi}{3}\right) & \sin\left(2\theta+\frac{4\pi}{3}\right) \\ \sin\left(\theta-\frac{2\pi}{3}\right) & \cos\left(\theta-\frac{2\pi}{3}\right) & \sin\left(2\theta+\frac{8\pi}{3}\right) \end{vmatrix}=0$$

Applying $R_2 \to R_2 + R_3$, then

$$\text{LHS} = \begin{vmatrix} \sin\theta & \cos\theta & \sin 2\theta \\ 2\sin\theta\cos\frac{2\pi}{3} & 2\cos\theta\cos\frac{2\pi}{3} & 2\sin(2\theta+2\pi)\cos\frac{2\pi}{3} \\ \sin\left(\theta-\frac{2\pi}{3}\right) & \cos\left(\theta-\frac{2\pi}{3}\right) & \sin\left(2\theta+\frac{8\pi}{3}\right) \end{vmatrix}$$

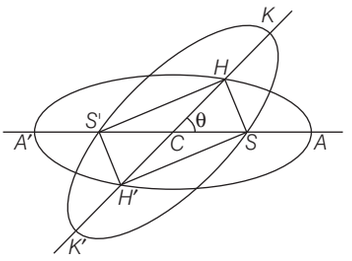
$$= -\begin{vmatrix} \sin\theta & \cos\theta & \sin 2\theta \\ \sin\theta & \cos\theta & \sin 2\theta \\ \sin\left(\theta-\frac{2\pi}{3}\right) & \cos\left(\theta-\frac{2\pi}{3}\right) & \sin\left(2\theta+\frac{8\pi}{3}\right) \end{vmatrix} = 0 \quad (\because R_1 = R_2)$$

● ***Ex. 37*** *If two concentric ellipses be such that the foci of one be on the other and if e and e′ be their eccentricities. Prove that the angle between their axes is*

$$\cos^{-1}\left\{\frac{\sqrt{(e^2+e'^2-1)}}{ee'}\right\}$$

Sol. Let S and S' be the foci of one ellipse and H and H' be the other, C being their common centre. Then, $SHS'H'$ is a parallelogram and since

$$SH + S'H = HS' + H'S' = 2a$$



Since, the sum of the focal distances of any point on an ellipse is equal to its major axis which is $2a$.

Then $CS = ae, CH = ae'$

Let θ be the angle between their axes.

then $SH^2 = a^2e^2 + a^2e'^2 - 2a^2ee'\cos\theta$

$$HS'^2 = a^2e^2 + a^2e'^2 + 2a^2ee'\cos\theta$$

Now, $2a = SH + S'H$

Squaring both sides, then

$$4a^2 = (SH)^2 + (S'H)^2 + 2(SH)\cdot(S'H)$$

$$\Rightarrow \quad 4a^2 = 2a^2(e^2+e'^2) + 2\sqrt{(a^2e^2+a^2e'^2)^2 - 4a^4e^2e'^2\cos^2\theta}$$

$$\Rightarrow \quad (2-e^2-e'^2)^2 = (e^2+e'^2)^2 - 4e^2e'^2\cos^2\theta$$

$$\Rightarrow \quad 4+(e^2+e'^2)^2 - 4(e^2+e'^2) = (e^2+e'^2)^2 - 4e^2e'^2\cos^2\theta$$

$$\Rightarrow \quad 1-e^2-e'^2 = -e^2e'^2\cos^2\theta$$

$$\therefore \quad \cos\theta = \frac{\sqrt{e^2+e'^2-1}}{ee'}$$

$$\therefore \quad \theta = \cos^{-1}\left(\frac{\sqrt{(e^2+e'^2-1}}{ee'}\right)$$

● ***Ex. 38*** *If the normals at the four points* $(x_1, y_1), (x_2, y_2), (x_3, y_3)$ *and* (x_4, y_4) *on the ellipse* $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ *are concurrent. Prove that*

$$(x_1+x_2+x_3+x_4)\left(\frac{1}{x_1}+\frac{1}{x_2}+\frac{1}{x_3}+\frac{1}{x_4}\right)=4$$

or $(\Sigma\cos\alpha)(\Sigma\sec\alpha)=4$

where, $\alpha, \beta, \gamma, \delta$ *are the eccentric angles of the points.*

Sol. Let point of concurrent is (h, k).

Equation of normal at (x', y') is

$$\frac{x-x'}{x'/a^2} = \frac{y_1-y'}{y'/b^2}$$

It is passes through (h, k) then

$$y'^2\{a^2(h-x')+b^2x'\}^2 = b^4k^2x'^2 \qquad \ldots(i)$$

But $\frac{x'^2}{a^2}+\frac{y'^2}{b^2}=1$ or $y'^2 = \frac{b^2}{a^2}(a^2-x'^2)$ ...(ii)

Values of y'^2 from Eq. (ii), putting in Eq. (i) we get

$$\frac{b^2}{a^2}(a^2-x'^2)\{a^2h+(b^2-a^2)x'\}^2 = b^4k^2x'^2$$

$$\Rightarrow \frac{b^2}{a^2}(a^2-x'^2)\{a^4h^2+(b^2-a^2)^2x'^2+2a^2hx'(b^2-a^2)\} = b^4k^2x'^2$$

Arranging above as a fourth degree equation in x', we get

$$\Rightarrow \quad -(a^2-b^2)^2x'^4 + 2ha^2(a^2-b^2)x'^3 + x'^2(\ldots)$$
$$-2a^4h(a^2-b^2)x' + a^6h^2 = 0$$

above equation being of fourth degree in x', therefore roots of the above equation are x_1, x_2, x_3, x_4 then

$$(x_1+x_2+x_3+x_4) = -\frac{2ha^2(a^2-b^2)}{-(a^2-b^2)^2} = \frac{2ha^2}{(a^2-b^2)} \qquad \ldots(iii)$$

$$\left(\frac{1}{x_1}+\frac{1}{x_2}+\frac{1}{x_3}+\frac{1}{x_4}\right) = \frac{\Sigma x_1x_2x_3}{x_1\cdot x_2\cdot x_3\cdot x_4}$$

$$= \frac{\frac{2a^4h(a^2-b^2)}{-(a^2-b^2)^2}}{\frac{a^6h^2}{-(a^2-b^2)^2}} = \frac{2(a^2-b^2)}{a^2h} \qquad \ldots(iv)$$

Multiplying Eqs. (iii) and (iv), we get

$$(x_1+x_2+x_3+x_4)\left(\frac{1}{x_1}+\frac{1}{x_2}+\frac{1}{x_3}+\frac{1}{x_4}\right)=4$$

Replacing x_1 by $a\cos\alpha$, x_2 by $a\cos\beta$, ... etc, then, we get the second form

i.e. $\Sigma\cos\alpha\,\Sigma\sec\alpha = 4.$

Ellipse Exercise 1 :
Single Option Correct Type Questions

■ This section contains **30 multiple choice questions.** Each question has four choices (a), (b), (c) and (d) out of which **ONLY ONE** is correct.

1. Given f is increasing, the equation $\frac{x^2}{f(2a)}+\frac{y^2}{f(a^2-3)}=1$ represents an ellipse with X-axis as major axis if
(a) $[-1,3]$ (b) $[1,3]$ (c) $(-1,3)$ (d) $(0,5)$

2. If $\frac{x^2}{f(4a)}+\frac{y^2}{f(a^2-5)}$ represents an ellipse with major axis as Y-axis and f is a decreasing fucntion, then
(a) $a\in(-\infty,1)$ (b) $a\in(5,\infty)$ (c) $a\in(1,4)$ (d) $a\in(-1,5)$

3. The curve represented by the equation $\frac{x^2}{\sin\sqrt{2}-\cos\sqrt{3}}+\frac{y^2}{\sin\sqrt{3}-\cos\sqrt{2}}=1$ is
(a) an ellipse with foci on X -axis
(b) an ellipse with foci on Y-axis
(c) a hyperbola with foci on X-axis
(d) a hyperbola with foci on Y-axis

4. The minimum distance of the centre of the ellipse $\frac{x^2}{16}+\frac{y^2}{9}=1$ from the chord of contact of mutually perpendicular tangents of the ellipse is
(a) $\frac{144}{5}$ (b) $\frac{16}{5}$ (c) $\frac{9}{5}$ (d) None of these

5. P and Q are the foci of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ and B is an end of the minor axis. If PBQ, is an equilateral triangle, then the eccentricity of the ellipse is
(a) $\frac{1}{\sqrt{2}}$ (b) $\frac{1}{3}$
(c) $\frac{1}{2}$ (d) $\frac{\sqrt{3}}{2}$

6. A circle of radius $\frac{5}{\sqrt{2}}$ is concentric with the ellipse $\frac{x^2}{16}+\frac{y^2}{9}=1$, then the acute angle made by the common tangent with the line $\sqrt{3}x-y+6=0$ is
(a) $\frac{\pi}{3}$ (b) $\frac{\pi}{4}$
(c) $\frac{\pi}{6}$ (d) $\frac{\pi}{12}$

7. Consider the particle travelling clockwise on the elliptical path $\frac{x^2}{100}+\frac{y^2}{25}=1$. The particle leaves the orbit at the point $(-8,3)$ and travels in a straight line tangent to the ellipse, then the point will the particle cross the Y-axis is
(a) $\left(0,-\frac{25}{3}\right)$ (b) $\left(0,\frac{7}{3}\right)$
(c) $\left(0,\frac{25}{3}\right)$ (d) $(0,9)$

8. C is the centre of the ellipse $\frac{x^2}{16}+\frac{y^2}{9}=1$ and A and B are two points on the ellipse such that $\angle ACB=90°$, then $\frac{1}{(CA)^2}+\frac{1}{(CB)^2}=$
(a) $\frac{7}{12}$ (b) $\frac{12}{7}$
(c) $\frac{25}{144}$ (d) $\frac{144}{25}$

9. Let (α,β) be a point from which two perpendicular tangents can be drawn to the ellipse $4x^2+5y^2=20$. If $F=4\alpha+3\beta$, then
(a) $-15\le F\le 15$ (b) $F\ge 0$
(c) $-5\le F\le 20$ (d) $F\le -5\sqrt{5}$ or $F\ge 5\sqrt{5}$

10. If $a=[t^2-3t+4]$ and $b=[3+5t]$, where $[\cdot]$ denotes the greatest integer function, then the latusrectum of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ at $t=\frac{3}{2}$ is
(a) 20 (b) 10
(c) $\frac{1}{5}$ (d) $\frac{1}{10}$

11. If the line $x+2y+4=0$ cutting the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ in points whose eccentric angles are $30°$ and $60°$ subtends a right angle at the orgin, then its equation is
(a) $\frac{x^2}{8}+\frac{y^2}{4}=1$
(b) $\frac{x^2}{16}+\frac{y^2}{4}=1$
(c) $\frac{x^2}{4}+\frac{y^2}{16}=1$
(d) None of the above

12. An arc of a bridge is semi-elliptical with major axis horizontal. If the length of the base is 9 m and the highest part of the bridge is 3 m from the horizontal; the best approximation of the height of the arch 2 m from the centre of the base is

(a) $\frac{11}{4}$m (b) $\frac{8}{3}$m

(c) $\frac{7}{2}$m (d) 2m

13. A tangent to the ellipse $\frac{x^2}{25}+\frac{y^2}{16}=1$ at any point P meet the line $x=0$ at a point Q. Let R be the image of Q in the line $y=x$, then circle whose extremities of a diameter are Q and R passes through a fixed point. The fixed point is

(a) (3, 0) (b) (4, 0)

(c) (5, 0) (d) (0, 0)

14. If tangents PQ and PR are drawn from a point on the circle $x^2+y^2=25$ to the ellipse $\frac{x^2}{16}+\frac{y^2}{b^2}=1, (b<4)$, so that the fourth vertex S of parallelogram $PQSR$ lies on the circumcircle of triangle PQR, then the eccentricity of the ellipse is

(a) $\frac{\sqrt{5}}{4}$ (b) $\frac{\sqrt{5}}{3}$

(c) $\frac{\sqrt{7}}{4}$ (d) $\frac{\sqrt{7}}{3}$

15. The equation of the chord of contact of the pair of tangents drawn to the ellipse $4x^2+9y^2=36$ from the point (m, n), where $m\cdot n=m+n$, m, n being non-zero positive integers is

(a) $2x+9y=18$ (b) $2x+2y=1$

(c) $4x+9y=18$ (d) $4x+2y=1$

16. $x-2y+4=0$ is a common tangent to $y^2=4x$ and $\frac{x^2}{4}+\frac{y^2}{b^2}=1$. Then, the value of b and the other common tangent are given by

(a) $b=\sqrt{3}$; $x+2y+4=0$

(b) $b=3$; $x+2y+4=0$

(c) $b=\sqrt{3}$; $x+2y-4=0$

(d) $b=\sqrt{3}$, $x-2y-4=0$

17. The point , at shortest distance from the line $x+y=7$ and lying on an ellipse $x^2+2y^2=6$, has coordinates

(a) $(\sqrt{2}, \sqrt{2})$ (b) $(0, \sqrt{3})$

(c) (2, 1) (d) $\left(\sqrt{5}, \frac{1}{\sqrt{2}}\right)$

18. From a point on the axis of x common tangents are drawn to the parabola $y^2=4x$ and the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1(a>b>0)$. If these tangents form an equilateral triangle with their chord of contact w.r.t parabola, then set of exhaustive values of a is

(a) (0, 3) (b) $\left(0, \frac{3}{2}\right)$

(c) $\left(\frac{3}{2}, 3\right)$ (d) $\left(1, \frac{3}{2}\right)$

19. If circumcentre of an equilateral triangle inscribed in $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, with vertices having eccentric angle α, β, γ respectively is (h, k), then $\Sigma\cos(\alpha-\beta)=$

(a) $\frac{9h^2}{a^2}+\frac{9k^2}{b^2}+\frac{3}{2}$ (b) $9h^2-9k^2+a^2b^2$

(c) $\frac{9h^2}{a^2}+\frac{9k^2}{b^2}+3$ (b) $\frac{9h^2}{2a^2}+\frac{9k^2}{2b^2}-\frac{3}{2}$

20. A parabola is drawn with focus at one of the foci of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, where $a>b$ and directrix passing through the other focus and perpendicular to the major axis of the ellipse. If the latusrectum of the ellipse and that of the parabola are some, then the eccentricity of the ellipse is

(a) $\sqrt{2}-1$ (b) $\sqrt{3}-1$

(c) $2\sqrt{2}-2$ (d) $3\sqrt{3}-5$

21. If the maximum distance of any point on the ellipse $x^2+2y^2+2xy=1$ from its center is r, then r is equal to

(a) $\frac{\sqrt{6}+1}{2}$ (b) $\frac{\sqrt{5}+1}{2}$

(c) $\frac{\sqrt{3}+1}{2}$ (d) $\frac{\sqrt{2}+2}{2}$

22. The length of the common chord of the ellipse $\frac{(x-1)^2}{9}+\frac{(y-2)^2}{4}=1$ and the circle $(x-1)^2+(y-2)^2=1$ is

(a) zero (b) one

(c) three (d) eight

23. The eccentricity of the ellipse $ax^2+by^2+2fx+2gy+c=0$ if axis of ellipse parallel to X-axis is

(a) $\sqrt{\left(\frac{b-a}{b}\right)}$ (b) $\sqrt{\left(\frac{a+b}{b}\right)}$

(c) $\sqrt{\left(\frac{a+b}{a}\right)}$ (d) None of these

24. A circle has the same center as an ellipse and passes through the foci F_1 and F_2 of the ellipse, such that two curves intersect at four points. Let P be any one of their point of intersection. If the major axis of the ellipse is 17 and the area of triangle PF_1F_2 is 30, then the distance between the foci is
(a) 13 (b) 11
(c) 9 (d) 7

25. The area of the rectangle formed by the perpendicular from the centre of the standard ellipse to the tangent and normal at its point whose eccentric angle is $\frac{\pi}{4}$, is
(a) $\frac{(a^2-b^2)\,ab}{a^2+b^2}$
(b) $\frac{(a^2-b^2)}{(a^2+b^2)\,ab}$
(c) $\frac{(a^2+b^2)\,ab}{(a^2-b^2)}$
(d) $\frac{(a^2+b^2)}{(a^2-b^2)\,ab}$

26. An ellipse is inscribed in a circle and a point within the circle is chosen at random. If the probability that this point lies outside the ellipse is 2/3, then the eccentricity of the ellipse is
(a) $\frac{2\sqrt{2}}{3}$ (b) $\frac{\sqrt{5}}{3}$
(c) $\frac{8}{9}$ (d) $\frac{2}{3}$

27. An ellipse slides between two perpendicular straight lines.
Then, the locus of its centre is a/an
(a) parabola (b) ellipse
(c) hyperbola (d) circle

28. The length of the chord of the ellipse $\frac{x^2}{25}+\frac{y^2}{16}=1$, where mid-point is $\left(\frac{1}{2},\frac{2}{3}\right)$ is
(a) $\frac{1}{10}$ (b) $\frac{\sqrt{8161}}{10}$
(c) $\frac{\sqrt{8061}}{10}$ (d) None of these

29. The equation of the locus of the middle point of the portion of the tangent to the ellipse $\frac{x^2}{16}+\frac{y^2}{9}=1$ include between the coordinate axes is the curve
(a) $9x^2+16y^2=4x^2y^2$ (b) $16x^2+9y^2=4x^2y^2$
(c) $3x^2+4y^2=4x^2y^2$ (d) $9x^2+16y^2=x^2y^2$

30. The tangent at the point 'θ' on the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ meets the auxilliary circle in two points which subtends a right angle at the centre, then the eccentricity 'e' of the ellipse is given by the equation
(a) $e^2(1+\cos^2\theta)=1$
(b) $e^2(\operatorname{cosec}^2\theta+1)=1$
(c) $e^2(1+\sin^2\theta)=1$
(d) $e^2(1+\tan^2\theta)=1$

Ellipse Exercise 2 : More than One Correct Option Type Questions

■ This section contains **15 multiple choice questions**. Each question has four choices (a), (b), (c) and (d) out of which **MORE THAN ONE** may be correct.

31. The locus extremities of the latusrectum of the family of ellipse $b^2x^2+y^2=a^2b^2$ is
(a) $x^2-ay=a^2$ (b) $x^2-ay=b^2$
(c) $x^2+ay=a^2$ (d) $x^2+ay=b^2$

32. The distance of a point on the ellipse $\frac{x^2}{6}+\frac{y^2}{2}=1$ from the centre is 2, then the eccentric angles are
(a) $\frac{\pi}{4}$ (b) $\frac{3\pi}{4}$ (c) $\frac{5\pi}{4}$ (d) $\frac{7\pi}{4}$

33. If the equation of family of ellipse is $x^2\sec^2\theta+y^2\operatorname{cosec}^2\theta=1$, where $\frac{\pi}{4}<\theta<\frac{\pi}{2}$, then the locus of extremities of the latusrectum is
(a) $2y^2(1+x^2)=(1-x^2)^2$ (b) $2x^2(1+y^2)=(1-y^2)^2$
(c) $2y(1-x^2)=1+x^2$ (d) $2y^2(1+x^2)=1+y^4-2x^2$

34. Let F_1, F_2 be two focii of the ellipse and PT and PN be the tangent and the normal respectively to the ellipse at point P. Then.
(a) PN bisects $\angle F_1PF_2$
(b) PT bisects $\angle F_1PF_2$
(c) PT bisects angle $(180^\circ-\angle F_1PF_2)$
(d) None of the above

35. $\frac{x^2}{(a^2-a-6)}+\frac{y^2}{(a^2-6a+5)}=1$ will represent an ellipse if a lies in the interval
(a) $(-\infty,-2)$ (b) $(1,\infty)$
(c) $(3,\infty)$ (d) $(5,\infty)$

36. A latusrectum of an ellipse is a line
(a) passing through a focus
(b) passing through the centre
(c) perpendicular to the major axis
(d) parallel to the minor axis

37. If the axes of an ellipse coincide with the coordinate axes and the ellipse passes through the point $(4,-1)$ and touches the line $x+4y-10=0$, then its equation is
(a) $x^2+64y^2=80$ (b) $x^2+4y^2=20$
(c) $x^2+20y^2=100$ (d) $x^2+8y^2=40$

38. If P is a point on the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, whose foci are S and S'. Let $\angle PSS'=\theta$ and $\angle PS'S=\phi$, then
(a) $SP+S'P=2a$, if $a>b$ (b) $SP+S'P=2b$, if $b>a$
(c) $\tan\left(\frac{\theta}{2}\right)\tan\left(\frac{\phi}{2}\right)=\frac{1-e}{1+e}$ (d) $\tan\left(\frac{\theta}{2}\right)\tan\left(\frac{\phi}{2}\right)=\frac{e-1}{e+1}$

39. If $(5,12)$ and $(24,7)$ are the focii of a conic passing through the origin, then the eccentricity of conic is
(a) $\frac{\sqrt{386}}{38}$ (b) $\frac{\sqrt{386}}{12}$
(c) $\frac{\sqrt{386}}{13}$ (d) $\frac{\sqrt{386}}{25}$

40. If a pair of variable straight lines $x^2+4y^2+axy=0$ (where a is a real parameter) cuts the ellipse $x^2+4y^2=4$ at two points A and B, then the locus of the point of intersection of tangents at A and B is
(a) $x-2y=0$ (b) $2x-y=0$
(c) $x+2y=0$ (d) $2x+y=0$

41. In the ellipse $25x^2+9y^2-150x-90y+225=0$
(a) foci are at (3, 1), (3, 9) (b) $e=\frac{4}{5}$
(c) centre is (5, 3) (d) major axis is 6

42. If the tangent to the ellipse $x^2+4y^2=16$ at the point $P(\theta)$ is a normal to the circle $x^2+y^2-8x-4y=0$, then θ equals
(a) $\frac{\pi}{2}$ (b) $\frac{\pi}{4}$
(c) 0 (d) $-\frac{\pi}{4}$

43. The product of eccentricties of two conics is unity, one of them can be a/an
(a) parabola (b) ellipse
(c) hyperbola (d) circle

44. The parametric angle α, where $-\pi<\alpha\le\pi$ of the point on the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ at which the tangent drawn cuts the intercept of minimum length on the coordinate axes, is/are
(a) $\tan^{-1}\sqrt{\left(\frac{b}{a}\right)}$ (b) $-\tan^{-1}\sqrt{\left(\frac{b}{a}\right)}$
(c) $\pi-\tan^{-1}\sqrt{\left(\frac{b}{a}\right)}$ (d) $\pi+\tan^{-1}\sqrt{\left(\frac{b}{a}\right)}$

45. If latusrectum of the ellipse $x^2\tan^2\alpha+y^2\sec^2\alpha=1$ is 1/2, then $\alpha(0<\alpha<\pi)$ is equal to
(a) $\pi/12$ (b) $\pi/6$
(c) $5\pi/12$ (d) $\pi/2$

Ellipse Exercise 3 : Paragraph Based Questions

- This section contains **5 paragraphs** based upon each paragraph **3 multiple choice question** have to be answered. Each of these questions has four choices (a), (b), (c) and (d) out of which **ONLY ONE** is correct.

Paragraph I

(Q. Nos. 46 to 48)

A conic is represented by

$$C\equiv 9x^2+4xy+6y^2-22x-16y+9=0$$

46. The centre of the conic C is
(a) (0, 0) (b) (1, 0) (c) (0, 1) (d) (1, 1)

47. The eccentricity of the conic C is
(a) $\frac{1}{2}$ (b) $\frac{1}{\sqrt{2}}$
(c) $\frac{2}{3}$ (d) $\frac{2}{\sqrt{5}}$

48. The lengths of axes of conic C are
(a) $2, 2\sqrt{2}$ (b) $4, 2\sqrt{3}$
(c) $6, 2\sqrt{5}$ (d) $5, 2\sqrt{6}$

Paragraph II

(Q. Nos. 49 to 51)

An ellipse E has its centre $C(3,1)$, focus at $(3,6)$ and passing through the point $P(7,4)$

49. The product of the lengths of the perpendicular segments from the focii on tangent at point P is

(a) 20 (b) 45

(c) 40 (d) 90

50. If F and F' are the foot of perpendiculars from focii S and S' on tangent at point P, then point of intersection of lines SF' and $S'F$ is

(a) $\left(5, \frac{5}{3}\right)$ (b) $\left(3, \frac{4}{3}\right)$

(c) $\left(5, \frac{10}{3}\right)$ (d) $\left(3, \frac{8}{3}\right)$

51. If the normal at a variable point on the ellipse (E) meets its axes in Q and R, then the locus of the mid-point of QR is a conic with eccentricity (e_1), then

(a) $e_1 = \frac{3}{\sqrt{5}}$ (b) $e_1 = \frac{\sqrt{5}}{3}$

(c) $e_1 = \frac{3}{\sqrt{10}}$ (d) $e_1 = \frac{\sqrt{10}}{3}$

Paragraph III

(Q. Nos. 52 to 54)

Curves $C_1 : x^2 + y^2 = r^2$ and $C_2 : \frac{x^2}{16} + \frac{y^2}{9} = 1$ intersect at four distinct points A, B, C and D. Their common tangents form a parallelogram PQRS.

52. If $ABCD$ is a square, then the value of $25r^2$ is

(a) 36 (b) 72

(c) 144 (d) 288

53. If $PQRS$ is a square, then the value of $2r^2$ is

(a) 12 (b) 15

(c) 20 (d) 25

54. If $PQRS$ is a square, then the ratio of the area of curve C_1 to the area of circumcircle of ΔPQR is

(a) 1 : 4 (b) 1 : 2

(c) 3 : 4 (d) 9 : 16

Paragraph IV

(Q. Nos. 55 to 57)

An ellipse whose distance between foci S and S′ is 4 units is inscribed in the ΔABC touching the sides AB, AC and BC at P, Q and R, respectively. If centre of ellipse is at origin and major axis along X-axis, $SP + S'P = 6$.

55. Equation of the ellipse is

(a) $9x^2 + 5y^2 = 45$ (b) $4x^2 + 9y^2 = 36$

(c) $5x^2 + 9y^2 = 45$ (c) $9x^2 + 4y^2 = 36$

56. If $AB = BC$ and $\angle B = \pi / 2$, then locus of A is

(a) $(x^2 + y^2 - 14)^2 = 4(5x^2 + 9y^2 - 45)$

(b) $(x^2 + y^2 - 14)^2 = 4(5x^2 + 9y^2 - 54)$

(c) $(x^2 + y^2 - 14)^2 = 4(9x^2 + 5y^2 - 45)$

(d) $(x^2 + y^2 - 14)^2 = 4(9x^2 + 5y^2 - 54)$

57. If the difference of eccentric angles of P and Q is $\pi / 3$, then locus of A is

(a) $5x^2 + 9y^2 = 15$ (b) $5x^2 + 9y^2 = 60$

(c) $9x^2 + 5y^2 = 14$ (d) $9x^2 + 5y^2 = 144$

Paragraph V

(Q. Nos. 58 to 60)

The line $2px + y\sqrt{(1 - p^2)} = 1$ $(|p| < 1)$ for different values of p, touches a fixed ellipse whose axes are the coordinate axes.

58. The eccentricity of the ellipse is

(a) $\frac{1}{\sqrt{5}}$ (b) $\frac{1}{\sqrt{3}}$

(c) $\frac{\sqrt{3}}{2}$ (d) $\frac{2}{\sqrt{5}}$

59. The foci of the ellipse are

(a) $\left(\pm\frac{\sqrt{3}}{2}, 0\right)$ (b) $\left(0, \pm\frac{\sqrt{3}}{2}\right)$

(c) $(\pm\sqrt{3}, 0)$ (d) $(0, \pm\sqrt{3})$

60. The locus of the point of intersection of perpendicular tangents of ellipse is

(a) $x^2 + y^2 = 2$ (b) $x^2 + y^2 = \frac{3}{2}$

(c) $x^2 + y^2 = \frac{5}{4}$ (d) $x^2 + y^2 = \frac{1}{2}$

Ellipse Exercise 4 :
Single Integer Answer Type Questions

■ This section contains **10 questions**. The answer to each question is a **single digit integer**, ranging from 0 to 9 (both inclusive).

61. Two concentric ellipse be such that the foci of one be on the other and if 3/5 and 4/5 be their eccentricities. If θ be the angle between their axes, then the value of $2(1+\sin^2\theta+\sin^4\theta)$ must be

62. Rectangle $ABCD$ has area 200 unit^2. An ellipse with area 200π unit^2, passes through A and C and has foci at B and D. If the perimeter of the rectangle is P, then the value of $\sqrt{(P+1)}$ is

63. Number of points on the ellipse $2x^2+5y^2=100$ from which pair of perpendicular tangents may be drawn to the ellipse $9x^2+16y^2=144$ is

64. The length of sides of square which can be made by four perpendicular tangents to the ellipse $\frac{x^2}{7}+\frac{2y^2}{11}=1$ is

65. The length of the focal chord of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ which makes an angle θ with the major axis is $\frac{\lambda ab^2}{a^2\sin^2\theta+b^2\cos^2\theta}$, then the value of λ is

66. Number of distinct normal lines that can be drawn to ellipse $\frac{x^2}{169}+\frac{y^2}{25}=1$ from the point $P(0,6)$ is n, then the value of 2^n is

67. If p is the length of the perpendicular from a focus upon the tangent at any point P of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ and r is the distance of P from the focus, then the value of $\frac{2a}{r}-\frac{b^2}{p^2}$ is

68. An ellipse passing through the origin has its foci (3, 4) and (6, 8). The length of its semi-minor axis is b, then the value of $b/\sqrt{2}$ is

69. The maximum value of 5λ for which four normals can be drawn to ellipse $\frac{x^2}{25}+\frac{y^2}{16}=1$ through a point $(\lambda,0)$ is

70. An ellipse with major and minor axis $6\sqrt{3}$ and 6 respectively, slides along the coordinate axes and always remains confined in the first quadrant. If the length of arc described by centre of ellipse is $\frac{\pi\lambda}{6}$, then the value of λ is

Ellipse Exercise 5 : Matching Type Questions

■ This Section Contains **3 questions**. Each question has four statements (A,B,C and D) given in **Column** I and four statements (p,q,r and s) in **Column II**. Any given statement in **Column I** can have correct matching with one or more statement (s) given in **Column II.**

71. Match the following

	Column I		Column II
(A)	For the ellipse $\frac{x^2}{9}+\frac{y^2}{4}=1$ with vertices A and A', tangents drawn at the point P in the first quadrant meets the $y-$axis at Q and the chord $A'P$ meets the y-axis at M. If O is the origin, then OQ^2-MQ^2 is a	(p)	Natural number
(B)	If $y=x$ and $3y+2x=0$ are the equations of a pair of conjugate diameters of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ and e be the eccentricity, then $4\,(1+e^2+e^4+...+\infty)$ is a	(q)	Composite number
(C)	If the variable line $y=kx+2h$ is tangent to an ellipse $2x^2+3y^2=6$, then the locus of $P(h,k)$ is a conic C whose eccentricity is e, thus $3e^2$ is a	(r)	Prime number
(D)	If extremities of the latusrectum of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, $(a>1)$ having positive ordinates lie on the parabola $x^2=-2(y-2)$, then a is a	(s)	Perfect number

72. Match the following

	Column I		Column II
(A)	An ellipse is sliding along the cordinate axes. If the foci of the ellipse are (1,1) and (3,3) if area of the director circle of the ellipse (in square units) is $\pi\lambda$, then λ is divisible by	(p)	3
(B)	If from a point P (0, λ) two normals other then axes are drawn to the ellipse $\frac{x^2}{25}+\frac{y^2}{16}=1$, such that $\lvert\lambda\rvert<p$, then $4p$ is divisible by,	(q)	4
(C)	The orbit of the earth is an ellipse with eccentricity $\frac{1}{60}$ with the sun at one focus the major axis being approximately 186×10^6 miles in length. If the shortest and longest distances of the earth from the sun are $\lambda\times10^5$ miles and $\mu\times10^5$ miles, then $\mu-(\lambda+1)$ is divisible by	(r)	5
(D)	If the mid point of a chord of the ellipse $\frac{x^2}{16}+\frac{y^2}{25}=1$ is (0,3) and length of the chord is $\frac{4\lambda}{5}$, then λ is divisible by	(s)	6

73. Match the following

	Column I		Column II
(A)	The minimum and maximum distances of a point (2,6) from the ellipse $9x^2+8y^2-36x-16y-28=0$ are L and G, then	(p)	L + G = 10
(B)	The minimum and maximum distances of a point (1,2) from the ellipse $4x^2+9y^2+8x-36y+4=0$ are L and G, then	(q)	L + G = 6
(C)	The minimum and maximum distances of a point $\left(\frac{9}{5},\frac{12}{5}\right)$ from the ellipse $4(3x+4y)^2+9(4x-3y)^2=900$ are L and G, then	(r)	G – L = 8
(D)	The minimum and maximum distances of a point (0,4) from the ellipse $25x^2+9y^2=225$ are L and G, then	(s)	G – L = 6

Ellipse Exercise 6 :
Statement I and II Type Questions

■ **Directions** (Q. Nos. 74 to 81) are Assertion-Reason type questions. Each of these qustions contains two statements :
Statement I (Assertion) and
Statement II (Reason)
Each of these questions also has four alternative choices, only one of which is the correct answer.

You have to select the correct choice as given below.

(a) Statement I is true, statement II is true; statement II is a correct explanation for statement I

(b) Statement I is true, statement II is true; statement II is not a correct explanation for statement I

(c) Statement I is true, statement II is false

(d) Statement I is false, statement II is true

74. Let the equation of ellipse be $\frac{x^2}{(a^2+1)}=\frac{y^2}{(a^2+2})=1$

Statement I If eccentricity of the ellipse be $\frac{1}{\sqrt{6}}$, then length of latusrectum is $\frac{10}{\sqrt{6}}$.

Statement II Length of latusrectum $=\frac{2(a^2+1)}{\sqrt{(a^2+2)}}$.

75. **Statement I** The area of the ellipse $2x^2+3y^2=6$ is more than the area of the circle $x^2+y^2-2x+4y+4=0$.

Statement II The length of semi-major axis of an ellipse is more than the radius of the circle.

76. **Statement I** The equation of the director circle to the ellipse $4x^2+9y^2=36$ is $x^2+y^2=13$

Statement II The locus of the point of intersection of perpendicular tangents to an ellipse is called the director circle.

77. **Statement I** In an ellipse the distance between foci is always less than the sum of focal distances of any point on it.

Statement II If e be the eccentricity of the ellipse, then $0<e<1$.

78. **Statement I** The sum of the focal distances of a point on the ellipse $4x^2+5y^2-16x-30y+41=0$ is $2\sqrt{5}$.

Statement II The equation $4x^2+5y^2-16x-30y+41=0$ can be expressed as $4(x-2)^2+5(y-3)^2=20$.

79. **Statement I** Locus of centre of a variable circle touching to circles $(x-1)^2+(y-2)^2=25$ and $(x-2)^2+(y-1)^2=16$ is an ellipse.

Statement II If a circle $S_2=0$ lies completely inside the circle $S_1=0$, then the locus of centre of a variable circle $S=0$ which touches both the circles is an ellipse.

80. **Statement I** The tangent and normal at any point P on a ellipse bisect the external and internal angles between the focal distance of P.

Statement II The straight line joining the foci of the ellipse subtends of a right angle at P.

81. **Statement I** In a ΔABC, if base BC is fixed and perimeter of the triangle is also fixed, then vertex moves on an ellipse.

Statement II If sum of distances of a point P from two fixed points is constant, then locus of P is an ellipse.

Ellipse Exercise 7 :
Subjective Type Questions

- In this section, there are **12 subjective questions**.

82. If three of the sides of a quadrilateral inscribed in an ellipse are parallel respectively to three given straight lines. Show that fourth side will also be parallel to a fixed straight line.

83. If S and S' are the focii of an ellipse and P any point on the curve, show that

$$\tan\left(\frac{PSS'}{2}\right)\tan\left(\frac{PS'S}{2}\right)=\frac{1-e}{1+e}$$

Hence, or otherwise show that the locus of the centre of the circle inscribed in the triangle PSS' is another ellipse.

84. If the normal at any point P of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ meets the major and minor axes in G and g respectively, and if CF is the perpendicular upon this normal from the centre C of the ellipse.

Show that $PF\cdot PG=b^2$

and $PF\cdot Pg=a^2$.

85. PQ is double ordinate of the ellipse $x^2/a^2+y^2/b^2=1$ and B an extremity of the minor axis. PB and QB meet the major axis in M and N. Show that M and N are inverse points with respect to the auxiliary circle of the ellipse.

86. Consider the family of circle $x^2+y^2=r^2, 2<r<5$. If in the first quadrant the common tangent to a circle of the family and the ellipse $4x^2+25y^2=100$ meets the coordinate axes at A and B, then find the equation of the locus of the mid-point of AB.

87. Prove that the normals at the four points, where the lines

$$\frac{lx}{a}+\frac{my}{b}=1$$

and $\frac{x}{la}+\frac{y}{mb}=-1$

cut the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ are concurrent.

88. The eccentric angle of any point P measured from the semi major axis CA is ϕ. If S be the focus nearest to A, and $\angle ASP=\theta$. Prove that

$$\tan\left(\frac{\theta}{2}\right)=\sqrt{\left(\frac{1+e}{1-e}\right)}\tan\left(\frac{\phi}{2}\right)$$

89. If θ is the difference of the eccentric angles of two points on an ellipse, the tangents at which are at right angles. Prove that $ab\sin\theta=d_1d_2$, where d_1, d_2 are the semi diameters parallel to the tangents at the points and a, b are the semi-axes of the ellipse.

90. A straight line PQ touches the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ and the circle $x^2+y^2=r^2\ (b<r<a)$. RS is a focal chord of the ellipse. If RS is parallel to PQ and meets the circle at points R and S. Find the length of RS.

91. Let d be the perpendicular distance from the centre of the ellipse to the tangent drawn at a point P on the ellipse. If F_1 and F_2 are two foci of the ellipse. Show that

$$(PF_1-PF_2)^2=4a^2\left(1-\frac{b^2}{d^2}\right).$$

92. TP and TQ are tangents drawn from an external point (x_1, y_1) to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$. Show that

(i) $\frac{ST^2}{SP\cdot SQ}=\frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}$

(ii) $ST\cdot S'T\cos\theta=(CT)^2-a^2-b^2$

where, S and S' are the foci, C the centre and θ is the angle between the tangents.

93. If PSQ and PHR are focal chords of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, where S and H are the foci. The tangents at Q and R meet at T. Show that the locus of T as P moves round the ellipse is

$$(1+e^2)^2\frac{x^2}{a^2}+(1-e^2)^2\frac{y^2}{b^2}=(1+e^2)^2$$

where, e is the eccentricity of the ellipse.

Ellipse Exercise 8 :
Questions Asked in Previous 13 Year's Exams

■ This section contains questions asked in **IIT-JEE, AIEEE, JEE Main & JEE Advanced** from year **2005** to **2017**.

94. The minimum area of triangle formed by the tangent to the $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ and coordinate axes is **[IIT-JEE 2003, 3M]**

(a) ab sq units (b) $\frac{a^2+b^2}{2}$ sq units

(c) $\frac{(a+b)^2}{2}$ sq units (d) $\frac{a^2+ab+b^2}{3}$ sq units

95. Find the equation of the common tangent in 1st quadrant to the circle $x^2+y^2=16$ and the ellipse $\frac{x^2}{25}+\frac{y^2}{4}=1$. Also find the length of the intercept of the tangent between the coordinate axes. **[IIT-JEE 2005, 4M]**

96. An ellipse has OB as semi minor axis, F and F' its focii and the angle FBF' is a right angle. Then, the eccentricity of the ellipse is **[AIEEE 2005, 3M]**

(a) $\frac{1}{\sqrt{2}}$ (b) $\frac{1}{2}$ (c) $\frac{1}{4}$ (d) $\frac{1}{\sqrt{3}}$

97. In an ellipse, the distance between its foci is 6 and minor axis is 8. Then, its eccentricity is **[AIEEE 2006, 4.5M]**

(a) $\frac{3}{5}$ (b) $\frac{1}{2}$

(c) $\frac{4}{5}$ (d) $\frac{1}{\sqrt{5}}$

98. Let $P(x_1, y_1)$ and $Q(x_2, y_2), y_1<0, y_2<0$ be the end points of the latusrectum of the, ellipse $x^2+4y^2=4$. The equations of parabolas with latusrectum PQ are **[IIT-JEE 2008, 4M]**

(a) $x^2+2\sqrt{3}y=3+\sqrt{3}$ (b) $x^2-2\sqrt{3}y=3+\sqrt{3}$

(c) $x^2+2\sqrt{3}y=3-\sqrt{3}$ (d) $x^2-2\sqrt{3}y=3-\sqrt{3}$

99. A focus of an ellipse is tat the origin. The directrix is the line $x=4$ and the eccentricity is $\frac{1}{2}$. Then, the length of the semi-major axis is **[AIEEE 2008, 3M]**

(a) $\frac{8}{3}$ (b) $\frac{2}{3}$

(c) $\frac{4}{3}$ (d) $\frac{5}{3}$

100. The line passing through the extermity A of the major axis and extremity B of the minor axis of the ellipse $x^2+9y^2=9$ meets its auxiliary circle at the point M. Then, the area of the triangle with vertices at A, M and the origin O is **[IIT-JEE 2009, 3M]**

(a) $\frac{31}{10}$ (b) $\frac{29}{10}$

(c) $\frac{21}{10}$ (d) $\frac{27}{10}$

101. The normal at a point P on the ellipse $x^2+4y^2=16$ meets the X-axis at Q. If M is the mid-point of the line segment PQ, then the locus of M intersects the latusrectum of the given ellipse at the points **[IIT-JEE 2009, 3M]**

(a) $\left(\pm\frac{3\sqrt{5}}{2},\pm\frac{2}{7}\right)$ (b) $\left(\pm\frac{3\sqrt{5}}{2},\pm\sqrt{\frac{19}{4}}\right)$

(c) $\left(\pm2\sqrt{3},\pm\frac{1}{7}\right)$ (d) $\left(\pm2\sqrt{3},\pm\frac{4\sqrt{3}}{7}\right)$

102. In a triangle ABC with fixed based BC, the vertex A moves such that

$$\cos B+\cos C=4\sin^2\frac{A}{2}$$

If a, b and c denote the lengths of the sides of the triangle opposite to the angles A, B and C, respectively, then **[IIT-JEE 2009, 4M]**

(a) $b+c=4a$

(b) $b+c=2a$

(c) locus of point A is an ellipse

(d) locus of point A is a pair of straight lines

103. The conic having parametric representation

$x=\sqrt{3}\left(\frac{1-t^2}{1+t^2}\right), y=\frac{2t}{1+t^2}$ is **[IIT-JEE 2009, 2M]**

(a) a circle (b) a parabola

(c) an ellipse (d) a hyperbola

104. The ellipse $x^2+4y^2=4$ is inscribed in a rectangle aligned with the coordinate axes, which in turn is inscribed in another ellipse that passes through the point (4, 0). Then, the equation of the ellipse is **[AIEEE 2009, 4M]**

(a) $x^2+12y^2=16$ (b) $4x^2+48y^2=48$

(c) $4x^2+64y^2=48$ (d) $x^2+16y^2=16$

Paragraph

(Q. Nos. 105 to 107)

Tangents are drawn from the point $P(3,4)$ *to the ellipse* $\frac{x^2}{9}+\frac{y^2}{4}=1$ *touching the ellipse at points A and B.*

105. The coordinates of A and B are

(a) (3, 0) and (0, 2)

(b) $\left(-\frac{8}{5},\frac{2\sqrt{161}}{15}\right)$ and $\left(-\frac{9}{5},\frac{8}{5}\right)$

(c) $\left(-\frac{8}{5},\frac{2\sqrt{161}}{15}\right)$ and (0, 2)

(d) (3, 0) and $\left(-\frac{9}{5},\frac{8}{5}\right)$

106. The orthocenter of the triangle PAB is

(a) $\left(5,\frac{8}{7}\right)$ (b) $\left(\frac{7}{5},\frac{25}{8}\right)$

(c) $\left(\frac{11}{5},\frac{8}{5}\right)$ (d) $\left(\frac{8}{25},\frac{7}{5}\right)$

107. The equation of the locus of the point whose distances from the point P and the line AB are equal, is **[IIT-JEE 2010, (3+3+3)M]**

(a) $9x^2+y^2-6xy-54x-62y+241=0$

(b) $x^2+9y^2+6xy-54x+62y-241=0$

(c) $9x^2+9y^2-6xy-54x-62y-241=0$

(d) $x^2+y^2-2xy+27x+31y-120=0$

108. Equation of the ellipse whose axes are the axes of coordinates an which passes through the point (−3, 1) and has eccentricity $\sqrt{\frac{2}{5}}$ is **[AIEEE 2011, 4M]**

(a) $5x^2+3y^2-48=0$ (b) $3x^2+5y^2-15=0$

(c) $5x^2+3y^2-32=0$ (d) $3x^2+5y^2-32=0$

109. The ellipse $E_1:\frac{x^2}{9}+\frac{y^2}{4}=1$ is inscribed in a rectangle R whose sides are parallel to the coordinate axes. Another ellipse E_2 passing through the point (0, 4) circumscribes the rectangle R. the eccentricity of the ellipse E_2 is **[IIT-JEE 2012, 4M]**

(a) $\frac{\sqrt{2}}{2}$ (b) $\frac{\sqrt{3}}{2}$

(c) $\frac{1}{2}$ (d) $\frac{3}{4}$

110. **Statement I :** An equation of a common tangent to the parabola $y^2=16\sqrt{3}x$ and the ellipse $2x^2+y^2=4$ is $y=2x+2\sqrt{3}$

Statement II : If the line $y=mx+\frac{4\sqrt{3}}{m},(m\neq 0)$ is a common tangent to the parabola $y^2=16\sqrt{3}x$ and the ellipse $2x^2+y^2=4$, then m satisfies $m^2+2m^2=24$ **[AIEEE 2012, 4M]**

(a) Statement I is false, statement-II is true

(b) Statement I is true, statementII is true; statement-II is a correct explanation for statement-I

(c) Statement I is true, statement II is true; statement II is not a correct explanation for statement I

(d) Statement I is true, statement II is false

111. An ellipse is drawn by taking a diameter of the circle $(x-1)^2+y^2=1$ as its semi-minor axis and diameter of the circle $x^2+(y-2)^2=4$ is semi-major axis. If the centre of the ellipse is at the origin and its axes are the coordinate axes, then the equation of the ellipse is **[AIEEE 2012, 4M]**

(a) $4x^2+y^2=4$ (b) $x^2+4y^2=8$

(c) $4x^2+y^2=8$ (d) $x^2+4y^2=16$

112. The equation of the circle passing through the foci of the ellipse $\frac{x^2}{16}+\frac{y^2}{9}=1$, and having centre at (0, 3) is **[JEE Main 2013, 4M]**

(a) $x^2+y^2-6y-7=0$ (b) $x^2+y^2-6y+7=0$

(c) $x^2+y^2-6y-5=0$ (d) $x^2+y^2-6y+5=0$

113. A vertical line passing through the point (h, 0) intersects the ellipse $\frac{x^2}{4}+\frac{y^2}{9}=1$ at the points P and Q. Let the tangents to the ellipse at P and Q meet at the point R. If $\Delta(h)$ = area of the triangle PQR, $\Delta_1=\frac{1}{2}\le h\le \max\Delta(h)$ and $\Delta_2=\frac{1}{2}\le h\le \min\Delta(h)$, then $\frac{8}{\sqrt{5}}\Delta_1-8\Delta_2=$ **[JEE Advanced 2013, 3M]**

114. The locus of the foot of perpendicular drawn from the centre of the ellipse $x^2+3y^2=6$ on any tangent to it is **[JEE Main 2014, 4M]**

(a) $(x^2+y^2)^2=6x^2+2y^2$ (b) $(x^2+y^2)^2=6x^2-2y^2$

(c) $(x^2-y^2)^2=6x^2+2y^2$ (d) $(x^2-y^2)^2=6x^2-2y^2$

115. The area (in sq units) of the quadrilateral formed by the tangents at the end points of the latus rectum to the ellipse $\frac{x^2}{9}+\frac{y^2}{5}=1$ is **[JEE Main 2015, 4M]**

(a) $\frac{27}{2}$ (b) 27

(c) $\frac{27}{4}$ (d) 18

116. Let E_1 and E_2 be two ellipses whose centers are at the origin. The major axes of E_1 and E_2 lie along the X-axis and the Y-axis, respectively. Let S be the circle $x^2 + (y-1)^2 = 2$. The straight line $x + y = 3$ touches the curves, S, E_1 and E_2 at P, Q and R respectively. Suppose that $PQ = PR = \frac{2\sqrt{2}}{3}$. If e_1 and e_2 are the eccentricities of E_1 and E_2, respectively, then the correct expression(s) is (are) **[JEE Advanced, 2015 4M]**

(a) $e_1^2 + e_2^2 = \frac{43}{40}$ (b) $e_1 e_2 = \frac{\sqrt{7}}{2\sqrt{10}}$

(c) $|e_1^2 - e_2^2| = \frac{5}{8}$ (d) $e_1 e_2 = \frac{\sqrt{3}}{4}$

117. Suppose that the foci of the ellipse $\frac{x^2}{9} + \frac{y^2}{5} = 1$ are $(f_1, 0)$ and $(f_2\ 0)$ where $f_1 > 0$ and $f_2 > 0$. Let P_1 and P_2 be two parabolas with a common vertex at (0, 0) and with foci at $(f_1, 0)$ and $(2f_2, 0)$, respectively. Let T_1 be a tangent to P_1 which passes through $(2f_2, 0)$ and T_2 be a tangent to P_2 which passes through $(f_1, 0)$. If m_1 is the slope of T_1 and m_2 is the slope of T_2, then the9 value of $\left(\frac{1}{m_1^2} + m_2^2\right)$ is **[JEE Advanced 2015, 4M]**

Paragraph

(Q. Nos. 118 and 119)

Let $F_1(x_1, 0)$ and $F_2(x_2, 0)$ for $x_1 < 0$ and $x_2 > 0$, be the foci of the ellipse $\frac{x^2}{9} + \frac{y^2}{8} = 1$. Suppose a parabola having vertex at the origin and focus at F_2 intersects the ellipse at point M in the first quadrant and at point N in the fourth quadrant.

118. The orthocentre of the triangle F_1MN is

(a) $\left(-\frac{9}{10}, 0\right)$ (b) $\left(\frac{2}{3}, 0\right)$ (c) $\left(\frac{9}{10}, 0\right)$ (d) $\left(\frac{2}{3}, \sqrt{6}\right)$

119. If the tangents to the ellipse at M and N meet at R and the normal to the parabola at M meets the X-axis at Q, then the ratio of area of the triangle MQR to area of the quadrilateral MF_1NF_2 is **[JEE Advanced 2016, (3+3)M]**

(a) 3 : 4 (b) 4 : 5 (c) 5 : 8 (d) 2 : 3

120. The eccentricity of an ellipse whose centre is at the origin is 1/2. If one of its directices is $x = -4$, then the equation of the normal to it at $(1, 3/2)$ is **[JEE Main 2017, 4M]**

(a) $x + 2y = 4$ (b) $2y - x = 2$

(c) $4x - 2y = 1$ (d) $4x + 2y = 7$

Solutions

1. $\because$ Major axis on X-axis.

$\therefore \quad f(2a) > f(a^2 - 3)$

$\Rightarrow \quad 2a > a^2 - 3 \qquad [\because f \text{ is increasing}]$

$\Rightarrow \quad a^2 - 2a - 3 < 0 \text{ or } (a-3)(a+1) < 0$

or $\quad -1 < a < 3$

$\therefore \quad a \in (-1, 3)$

2. $\because$ Major axis on Y-axis.

$\therefore \quad f(a^2 - 5) > f(4a)$

$\Rightarrow \quad a^2 - 5 < 4a \qquad [\because f \text{ is decreasing}]$

$\Rightarrow \quad a^2 - 4a - 5 < 0$

or $\quad (a-5)(a+1) < 0$

or $\quad -1 < a < 5$

$\therefore \quad a \in (-1, 5)$

3. Let $\quad a^2 = \sin\sqrt{2} - \cos\sqrt{3} = \sin\sqrt{2} - \sin\left(\frac{\pi}{2} - \sqrt{3}\right)$

$$= \sin\sqrt{2} + \sin\left(\sqrt{3} - \frac{\pi}{2}\right)$$

$$= \sin(1.41) + \sin(1.73 - 1.57)$$

$$= \sin(1.41) + \sin(0.16) > 0$$

and $\quad b^2 = \sin\sqrt{3} - \cos\sqrt{2}$

$$= \sin\sqrt{3} - \sin\left(\frac{\pi}{2} - \sqrt{2}\right)$$

$$= \sin(1.73) - \sin(1.57 - 1.41)$$

$$= \sin(1.73) - \sin(0.36) > 0$$

Also, $a^2 > b^2$

Hence, curve represent an ellipse with foci on X-axis.

4. Mutually perpendicular tangents have been drawn by taking any point on the director circle of given ellipse. Any point on the director circle can be taken as $(5\cos\theta, 5\sin\theta)$. Equation of corresponding chord of contact is

$$\frac{5x}{16}\cos\theta + \frac{5y}{9}\sin\theta - 1 = 0$$

It's distance from the origin is equal to

$$\frac{1}{\sqrt{\left(\frac{25\cos^2\theta}{256} + \frac{25\sin^2\theta}{81}\right)}} = \frac{144}{5}$$

$$\Rightarrow \quad \frac{1}{\sqrt{(256 - 175\cos^2\theta)}} \le \frac{144}{5.9} = \frac{16}{5}$$

5. We have, $PQ = BP$

$$\Rightarrow \quad 2ae = \sqrt{(a^2e^2 + b^2)} = \sqrt{a^2} = a$$

$$\therefore \quad e = \frac{1}{2}$$

6. Any tangent to $\frac{x^2}{16} + \frac{y^2}{9} = 1$, is

$$y = mx + \sqrt{(16m^2 + 9)}$$

It is also tangent to the circle $x^2 + y^2 = \left(\frac{5}{\sqrt{2}}\right)^2$, then perpendicular distance from $(0, 0)$ is equal to $\frac{5}{\sqrt{2}}$

$$\therefore \quad \frac{\sqrt{(16m^2 + 9)}}{\sqrt{(m^2 + 1)}} = \frac{5}{\sqrt{2}}$$

$$\Rightarrow \quad 32m^2 + 18 = 25m^2 + 25$$

or $\quad 7m^2 = 7 \Rightarrow m = \pm 1$

for acute $m = 1$.

Now, let θ be the angle between common tangent and the line $\sqrt{3}x - y + 6 = 0$, then

$$\tan\theta = \left|\frac{\sqrt{3} - 1}{1 + \sqrt{3}}\right| = \frac{\sqrt{3} - 1}{\sqrt{3} + 1} = \tan\left(\frac{\pi}{12}\right)$$

$$\therefore \quad \theta = \frac{\pi}{12}$$

7. Tangent at $(-8, 3)$ is

$$\frac{x(-8)}{100} + \frac{y(3)}{25} = 1$$

or $\quad 2x - 3y + 25 = 0$

for Y-axis put $x = 0$, then $y = \frac{25}{3}$

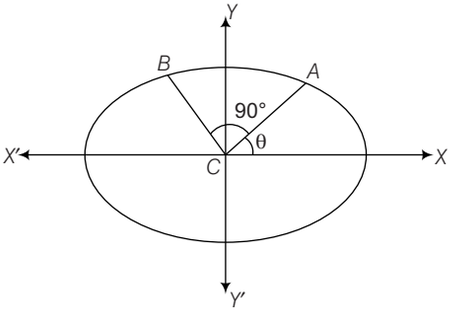
Hence, required point is $\left(0, \frac{25}{3}\right)$.

8. Let $A \equiv (4\cos\theta, 3\sin\theta)$, then

$B \equiv (-4\sin\theta, 3\cos\theta)$

$\therefore \quad (CA)^2 = 16\cos^2\theta + 9\sin^2\theta$

and $(CB)^2 = 16\sin^2\theta + 9\cos^2\theta$



$$\therefore \frac{1}{(CA)^2} + \frac{1}{(CB)^2} = \frac{1}{16\cos^2\theta + 9\sin^2\theta} + \frac{1}{16\sin^2\theta + 9\cos^2\theta}$$

$$= \frac{25}{144(\sin^4\theta + \cos^4\theta) + 337\sin^2\theta\cos^2\theta}$$

$$= \frac{25}{144(1 - 2\sin^2\theta\cos^2\theta) + 337\sin^2\theta\cos^2\theta}$$

$$= \frac{25}{144 + 49\sin^2\theta\cos^2\theta} = \frac{25}{144} \qquad (\text{for } \theta = 0)$$

9. (α, β) lies on the director circle of the ellipse i.e. on $x^2 + y^2 = 9$

So, we can assume

$$\alpha = 3\cos\theta, \beta = \sin\theta$$

$$\therefore \quad F = 12\cos\theta + 9\sin\theta = 3(4\cos\theta + 3\sin\theta)$$

$$\Rightarrow \quad -15 \le F \le 15$$

10. At, $t = \frac{3}{2}$, $\quad b > a$

$$\therefore \text{ Length of latusrectum} = \frac{2a^2}{b} = \frac{2[t^2 - 3t + 4]^2}{[3 + 5t]}$$

$$= \frac{2\left[\frac{9}{4} - \frac{9}{2} + 4\right]^2}{\left[3 + \frac{15}{2}\right]} \qquad [\text{at } t = \frac{3}{2}]$$

$$= \frac{2[1.75]^2}{[10.5]} = \frac{2(1)^2}{10} = \frac{1}{5}$$

11. Slope of line $= \frac{b}{a}\left(\frac{\sin 60° - \sin 30°}{\cos 60° - \cos 30°}\right) = -\frac{b}{a} = -\frac{1}{2}$ or $a = 2b$

Homogenizing the ellipse with $x + 2y + 4 = 0$, then

$$\frac{x^2}{4b^2} + \frac{y^2}{b^2} = \left(\frac{x + 2y}{-4}\right)^2$$

or $\quad x^2\left(\frac{1}{4b^2} - \frac{1}{16}\right) + y^2\left(\frac{1}{b^2} - \frac{1}{4}\right) - \frac{xy}{4} = 0$

Now, coefficients of x^2 + coefficient of $y^2 = 0$

$$\Rightarrow \quad \frac{1}{4b^2} - \frac{1}{16} + \frac{1}{b^2} - \frac{1}{4} = 0$$

or

$$\frac{5}{4b^2} = \frac{5}{16}$$

or $\quad b^2 = 4$ then, $a^2 = 16$

$\therefore$ Ellipse is $\frac{x^2}{16} + \frac{y^2}{4} = 1$

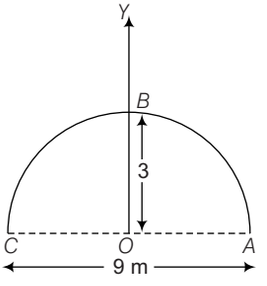
12. Let the equation of the semi elliptical arch be

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \qquad [y > 0]$$

Length of the major axis $= 2a = 9$

$$\Rightarrow \quad a = \frac{9}{2}$$

Length of the semi minor axis $b = 3$



So, the equation of the arch becomes

$$\frac{4x^2}{81} + \frac{y^2}{9} = 1$$

If $\quad x = 2$, then $y^2 = \frac{65}{9}$

$$\Rightarrow \quad y = \frac{\sqrt{65}}{3} = \frac{8}{3} \qquad [\text{approximately}]$$

13. Equation of tangent of the ellipse at $P(5\cos\theta, 4\sin\theta)$ is

$$\frac{x}{5}\cos\theta + \frac{y}{4}\sin\theta = 1$$

It meets the line $x = 0$ at $Q(0, 4\ \text{cosec}\ \theta)$ and image of Q in the line $y = x$ is $R(4\ \text{cosec}\ \theta, 0)$.

$\therefore$Equation of the circle is

$$(x - 0)(x - 4\ \text{cosec}\ \theta) + (y - 4\ \text{cosec}\ \theta)(y - 0) = 0$$

i.e. $\quad x^2 + y^2 - 4(x + y)\ \text{cosec}\ \theta = 0$

$\therefore$Each member of the family passes through the intersection of

$$x^2 + y^2 = 0 \text{ and } x + y = 0$$

i.e. the point $(0, 0)$.

14. A cyclic parallelogram will be a rectangle or square.

So, $\quad \angle QPR = 90°$

Therefore, P lies on the director circle of the ellipse

$$\frac{x^2}{16} + \frac{y^2}{b^2} = 1$$

Hence, $x^2 + y^2 = 25$ is the director circle of $\frac{x^2}{16} + \frac{y^2}{b^2} = 1$,

then $\quad 16 + b^2 = 25$ or $b^2 = 9$

$$\Rightarrow \quad a^2(1 - e^2) = 9$$

$$\Rightarrow \quad 16(1 - e^2) = 9 \qquad [\because a^2 = 16]$$

$$\Rightarrow \quad e^2 = 1 - \frac{9}{16} = \frac{7}{16}$$

$$\therefore \quad e = \frac{\sqrt{7}}{4}$$

15. $\because m, n \in N$ and $m.n = m + n$

or $\quad m(n - 1) = n$

n is divisible by $n - 1$. Therefore

$$n - 1 = 1$$

$$\Rightarrow \quad n = 2, m = 2$$

Hence, the chord of contact of tangents drawn from

$(2, 2)$ to $4x^2 + 9y^2 = 36$

is $\quad 4x \cdot 2 + 9y \cdot 2 = 36$

or $\quad 4x + 9y = 18$

16. $\because x - 2y + 4 = 0$ or $y = \frac{x}{2} + 2$

Condition of tangency

$$c^2 = a^2 m^2 + b^2 \Rightarrow 4 = 4 \times \frac{1}{4} + b^2$$

$$\therefore \quad b = \sqrt{3}$$

Now, common tangent meet on X-axis at a point $(-4, 0)$.

According to symmetry other common tangent meet Y-axis at $(0, -2)$.

$\therefore$Equation of other common tangent is

$$\frac{x}{-4} + \frac{y}{-2} = 1 \text{ or } x + 2y + 4 = 0$$

17. The tangent at the point of shortest distance from the line $x + y = 7$ parallel to the given line.

Any point on the given ellipse is

$$(\sqrt{6}\cos\theta, \sqrt{3}\sin\theta).$$

Equation of the tangent is

$$\frac{x\cos\theta}{\sqrt{6}} + \frac{y\sin\theta}{\sqrt{3}} = 1.$$

It is parallel to $x + y = 7$

$$\Rightarrow \quad \frac{\cos\theta}{\sqrt{6}} = \frac{\sin\theta}{\sqrt{3}}$$

$$\Rightarrow \quad \frac{\cos\theta}{\sqrt{2}} = \frac{\sin\theta}{1} = \frac{1}{\sqrt{3}}$$

The required point is (2, 1).

18. Let $y = mx + \frac{1}{m}$ be a tangent to the parabola, then for the required equilateral triangle.

$m = \pm\frac{1}{\sqrt{3}}$ and it is tangent to ellipse also, if

$$\left(\frac{1}{m}\right)^2 = a^2m^2 + b^2$$

$$\Rightarrow \quad 3 = \frac{a^2}{3} + b^2$$

$$\Rightarrow \quad 3 = \frac{a^2}{3} + a^2 - a^2e^2$$

$$\Rightarrow \quad a^2e^2 = \frac{4a^2}{3} - 3$$

$$\text{or} \quad e^2 = \frac{4}{3} - \frac{3}{a^2}$$

Now, $0 < e^2 < 1$

$$\Rightarrow \quad 0 < \frac{4}{3} - \frac{3}{a^2} < 1$$

$$\Rightarrow \quad \frac{3}{2} < a < 3$$

19. For equilateral triangle

Circumcentre = Centroid

$$\therefore \quad h = \frac{a\cos\alpha + a\cos\beta + a\cos\gamma}{3} \text{ or } \frac{3h}{a} = \Sigma\cos\alpha$$

$$\text{or} \quad \left(\frac{3h}{a}\right)^2 = (\Sigma\cos\alpha)^2 = \Sigma\cos^2\alpha + 2\,\Sigma\cos\alpha\cos\beta \qquad \ldots(i)$$

$$\text{and} \quad k = \frac{b\sin\alpha + b\sin\beta + b\sin\gamma}{3}$$

$$\text{or} \quad \frac{3k}{b} = \Sigma\sin\alpha$$

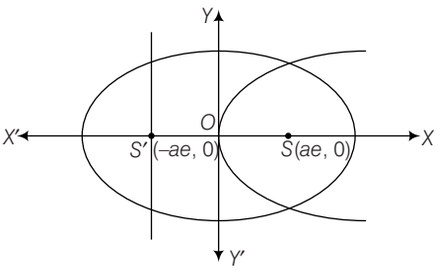
$$\text{or} \quad \left(\frac{3k}{b}\right)^2 = (\Sigma\sin\alpha)^2 = \Sigma\sin^2\alpha + 2\,\Sigma\sin\alpha\sin\beta \qquad \ldots(ii)$$

Adding Eqs. (i) and (ii), we get

$$\frac{9h^2}{a^2} + \frac{9k^2}{b^2} = 3 + 2\,\Sigma\cos(\alpha - \beta)$$

$$\text{or} \quad \Sigma\cos(\alpha - \beta) = \frac{9h^2}{2a^2} + \frac{9k^2}{2b^2} - \frac{3}{2}$$

20. $\because$ Latusrectum and parabola = $4(ae)$ ...(i)



and latusrectum of ellipse $= \frac{2b^2}{a}$ ...(ii)

$\because$ Latusrectum and parabola and ellipse be equal

$$\therefore \quad \frac{2b^2}{a} = 4ae \qquad \text{[from Eqs. (i) and (ii)]}$$

$$\Rightarrow \quad 2b^2 = 4a^2e$$

$$\text{or} \quad 2a^2(1 - e^2) = 4a^2e \quad \text{or} \quad e^2 + 2e - 1 = 0$$

$$\text{Therefore, } e = \frac{-2 \pm \sqrt{(4+4)}}{2} = -1 \pm \sqrt{2}$$

$$\text{Hence,} \quad e = \sqrt{2} - 1$$

21. Here, the center of the ellipse is (0, 0)

Let $P(r\cos\theta, r\sin\theta)$ be any point on the given ellipse, then

$$r^2\cos^2\theta + 2r^2\sin^2\theta + 2r^2\sin\theta\cos\theta = 1$$

$$\text{or} \quad r^2 = \frac{1}{1 + \sin^2\theta + \sin 2\theta}$$

$$= \frac{2}{2 + (1 - \cos 2\theta) + 2\sin 2\theta} = \frac{2}{2\sin 2\theta - \cos 2\theta + 3}$$

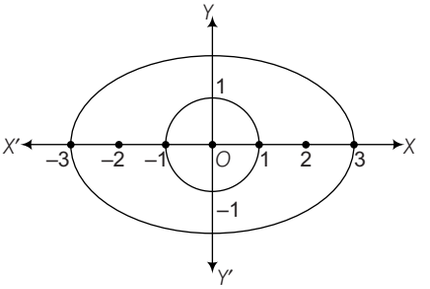
$\because \quad 3 - \sqrt{5} \le 2\sin 2\theta - \cos 2\theta + 3 \le 3 + \sqrt{5}$

For r_{max}, $2\sin 2\theta - \cos 2\theta + 3 = 3 - \sqrt{5}$

$$\therefore \quad r_{max}^2 = \frac{2}{3 - \sqrt{5}} = \frac{2(3 + \sqrt{5})}{4} = \frac{6 + 2\sqrt{5}}{4} = \left(\frac{\sqrt{5} + 1}{2}\right)^2$$

$$\text{Hence,} \quad r_{max} = \frac{\sqrt{5} + 1}{2}$$

22. Centre of the ellipse if (1, 2) and length of major axis and minor axis are 6 and 4 respectively and centre and radius of the circle are (1, 2) and 1 respectively.



Hence, ellipse and circle do not touch or cut.

$\therefore$ Common chord impossible.

$\therefore$ Hence, length of common chord = 0

23. $ax^2 + by^2 + 2fx + 2gy + c = 0$

$$a\left\{x^2 + \frac{2fx}{a}\right\} + b\left\{y^2 + \frac{2gy}{b}\right\} + c = 0$$

$$\Rightarrow \quad a\left(x + \frac{f}{a}\right)^2 + b\left(y + \frac{g}{b}\right)^2 = \left(\frac{f^2}{a} + \frac{g^2}{b} - c\right)$$

$$\Rightarrow \quad \frac{(x + f/a)^2}{\left(\frac{f^2}{a} + \frac{g^2}{b} - c\right)/a} + \frac{(y + g/b)^2}{\left(\frac{f^2}{a} + \frac{g^2}{b} - c\right)/b} = 1$$

If e eccentricity, then

$$\frac{\left(\frac{f^2}{a} + \frac{g^2}{b} - c\right)}{b} = \frac{\left(\frac{f^2}{a} + \frac{g^2}{b} - c\right)}{a}(1 - e^2)$$

$$\Rightarrow \quad 1 - e^2 = \frac{a}{b}$$

$$\Rightarrow \quad e^2 = \frac{b - a}{b}$$

$$\therefore \quad e = \sqrt{\left(\frac{b - a}{b}\right)}$$

24. Let ellipse be $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ and the circle be $x^2 + y^2 = a^2e^2$,

point of intersection of the circle and the ellipse is

$$P\left(\frac{a}{e}\sqrt{(2e^2 - 1)}, \frac{a}{e}(1 - e^2)\right)$$

Now, area of $\Delta\, PF_1F_2 = \left|\frac{1}{2} \times 2ae \times \frac{a}{e}(1 - e^2)\right|$

$$= a^2(1 - e^2) = 30 \qquad \text{[given]}$$

or $\quad a^2e^2 = a^2 - 30 = \left(\frac{17}{2}\right)^2 - 30 = \frac{169}{4}$

$$\therefore \quad ae = \frac{13}{2} \text{ or } 2ae = 13$$

25. Let standard ellipse is $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \qquad (a > b)$

Equations of tangent and normal at $\left(\frac{a}{\sqrt{2}}, \frac{b}{\sqrt{2}}\right)$

are $bx + ay - \sqrt{2}\,ab = 0$ and $ax - by - \frac{(a^2 - b^2)}{\sqrt{2}} = 0$

If sides of rectangles are p and q, then

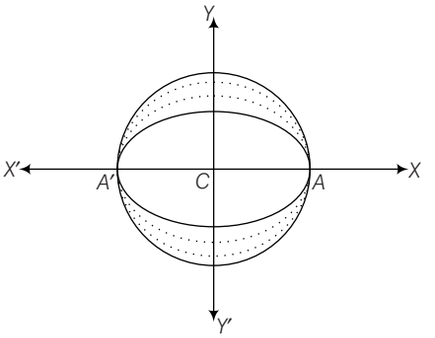
$$p = \frac{|0 + 0 - \sqrt{2}\,ab|}{\sqrt{(a^2 + b^2)}} = \frac{\sqrt{2}\,ab}{\sqrt{(a^2 + b^2)}}$$

and $$q = \left|\frac{0 - 0 - \frac{(a^2 - b^2)}{\sqrt{2}}}{\sqrt{(a^2 + b^2)}}\right|$$

$$= \frac{(a^2 - b^2)}{\sqrt{2}\sqrt{(a^2 + b^2)}}$$

$\therefore$ Area of rectangle $= pq = \frac{(a^2 - b^2)\,ab}{(a^2 + b^2)}$

26. Let equation of ellipse be $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$



and equation of circle is $x^2 + y^2 = a^2$

$\therefore$ Area of ellipse $= \pi ab$

and Area of circle $= \pi a^2$

$$\therefore \quad \text{Probability} = \frac{\pi a^2 - \pi ab}{\pi a^2} = \frac{a - b}{a} = \frac{2}{3} \qquad \text{[given]}$$

$$\Rightarrow \quad 3a - 3b = 2a$$

or $\quad a = 3b$

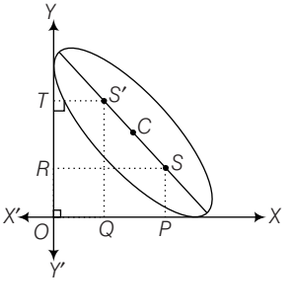
or $\quad a^2 = 9b^2 = 9a^2(1 - e^2)$

$$\Rightarrow \quad 9e^2 = 8$$

$$\therefore \quad e = \frac{2\sqrt{2}}{3}$$

27. Let $S \equiv (x_1, y_1)$, $S' \equiv (x_2, y_2)$

Let $C \equiv (h, k)$



$$\therefore \quad \frac{x_1 + x_2}{2} = h$$

$$\Rightarrow \quad x_1 + x_2 = 2h$$

and $\quad y_1 + y_2 = 2k$

$\because \quad SP\,S'Q = b^2$

$$\Rightarrow \quad y_1\,y_2 = b^2 \text{ and } SR \cdot S'T = b^2$$

$$\Rightarrow \quad x_1\,x_2 = b^2$$

Distance between foci $SS' = 2ae$

$$\Rightarrow \quad \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2} = (2ae)$$

$$\Rightarrow \quad (x_1 - x_2)^2 + (y_1 - y_2)^2 = 4a^2e^2$$

$$\Rightarrow (x_1 + x_2)^2 - 4x_1x_2 + (y_1 + y_2)^2 - 4\,y_1y_2 = 4a^2e^2$$

$$\Rightarrow \quad 4h^2 - 4b^2 + 4k^2 - 4b^2 = 4(a^2 - b^2)$$

$$\Rightarrow \quad h^2 + k^2 - 2b^2 = a^2 - b^2$$

$$\therefore \quad h^2 + k^2 = a^2 + b^2$$

Locus of centre is $x^2 + y^2 = a^2 + b^2$ which is a circle.

28. If chord AB, then equation of AB, here mid-point of the chord is $\left(\frac{1}{2}, \frac{2}{3}\right)$

$\therefore \quad T = S_1$

$$\frac{x}{50} + \frac{y}{24} = \frac{1}{100} + \frac{1}{36} \quad \text{...(i)}$$

Let $A \equiv (x_1, y_1)$ and $B \equiv (x_2, y_2)$

$$\therefore \quad \frac{x_1}{50} + \frac{y_1}{24} = \frac{1}{100} + \frac{1}{36} \quad \text{...(ii)}$$

and $$\frac{x_2}{50} + \frac{y_2}{24} = \frac{1}{100} + \frac{1}{36} \quad \text{...(iii)}$$

$$\therefore \quad \frac{(x_2 - x_1)}{50} + \frac{(y_2 - y_1)}{24} = 0$$

$$\therefore \quad AB = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

$$= \sqrt{(x_2 - x_1)^2 + \left(\frac{24}{50}\right)^2 (x_2 - x_1)^2}$$

$$= \frac{|x_2 - x_1|}{25}\sqrt{769}$$

Now, solving $\frac{x}{50} + \frac{y}{24} = \frac{1}{100} + \frac{1}{36}$

and $$\frac{x^2}{25} + \frac{y^2}{16} = 1$$

then, $$x^2 - x - \frac{5336}{9} = 0$$

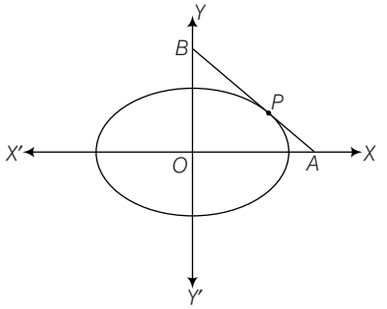
$$\therefore \quad |x_2 - x_1| = \frac{\sqrt{D}}{a} = \frac{\sqrt{21353}}{3}$$

$$\therefore \quad AB = \frac{\sqrt{21353}}{3 \times 25} \times \sqrt{769}$$

29. Equation of tangent at the point $P(4\cos\theta, 3\sin\theta)$ is

$$\frac{x}{4}\cos\theta + \frac{y}{3}\sin\theta = 1$$

or $$\frac{x}{4\sec\theta} + \frac{y}{3\,\text{cosec}\,\theta} = 1$$



Coordinates of A and B are

$$A \equiv (4\sec\theta, 0) \text{ and } B \equiv (0, 3\,\text{cosec}\,\theta)$$

Let middle point (h, k)

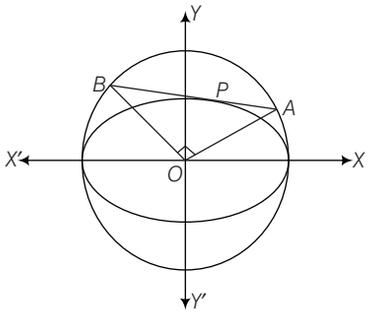
$$\therefore \quad h = 2\sec\theta, k = \frac{3}{2}\,\text{cosec}\,\theta$$

$$\Rightarrow \quad \left(\frac{2}{h}\right)^2 + \left(\frac{3}{2k}\right)^2 = 1$$

$\therefore$ Locus is $9x^2 + 16y^2 = 4x^2y^2$

30. Equation of tangent at $(a\cos\alpha, b\sin\alpha)$ is

$$\frac{x}{a}\cos\alpha + \frac{y}{b}\sin\alpha = 1 \quad \text{...(i)}$$



Equation of auxiliary circle is

$$x^2 + y^2 = a^2 \quad \text{...(ii)}$$

For combined equation of OA and OB, making homogeneous Eq. (ii) with the help of Eq. (i), then

$$x^2 + y^2 = a^2\left(\frac{x}{a}\cos\alpha + \frac{y}{b}\sin\alpha\right)^2$$

$$\Rightarrow \quad x^2\sin^2\alpha + y^2\left(1 - \frac{a^2}{b^2}\sin^2\alpha\right) - \frac{2axy}{b}\sin\alpha\cos\alpha = 0$$

$\because \quad \angle AOB = 90°$

$\therefore$ Coefficient of x^2 + Coefficient of $y^2 = 0$

$$\Rightarrow \quad \sin^2\alpha + 1 - \frac{a^2}{b^2}\sin^2\alpha = 0$$

$$\Rightarrow \quad 1 + \sin^2\alpha - \frac{a^2}{a^2(1 - e^2)}\sin^2\alpha = 0$$

$$\Rightarrow \quad (1 - e^2)(1 + \sin^2\alpha) - \sin^2\alpha = 0$$

$$\Rightarrow \quad 1 - e^2(1 + \sin^2\alpha) = 0$$

or $$e^2(1 + \sin^2\alpha) = 1$$

31. $\because \; b^2x^2 + y^2 = a^2b^2 \Rightarrow \frac{x^2}{a^2} + \frac{y^2}{a^2b^2} = 1$

Let $a > ab$,

Then, $$(ab)^2 = a^2(1 - e^2)$$

$$\Rightarrow \quad b^2 = 1 - e^2 \quad \text{...(i)}$$

$\therefore$ Extremities of the latusrectum $(\pm ae, \pm ab^2)$

Let $x_1 = \pm ae$ and $y_1 = \pm ab^2 = \pm a(1 - e^2)$

or $$y_1 = \pm(a - ae^2)$$

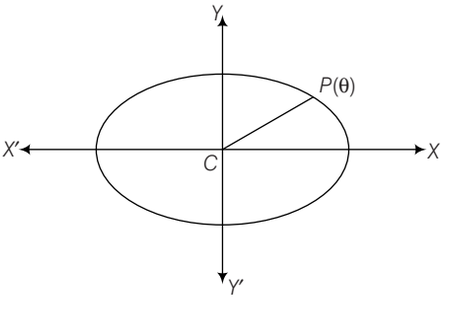
$$\Rightarrow \quad ay_1 = \pm(a^2 - a^2e^2)$$

$$= \pm(a^2 - x_1^2) \quad [\because x_1 = \pm ae]$$

or $$x_1^2 \pm ay_1 = a^2$$

$\therefore$ Required locus is $x^2 \pm ay = a^2$

32. Let $P \equiv (\sqrt{6}\cos\theta, \sqrt{2}\sin\theta)$ be any point on the ellipse



$$\frac{x^2}{6}+\frac{y^2}{2}=1$$

Given, $CP=2 \Rightarrow (CP)^2=4$

$\Rightarrow \quad 6\cos^2\theta+2\sin^2\theta=4$

$\Rightarrow \quad 6\cos^2\theta+2(1-\cos^2\theta)=4$

or $\quad \cos^2\theta=\frac{1}{2}=\left(\frac{1}{\sqrt{2}}\right)^2=\left(\cos\frac{\pi}{4}\right)^2$

$\therefore \quad \theta=n\pi\pm\frac{\pi}{4}, n\in I$

$\therefore \quad \theta=\frac{\pi}{4},\frac{3\pi}{4},\frac{5\pi}{4},\frac{7\pi}{4}$

33. Here, $a=\cos\theta$ and $b=\sin\theta$

$\therefore \quad \frac{\pi}{4}<\theta<\frac{\pi}{2}$

$\therefore \quad a<b$

then, $\quad a^2=b^2(1-e^2)$

$\Rightarrow \quad \cos^2\theta=\sin^2\theta(1-e^2)$

$\therefore \quad e^2=1-\cot^2\theta$

or $\quad e=\sqrt{(1-\cot^2\theta)} \qquad \left(\because \frac{\pi}{4}<\theta<\frac{\pi}{2}\right)$

$\because$ Extremities of latusrectum are $\left(\pm\frac{a^2}{b},\pm be\right)$

$\Rightarrow \quad x=\pm\frac{a^2}{b},\ y=\pm be$

or $\quad b^2x^2=a^4$ and $y^2=b^2e^2=\sin^2\theta-\cos^2\theta$

or $\quad \sin^2\theta x^2=\cos^4\theta$ and $y^2=1-2\cos^2\theta$

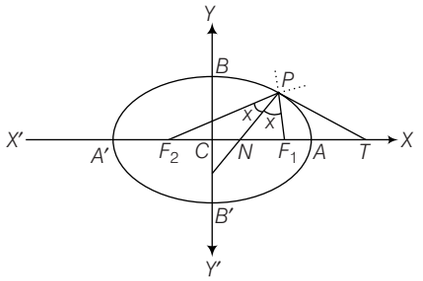
or $\quad (1-\cos^2\theta)x^2=\cos^4\theta$ and $\cos^2\theta=\frac{1-y^2}{2}$

$\therefore \quad \left(1-\frac{1-y^2}{2}\right)x^2=\left(\frac{1-y^2}{2}\right)^2$

or $\quad 2x^2(1+y^2)=(1-y^2)^2$

or $\quad 2y^2(x^2+1)=1+y^4-2x^2$

34. $\because \frac{PF_1}{PF_2}=\frac{NF_1}{NF_2}$



$\therefore$ PN bisects the $\angle F_1PF_2$

$\because$ Bisectors are perpendicular to each other.

$\therefore$ PT bisects the angle $(180^\circ-\angle F_1PF_2)$

35. $\because \ a^2-a-6>0 \Rightarrow (a-3)(a+2)>0$

$\therefore \quad a<-2$ or $a>3$ ...(i)

and $\quad a^2-6a+5>0 \Rightarrow (a-1)(a-5)>0$

$\therefore \quad a<1$ or $a>5$ ...(ii)

Also $\quad a^2-a-6 \neq a^2-6a+5$

or $\quad a\neq\frac{11}{5}$ ...(iii)

From Eqs. (i), (ii) and (iii) we get

$a\in(-\infty,-2)\cup(5,\infty)$

36. $\because$ A latusrectum of an ellipse is a line passing through a focus, perpendicular to major axis i.e. parallel to minor axis.

37. Let the required equation be

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1 \qquad ...(i)$$

Since, Eq. (i) passes through $(4,-1)$, then

$$\frac{16}{a^2}+\frac{1}{b^2}=1 \qquad ...(ii)$$

The equation of given line is $y=-\frac{x}{4}+\frac{10}{4}$

Which touches the ellipse Eq. (i),

$$\left(\frac{10}{4}\right)^2=a^2\left(-\frac{1}{4}\right)^2+b^2$$

$$\Rightarrow \quad \frac{a^2}{16}+b^2=\frac{25}{4} \qquad ...(iii)$$

Solving, Eqs. (ii) and (iii), we get $a^2=20,\ b^2=5$

or $\quad a^2=80,\ b^2=\frac{5}{4}$

Therefore, the required equation of ellipse will be

$$\frac{x^2}{20}+\frac{y^2}{5}=1 \text{ or } \frac{x^2}{80}+\frac{y^2}{5/4}=1$$

i.e. $\quad x^2+4y^2=20$ or $x^2+64y^2=80$

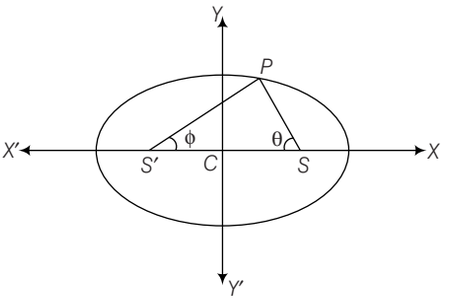
38. From focal property of ellipse

$SP+S'P=2a$, if $a>b$

and $\quad SP+S'P=2b$, if $b>a$

Also, $\quad PS\cos\theta+PS'\cos\phi=2ae$ ...(i)

$PS\sin\theta-PS'\sin\phi=0$ ...(ii)



From Eqs. (i) and (ii), we get

$$PS=\frac{2ae\sin\phi}{\sin(\theta+\phi)},\ PS'=\frac{2ae\sin\theta}{\sin(\theta+\phi)}$$

$\because \quad SP+S'P=2a$

$\therefore \quad e(\sin\theta+\sin\phi)=\sin(\theta+\phi)$

$$\Rightarrow \quad e\cdot 2\sin\left(\frac{\theta+\phi}{2}\right)\cos\left(\frac{\theta-\phi}{2}\right)=2\sin\left(\frac{\theta+\phi}{2}\right)\cos\left(\frac{\theta+\phi}{2}\right)$$

or $$\frac{\cos\left(\frac{\theta-\phi}{2}\right)}{\cos\left(\frac{\theta+\phi}{2}\right)}=\frac{1}{e}$$

or $$\frac{\cos\left(\frac{\theta-\phi}{2}\right)-\cos\left(\frac{\theta+\phi}{2}\right)}{\cos\left(\frac{\theta-\phi}{2}\right)+\cos\left(\frac{\theta+\phi}{2}\right)}=\frac{1-e}{1+e}$$

or $$\tan\left(\frac{\theta}{2}\right)\tan\left(\frac{\phi}{2}\right)=\frac{1-e}{1+e}$$

39. Let $S\equiv(5,12)$, $S'\equiv(24,7)$ and let $P\equiv(0,0)$

Now, $$SS'=\sqrt{(24-5)^2+(7-12)^2}$$
$$=\sqrt{(361+25)}=\sqrt{(386)}$$

For ellipse $SP+S'P=2a$

$\Rightarrow$ $13+25=2a$

$\therefore$ $2a=38$

$\because$ $SS'=2ae \Rightarrow e=\frac{\sqrt{386}}{38}$

and for hyperbola $S'P-SP=2a$

$\Rightarrow$ $25-13=2a \Rightarrow 2a=12$

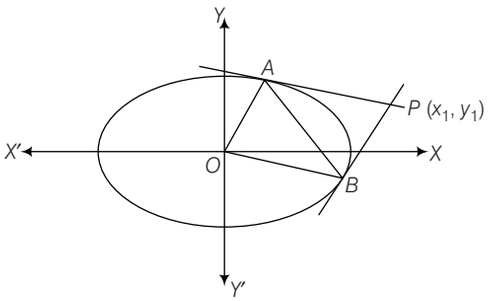
$\therefore$ $SS'=2ae \Rightarrow e=\frac{\sqrt{386}}{12}$

40. Let the point of intersection of tangents at A and B be $P(x_1, y_1)$.

Then, equation of AB is

$$xx_1+4yy_1=4$$

or $$\frac{xx_1}{4}+yy_1=1 \quad \ldots(i)$$



For point of OA and OB, homogenizing the equation of ellipse with the help of Eq. (i), then

$$x^2+4y^2=4\left(\frac{xx_1}{4}+yy_1\right)^2$$

or $$x^2\left(\frac{x_1^2}{4}-1\right)+y^2(4y_1^2-4)+2xyx_1y_1=0 \quad \ldots(ii)$$

But gives equation of OA and OB is

$$x^2+4y^2+axy=0 \quad \ldots(iii)$$

Since, Eqs. (ii) and (iii) an identical, then

$$\frac{\frac{x_1^2}{4}-1}{1}=\frac{4y_1^2-4}{4}=\frac{2x_1y_1}{a}$$

or $$x_1^2-4=4(y_1^2-1)$$

or $$x_1^2-4y_1^2=0$$

Therefore, the locus is $x^2-4y^2=0$

or $$(x+2y)(x-2y)=0$$

or $x+2y=0$ and $x-2y=0$

41. $\because$ $25x^2+9y^2-150x-90y+225=0$

$\Rightarrow$ $25(x^2-6x)+9(y^2-10y)+225=0$

$\Rightarrow$ $25\{(x-3)^2-9\}+9\{(y-5)^2-25\}+225=0$

$\Rightarrow$ $25(x-3)^2+9(y-5)^2=225$

$\Rightarrow$ $\frac{(x-3)^2}{3^2}+\frac{(y-5)^2}{5^2}=1 \quad \ldots(i)$

Let $x-3=X,\ y-5=Y$

Then, Eq. (i) becomes

$$\frac{X^2}{3^2}+\frac{Y^2}{5^2}=1 \quad \ldots(ii)$$

Now, comparing Eq. (ii) with

$$\frac{X^2}{a^2}+\frac{Y^2}{b^2}=1$$

$\therefore$ $a=3, b=5$

$\Rightarrow$ $a^2=b^2(1-e^2)$

$\Rightarrow$ $9=25(1-e^2)$

$\Rightarrow$ $e=\frac{4}{5}$

Centre : $X=0,\ Y=0$

$x-3=0,\ y-5=0$

$\therefore$ Centre $\equiv(3,5)$

Foci : $X=0, Y=\pm be$

$\Rightarrow$ $x-3=0, y-5=\pm 4$

$\Rightarrow$ $y=5\pm 4$

$\therefore$ Foci (3, 1) and (3, 9)

Major axis $2b=10$

42. $P(\theta)$ on the ellipse $x^2+4y^2=16$ is $(4\cos\theta, 2\sin\theta)$

Equation of tangent at P is

$$4\cos\theta\, x+8\sin\theta\, y=16$$

$\Rightarrow$ $x\cos\theta+2y\sin\theta=4$

It passes through centre (4, 2) of the given circle

$\therefore$ $4\cos\theta+4\sin\theta=4$

$\Rightarrow$ $\cos\theta+\sin\theta=1,\ \theta=0, \frac{\pi}{2}$

43. Since, the product of the two eccentricities e and e' is 1. Either $e=e'=1$ in which case both the conics are parabolas or if $e>1, e'<1$ and *vice-versa.*

So, one of them is an ellipse and the other is a hyperbola.

44. Equation of tangent at 'α' is

$$\frac{x}{a}\cos\alpha+\frac{y}{b}\sin\alpha=1$$

$\Rightarrow$ $$\frac{x}{a\sec\alpha}+\frac{y}{b\,\mathrm{cosec}\,\alpha}=1$$

Now, length of intercept,

$$z=\sqrt{(a^2\sec^2\alpha+b^2\,\mathrm{cosec}^2\,\alpha)}$$

or $$z^2=a^2\sec^2\alpha+b^2\,\mathrm{cosec}^2\,\alpha$$

$\therefore$ $$\frac{d(z^2)}{d\alpha}=2\left(\frac{a^2\sin\alpha}{\cos^3\alpha}-\frac{b^2\cos\alpha}{\sin^3\alpha}\right)$$

and $$\frac{d^2(z^2)}{d\alpha^2}>0$$

For minimum of z, $\frac{d(z^2)}{d\alpha} = 0$

$\therefore \quad \tan^4\alpha = \frac{b^2}{a^2}$

or $\quad \tan\alpha = \pm\sqrt{\left(\frac{b}{a}\right)}$

$\Rightarrow \quad \alpha = \tan^{-1}\sqrt{\left(\frac{b}{a}\right)},\ \pi - \tan^{-1}\sqrt{\left(\frac{b}{a}\right)},$

$-\pi + \tan^{-1}\sqrt{\left(\frac{b}{a}\right)}, -\tan^{-1}\sqrt{\left(\frac{b}{a}\right)}$

45. $x^2\tan^2\alpha + y^2\sec^2\alpha = 1$

$\Rightarrow \quad \frac{x^2}{\cot^2\alpha} + \frac{y^2}{\cos^2\alpha} = 1$

$\because \quad \cos^2\alpha = \cot^2\alpha(1-e^2)$

$\Rightarrow \quad \sin^2\alpha = (1-e^2)$

$\therefore \quad e^2 = \cos^2\alpha \qquad (\alpha \neq 90°)$

$e = \cos\alpha$

$\because \quad$ Latusrectum $= \frac{1}{2} = \frac{2b^2}{a}$

$\Rightarrow \quad a = 4b^2 \quad \Rightarrow \cot\alpha = 4\cos^2\alpha$

$\Rightarrow \quad \frac{1}{\sin\alpha} = 4\cos\alpha \quad \Rightarrow \sin 2\alpha = \frac{1}{2}$

$2\alpha = n\pi + (-1)^n\frac{\pi}{6} \quad \Rightarrow \alpha = \frac{n\pi}{2} + (-1)^n\frac{\pi}{12}$

For $n = 0$

$\alpha = \frac{\pi}{12}$ and for $n = 1$

$\alpha = \frac{\pi}{2} - \frac{\pi}{12} = \frac{5\pi}{12}$

Sol. (Q. Nos. 46 to 48)

$\because \quad 9x^2 + 4xy + 6y^2 - 22x - 16y + 9 = 0$

or $\quad 2(2x + y - 3)^2 + (x - 2y + 1)^2 = 10$

or $\quad 2\left(\frac{2x+y-3}{\sqrt{5}}\right)^2 + \left(\frac{x-2y+1}{\sqrt{5}}\right)^2 = 2$

or $\quad \frac{\left(\frac{2x+y-3}{\sqrt{5}}\right)^2}{1} + \frac{\left(\frac{x-2y+1}{\sqrt{5}}\right)^2}{2} = 1$

or $\quad \frac{X^2}{a^2} + \frac{Y^2}{b^2} = 1$

Here, $b > a$

46. For centre: $X = 0, Y = 0$

$\Rightarrow \quad 2x + y - 3 = 0$

and $\quad x - 2y + 1 = 0$

we get, $\quad x = 1, y = 1$

$\therefore$ Centre is (1, 1).

47. For eccentricity: $a^2 = b^2(1-e^2)$

$\Rightarrow \quad 1 = 2(1-e^2)$ or $e^2 = \frac{1}{2}$

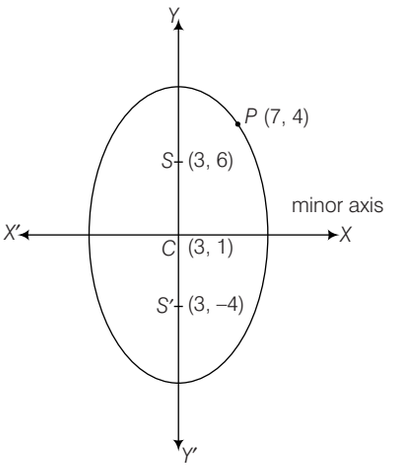
$\therefore \quad e = \frac{1}{\sqrt{2}}$

48. Lengths of axes are $2a$ and $2b$

i.e. 2 and $2\sqrt{2}$.

Sol. (Q. Nos. 49 to 51)

Here, $\quad b > a$



and $\quad CS = 5 = be$ ...(i)

Equation of ellipse is

$\frac{(x-3)^2}{a^2} + \frac{(y-1)^2}{b^2} = 1$ ...(ii)

Which pass through $P(7, 4)$, then

$\frac{16}{a^2} + \frac{9}{b^2} = 1$

$\Rightarrow \quad \frac{16}{b^2-25} + \frac{9}{b^2} = 1 \quad [\because a^2 = b^2(1-e^2) = b^2 - 25]$

$\Rightarrow \quad b^4 - 50b^2 + 225 = 0$

or $\quad (b^2 - 45)(b^2 - 5) = 0$

$\therefore \quad b = 3\sqrt{5} \qquad (b \neq \sqrt{5})$

From Eq. (i),

$e = \frac{\sqrt{5}}{3}$ and $a^2 = 45 - 25 = 20$

From Eq. (ii), ellipse (E) is

$\frac{(x-3)^2}{20} + \frac{(y-1)^2}{45} = 1$

49. Product of the lengths of the perpendicular segments from the foci on tangent at $P(7, 4)$ is equal to a^2 i.e. 20 ($\because b > a$)

50. $\because$ Lines SF' and $S'F$ meet the normal PG and bisects it.

$\therefore$ Required point is mid-point of PG.

$\because$ Equation of ellipse E is

$\frac{(x-3)^2}{20} + \frac{(y-1)^2}{45} = 1$

$\Rightarrow \quad \frac{2(x-3)}{20} + \frac{2(y-1)}{45}\frac{dy}{dx} = 0$

$\therefore \quad \left.\frac{dy}{dx}\right|_{(7,4)} = -3$

$\therefore$ Slope of normal $= \frac{1}{3}$

Equation of normal at $P(7, 4)$ is

$$y-4=\frac{1}{3}(x-7)$$

$$\Rightarrow \quad x-3y+5=0$$

Which meet the major axis in $G\left(3,\frac{8}{3}\right)$.

Required point is mid-point of PG i.e. $\left(5,\frac{10}{3}\right)$.

51. Since locus of mid-point of QR is another ellipse having the same eccentricity as that of ellipse (E).

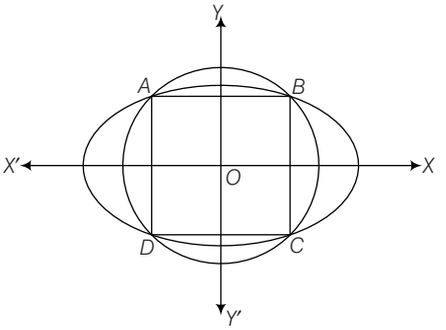
$$\Rightarrow\ e_1=e=\sqrt{\left(1-\frac{a^2}{b^2}\right)}=\sqrt{\left(1-\frac{20}{45}\right)}=\sqrt{\left(1-\frac{4}{9}\right)}=\frac{\sqrt{5}}{3}$$

Sol. (Q. Nos. 52 to 54)

52. Solving curves C_1 and C_2

$$x^2+y^2-r^2=0$$

and $$9x^2+16y^2-144=0$$



then,

$$\begin{array}{cccccc} x^2 & y^2 & 1 & x^2 & y^2 \\ 1 & 1 & -r^2 & 1 & 1 \\ 9 & 16 & -144 & 9 & 16 \end{array}$$

$$\therefore \quad \frac{x^2}{16r^2-144}=\frac{y^2}{144-9r^2}=\frac{1}{7}$$

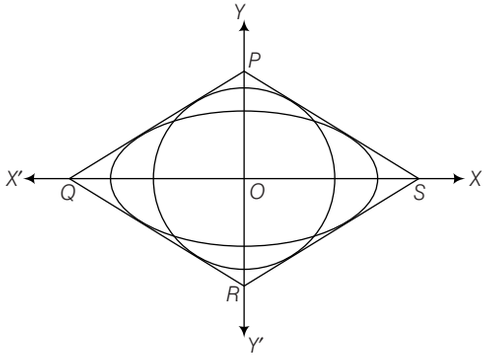
$$\therefore \quad x^2=\frac{16r^2-144}{7} \text{ and } y^2=\frac{144-9r^2}{7}$$

If $ABCD$ is a square, then $x^2=y^2$

or $$\frac{16r^2-144}{7}=\frac{144-9r^2}{7} \Rightarrow 25r^2=288$$

53. Tangents of slope m to the circle and ellipse are respectively.

$$y=mx\pm r\sqrt{(m^2+1)} \text{ and } y=mx\pm\sqrt{(16m^2+9)}$$



For common tangent, $r^2(m^2+1)=16m^2+9$

$$\Rightarrow \quad r=\sqrt{\left(\frac{16m^2+9}{m^2+1}\right)}$$

If $PQRS$ is a square,

then, $\quad m=\pm1$

or $\quad r\sqrt{2}=\sqrt{25}$

or $\quad 2r^2=25$

54. $\because$ $PQRS$ is a square, then $\angle PQR=90°$

$\therefore$ PR is diameter of circle through P, Q, R

$\therefore$ Area of circumcircle of

$$\Delta PQR=\pi(OP)^2=\pi(r\sqrt{2})^2=2\pi r^2$$

and area of circle C_1 is πr^2.

Hence, the required ratio is 1/2.

Sol. (Q. Nos. 55 to 57)

55. $\because$ Distance between foci S and S' is 4 units

$\therefore \quad SS'=4$

$\Rightarrow \quad 2ae=4$

$\therefore \quad ae=2$ … (i)

and given $SP+S'P=6$

$\Rightarrow \quad 2a=6$

$\because \quad a=3$ … (ii)

From Eqs. (i) and (ii), we get

$$e=\frac{2}{3}$$

and $$b^2=a^2(1-e^2)=a^2-(ae)^2=9-4=5$$

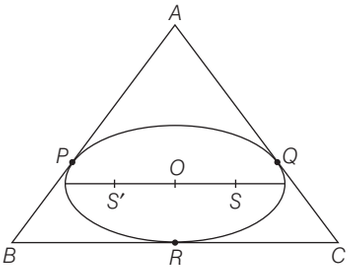
$\therefore$ Equation of ellipse with centre (0, 0) is

$$\frac{x^2}{9}+\frac{y^2}{5}=1 \Rightarrow 5x^2+9y^2=45$$

56. $\because$ $AB=AC$ and $\angle B=\pi/2$

$\because \quad \angle A=\angle C=\pi/4$

Now, if two tangents drawn from (x_1, y_1) on ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$



and angle between tangents is α, then

$$\tan\alpha=\frac{2ab\sqrt{\left(\frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}-1\right)}}{|x_1^2+y_1^2-a^2-b^2|}$$

Let $A(x_1, y_1)$

Here, $\alpha=\frac{\pi}{4}$ and $a=3, b=\sqrt{5}$

then, $$1=\frac{6\sqrt{5}\sqrt{\left(\frac{x_1^2}{9}+\frac{y_1^2}{5}-1\right)}}{(x_1^2+y_1^2-9-5)}$$

or $$(x_1^2+y_1^2-14)^2=180\left(\frac{x_1^2}{9}+\frac{y_1^2}{5}-1\right)$$

$\therefore$ Required locus is

$$(x^2+y^2-14)^2=4(5x^2+9y^2-45)$$

$$x^2+y^2=\frac{1}{4}+1$$

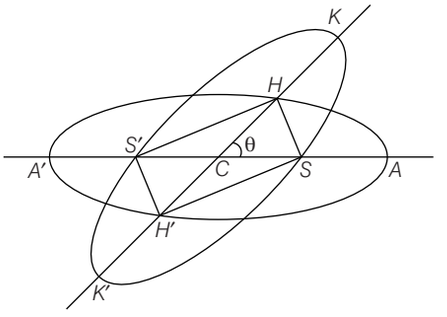
i.e. $$x^2+y^2=5/4$$

61. Let S and S' be the foci of one ellipse and H and H' be the other, C being their common centre. Then, $SHS'H'$ is a parallelogram and since

$$SH+S'H=HS'+H'S'=2a$$

Since, the sum of the focal distances of any point on an ellipse is equal to its major axis which is $2a$.

Then, $$CS=ae, \; CH=ae'$$



Let θ be the angle between their axes.

Then, $$SH^2=a^2e^2+a^2e'^2-2a^2ee'\cos\theta$$

$$HS^2=a^2e^2+a^2e'^2+2a^2ee'\cos\theta$$

Now, $$2a=SH+S'H$$

Squaring both sides, then

$$4a^2=(SH)^2+(S'H)^2+2(SH)\cdot(S'H)$$

$$\Rightarrow \quad 4a^2=2a^2(e^2+e'^2)+2\sqrt{(a^2e^2+a^2e'^2)^2-4a^4e^2e'^2\cos^2\theta}$$

$$\Rightarrow \quad (2-e^2-e'^2)^2=(e^2+e'^2)^2-4e^2e'^2\cos^2\theta$$

$$\Rightarrow \quad 4+(e^2+e'^2)^2-4(e^2+e'^2)=(e^2+e'^2)^2-4e^2e'^2\cos^2\theta$$

$$\Rightarrow \quad 1-e^2-e'^2=-e^2e'^2\cos^2\theta$$

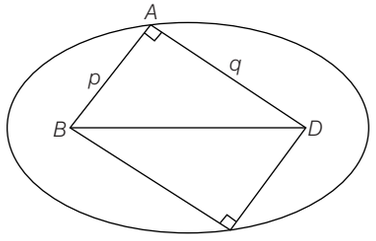
$$\therefore \quad \cos\theta=\frac{\sqrt{e^2+e'^2-1}}{ee'}=\frac{\sqrt{\left(\frac{9}{25}+\frac{16}{25}-1\right)}}{12/25}=0$$

$$\therefore \quad \theta=\frac{\pi}{2}$$

$$\sin\theta=1$$

$$\therefore \quad 2(1+\sin^2\theta+\sin^4\theta)=2(1+1+1)=6$$

62. Let the sides of the rectangle be p and q.



$\therefore$ Area of rectangle $= pq = 200$ ...(i)

and area of ellipse $= \pi ab = 200\pi$

$\therefore$ $ab = 200$ ...(ii)

Perimeter of rectangle $= 2(p + q)$ ...(iii)

In ΔABD,

Distance $BD = \sqrt{(p^2 + q^2)}$ = Distance between foci

$= 2ae$

or $p^2 + q^2 = 4a^2e^2 = 4(a^2 - b^2)$ ...(iv)

Also, $BA + DA = 2a$ [$\because SP + S'P = 2a$]

$\Rightarrow$ $p + q = 2a$ ...(v)

From Eq. (iv),

$(p + q)^2 - 2pq = 4(a^2 - b^2)$

$\Rightarrow$ $(2a)^2 - 2 \times 200 = 4(a^2 - b^2)$ [From Eqs. (i) and (v)]

or $b^2 = 100$ or $b = 10$

From Eq. (ii), $a = 20$

From Eq. (iii),

$P = 2(p + q) = 2(2a) = 4a = 80$

$\therefore$ $P + 1 = 81$

Hence, $\sqrt{(P + 1)} = 9$

63. For ellipse

$$9x^2 + 16y^2 = 144 \text{ or } \frac{x^2}{16} + \frac{y^2}{9} = 1$$

Equation of director circle is

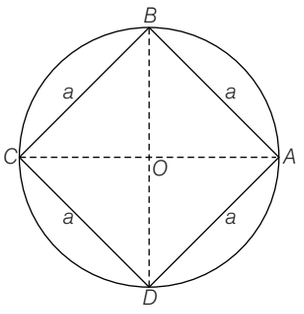
$$x^2 + y^2 = 25$$

This director circle will cut the ellipse $\frac{x^2}{50} + \frac{y^2}{20} = 1$ at four points.

Hence, number of points = 4

64. $\because$ Perpendicular tangents meets on director circle of ellipse $\frac{x^2}{7} + \frac{y^2}{11/2} = 1$ is $x^2 + y^2 = 7 + \frac{11}{2}$

i.e., $$x^2 + y^2 = \left(\frac{5}{\sqrt{2}}\right)^2$$



Let length of sides $= a$

$\therefore$ $OA = OB = OC = OD = \frac{a}{\sqrt{2}}$

Given $\frac{a}{\sqrt{2}} = \frac{5}{\sqrt{2}}$

$\therefore$ $a = 5$

65. We know that, for $\theta = \frac{\pi}{2}$ the focal chord will be latusrectum with length $\frac{2b^2}{a}$.

$$\Rightarrow \frac{\lambda ab^2}{a^2 \sin^2\left(\frac{\pi}{2}\right) + b^2 \cos^2\left(\frac{\pi}{2}\right)} = \frac{2b^2}{a}$$

$$\Rightarrow \frac{\lambda ab^2}{a^2 + 0} = \frac{2b^2}{a}$$

$\therefore$ $\lambda = 2$

66. Equation of normal at the point $(13\cos\theta, 5\sin\theta)$ is

$$y - 5\sin\theta = \frac{13}{5}\frac{\sin\theta}{\cos\theta}(x - 13\cos\theta)$$

or $5y\cos\theta - 25\sin\theta\cos\theta = 13x\sin\theta - 169\sin\theta\cos\theta$

It passes through (0, 6), then

$30\cos\theta - 25\sin\theta\cos\theta = 0 - 169\sin\theta\cos\theta$

$\Rightarrow$ $30\cos\theta + 144\sin\theta\cos\theta = 0$

or $6\cos\theta(5 + 24\sin\theta) = 0$

or $\cos\theta = 0,\ \sin\theta = -\frac{5}{24}$

$\therefore$ $\theta = \frac{\pi}{2},\ \theta = \pi + \sin^{-1}\left(\frac{5}{24}\right),$

$$\theta = 2\pi - \sin^{-1}\left(\frac{5}{24}\right)$$

Hence, three normals can be drawn.

i.e. $n = 3$

$\therefore$ $2^n = 2^3 = 8$

67. The equation of the tangent at $P(a\cos\theta, b\sin\theta)$ on the given ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is $\frac{x}{a}\cos\theta + \frac{y}{b}\sin\theta = 1$

Length of the perpendicular from the focus $(ae, 0)$ on the ellipse is

$$p = \frac{|e\cos\theta - 1|}{\sqrt{\left(\frac{\cos^2\theta}{a^2} + \frac{\sin^2\theta}{b^2}\right)}}$$

$$= \frac{|ab(e\cos\theta - 1)|}{\sqrt{(b^2\cos^2\theta + a^2(1 - \cos^2\theta))}}$$

$$= \frac{ab(1 - e\cos\theta)}{\sqrt{a^2 - a^2e^2\cos^2\theta}} = b\sqrt{\left(\frac{1 - e\cos\theta}{1 + e\cos\theta}\right)}$$

$$\Rightarrow \frac{b^2}{p^2} = \frac{1 + e\cos\theta}{1 - e\cos\theta}$$

Now, $r^2 = (ae - a\cos\theta)^2 + b^2\sin^2\theta$

$= a^2[(e - \cos\theta)^2 + (1 - e^2)\sin^2\theta]$

$$= a^2[e^2 \cos^2\theta - 2e\cos\theta + 1]$$
$$= a^2(1 - e\cos\theta)^2$$
$$\Rightarrow \quad r = a(1 - e\cos\theta)$$
Now, $\frac{2a}{r} - \frac{b^2}{p^2} = \frac{2}{1 - e\cos\theta} - \frac{1 + e\cos\theta}{1 - e\cos\theta} = 1$

68. The points are $A(3, 4)$, $B(6, 8)$ and $O(0, 0)$.

$\because$ $OA + OB = 2a$ (where, a is semi major axis)

$\Rightarrow \quad 5 + 10 = 2a$

$\therefore \quad a = \frac{15}{2}$

Now, $AB = 2ae$

$\Rightarrow \quad \sqrt{(6-3)^2 + (8-4)^2} = 2 \times \frac{15}{2} \times e$

or $5 = 15e$

$\therefore \quad e = \frac{1}{3}$

$\therefore \quad b^2 = a^2(1 - e^2) = \frac{225}{4}\left(1 - \frac{1}{9}\right) = 50$

Hence, $\left(\frac{b}{\sqrt{2}}\right) = 5$

69. For the ellipse $\frac{x^2}{25} + \frac{y^2}{16} = 1$, a normal at $P(5\cos\theta, 4\sin\theta)$ is

$$5x\sin\theta - 4y\cos\theta = 9\sin\theta\cos\theta$$

Since, the normal pass through $(\lambda, 0)$, then

$$5\lambda\sin\theta - 0 = 9\sin\theta\cos\theta$$

For, $\sin\theta \neq 0$ (i.e. $\theta \neq 0, \pi$), we get

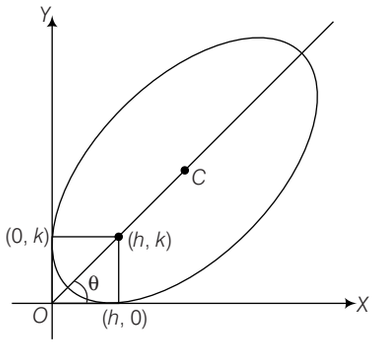
$5\lambda = 9\cos\theta < 9$ $\quad (\because \cos\theta < 1)$

$\therefore \quad 5\lambda < 9$

Hence, maximum value of 5λ is 9.

70. Here, $a = 3\sqrt{3}, b = 3$

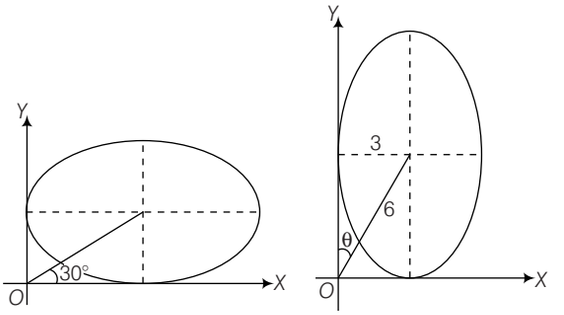
Since, axes are at 90° to each other.



$\therefore$ $O(0, 0)$ being the centre of arc and radius of arc is OC

$\Rightarrow \quad OC = \sqrt{(27 + 9)} = 6$ units

The two extreme positions are horizontal and vertical orientation.



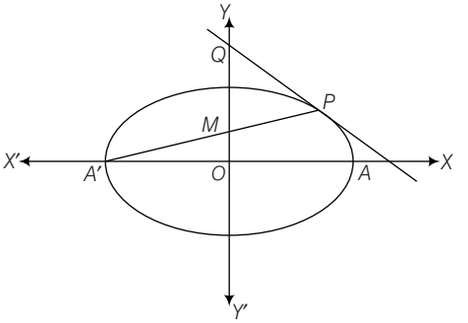
Hence, rotation 30° takes place in totality

$\Rightarrow$ Length of arc $= \frac{2\pi r}{12} = \frac{2\pi}{12} \times 6 = \pi = \frac{\pi\lambda}{6}$ [given]

$\therefore \quad \lambda = 6$

71. (A) Let point P be $(a\cos\theta, b\sin\theta)$. The equation of tangent at point P is $\frac{x}{a}\cos\theta + \frac{y}{b}\sin\theta = 1$

The point Q is $(0, b\,\text{cosec}\,\theta)$.



The equations of chord $A'P$ is

$$y - 0 = \frac{b\sin\theta - 0}{a\cos\theta + a}(x + a)$$

The point M is $\left(0, \frac{b\sin\theta}{1 + \cos\theta}\right)$

Then, $(OQ)^2 - (MQ)^2 = b^2\,\text{cosec}^2\theta - \left(b\,\text{cosec}\,\theta - \frac{b\sin\theta}{1 + \cos\theta}\right)^2$

$$= \frac{2b^2}{1 + \cos\theta} - \frac{b^2\sin^2\theta}{(1 + \cos\theta)^2}$$
$$= \frac{2b^2}{1 + \cos\theta} - \frac{b^2(1 - \cos^2\theta)}{(1 + \cos\theta)^2}$$
$$= \frac{2b^2}{(1 + \cos\theta)} - \frac{b^2(1 - \cos\theta)}{(1 + \cos\theta)}$$
$$= b^2 = 4$$

(B) We know that, two diameters $y = m_1x$, $y = m_2x$ are conjugate diameters of $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ if $m_1m_2 = -\frac{b^2}{a^2}$

$\Rightarrow \quad 1 \times -\frac{2}{3} = \frac{-b^2}{a^2}$

or $b^2 = \frac{2}{3}a^2$

or $a^2(1-e^2) = \frac{2}{3}a^2$

or $1-e^2 = \frac{2}{3}$ or $e^2 = \frac{1}{3}$

Hence, $4\left(1+\frac{1}{3}+\frac{1}{9}+\ldots\infty\right) = 4\left(\frac{1}{1-\frac{1}{3}}\right) = 6$

(C) $\because\ 2x^2+3y^2=6 \Rightarrow \frac{x^2}{3}+\frac{y^2}{2}=1$

By using condition of tangency $(2h)^2 = 3\times(k)^2+2$

Therefore, the locus of $P(h,k)$ is

$4x^2-3y^2=2$ (which is hyperbola)

or $\frac{x^2}{1/2}-\frac{y^2}{2/3}=1$

Hence, $\frac{2}{3}=\frac{1}{2}(e^2-1)$

$\Rightarrow\ e^2 = 1+\frac{4}{3}$ or $3e^2=7$

(D) $\left(\pm ae, \frac{b^2}{a}\right)$ are extremities of the latusrectum having positive ordinates, then,

$$a^2e^2 = -2\left(\frac{b^2}{a}-2\right) \quad \ldots(i)$$

But $b^2 = a^2(1-e^2)$ ...(ii)

From Eqs. (i) and (ii), we get

$$a^2e^2 = -2(a(1-e^2)-2)$$

$\Rightarrow\ a^2e^2-2ae^2+2a-4=0$

$\Rightarrow\ ae^2(a-2)+2(a-2)=0$

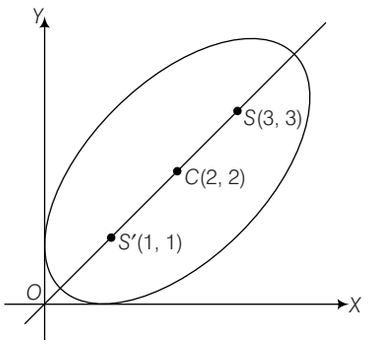
$\therefore\ (ae^2+2)(a-2)=0$

Hence, $a=2$

72. (A) $\because$ (0, 0) lies on the director circle and mid-point of foci (2, 2) is the center of the circle.

Hence, radius of director circle = OC

$r = \sqrt{(4+4)} = 2\sqrt{2}$



Therefore, the area is πr^2 i.e. $8\pi = \pi\lambda$ (given)

$\therefore\ \lambda = 8$

(B) Equation of normal at $(5\cos\theta,\ 4\sin\theta)$ is

$5x\sec\theta - 4y\,\text{cosec}\,\theta = 9$ and it passes through $P(0,\lambda)$.

Then, $0-4\lambda\ \text{cosec}\,\theta = 9$

or $\lambda = -\frac{9}{4}\sin\theta$

or $|\lambda| = \frac{9}{4}|\sin\theta| < \frac{9}{4}$

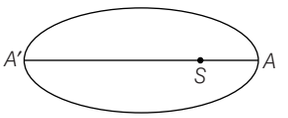
$\therefore\ p = \frac{9}{4} \Rightarrow 4p = 9$

(C) Let the orbit of the earth be the ellipse

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1 \quad \ldots(i)$$

Its major axis $= 2a = 186\times10^6$ miles (given)

i.e. $a = 93\times10^6$ miles and $e = 1/60$ (given)



Let the Sun be at the focus $S(ae,0)$. Then, the Earth will be at shortest and longest distance from the Sun when the Earth is at the extremities of the major axis which are respectively nearest and farthest from this focus S.

$\therefore$ Shortest distance of the Earth from the Sun

$= SA$, where S is $(ae, 0)$ and A is $(a,0)$

$= a-ae = a(1-e)$

$= (93\times10^6)(1+(1/60))$

$= 91450000$ miles $= 914.5\times10^5$ miles and longest distance of Earth from the Sun

$= SA'$, where S is $(ae,0)$ and A' is $(-a,0)$

$= a+ae$

$= a(1+e)$

$= (93\times10^6)(1+(1/60))$

$= 94550000$ miles $= 945.5\times10^5$ miles

$\therefore\ \mu-\lambda+1 = 945.5-914.5-1 = 30$

(D) Equation of chord whose mid-point (0,3) is $T = S_1$

$\Rightarrow\ 0+\frac{3.y}{25}-1 = 0+\frac{9}{25}-1$

$\Rightarrow\ y = 3$

It intersects the ellipse $\frac{x^2}{16}+\frac{y^2}{25}=1$

at $\frac{x^2}{16} = 1-\frac{3^2}{25} = \frac{16}{25}$

or $x = \pm\frac{16}{5}$

$\therefore$ Length of chord $= \frac{32}{5} = \frac{4\lambda}{5}$ (given)

$\therefore\ \lambda = 8$

73. (A) Let $S = 9x^2+8y^2-36x-16y-28$

$\therefore$ Value of S at (2,6)

$S_1 = 9(2)^2+8(6)^2-36(2)-16(6)-28$

$= 36+288-72-96-28$

$= 128 > 0$

$\therefore$ Point (2,6) lies outside the ellipse.

The equation of the given ellipse be rewritten as

$$9(x-2)^2+8(y-1)^2=72$$

$$\Rightarrow \quad \frac{(x-2)^2}{8}+\frac{(y-1)^2}{9}=1$$

Centre of ellipse is (2,1) and axis parallel to Y-axis

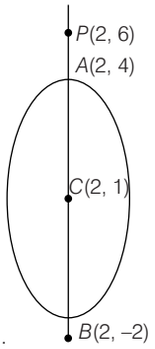
$\therefore$ Vertices are $x-2=0$

and $y-1=\pm 3$

or (2,–2) and (2,4)

$\therefore$ Minimum distance

$$L=PA=2$$



and maximum distance

$$G=PB=8$$

Then, $L+G=10, G-L=6$

(B) Let $S=4x^2+9y^2+8x-36y+4$

$\therefore$ Value of S at (1,2) is

$$S_1=4(1)^2+9(2)^2+8(1)-36(2)+4$$
$$=4+36+8-72+4$$
$$=-20<0$$

$\therefore$ Point (1,2) lies inside the ellipse

The equation of the given ellipse be rewritten as

$$4(x+1)^2+9(y-2)^2=36$$

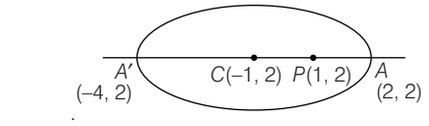
or $$\frac{(x+1)^2}{9}+\frac{(y-2)^2}{4}=1$$

$\therefore$ Centre of ellipse is $(-1, 2)$ and axis parallel to X-axis.

$\therefore$ Vertices are $x+1=\pm 3$

and $y-2=0$

or (-4,2) and (2,2)



$\therefore$ Minimum distance $L=PA=1$

and Maximum distance

$$G=PA'=AA'-PA=6-1=5$$

$\therefore \quad L+G=6, G-L=4,$

(C) Here $3x+4y=0$ and $4x-3y=0$ are mutually perpendicular lines, then substituting

$$\frac{3x+4y}{\sqrt{(3^2+4^2)}}=X \text{ and } \frac{4x-3y}{\sqrt{((4)^2+(-3)^2)}}=Y$$

Then, the given equation can be written as

$$4X^2+9Y^2=36 \Rightarrow \frac{X^2}{9}+\frac{Y^2}{4}=1$$

$\therefore$ Vertices, $X=\pm 3, Y=0$

or $$\frac{3x+4y}{5}=\pm 3, \frac{4x-3y}{5}=0$$

or $$3x+4y=\pm 15, y=\frac{4x}{3}$$

Vertices are $\left(\frac{9}{5}, \frac{12}{5}\right)$ and $\left(-\frac{9}{5}, \frac{-12}{5}\right)$

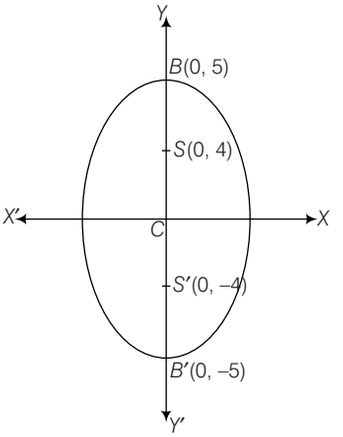
$\because$ Given point is a vertex.

$\therefore$ Minimum distance $L=0$

and maximum distance $G=$ Length of major axis $=2\times 3=6$

Then, $L+G=6, G-L=6$

(D) Given ellipse is $25x^2+9y^2=225$



or $$\frac{x^2}{9}+\frac{y^2}{25}=1$$

$\therefore$ focii $(0, \pm \sqrt{(25-9)})$ or $(0, \pm 4)$

and vertices are $B(0, 5)$ and $B'(0, -5)$

$\therefore$ Minimum distance $L=SB=1$

and maximum distance $G=SB'=4+5=9$

Then, $L+G=10, G-L=8$

74. Here, $(a^2+1)<(a^2+2)$

$\therefore$ Length of latusrectum $=\frac{2(a^2+1)}{\sqrt{(a^2+2)}}=\frac{10}{\sqrt{6}}$

$\Rightarrow \quad 6(a^2+1)^2=25(a^2+2)$

or $6a^4-13a^2-44=0$

or $(a^2-4)(6a^2+11)=0$

$\therefore \quad a^2=4, \ 6a^2+11\neq 0$

If e be the eccentricity, then

$$(a^2+1)=(a^2+2)(1-e^2)$$

$\Rightarrow \quad e^2=1-\frac{5}{6}=\frac{1}{6}$

$\therefore \quad e=\frac{1}{\sqrt{6}}$

Hence, both statements are true, statement II is correct explanation for statement I.

75. The given ellipse is $\frac{x^2}{3}+\frac{y^2}{2}=1$

$\therefore$ Area of ellipse $=\pi\sqrt{3}\sqrt{2}=\pi\sqrt{6}$

The circle is $x^2+y^2-2x+4y+4=0$

or $(x-1)^2+(y+2)^2=1$

Its area is π. Hence, statement I is true.

Also, statement II is true but it is not the correct explanation of statement I.

76. Given, ellipse is $4x^2+9y^2=36$

or $$\frac{x^2}{3^2}+\frac{y^2}{2^2}=1 \quad \ldots(i)$$

Equation of tangents in terms of slope (m) are

$$y=mx\pm\sqrt{(9m^2+4)}$$

$\Rightarrow$ $(y-mx)^2=9m^2+4$

$\Rightarrow$ $m^2(x^2-9)-2mxy+y^2-4=0$

$\therefore$ $m_1m_2=-1 \Rightarrow \frac{y^2-4}{x^2-9}=-1$

$\Rightarrow x^2+y^2=13$, which is director circle of (i).

Hence, both statements are true and statement II is a correct explanation for statement I.

77. Distance between foci $=2ae$ and sum of focal distances from a point $=2a$

$\therefore$ $2ae<2a \Rightarrow e<1$

Both statements are true, statement II is correct explanation for statement I.

78. $4x^2+5y^2-16x-30y+41=0$ ...(i)

$\Rightarrow$ $4(x^2-4x)+5(y^2-6y)+41=0$

$\Rightarrow$ $4\{(x-2)^2-4\}+5\{(y-3)^2-9\}+41=0$

$\Rightarrow$ $4(x-2)^2+5(y-3)^2=20$

$\therefore$ statement II is true.

and $\frac{(x-2)^2}{5}+\frac{(y-3)^2}{4}=1$ or $\frac{(x-2)^2}{(\sqrt{5})^2}+\frac{(y-3)^2}{2^2}=1$

$\therefore$ Sum of focal distances of a point (P) on the ellipse (i) is $2\sqrt{5}$.

$\therefore$ Statement I is true, but statement II is not a correct explanation for statement I.

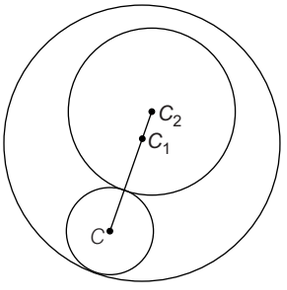
79. Let variable circle is $(x-h)^2+(y-k)^2=r^2$ ...(i)

$\therefore$ $C(h, k)$ and radius r and given circles

$$(x-1)^2+(y-2)^2=5^2 \quad \ldots(ii)$$

$\therefore$ $C_1(1, 2)$ and $r_1=5$

and $$(x-2)^2+(y-1)^2=4^2 \quad \ldots(iii)$$



$\therefore$ $C_2(2, 1)$ and $r_2=4$

$$|C_1C_2|=\sqrt{2}>|r_1-r_2|$$

$\therefore$ Circle (iii) lies completely inside the circle (ii)

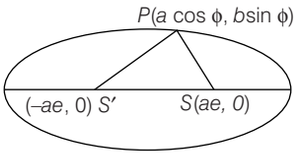
$\because$ $CC_2=r+4$ and $CC_1=5-r$

$\Rightarrow$ $CC_1+CC_2=9=$ constant

$\therefore$ C lies on a ellipse.

Statement I is true and Statement II is false.

80. Statement I is obviously true since it is a theorem

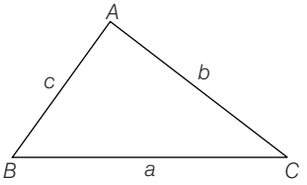


$\because$ (Slope of SP) $\times$ (Slope of $S'P$) $\neq -1$

$\therefore$ Statement II is false.

81. Given, $a=$ constant and $a+b+c=$ constant $=2s$.

Now, $BA+CA=c+b=2s-a=$ constant



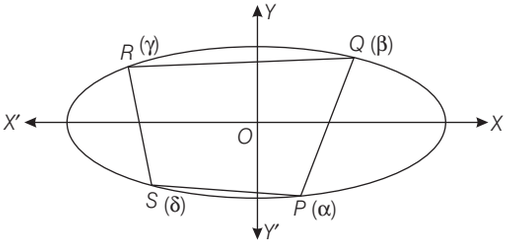
$\therefore$ Locus of A is an ellipse.

$\Rightarrow$ Both statements are true and statement II is a correct explanation for statement I.

82. Let $PQRS$ be a quadrilateral inscribed in the ellipse.

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$$

Let PQ, QR and RS be the three sides parallel to the given lines.



Equation of PQ is

$$\frac{x}{a}\cos\left(\frac{\alpha+\beta}{2}\right)+\frac{y}{b}\sin\left(\frac{\alpha+\beta}{2}\right)=\cos\left(\frac{\alpha-\beta}{2}\right)$$

Its slope is $-\frac{b}{a}\cot\left(\frac{\alpha+\beta}{2}\right)$ which is constant by hypothesis

$\therefore$ $\alpha+\beta=$ constant $=2\lambda_1$ (say)

Similarly $\beta+\gamma=$ constant $=2\lambda_2$ (say)

and $\gamma+\delta=$ constant $=2\lambda_3$ (say)

Now the equation of SP is

$$\frac{x}{a}\cos\left(\frac{\alpha+\delta}{2}\right)+\frac{y}{b}\sin\left(\frac{\alpha+\delta}{2}\right)$$

$$=\cos\left(\frac{\alpha-\delta}{2}\right)$$

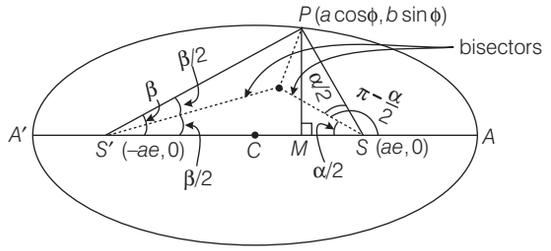
Its slope $m = -\frac{b}{a}\cot\left(\frac{\alpha+\delta}{2}\right)$

But $\alpha + \delta = (\alpha+\beta) - (\beta+\gamma) + (\gamma+\delta)$
$= 2\lambda_1 - 2\lambda_2 + 2\lambda_3$
$=$ constant

Hence, the slope of the fourth side PS is constant. Hence the fourth side is also parallel to a fixed straight line.

83. Let $\angle PSS' = \alpha$ and $\angle PS'S = \beta$

$\therefore \quad SS' = 2ae$



By sine rule in $\Delta PSS'$, then

$$\frac{SP}{\sin\beta} = \frac{S'P}{\sin\alpha} = \frac{SS'}{\sin\{\pi - (\alpha+\beta)\}}$$

$$\Rightarrow \quad \frac{SP}{\sin\beta} = \frac{S'P}{\sin\alpha} = \frac{SS'}{\sin(\alpha+\beta)}$$

or $$\frac{SP + S'P}{\sin\beta + \sin\alpha} = \frac{SS'}{(\sin\alpha+\beta)}$$

or $$\frac{2a}{\sin\beta + \sin\alpha} = \frac{2ae}{\sin(\alpha+\beta)} \qquad [\because SP + S'P = 2a]$$

or $$\frac{2a}{2ae} = \frac{\sin\beta + \sin\alpha}{\sin(\alpha+\beta)}$$

$$\Rightarrow \quad \frac{1}{e} = \frac{2\sin\left(\frac{\alpha+\beta}{2}\right)\cos\left(\frac{\alpha-\beta}{2}\right)}{2\sin\left(\frac{\alpha+\beta}{2}\right)\cos\left(\frac{\alpha+\beta}{2}\right)} \Rightarrow \frac{1}{e} = \frac{\cos\left(\frac{\alpha-\beta}{2}\right)}{\cos\left(\frac{\alpha+\beta}{2}\right)}$$

$$\frac{1-e}{1+e} = \frac{\cos\left(\frac{\alpha-\beta}{2}\right) - \cos\left(\frac{\alpha+\beta}{2}\right)}{\cos\left(\frac{\alpha-\beta}{2}\right) + \cos\left(\frac{\alpha+\beta}{2}\right)}$$

{By componendo and dividendo rule}

$$\Rightarrow \quad \frac{1-e}{1+e} = \tan(\alpha/2)\tan(\beta/2) \qquad \ldots(i)$$

or $$\tan\left(\frac{PSS'}{2}\right)\tan\left(\frac{PS'S}{2}\right) = \frac{1-e}{1+e}$$

The centre of the circle inscribed in $\Delta PSS'$ will lie on the bisectors of angles α and β whose equations are

$$y = \tan\left(\frac{\beta}{2}\right)(x + ae)$$

and $y = \tan\left(\pi - \frac{\alpha}{2}\right)(x - ae)$ or $y = -\tan\left(\frac{\alpha}{2}\right)(x - ae)$

By multiplying we get

$$y^2 = -\tan\left(\frac{\alpha}{2}\right)\tan\left(\frac{\beta}{2}\right)(x^2 - a^2e^2)$$

$$y^2 = -\left(\frac{1-e}{1+e}\right)(x^2 - a^2e^2) \qquad \text{[From Eq. (i)]}$$

or $$y^2 + x^2\left(\frac{1-e}{1+e}\right) = a^2e^2\left(\frac{1-e}{1+e}\right)$$

or $$\frac{x^2}{a^2e^2} + \frac{y^2}{a^2e^2\left(\frac{1-e}{1+e}\right)} = 1$$

which is an ellipse.

84. Let P be $(a\cos\phi, b\sin\phi)$

$\therefore$ Equation of tangent at P is

$$\frac{x}{a}\cos\phi + \frac{y}{b}\sin\phi = 1 \qquad \ldots(i)$$

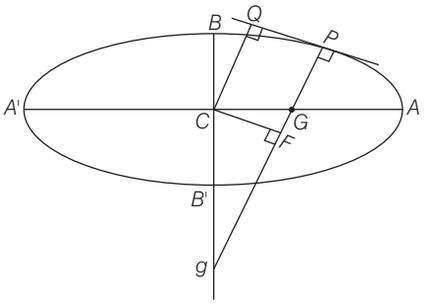
and equation of normal at P is

$$ax\sec\phi - by\,\text{cosec}\,\phi = a^2 - b^2 \qquad \ldots(ii)$$

It is clear from the figure $CFPQ$ is rectangle

$\therefore \quad PF = CQ$

{i.e. the perpendicular from $C(0, 0)$ on Eq. (i)}



$$= \frac{1}{\sqrt{\left(\frac{\cos^2\phi}{a^2} + \frac{\sin^2\phi}{b^2}\right)}} = \frac{ab}{\sqrt{(a^2\sin^2\phi + b^2\cos^2\phi)}} \qquad \ldots(iii)$$

Putting $y = 0$ in Eq. (ii), the point G is $\left(\frac{a^2-b^2}{a}\cos\phi,\ 0\right)$

and Putting $x = 0$ in Eq. (ii), the point g is

$$\left(0, -\frac{(a^2-b^2)}{b}\sin\phi\right)$$

$$\therefore \quad (PG)^2 = \left(a\cos\phi - \left(\frac{a^2-b^2}{2}\right)\cos\phi\right)^2 + (b\sin\phi - 0)^2$$

$$= \frac{b^4}{a^2}\cos^2\phi + b^2\sin^2\phi = \frac{b^2}{a^2}(b^2\cos^2\phi + a^2\sin^2\phi)$$

$$\therefore \quad PG = \frac{b}{a}\sqrt{(a^2\sin^2\phi + b^2\cos^2\phi)} \qquad \ldots(iv)$$

and $$(Pg)^2 = (a\cos\phi - 0)^2 + \left(b\sin\phi + \frac{(a^2-b^2)}{b}\sin\phi\right)^2$$

$$= a^2\cos^2\phi + \frac{a^4}{b^2}\sin^2\phi = \frac{a^2}{b^2}(a^2\sin^2\phi + b^2\cos^2\phi)$$

$$\therefore \quad Pg = \frac{a}{b}\sqrt{(a^2\sin^2\phi + b^2\cos^2\phi)} \qquad \ldots(v)$$

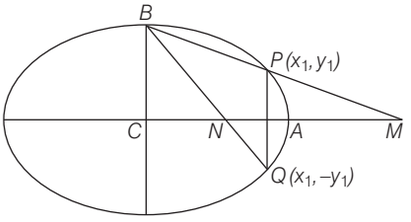
From Eqs. (iii) and (iv), $PF \cdot PG = b^2$
and from Eqs. (iii) and (v), $PF \cdot Pg = a^2$.

85. Let the coordinates of P be (x_1, y_1) then Q is $(x_1, -y_1)$.
Also B is $(0, b)$

$\therefore$ Equation of PB is

$$y - y_1 = \frac{b - y_1}{0 - x_1}(x - x_1)$$

It meets major axis i.e. $y = 0$ in M



$$\therefore \qquad M \text{ is } \left(\frac{bx_1}{(b - y_1)}, 0\right)$$

Also equation of BQ is $y + y_1 = \frac{b + y_1}{0 - x_1}(x - x_1)$

It meets the major axis *i.e.*, $y = 0$ in N.

$$\therefore \qquad N \text{ is } \left(\frac{bx_1}{b + y_1}, 0\right)$$

Now the polar of M with respect to the auxiliary circle $x^2 + y^2 = a^2$ is

$$\frac{xbx_1}{b - y_1} + 0 \cdot y = a^2$$

or $$bxx_1 = a^2(b - y_1) \qquad \ldots(i)$$

If Eq. (i) passes through N, then

$$\frac{b^2x_1^2}{(b + y_1)} = a^2(b - y)$$

$$\Rightarrow \qquad b^2x_1^2 = a^2(b^2 - y_1^2)$$

or $$\frac{x_1^2}{a^2} + \frac{y_1^2}{b^2} = 1 \text{ which is true.}$$

86. The equation of any tangent to the ellipse

$$4x^2 + 25y^2 = 100 \text{ or } \frac{x^2}{25} + \frac{y^2}{4} = 1 \text{ is}$$

$$y = mx + \sqrt{(25m^2 + 4)} \qquad \ldots(i)$$

It meets the coordinate of axes at

$$A\left(-\frac{\sqrt{(25m^2 + 4)}}{m}, 0\right) \quad \text{and} \quad B\left(0, \sqrt{(25m^2 + 4}\right)$$

Let $P(h, k)$ be the mid-point of AB. Then

$$2h = -\frac{\sqrt{(25m^2 + 4)}}{m} \quad \text{and} \quad 2k = \sqrt{(25m^2 + 4)}$$

$$\Rightarrow \frac{2k}{2h} = -m \quad \Rightarrow \quad m = -\frac{k}{h}$$

Since, Eq. (i) touches the circle $x^2 + y^2 = r^2$

Therefore, $$\frac{\sqrt{(25m^2 + 4)}}{\sqrt{(1 + m^2)}} = |r|$$

or $$\frac{25m^2 + 4}{1 + m^2} = r^2$$

or $$25\left(\frac{k^2}{h^2}\right) + 4 = r^2\left(1 + \frac{k^2}{h^2}\right) \qquad \left(\because m = -\frac{k}{h}\right)$$

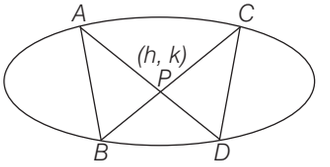
Hence the locus of $P(h, k)$ is

$$25y^2 + 4x^2 = r^2(x^2 + y^2)$$

or $$y = \pm\sqrt{\left(\frac{(r^2 - 4)}{(25 - r^2)}\right)}x$$

87. Let the normals at the points when the line, $\frac{lx}{a} + \frac{my}{b} = 1$ meet in $P(h, k)$

Let the line joining the feet of the other two normals from (h, k) have for its equation, $rx + sy = 1$



Then the general equation of a curve through the intersection of the ellipse and the two lines is

$$\left(\frac{x^2}{a^2} + \frac{y^2}{b^2} - 1\right) + \lambda\left(\frac{lx}{a} + \frac{my}{b} - 1\right) \times (rx + sy - 1) = 0 \qquad \ldots(i)$$

But the four points A, B, C, D also lie on the ellipse

$$(a^2 - b^2)\,xy + kb^2x - ha^2y = 0 \qquad \ldots(ii)$$

Curves Eqs. (i) and (ii) must be identical.

This is possible only one coefficient of x^2 and y^2 and the constant terms in Eq. (i) must vanish separately.

$$\frac{1}{a^2} + \frac{\lambda rl}{a} = 0, \quad \text{and} \quad \frac{1}{b^2} + \frac{\lambda ms}{b} = 0, \lambda - 1 = 0$$

$$\therefore \qquad \lambda = 1,\ 1 + arl = 0 = 1 + bms$$

$$\therefore \qquad r = \frac{-1}{al} \quad \text{and} \quad s = \frac{-1}{mb}$$

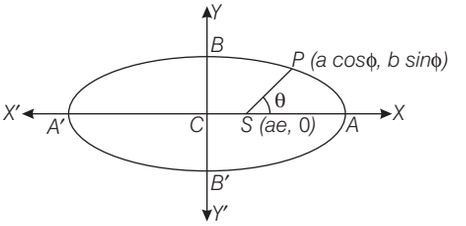
Therefore, the line $rx + sy = 1$ become

$$-\frac{x}{al} - \frac{y}{mb} = 1 \text{ or } \frac{x}{al} + \frac{y}{mb} = -1$$

88. $\therefore \quad \tan\theta = \dfrac{b\sin\phi}{(a\cos\phi - ae)} = \dfrac{\left(\frac{b}{a}\right)\sin\phi}{(\cos\phi - e)}$

$\because \qquad b^2 = a^2(1 - e^2)$

$\therefore \qquad \dfrac{b}{a} = \sqrt{(1 - e^2)}$



$$\Rightarrow \tan\theta = \frac{\sqrt{(1 - e^2)}\sin\phi}{(\cos\phi - e)}$$

$$\Rightarrow \sin\theta\cos\phi - e\sin\theta = \sqrt{(1 - e^2)}\sin\phi\cos\theta$$

$$\Rightarrow \frac{2\tan(\theta/2)}{1+\tan^2(\theta/2)}\cdot\frac{1-\tan^2(\phi/2)}{1+\tan^2(\phi/2)}-\frac{e\,(2\tan(\theta/2))}{(1+\tan^2(\theta/2))}$$

$$=\sqrt{(1-e^2)}\cdot\frac{2\tan(\phi/2)}{1+\tan^2(\phi/2)}\cdot\frac{1-\tan^2(\theta/2)}{1+\tan^2(\theta/2)}$$

$$\Rightarrow 2\tan(\theta/2)(1-\tan^2(\phi/2))-2e\tan(\theta/2)(1+\tan^2(\phi/2))$$

$$=2\sqrt{(1-e^2)}\cdot\tan(\phi/2)(1-\tan^2(\theta/2))$$

$$\Rightarrow (1-e)\tan(\theta/2)-(1+e)\tan(\theta/2)$$

$$\tan^2(\phi/2)-\sqrt{(1-e^2)}\tan(\phi/2)$$

$$+\sqrt{(1-e^2)}\tan^2(\theta/2)\tan(\phi/2)=0$$

$$\Rightarrow (1+e)\tan^2(\phi/2)+\sqrt{(1-e^2)}\tan(\phi/2)$$

$$(\cot(\theta/2)-\tan(\theta/2))-(1-e)=0$$

$$\Rightarrow \sqrt{(1+e)}\tan(\phi/2)\{\sqrt{(1+e)}\tan(\phi/2)-\sqrt{(1-e)}\tan(\theta/2)\}$$

$$+\sqrt{(1-e)}\cot(\theta/2)\{\sqrt{(1+e)}\tan(\phi/2)-\sqrt{(1-e)}\tan(\theta/2)\}=0$$

$$\Rightarrow (\sqrt{(1+e)}\tan(\phi/2)+\sqrt{(1-e)}\cot(\theta/2))$$

$$(\sqrt{(1+e)}\tan(\phi/2)-\sqrt{(1-e)}\tan(\theta/2))=0$$

But ϕ and θ lies between 0 and π

then $\tan(\phi/2)>0$ and $\tan(\theta/2)>0$

then $\sqrt{(1+e)}\tan(\phi/2)+\sqrt{(1-e)}\cot(\theta/2)\neq 0$

$$\therefore \sqrt{(1+e)}\tan(\phi/2)-\sqrt{(1-e)}\tan(\theta/2)=0$$

$$\tan(\theta/2)=\sqrt{\left(\frac{1+e}{1-e}\right)}\tan(\phi/2)$$

89. Let the given ellipse be

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1 \quad ...(i)$$

Let $P(\alpha)$ and $Q(\beta)$ be two points on Eq. (i) such that

$$\theta=\alpha-\beta \quad ...(ii)$$

Given that tangents at P and Q are right angles.

$$\therefore \left(-\frac{b}{a}\cot\alpha\right)\left(-\frac{b}{a}\cot\beta\right)=-1$$

$$\Rightarrow a^2\sin\alpha\sin\beta+b^2\cos\alpha\cos\beta=0 \quad ...(iii)$$

But the diameter parallel to the tangent at $P(\alpha)$ will be conjugate to the diameter CP, then its extremities will be

$$(-a\sin\alpha,\ b\cos\alpha)$$

$$\therefore d_1^2=a^2\sin^2\alpha+b^2\cos^2\alpha$$

Similarly $d_2^2=a^2\sin^2\beta+b^2\cos^2\beta$

$$\Rightarrow d_1^2d_2^2=(a^2\sin^2\alpha+b^2\cos^2\alpha)(a^2\sin^2\beta+b^2\cos^2\beta)$$

$$=(a^2\sin\alpha\sin\beta+b^2\cos\alpha\cos\beta)^2$$

$$+a^2b^2(\sin\alpha\cos\beta-\cos\alpha\sin\beta)^2$$

$$=0+a^2b^2\sin^2(\alpha-\beta) \quad \text{[from Eq. (iii)]}$$

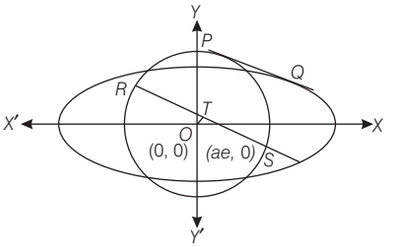
$$=a^2b^2\sin^2\theta \quad \text{[from Eq. (ii)]}$$

$$\therefore ab\sin\theta=d_1d_2$$

90. $y=mx+\sqrt{(a^2m^2+b^2)}$ is a tangent to the ellipse this tangent also touches the circle $x^2+y^2=r^2$

then $$\pm r=\frac{0-0+\sqrt{a^2m^2+b^2}}{\sqrt{1+m^2}}$$

we get $$m=\sqrt{\left(\frac{r^2-b^2}{a^2-r^2}\right)} \quad (\because b<r<a)$$



The line RS passes through $(ae, 0)$ and parallel to PQ is

$$y-0=m(x-ae)$$

$$\Rightarrow mx-y-ame=0$$

Let T be the feet of the perpendicular dropped from the origin on RS

$$\therefore OT=\frac{ame}{\sqrt{1+m^2}}$$

$$(RT)^2=(OR)^2-(OT)^2$$

$$=r^2-\frac{a^2m^2e^2}{1+m^2}=r^2-(r^2-b^2)=b^2$$

$$\therefore RT=b,\ RS=2b$$

91. Equation of the tangent at the point $P(a\cos\phi, b\sin\phi)$ on $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ is

$$\frac{x}{a}\cos\phi+\frac{y}{b}\sin\phi=1 \quad ...(i)$$

and foci $F_1\equiv(ae, 0)$ $F_2\equiv(-ae, 0)$

$\therefore$ $d=$ perpendicular distance of Eq. (i) form the centre $(0, 0)$ of the ellipse

$$\therefore d=\frac{1}{\sqrt{\frac{\cos^2\phi}{a^2}+\frac{\sin^2\phi}{b^2}}}=\frac{ab}{\sqrt{(a^2\sin^2\phi+b^2\cos^2\phi)}}$$

$$\therefore 4a^2\left(1-\frac{b^2}{d^2}\right)=4a^2\left(1-\frac{b^2(a^2\sin^2\phi+b^2\cos^2\phi)}{a^2b^2}\right)$$

$$=4a^2\left(1-\sin^2\phi-\frac{b^2}{a^2}\cos^2\phi\right)$$

$$=4a^2\cos^2\phi\,\frac{(a^2-b^2)}{a^2}$$

$$=4\cos^2\phi\,(a^2-b^2)$$

$$=4a^2e^2\cos^2\phi=(2ae\cos\phi)^2$$

$$=[(a-ae\cos\phi)-(a+ae\cos\phi)]^2$$

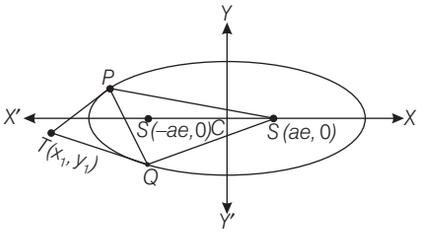
$$=(PF_1-PF_2)^2$$

Hence $(PF_1-PF_2)^2=4a^2\left(1-\frac{b^2}{d^2}\right)$.

92. **(i)** Equation of ellipse is $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ ...(i)

PQ is the chord of contact.

Equation of chord of contact is $\frac{xx_1}{a^2}+\frac{yy_1}{b^2}=1$ ...(ii)



Eliminate y from Eqs. (i) and (ii), we get

$x^2(a^2y_1^2+b^2x_1^2)-2a^2b^2xx_1+a^4(b^2-y_1^2)=0$

Let x' and x'' be it roots

$\therefore \quad x'+x''=\frac{2a^2b^2x_1}{(a^2y_1^2+b^2x_1^2)}, x'x''=\frac{a^4(b^2-y_1^2)}{(a^2y_1^2+b^2x_1^2)}$

Now, $ST^2=(x_1-ae)^2+y_1^2$

Also, $SP\cdot SQ=(a-ex')(a-ex'')$

$=a^2-ae(x'+x'')+e^2x'x''$

$=a^2-\frac{ae\cdot(2a^2b^2x_1)}{(a^2y_1^2+b^2x_1^2)}+\frac{e^2a^4(b^2-y_1^2)}{(a^2y_1^2+b^2x_1^2)}$

$=\frac{a^2}{(a^2y_1^2+b^2x_1^2)}\{b^2(x_1-ae)^2+b^2y_1^2\}$

$=\frac{a^2b^2(ST)^2}{(a^2y_1^2+b^2x_1^2)}$

$\therefore \quad \frac{(ST)^2}{SP\cdot SQ}=\frac{y_1^2}{b^2}+\frac{x_1^2}{a^2}$

(ii) $ST\cdot S'T\cos\theta=(\sqrt{(x_1-ae)^2+y_1^2})(\sqrt{(x_1+ae)^2+y_1^2})\cos\theta$

$=\sqrt{(x_1^2+y_1^2+a^2e^2)^2-4a^2e^2x_1^2}\cos\theta$ ...(i)

Equation pair of tangents.

$SS_1=T^2$

$\left(\frac{x^2}{a^2}+\frac{y^2}{b^2}-1\right)\left(\frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}-1\right)=\left(\frac{xx_1}{a^2}+\frac{yy_1}{b^2}-1\right)^2$

$\therefore \quad \tan\theta=\frac{2ab\sqrt{\left(\frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}-1\right)}}{(x_1^2+y_1^2-a^2-b^2)}$

$\therefore \quad \cos\theta=\frac{(x_1^2+y_1^2-a^2-b^2)}{\sqrt{(x_1^2+y_1^2+a^2e^2)^2-4a^2e^2x_1^2}}$

From Eq. (i), $ST\cdot S'T\cos\theta=x_1^2+y_1^2-a^2-b^2$

Hence $ST\cdot S'T\cos\theta=(CT)^2-a^2-b^2$

93. Let coordinates of T be (x_1, y_1). Let eccentric angles of P, Q, R be ϕ, ϕ_1, ϕ_2

Thus equation of chords PSQ and PHR are

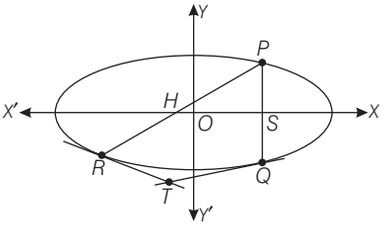
$\frac{x}{a}\cos\left(\frac{\phi+\phi_1}{2}\right)+\frac{y}{b}\sin\left(\frac{\phi+\phi_1}{2}\right)=\cos\left(\frac{\phi-\phi_1}{2}\right)$ ...(i)

and $\frac{x}{a}\cos\left(\frac{\phi+\phi_2}{2}\right)+\frac{y}{b}\sin\left(\frac{\phi+\phi_2}{2}\right)=\cos\left(\frac{\phi-\phi_2}{2}\right)$ ...(ii)

$\because$ Eqs. (i) and (ii) passes through $(ae, 0)$ and $(-ae, 0)$ then Eqs.(i) and (ii) becomes

$e\cos\left(\frac{\phi+\phi_1}{2}\right)=\cos\left(\frac{\phi-\phi_1}{2}\right)$ ...(iii)

and $-e\cos\left(\frac{\phi+\phi_2}{2}\right)=\cos\left(\frac{\phi-\phi_2}{2}\right)$ ...(iv)



By componendo and dividendo

$\frac{1-e}{1+e}=-\frac{2\cos(\phi/2)\cos(\phi_2/2)}{2\sin(\phi/2)\sin(\phi_2/2)}$

or $\frac{1-e}{1+e}=-\cot(\phi/2)\cot(\phi_2/2)$

or $\tan(\phi_2/2)=-\frac{(1+e)}{(1-e)}\cot(\phi/2)$

Similarly, $\tan(\phi_1/2)=-\frac{(1-e)}{(1+e)}\cot(\phi/2)$

the equation of QR is

$\frac{x}{a}\cos\left(\frac{\phi_1+\phi_2}{2}\right)+\frac{y}{b}\sin\left(\frac{\phi_1+\phi_2}{2}\right)=\cos\left(\frac{\phi_1-\phi_2}{2}\right)$

Dividing both sides by $\cos(\phi_1/2)\cos(\phi_2/2)$, we get

$\Rightarrow \frac{x}{a}(1-\tan(\phi_1/2)\tan(\phi_2/2)+\frac{y}{b}(\tan(\phi_1/2)+\tan(\phi_2/2))$

$=1+\tan(\phi_1/2)\tan(\phi_2/2)$ or $\frac{x}{a}(1-\cot^2(\phi/2))+\frac{y}{b}$

$\left\{-2\left(\frac{1+e^2}{1-e^2}\right)\cot(\phi/2)\right\}=1+\cot^2(\phi/2)$

or $\frac{x}{a}\frac{(1-\cot^2(\phi/2))}{(1+\cot^2(\phi/2))}-\frac{1+e^2}{1-e^2}\frac{2\cot\phi/2}{1+\cot^2\phi/2}\cdot\frac{y}{b}=1$

or $-\frac{x}{a}\cos\phi-\left(\frac{1+e^2}{1-e^2}\right)\sin\phi\cdot\frac{y}{b}=1$

or $\frac{x}{a}(1-e^2)\cos\phi+\frac{y}{b}(1+e^2)\sin\phi=-(1-e^2)$ ...(v)

But QR is also chord of contact.

Thus equation of QR is

$\frac{xx_1}{a^2}+\frac{yy_1}{b^2}=1$ ...(vi)

Comparing the co-efficients of Eqs. (v) and (vi), we get

$\frac{(1-e^2)\cos\phi}{x_1/a}=\frac{(1+e^2)\sin\phi}{y_1/b}=-(1-e^2)$

$\Rightarrow \quad \cos^2\phi=\frac{x_1^2}{a^2}$ and $\sin^2\phi=\frac{y_1^2}{b^2}\frac{(1-e^2)^2}{(1+e^2)^2}$

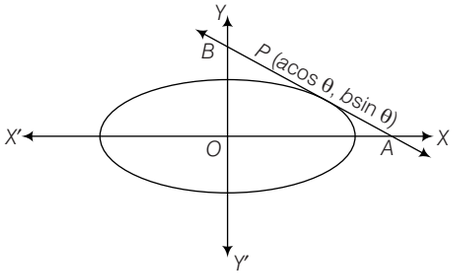
$\because \quad \cos^2\phi+\sin^2\phi=1$

$\therefore \quad \frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}\cdot\frac{(1-e^2)^2}{(1+e^2)^2}=1$

Locus of (x_1, y_1) is $\frac{x^2}{a^2}(1+e^2)^2+(1-e^2)^2\frac{y^2}{b^2}=(1+e^2)^2$.

94. Any tangent to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ at $P(a\cos\theta, b\sin\theta)$ is

$$\frac{x\cos\theta}{a}+\frac{y\sin\theta}{b}=1$$



It meets coordinate axes at $A(a\sec\theta, 0)$ and $B(0, b\,\text{cosec}\theta)$.

$\therefore$ Area of $\Delta OAB=\frac{1}{2}\times a\sec\theta\times b\,\text{cosec}\theta$

$\Rightarrow \quad \Delta=\frac{ab}{\sin 2\theta}$

For Δ to be min, $\sin 2\theta$ should be max and we know max value of $\sin 2\theta = 1$.

$\therefore \quad \Delta_{max}=ab$ sq units.

95. Let the common tangent to circle $x^2+y^2=16$ and ellipse $x^2/25+y^2/4=1$ be

$$y=mx+\sqrt{25m^2+4} \qquad \text{...(i)}$$

As it is tangent to circle $x^2+y^2=16$, we should have

$$\frac{\sqrt{25m^2+4}}{\sqrt{m^2+1}}=4 \quad \text{[Using: length of perpendicular from (0, 0) to (1) = 4]}$$

$\Rightarrow \quad 25m^2+4=16m^2+16$

$\Rightarrow \quad 9m^2=12$

$\Rightarrow \quad m=\frac{-2}{\sqrt{3}}$

[Leaving + ve sign to consider tangent in I quadrant]

$\therefore$ Equation of common tangent is

$$y=-\frac{2}{\sqrt{3}}x+\sqrt{25\cdot\frac{4}{3}+4}$$

$\Rightarrow \quad y=-\frac{2}{\sqrt{3}}x+4\sqrt{\frac{7}{3}}$

This tangent meets the axes at $A(2\sqrt{7}, 0)$ and $B\left(0, 4\sqrt{\frac{7}{3}}\right)$.

$\therefore$ Length of intercepted portion of tangent between axes

$$AB=\sqrt{(2\sqrt{7})+\left(4\sqrt{\frac{7}{3}}\right)^3}$$

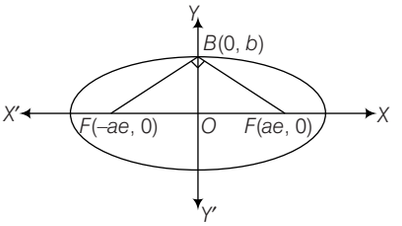
$$=14/\sqrt{3}$$

96. $\because \angle FBF'=90^\circ \Rightarrow FB^2+F'B^2=FF'^2$

$\therefore \quad (\sqrt{a^2e^2+b^2})^2+(\sqrt{a^2e^2+b^2})^2=(2ae)^2$

$\Rightarrow \quad 2(a^2e^2+b^2)=4a^2e^2$

$\Rightarrow \quad e^2=\frac{b^2}{a^2}$



Also, $\quad e^2=1-b^2/a^2=1-e^2$

$\Rightarrow \quad 2e^2=1, e=\frac{1}{\sqrt{2}}$

97. $2ae=6 \Rightarrow ae=3; 2b=8$

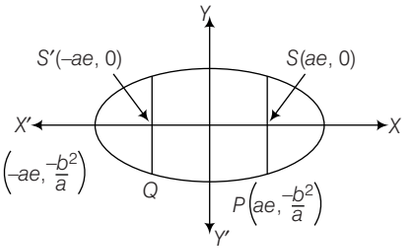
$\Rightarrow \quad b=4$

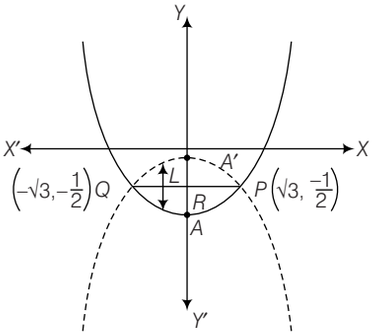
$b^2=a^2(1-e^2); 16=a^2-a^2e^2$

$\Rightarrow \quad a^2=16+9=25 \Rightarrow a=5$

$\therefore \quad e=\frac{3}{a}=\frac{3}{5}$

98.





Given, ellipse is $x^2+4y^2=4$

or $\quad \frac{x^2}{2^2}+\frac{y^2}{1}=1 \Rightarrow a=2, b=1$

$\therefore \quad e=\sqrt{1-\frac{1}{4}}=\frac{\sqrt{3}}{2}$

$\therefore \quad ae=\sqrt{3}$

As per question $P\equiv(ae, -b^2/a)=\left(\sqrt{3}, -\frac{1}{2}\right)$

$$Q\equiv(-ae, -b^2/a)=\left(-\sqrt{3}, -\frac{1}{2}\right)$$

$\therefore \quad PQ=2\sqrt{3}$

Now, if PQ is the length of latusrectum to be found, then

$$PQ=4a=2\sqrt{3} \Rightarrow a=\frac{\sqrt{3}}{2}$$

Also, as PQ is horizontal, parabola with PQ as latusrectum can be upward parabola (with vertex at A) or down ward parabola (with vertex at A').

For upward parabola, $Ar = a = \frac{\sqrt{3}}{2}$

$\therefore$ Coordinates of $A = \left(0, -\left(\frac{\sqrt{3}+1}{2}\right)\right)$

So, Equation of upward parabola is given by

$$x^2 = 2\sqrt{3}\left(y + \frac{\sqrt{3}+1}{2}\right) \text{ or } x^2 - 2\sqrt{3}y = 3 + \sqrt{3} \quad \ldots(i)$$

For downward parabola $A'R = a = \frac{\sqrt{3}}{2}$

$\therefore$ Coordinates of $A' = \left(0, -\left(\frac{1-\sqrt{3}}{2}\right)\right)$

So, equation of downward parabola is given by

$$x^2 = -2\sqrt{3}\left(y + \frac{1-\sqrt{3}}{2}\right)$$

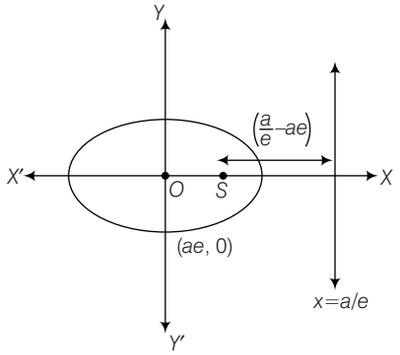
or $$x^2 + 2\sqrt{3}y = 3 - \sqrt{3} \quad \ldots(ii)$$

$\therefore$ Equation of required parabola is given by Eqs. (i) and (ii).

99. Perpendicular distance of directrix from focus

$$= \frac{a}{e} - ae = 4$$

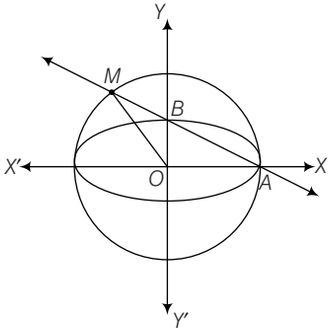
$$\Rightarrow a\left(2 - \frac{1}{2}\right) = 4 \Rightarrow a = \frac{8}{3}$$



$\therefore$ Semi major axis = 8/3

100. The given ellipse is $x^2 + 9y^2 = 9$

or $$\frac{x^2}{3^2} + \frac{y^2}{1^2} = 1$$



So, the $A(3, 0)$ and $B(0, 1)$

$\therefore$ Equation of AB is $\frac{x}{3} + \frac{y}{1} = 1$ or $x + 3y - 3 = 0$ ...(i)

Also, auxillary circle of given ellipse is

$$x^2 + y^2 = 9 \quad \ldots(ii)$$

Solving Eqs. (i) and (ii), we get the point M where line AB meets the auxillary circle.

Putting $x = 3 - 3y$ from Eqs. (i) and (ii)

we get $$(3 - 3y)^2 + y^2 = 9$$

$$\Rightarrow 9 - 18y + 9y^2 + y^2 = 9$$

$$\Rightarrow 10y^2 - 18y = 0$$

$$\Rightarrow y = 0, \frac{9}{5} \Rightarrow x = 3, \frac{-12}{5}$$

Clearly, $M\left(\frac{-12}{5}, \frac{9}{5}\right)$

$$\therefore \text{Area of } \Delta OAM = \frac{1}{2} \times \left| \begin{vmatrix} 0 & 0 & 1 \\ 3 & 0 & 1 \\ \frac{-12}{5} & \frac{9}{5} & 1 \end{vmatrix} \right| = \frac{27}{10}$$

101. The given ellipse is $\frac{x^2}{4^2} + \frac{y^2}{2^2} = 1$

such that $a^2 = 16$ and $b^2 = 4$

$$\therefore e^2 = 1 - \frac{4}{16} = \frac{3}{4}$$

$$\Rightarrow e = \frac{\sqrt{3}}{2}$$

Let $P(4\cos\theta, 2\sin\theta)$ be any point on the ellipse, then equation of normal at P is

$$4x\sin\theta - 2y\cos\theta = 12\sin\theta\cos\theta$$

$$\Rightarrow \frac{x}{3\cos\theta} - \frac{y}{6\sin\theta} = 1$$

$\therefore$ Q, the point where normal at P meets X-axis, has coordinates $(3\cos\theta, 0)$

$\therefore$ Mid-point of PQ is $M\left(\frac{7\cos\theta}{2}, \sin\theta\right)$

For locus of point M we consider

$$x = \frac{7\cos\theta}{2} \text{ and } y = \sin\theta$$

$$\Rightarrow \cos\theta = \frac{2x}{7} \text{ and } \sin\theta = y \Rightarrow \frac{4x^2}{49} + y^2 = 1 \quad \ldots(i)$$

Also, the latusrectum of given ellipse is

$$x = \pm\, ae = \pm\, 4 \times \frac{\sqrt{3}}{2} = \pm 2\sqrt{3}$$

or $$x = \pm 2\sqrt{3} \quad \ldots(ii)$$

Solving Eqs. (i) and (ii), we get

$$\frac{4 \times 12}{49} + y^2 = 1$$

$$\Rightarrow y^2 = \frac{1}{49} \text{ or } y = \pm\frac{1}{7}$$

$\therefore$ The required points are $\left(\pm 2\sqrt{3}, \pm\frac{1}{7}\right)$.

102. In ΔABC, given that $\cos B + \cos C = 4\sin^2\frac{A}{2}$

$$\Rightarrow 2\cos\frac{B+C}{2}\cos\frac{B-C}{2} - 4\sin^2\frac{A}{2} = 0$$

$$\Rightarrow 2\sin\frac{A}{2}\left[\cos\frac{B-C}{2} - 2\sin\frac{A}{2}\right] = 0$$

$$\Rightarrow \sin\frac{A}{2} = 0 \text{ or } \left(\cos\frac{B-C}{2} - 2\cos\frac{B+C}{2}\right) = 0$$

$$\left(\because \frac{A}{2} = 90° - \left(\frac{B+C}{2}\right)\right)$$

But in a triangle $\sin\frac{A}{2} \neq 0$

$$\cos\frac{B-C}{2} - 2\cos\frac{B+C}{2} = 0$$

$$\Rightarrow \frac{\cos\left(\frac{B+C}{2}\right)}{\cos\left(\frac{B-C}{2}\right)} = \frac{1}{2}$$

Applying componendo and dividendo, we get

$$\frac{\cos\left(\frac{B+C}{2}\right) + \cos\left(\frac{B-C}{2}\right)}{\cos\left(\frac{B+C}{2}\right) - \cos\left(\frac{B-C}{2}\right)} = \frac{1+2}{1-2} = -3$$

$$\Rightarrow -\frac{2\cos\frac{B}{2}\cos\frac{C}{2}}{2\sin\frac{B}{2}\sin\frac{C}{2}} = -3$$

$$\Rightarrow \tan\frac{B}{2}\tan\frac{C}{2} = \frac{1}{3}$$

$$\Rightarrow \sqrt{\frac{(s-a)(s-c)}{s(s-b)}}\sqrt{\frac{(s-a)(s-b)}{s(s-c)}} = \frac{1}{3}$$

$$\Rightarrow \frac{s-a}{s} = \frac{1}{3}$$

or $2s = 3a$

$\Rightarrow a + b + c = 3a$

or $b + c = 2a$

i.e. $AC + AB =$ constant

[$\because$ base $BC = a$ is given to be constant]

$\Rightarrow A$ moves on an ellipse.

103. $\left(\frac{x}{\sqrt{3}}\right)^2 + (y)^2 = \left(\frac{1-t^2}{1+t^2}\right)^2 + \left(\frac{2t}{1+t^2}\right)^2$

$$= \frac{(1+t^2)^2}{(1+t^2)^2} = 1$$

$$\Rightarrow \frac{x^2}{3} + y^2 = 1$$

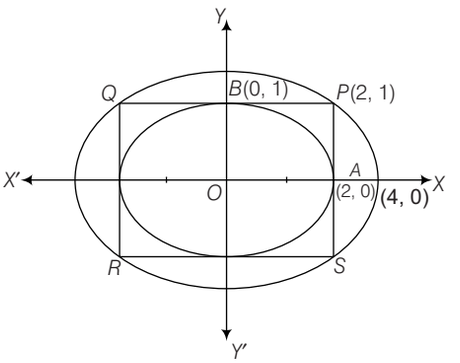
Which is an ellipse.

104. The given ellipse is $\frac{x^2}{4} + \frac{y^2}{1} = 1$

So, $A = (2, 0)$ and $B = (0,1)$

If $PQRS$ is the rectangle in which it is inscribed, then $P = (2, 1)$.

Let $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ be the ellipse circumscribing the rectangle $PQRS$. Then it passes through $P(2, 1)$



$$\therefore \frac{4}{a^2} + \frac{1}{b^2} = 1 \quad \ldots(i)$$

Also, given that, it passes through (4, 0)

$$\therefore \frac{16}{a^2} + 0 = 1$$

$$\Rightarrow a^2 = 16$$

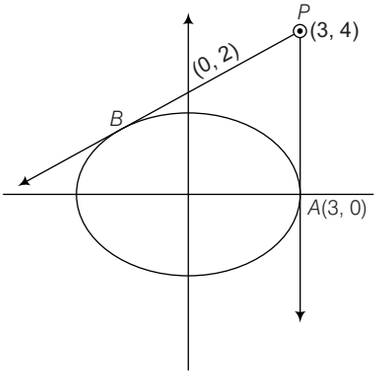
$$\Rightarrow b^2 = 4/3 \quad [\text{substituting } a^2 = 16 \text{ in Eq. (i)}]$$

$\therefore$ The required ellipse is $\frac{x^2}{16} + \frac{y^2}{4/3} = 1$

or $x^2 + 12y^2 = 16$

105. Tangent to $\frac{x^2}{3^2} + \frac{y^2}{2^2} = 1$ at the point $(3\cos\theta, 2\sin\theta)$ is

$$\frac{x\cos\theta}{3} + \frac{y\sin\theta}{2} = 1$$



As it passes through (3, 4), we get

$$\cos\theta + 2\sin\theta = 1$$

$$\Rightarrow 4\sin^2\theta = 1 + \cos^2\theta - 2\cos\theta$$

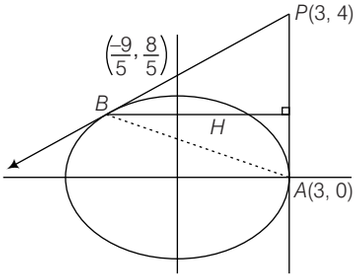
$$\Rightarrow 5\cos^2\theta - 2\cos\theta - 3 = 0$$

$$\Rightarrow \cos\theta = 1, -\frac{3}{5}$$

$$\Rightarrow \sin\theta = 0, \frac{4}{5}$$

$\therefore$ Required points are $A(3, 0)$ and $B\left(\frac{9}{5}, \frac{8}{5}\right)$.

106. Let H be orthocentre of ΔPAB, then as $BH \perp AP$, BH is a horizontal line through B.



$\therefore y$-coordinate of $B = 8/5$

Let H has coordinate $(\alpha, 8/5)$

Then, slope of $PH = \dfrac{\frac{8}{5} - 4}{\alpha - 3} = \dfrac{-12}{5(\alpha - 3)}$

and s lope of $AB = \dfrac{\frac{8-0}{5}}{-\frac{9}{5-3}} = \dfrac{8}{-24} = \dfrac{-1}{3}$

But $PH \perp AB$

$$\Rightarrow \quad \frac{-12}{5(\alpha - 3)} \times \left(\frac{-1}{3}\right) = -1$$

$$\Rightarrow \quad 4 = -5\alpha + 15 \text{ or } \alpha = 11/5$$

Hence $H\left(\dfrac{11}{5}, \dfrac{8}{5}\right)$.

107. Clearly, the moving point traces a parabola with focus at $P(3, 4)$ and directrix as

$$AB: \frac{y-0}{x-3} = \frac{-1}{3}$$

or $\quad x + 3y - 3 = 0$

$\therefore$ Equation of parabola is

$$(x-3)^2 + (y-4)^2 = \frac{(x+3y-3)^2}{10}$$

or $\quad 9x^2 + y^2 - 6xy - 54x - 62y + 241 = 0$

108. Let the ellipse be $\dfrac{x^2}{a^2} + \dfrac{y^2}{b^2} = 1$

It passes through $(-3, 1)$, so

$$\frac{9}{a^2} + \frac{1}{b^2} = 1 \qquad \ldots(i)$$

Also, $\quad b^2 = a^2(1 - 2/5)$

$$\Rightarrow \quad 5b^2 = 3a^2 \qquad \ldots(ii)$$

Solving Eqs. (i) and (ii), we get

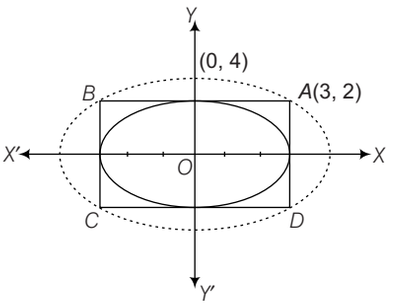
$$a^2 = \frac{32}{3}, b^2 = \frac{32}{5}$$

So, the equation of the ellipse is $3x^2 + 5y^2 = 32$

109. As rectangle $ABCD$ circumscribed the ellipse

$$\frac{x^2}{9} + \frac{y^2}{4} = 1$$

$\therefore \quad A = (3, 2)$



Let the ellipse circumscribing the rectangle $ABCD$ is

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

Given that, it passes through (0, 4)

$\therefore \quad b^2 = 16$

Also, it passes through $A(3, 2)$

$$\therefore \quad \frac{9}{a^2} + \frac{4}{16} = 1 \Rightarrow a^2 = 12$$

$$\therefore \quad e = \sqrt{1 - \frac{12}{16}} = \sqrt{\frac{1}{4}} = \frac{1}{2}$$

110. Given, equation of ellipse is $2x^2 + y^2 = 4$

$$\Rightarrow \quad \frac{2x^2}{4} + \frac{y^2}{4} = 1 \Rightarrow \frac{x^2}{2} + \frac{y^2}{4} = 1$$

Equation of tangent to the ellipse $\dfrac{x^2}{2} + \dfrac{y^2}{4} = 1$ is

$$y = mx \pm \sqrt{2m^2 + 4} \qquad \ldots(i)$$

$\because$ equation of tangent to the ellipse $\dfrac{x^2}{a^2} + \dfrac{y^2}{b^2} = 1$

is $y = mx + c$, where $c = \pm\sqrt{a^2m^2 + b^2}$

Now, equation of tangent to the parabola

$\because \quad y^2 = 16\sqrt{3}x$ is $y = mx + \dfrac{4\sqrt{3}}{m} \qquad \ldots(ii)$

($\because$ Equation of tangent to the parabola $y^2 = 4ax$ is $y = mx + \dfrac{a}{m}$)

On comparing Eqs. (i) and (ii), we get

$$\frac{4\sqrt{3}}{m} = \pm\sqrt{2m^2 + 4}$$

Squaring on both the sides, we get

$$16(3) = (2m^2 + 4)m^2$$

$$\Rightarrow \quad 48 = m^2(2m^2 + 4)$$

$$\Rightarrow \quad 2m^2 + 4m^2 - 48 = 0$$

$$\Rightarrow \quad m^4 + 2m^2 - 24 = 0$$

$$\Rightarrow \quad (m^2 + 6)(m^2 - 4) = 0$$

$$\Rightarrow \quad m^2 = 4 \qquad (\because m^2 \neq -6)$$

$$\Rightarrow \quad m = \pm 2$$

$\Rightarrow$ Equation of common tangents are $y = \pm 2x \pm 2\sqrt{3}$

Thus, statement I is true.

statement II is obviously true.

111. Equation of circle is $(x-1)^2 + y^2 = 1$

$\Rightarrow$ Radius $= 1$ and Diameter $= 2$

$\therefore$ Length of semi-minor axis is 2.

Equation of circle is $x^2 + (y-2)^2 = 4 = (2)^2$

$\Rightarrow$ Radius $= 2$ and Diameter $= 4$

$\Rightarrow$ Length of semi-major axis is 4

We know, equation of ellipse is given by

$$\frac{x^2}{(\text{Major-axis})^2} + \frac{y^2}{(\text{Major-axis})^2} = 1$$

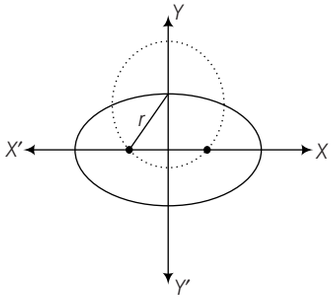
$$\Rightarrow \quad \frac{x^2}{(4)^2} + \frac{y^2}{(2)^2} = 1 \Rightarrow \frac{x^2}{16} + \frac{y^2}{4} = 1$$

$$\Rightarrow \quad x^2 + 4y^2 = 16$$

112. From the given equation of ellipse, we have

$$a = 4, b = 3e = \sqrt{1 - \frac{9}{16}}$$

$$\Rightarrow \quad e = \frac{\sqrt{7}}{4}$$



Now, radius of this circle $= a^2 = 16$

$$\Rightarrow \quad \text{Foci} = (\pm\sqrt{7}, 0)$$

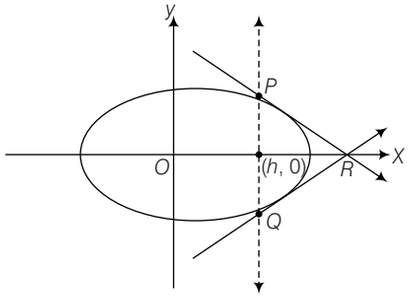
Now, equation of circle is $(x-0)^2 + (y-3)^2 = 16$

$$x^2 + y^2 - 6y - 7 = 0$$

113. Vertical line $x = h$, meets the ellipse $\frac{x^2}{4} + \frac{y^2}{3} = 1$ at

$$P\left(h, \frac{\sqrt{3}}{2}\sqrt{(4-h^2)}\right) \text{ and } Q\left(h, \frac{-\sqrt{3}}{2}\sqrt{(4-h^2)}\right)$$

By symmetry, tangents at P and Q will meet each other at X-axis



Tangent at P is $\frac{xh}{4} + \frac{y\sqrt{3}}{6}\sqrt{(4-h^2)} = 1$

Which meets X-axis at $R\left(\frac{4}{h}, 0\right)$

Area of $\Delta PQR = \frac{1}{2} \times \sqrt{3}\sqrt{(4-h^2)} \times \left(\frac{4}{h} - h\right)$

i.e. $\Delta(h) = \frac{\sqrt{3}}{2}\frac{(4-h^2)^{3/2}}{h}$

$$\frac{d\Delta}{dh} = -\sqrt{3}\left[\frac{\sqrt{(4-h^2)}(h^2+2)}{h^2}\right] < 0$$

$\therefore \Delta(h)$ is a decreasing function.

$$\therefore \quad \frac{1}{2} \le h \le 1$$

$$\Rightarrow \quad \Delta_{\max} = \Delta\left(\frac{1}{2}\right) \text{ and } \Delta_{\max} = \Delta(1)$$

$$\therefore \quad \Delta_1 = \frac{\sqrt{3}}{2}\left(\frac{\left(4 - \frac{1}{4}\right)^{3/2}}{\frac{1}{2}}\right) = \frac{45}{8}\sqrt{5}$$

$$\Delta_2 = \frac{\sqrt{3}}{2} \cdot \frac{3\sqrt{3}}{1} = \frac{9}{2}$$

$$\therefore \quad \frac{8}{\sqrt{5}}\Delta_1 - 8\Delta_2 = 45 - 36 = 9$$

114. Given, equation of ellipse can be written as

$$\frac{x^2}{6} + \frac{y^2}{2} = 1$$

$$\Rightarrow \quad a^2 = 6, b^2 = 2$$

Now, equation of any variable tangent is

$$y = mx \pm \sqrt{a^2m^2 + b^2} \quad \ldots(i)$$

where m is slope of the tangent

So, equation of perpendicular line drawn from centre to tangent is

$$y = \frac{-x}{m} \quad \ldots(ii)$$

Eliminating m,we get

$$(x^4 + y^4 + 2x^2y^2) = a^2x^2 + b^2y^2$$

$$\Rightarrow \quad (x^2 + y^2)^2 = a^2x^2 + b^2y^2$$

$$\Rightarrow \quad (x^2 + y^2)^2 = 6x^2 + 2y^2$$

115. The end point of latusrectum of ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ in first quadrant is $\left(ae, \frac{b^2}{a}\right)$ and the tangent at this point intersects X-axis at $\left(\frac{a}{e}, 0\right)$ and Y- axis at $(0, a)$.

The given ellipse is $\frac{x^2}{9} + \frac{y^2}{5} = 1$

Then, $a^2 = 9, b^2 = 5$

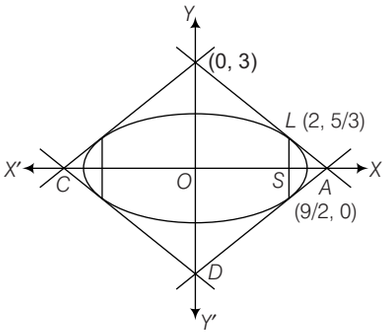
$$\Rightarrow \quad e = \sqrt{\left(1 - \frac{5}{9}\right)} = \frac{2}{3}$$

$\therefore$ End point of latusrectum in first quadrant is $L(2, 5/3)$

Equation of tangent at L is $\frac{2x}{9} + \frac{y}{3} = 1$

It meets X-axis at A (9/2, 0) and Y-axis at B (0, 3)

$\therefore$ Area of $\Delta OAB = \frac{1}{2} \times \frac{9}{2} \times 3 = \frac{27}{4}$



By symmetry area of quadrilateral

$$= 4 \times (\text{Area } \Delta OAB) = 4 \times \frac{27}{4} = 27 \text{ sq units}$$

116. Let $E_1 : \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, where $a > b$

and $E_2 : \frac{x^2}{c^2} + \frac{y^2}{d^2} = 1$, where $c < d$

Also, $S : x^2 + (y-1)^2 = 2$

Tangent at $P(x_1, y_1)$ to S is $x + y = 3$

To find point of contact put $x = 3 - y$ in S, we get $P(1, 2)$

writing equation of tangent in parametric form

$$\frac{x-1}{\frac{-1}{\sqrt{2}}} = \frac{y-2}{\frac{1}{\sqrt{2}}} = \pm \frac{2\sqrt{2}}{3}$$

$$x = \frac{-2}{3} + 1 \quad \text{or} \quad \frac{2}{3} + 1 \text{ and } y = \frac{2}{3} + 2 \text{ or } \frac{-2}{3} + 2$$

$\Rightarrow \quad x = \frac{1}{3}$ or $\frac{5}{3}$ and $y = \frac{8}{3}$ or $\frac{4}{3}$

$\therefore \quad Q\left(\frac{5}{3}, \frac{4}{3}\right)$ and $R\left(\frac{1}{3}, \frac{8}{3}\right)$

Equation of tangent to E_1 at Q is

$\frac{5x}{3a^2} + \frac{4y}{3b^2} = 1$ which is identical to $\frac{x}{3} + \frac{y}{3} = 1$

$\Rightarrow \; a^2 = 5$ and $b^2 = 4 \; \Rightarrow \; e_1^2 = 1 - \frac{4}{5} = \frac{1}{5}$

Equation of tangent to E_2 at R is

$\frac{x}{3c^2} + \frac{8y}{3d^2} = 1$ identical to $\frac{x}{3} + \frac{y}{3} = 1$

$\Rightarrow \quad c^2 = 1, d^2 = 8 \; \Rightarrow \; e_2^2 = 1 - \frac{1}{8} = \frac{7}{8}$

$\therefore \quad e_1^2 + e_2^2 = \frac{43}{40}, e_1 e_2 = \frac{\sqrt{7}}{2\sqrt{10}}, \left|e_1^2 - e_2^2\right| = \frac{27}{40}$

117. Ellipse $\frac{x^2}{9} + \frac{y^2}{5} = 1 \Rightarrow a = 3, b = \sqrt{5}$ and $e = \frac{2}{3}$

$\therefore \quad f_1 = 2$ and $f_2 = -2$

$$P_1 : y^2 = 8x \quad \text{and} \quad P_2 : y^2 = -16x$$

$$T_1 : y = m_1 x + \frac{2}{m_1}$$

It passes through (–4, 0),

$$0 = -4m_1 + \frac{2}{m_1} \; \Rightarrow \; m_1^2 = \frac{1}{2}$$

$$T_2 : y = m_2 x - \frac{4}{m_2}$$

It passes through (2, 0)

$$0 = 2m_2 - \frac{4}{m_2} \; \Rightarrow \; m_2^2 = 2$$

$\therefore \quad \frac{1}{m_1^2} + m_2^2 = 4$

Sol. (Q. Nos. 118 & 119)

118. For ellipse $\frac{x^2}{9} + \frac{y^2}{8} = 1$, $e = \sqrt{\left(1 - \frac{8}{9}\right)} = \frac{1}{3}$

$\therefore \quad F_1(-1, 0)$ and $F_2(1, 0)$

Parabola with vertex at (0, 0) and focus at F_2 (1, 0) is $y^2 = 4x$.

Intersection points of ellipse and parabola are $M\left(\frac{3}{2}, \sqrt{6}\right)$ and $N\left(\frac{3}{2}, -\sqrt{6}\right)$.

For orthocentre of $\Delta F_1 MN$, clearly one altitude is X-axis i.e. $y = 0$ and altitude from M to F_1 N is

$$y - \sqrt{6} = \frac{5}{2\sqrt{6}}\left(x - \frac{3}{2}\right)$$

Putting $y = 0$ in above equation, we get $x = -\frac{9}{10}$

Orthocentre $\left(-\frac{9}{10}, 0\right)$

119. Tangents to ellipse at M and N are

$$\frac{x}{6} + \frac{y\sqrt{6}}{8} = 1 \text{ and } \frac{x}{6} - \frac{y\sqrt{6}}{8} = 1$$

their intersection point is R (6, 0)

Also, normal to parabola at $M\left(\frac{3}{2}, \sqrt{6}\right)$ is

$$y - \sqrt{6} = -\frac{\sqrt{6}}{2}\left(x - \frac{3}{2}\right)$$

Its intersection with x-axis is $Q\left(\frac{7}{2}, 0\right)$

Now, $\quad \text{ar}(\Delta MQR) = \frac{1}{2} \times \frac{5}{2} \times \sqrt{6} = \frac{5\sqrt{6}}{4}$

Also, area $(MF_1NF_2) = 2 \times$ Area of (F_1MF_2)

$$= 2 \times \frac{1}{2} \times 2 \times \sqrt{6} = 2\sqrt{6}$$

$$\frac{\text{area}(\Delta MQR)}{\text{area}(MF_1NF_2)} = \frac{5\sqrt{6}}{4 \times 2\sqrt{6}} = 5 : 8$$

120. Here, $e = \frac{1}{2}$ and $x = -\frac{a}{e} = -4$

$\therefore \quad a = 2$

and $\quad b^2 = a^2(1 - e^2) = 4(1 - 1/4) = 3$

$\therefore$ Equation of ellipse is $\frac{x^2}{4} + \frac{y^2}{3} = 1$

$\Rightarrow$ Equation of normal at (1, 3/2) is

$$\frac{4x}{1} - \frac{3y}{3/2} = 4 - 3$$

or $\quad 4x - 2y = 1$

Session 1

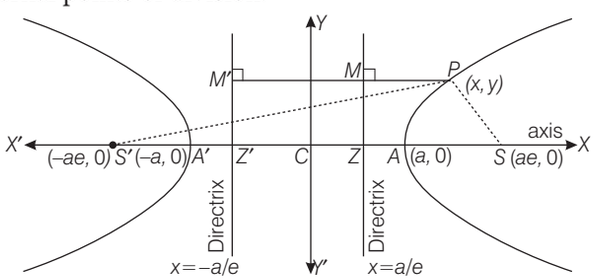
Hyperbola : Definition, Standard Equation of Hyperbola, The Foci and Two Directrices of a Hyperbola, Tracing of the Hyperbola, Focal Distances of a Point, Conjugate Hyperbola, Position of a Point with Respect to a Hyperbola, Intersection of a Line and a Hyperbola

Hyperbola : Definition

The locus of a point which moves in a plane such that its distance from a fixed point (i.e. focus) is e times its distance from a fixed line (i.e. directrix) is known as hyperbola. For hyperbola $e > 1$.

Standard Equation of Hyperbola

Let S be the focus and ZM the directrix of the hyperbola. Draw $SZ \perp ZM$. Divide SZ internally and externally in the ratio $e:1\,(e>1)$ and let A and A' be their internal and external points of division.



then $$SA = e\,AZ \qquad \ldots(i)$$

and $$SA' = e\,A'Z \qquad \ldots(ii)$$

Clearly A and A' will lie on the hyperbola. Let $AA' = 2a$ and take C the mid-point of AA' as origin

$$\therefore \quad CA = CA' = a$$

Let $P(x, y)$ be any point on the hyperbola and CA as X-axis, the line through C perpendicular to CA as Y-axis.

Then adding Eqs. (i) and (ii)

$$\therefore \quad SA + SA' = e\,(AZ + A'Z)$$

$$\Rightarrow \quad CS - CA + CS + CA' = e\,(AA')$$

$$\Rightarrow \quad 2CS = e\,(2a) \qquad (\because CA = CA')$$

$$\therefore \quad CS = ae$$

$\therefore$ The focus S is $(CS, 0)$ i.e. $(ae, 0)$ and subtracting Eq. (i) from Eq. (ii), then

$$SA' - SA = e\,(A'Z - AZ)$$

$$AA' = e\,[(CA' + CZ) - (CA - CZ)]$$

$$\Rightarrow \quad AA' = e\,(2CZ) \qquad (\because CA = CA')$$

$$\Rightarrow \quad 2a = e\,(2CZ)$$

$$\therefore \quad CZ = a/e$$

$\therefore$ The directrix MZ is $x = CZ = a/e$

or $$x - a/e = 0 \qquad \left(\because e > 1, \therefore \ \frac{a}{e} < 1\right)$$

Now, draw $PM \perp MZ$,

$$\therefore \quad \frac{SP}{PM} = e \quad \text{or} \quad (SP)^2 = e^2\,(PM)^2$$

or $$(x - ae)^2 + (y - 0)^2 = e^2\left(x - \frac{a}{e}\right)^2$$

or $$(x - ae)^2 + y^2 = (ex - a)^2$$

$$\Rightarrow \quad x^2 + a^2e^2 - 2aex + y^2 = e^2x^2 - 2aex + a^2$$

$$\Rightarrow \quad x^2(e^2 - 1) - y^2 = a^2\,(e^2 - 1)$$

$$\Rightarrow \quad \frac{x^2}{a^2} - \frac{y^2}{a^2\,(e^2 - 1)} = 1$$

or $$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1, \text{ where, } b^2 = a^2\,(e^2 - 1)$$

This is the standard equation of the hyperbola.

Generally : The equation of the hyperbola whose focus is the point (h, k) and directrix is $lx + my + n = 0$ and whose eccentricity is e, is

$$(x - h)^2 + (y - k)^2 = e^2\,\frac{(lx + my + n)^2}{(l^2 + m^2)}$$

The Foci and Two Directrices of a Hyperbola

On the negative side of origin take a point S' which is such that

$$CS = CS' = ae$$

and another point Z', then $CZ = CZ' = \frac{a}{e}$

$\therefore$ Coordinates of S' are $(-ae, 0)$ and equation of second directrix (i.e. $Z'M'$) is

$$x = -\frac{a}{e}$$

Let $P(x, y)$ be any point on the hyperbola, then

$$S'P = ePM' \text{ or } (S'P)^2 = e^2 (PM')^2$$

or $$(x + ae)^2 + (y - 0)^2 = e^2 \left(x + \frac{a}{e}\right)^2$$

or $$(x + ae)^2 + y^2 = (ex + a)^2$$

or $$x^2 + 2aex + a^2e^2 + y^2 = e^2x^2 + 2aex + a^2$$

or $$x^2 (e^2 - 1) - y^2 = a^2(e^2 - 1)$$

or $$\frac{x^2}{a^2} - \frac{y^2}{a^2 (e^2 - 1)} = 1$$

or $$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1, \text{ where, } b^2 = a^2 (e^2 - 1)$$

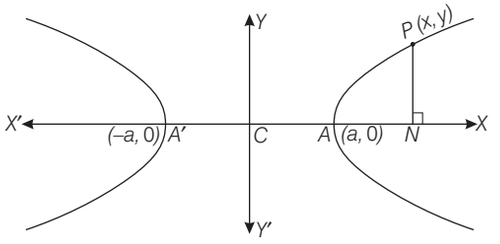
The equation being the same as that of hyperbola when $S(ae, 0)$ is focus and MZ i.e. $x = \frac{a}{e}$ is directrix.

Hence, coordinates of foci are $(\pm ae, 0)$ and equations of directrices are

$$x = \pm a / e$$

Remarks

1. Distance between foci $SS' = 2ae$ and distance between directrices $ZZ' = 2a/e$
2. Two hyperbolas are said to be similar if they have the same value of eccentricity.
3. Since, $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$



$$\Rightarrow \quad \frac{y^2}{b^2} = \frac{x^2}{a^2} - 1$$

$$\frac{y^2}{b^2} = \frac{(x - a)(x + a)}{a^2} \quad \ldots(i)$$

$\because$ $AN = CN - CA = (x - a)$

and $A'N = CN + CA' = (x + a)$

and $PN = y$

$\therefore$ From Eq. (i), $\frac{(PN)^2}{AN \cdot A'N} = \frac{b^2}{a^2}$

Tracing of the Hyperbola

Equation of the hyperbola is

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \quad \ldots(i)$$

(i) Since only even powers of x and y occur in this equation so it (hyperbola) is symmetrical about the both axes.

(ii) The hyperbola (i) does not cut Y-axis in real points where as it cuts X-axis at $(a, 0)$ and $(-a, 0)$.

(iii) The Eq. (i) may be written as

$$y = \pm \frac{b}{a}\sqrt{(x^2 - a^2)}$$

If follows that $x^2 - a^2 \geq 0$

$\therefore$ $x^2 \geq a^2$

$\Rightarrow$ $x \leq -a$ or $x \geq a$

Hence, $x \notin (-a, a)$

The curve does not exist in the region

$$x = -a \text{ to } x = a .$$

(iv) As x increases, y also increases i.e. the curve extends to infinity.

Some Terms Related to Hyperbola

Let the equation of hyperbola is $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$

(1) Centre : All chords passing through C and bisected at C.

Here $C \equiv (0, 0)$

(2) Eccentricity : For the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ we have

$$b^2 = a^2 (e^2 - 1)$$

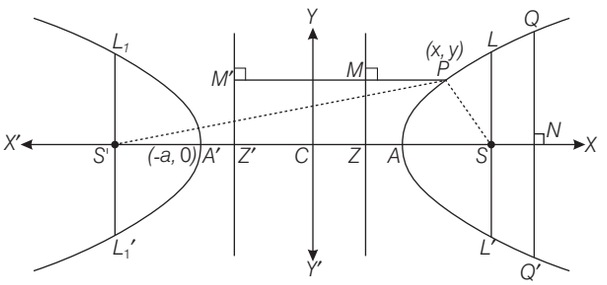
$$\Rightarrow \quad e^2 = \frac{a^2 + b^2}{a^2}$$

$$\Rightarrow \qquad e=\sqrt{1+\left(\frac{b^2}{a^2}\right)} \Rightarrow e=\sqrt{\left\{1+\frac{(2b)^2}{(2a)^2}\right\}}$$

$$\Rightarrow \qquad e=\sqrt{\left\{1+\frac{(\text{conjugate axis})^2}{(\text{transverse axis})^2}\right\}}$$

(3) Foci and directrices : S and S' are the foci of the ellipse and their coordinates are $(ae, 0)$ and $(-ae, 0)$ respectively and ZM and $Z'M'$ are two directrices of the hyperbola and their equations are

$$x=\frac{a}{e} \quad \text{and} \quad x=-\frac{a}{e} \text{ respectively.}$$



(4) Axes : The points $A(a, 0)$ and $A'(-a, 0)$ are called the vertices of the hyperbola and line AA' is called **transverse axis** and the line perpendicular to its through the centre $(0, 0)$ of the hyperbola is called **conjugate axis.**

The length of transverse and conjugate axes are taken as $2a$ and $2b$ respectively.

(5) Double ordinates : If Q be a point on the hyperbola draw QN perpendicular to the axis of the hyperbola and produced to meet the curve again at Q'. Then QQ' is called a double ordinate of Q.

If abscissa of Q is h, then ordinates of Q are

$$\frac{y^2}{b^2}=\frac{h^2}{a^2}-1$$

$$\therefore \qquad y=\pm\frac{b}{a}\sqrt{(h^2-a^2)}$$

$$\therefore \qquad y=\frac{b}{a}\sqrt{(h^2-a^2)} \qquad \text{(for I quadrant)}$$

and ordinate of Q' is

$$y=-\frac{b}{a}\sqrt{(h^2-a^2)} \qquad \text{(for IV quadrant)}$$

Hence, coordinates of Q and Q' are

$$\left(h, \frac{b}{a}\sqrt{(h^2-a^2)}\right) \text{ and } \left(h, -\frac{b}{a}\sqrt{(h^2-a^2)}\right)$$

respectively.

(6) Latusrectum : The double ordinates LL' and L_1L_1' are the latusrectums of the hyperbola. These lines are perpendicular to transverse axis AA' and through the foci S and S' respectively.

Length of latusrectum

Now, let $LL'=2k$, then $LS=L'S=k$

Coordinates of L and L' are (ae, k) and $(ae, -k)$

lie on the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$

$$\therefore \qquad \frac{a^2e^2}{a^2}-\frac{k^2}{b^2}=1$$

or $\quad k^2=b^2(e^2-1)=b^2\left(\frac{b^2}{a^2}\right) \qquad [\because b^2=a^2(e^2-1)]$

$$\therefore \qquad k=\frac{b^2}{a} \qquad (\because k>0)$$

$$\therefore \qquad 2k=\frac{2b^2}{a}=LL'$$

$\therefore$ Length of latusrectum $LL'=L_1L'_1=\frac{2b^2}{a}$ and end points of latusrectums are

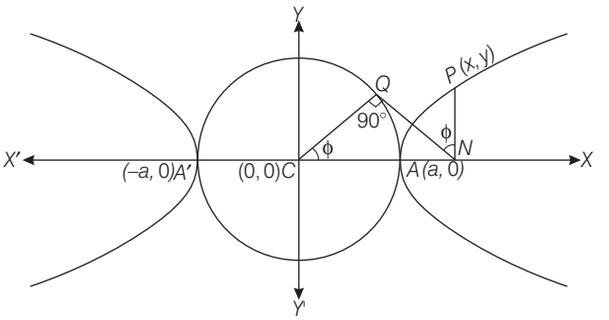
$$L\equiv\left(ae, \frac{b^2}{a}\right); L'\equiv\left(ae, -\frac{b^2}{a}\right);$$

$$L_1\equiv\left(-ae, \frac{b^2}{a}\right); L_1'\equiv\left(-ae, -\frac{b^2}{a}\right) \text{ respectively.}$$

(7) Focal chord : A chord of hyperbola passing through its focus is called a focal chord.

(8) Parametric equations of the hyperbola : Let $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ be the hyperbola with centre C and transverse axis $A'A$. Therefore, circle drawn with centre C and segment $A'A$ as a diameter is called auxiliary circle of the hyperbola.

$$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$$



$\therefore$ Equation of the auxiliary circle is $x^2 + y^2 = a^2$

Let $P(x, y)$ be any point on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$. Draw PN perpendicular to X-axis.

Let NQ be a tangent to the auxiliary circle $x^2 + y^2 = a^2$. Join CQ

Let $\angle QCN = \phi$

Here, P and Q are the **corresponding points** of the hyperbola and the auxiliary circle. ϕ is the eccentric angle of $P \cdot (0 \le \phi < 2\pi)$

Since, $Q \equiv (a\cos\phi, a\sin\phi)$

Now, $x = CN = \frac{CN}{CQ} \cdot CQ = \sec\phi \cdot a$

$\therefore$ $x = CN = a\sec\phi$

$\therefore$ $P(x, y) \equiv (a\sec\phi, y)$

$\because$ P lies on $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$

$\therefore$ $\frac{a^2\sec^2\phi}{a^2} - \frac{y^2}{b^2} = 1$

or $\frac{y^2}{b^2} = \sec^2\phi - 1 = \tan^2\phi$

$\therefore$ $y = \pm b\tan\phi$

$\therefore$ $y = b\tan\phi$ (P lies in I quadrant)

The equations of $x = a\sec\phi$ and $y = b\tan\phi$ are known as the parametric equations of the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

Position of points Q an auxiliary circle and the corresponding point P which describes the hyperbola and $0 \le \phi < 2\pi$.

ϕ varies from	$Q(a\cos\phi, a\sin\phi)$	$P(a\sec\phi, b\tan\phi)$
0 to $\frac{\pi}{2}$	I	I
$\frac{\pi}{2}$ to π	II	III
π to $\frac{3\pi}{2}$	III	II
$\frac{3\pi}{2}$ to 2π	IV	IV

Remark

Equation of the chord joining the points $P \equiv (a\sec\phi_1, b\tan\phi_1)$ and $Q \equiv (a\sec\phi_2, b\tan\phi_2)$ is

$$\frac{x}{a}\cos\left(\frac{\phi_1 - \phi_2}{2}\right) - \frac{y}{b}\sin\left(\frac{\phi_1 + \phi_2}{2}\right) = \cos\left(\frac{\phi_1 + \phi_2}{2}\right)$$

If it is focal chord, then pass through $(ae, 0)$ or $(-ae, 0)$. Suppose it pass through $(ae, 0)$, then

$$e\cos\left(\frac{\phi_1 - \phi_2}{2}\right) - 0 = \cos\left(\frac{\phi_1 + \phi_2}{2}\right)$$

$$\Rightarrow \quad \frac{\cos\left(\frac{\phi_1 - \phi_2}{2}\right)}{\cos\left(\frac{\phi_1 + \phi_2}{2}\right)} = \frac{1}{e}$$

$$\Rightarrow \quad \frac{\cos\left(\frac{\phi_1 - \phi_2}{2}\right) - \cos\left(\frac{\phi_1 + \phi_2}{2}\right)}{\cos\left(\frac{\phi_1 - \phi_2}{2}\right) + \cos\left(\frac{\phi_1 + \phi_2}{2}\right)} = \frac{1 - e}{1 + e}$$

or $$\tan\left(\frac{\phi_1}{2}\right)\tan\left(\frac{\phi_2}{2}\right) = \frac{1 - e}{1 + e}$$

Hence, if ϕ_1 and ϕ_2 are the eccentric angles of extremities of a focal chord of the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, then

$$\tan\left(\frac{\phi_1}{2}\right)\tan\left(\frac{\phi_2}{2}\right) = \frac{1 - e}{1 + e} \quad \text{or} \quad \frac{1 + e}{1 - e}$$

according as focus $(ae, 0)$ or $(-ae, 0)$.

Focal Distances of a Point

The difference of the focal distances of any point on the hyperbola is constant and equal to length of the transverse axis of the hyperbola.

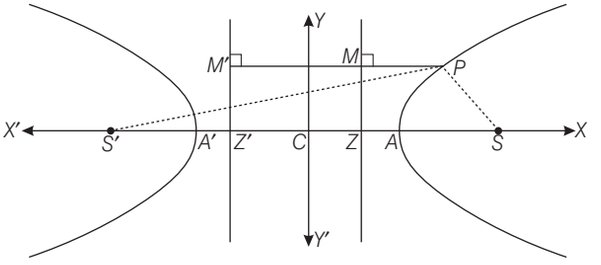
The hyperbola is $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ ...(i)

The foci S and S' are $(ae, 0)$ and $(-ae, 0)$.

The equation of its directrices MZ and $M'Z'$ are

$$x = \frac{a}{e} \quad \text{and} \quad x = -\frac{a}{e}$$

respectively.



Let $P(x_1, y_1)$ be any point on Eq. (i).

Now $SP = ePM = e\left(x_1 - \frac{a}{e}\right) = ex_1 - a$

and $S'P' = ePM' = e\left(x_1 + \frac{a}{e}\right) = ex_1 + a$

$\therefore$ $S'P - SP = (ex_1 + a) - (ex_1 - a) = 2a = AA'$

= Transverse axis

A hyperbola is the locus of a point which moves in a plane such that the difference of its distances from two fixed point (foci) is always constant.

Example 1 To find the equation of the hyperbola from the definition that hyperbola is the locus of a point which moves such that the difference of its distances from two fixed points is constant with the fixed point as foci.

Sol. Let two fixed point be $S(ae, 0)$ and $S'(-ae, 0)$. Let $P(x, y)$ be a moving point such that

$$S'P - SP = \text{constant} = 2a \text{ (say)}$$

i.e. $\sqrt{(x+ae)^2 + (y-0)^2} - \sqrt{(x-ae)^2 + (y-0)^2} = 2a$

or $\sqrt{(x^2 + y^2 + 2aex + a^2e^2)}$

$$- \sqrt{(x^2 + y^2 - 2aex + a^2e^2)} = 2a \quad \text{...(i)}$$

Let $l = x^2 + y^2 + 2aex + a^2e^2$ ...(ii)

and $m = x^2 + y^2 - 2aex + a^2e^2$ ...(iii)

Eq. (i) can be re-written as

$$\sqrt{l} - \sqrt{m} = 2a \quad \text{...(iv)}$$

From Eqs. (ii) and (iii),

$$l - m = 4aex$$

$\Rightarrow$ $(\sqrt{l} + \sqrt{m})(\sqrt{l} - \sqrt{m}) = 4aex$

$\Rightarrow$ $2a(\sqrt{l} + \sqrt{m}) = 4aex$ [from Eq. (iv)]

or $\sqrt{l} + \sqrt{m} = 2ex$ ...(v)

Adding Eqs. (iv) and (v), then

$$2\sqrt{l} = 2a + 2ex$$

$\Rightarrow$ $\sqrt{l} = a + ex \Rightarrow l = (a + ex)^2$

$$x^2 + y^2 + 2aex + a^2e^2 = a^2 + 2aex + e^2x^2$$

or $x^2(e^2 - 1) - y^2 = a^2(e^2 - 1)$

or $\dfrac{x^2}{a^2} - \dfrac{y^2}{a^2(e^2-1)} = 1$

or $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$, where $b^2 = a^2(e^2 - 1)$.

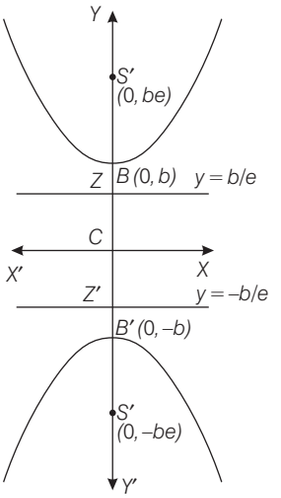
Conjugate Hyperbola

The hyperbola whose transverse and conjugate axes are respectively the conjugate and transverse axes of a given hyperbola is called the conjugate hyperbola of the given hyperbola.

The conjugate hyperbola of the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \quad \text{is} \quad -\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

its shape is shown alongside.



Various results related to hyperbola $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$ and its conjugate

$$-\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad \text{or} \quad \frac{x^2}{a^2} - \frac{y^2}{b^2} = -1$$

are given in the following table

Basic fundamentals \ Hyperbola	$\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$	$-\dfrac{x^2}{a^2} + \dfrac{y^2}{b^2} = 1$ or $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = -1$
Centre	$(0, 0)$	$(0, 0)$
Length of transverse axis	$2a$	$2b$
Length of conjugate axis	$2b$	$2a$
Foci	$(\pm ae, 0)$	$(0, \pm be)$
Equation of directrices	$x = \pm a/e$	$y = \pm b/e$
Eccentricity	$e = \sqrt{\left(\dfrac{a^2 + b^2}{a^2}\right)}$	$e = \sqrt{\left(\dfrac{a^2 + b^2}{b^2}\right)}$
Length of latusrectum	$\dfrac{2b^2}{a}$	$\dfrac{2a^2}{b}$
Parametric coordinates	$(a \sec \phi, b \tan \phi)$, $0 \le \phi < 2\pi$	$(a \tan \phi, b \sec \phi)$, $0 \le \phi < 2\pi$
Focal radii	$SP = ex_1 - a$ and $S'P = ex_1 + a$	$SP = ey_1 - b$ and $S'P = ey_1 + b$
Difference of focal radii ($S'P - SP$)	$2a$	$2b$
Tangents at the vertices	$x = -a, x = a$	$y = -b, y = b$
Equation of the transverse axis	$y = 0$	$x = 0$
Equation of the conjugate axis	$x = 0$	$y = 0$

Remarks

1. If the centre of hyperbola is (h,k) and axes are parallel to the coordinates axes, then its equation is

$$\frac{(x-h)^2}{a^2}-\frac{(y-k)^2}{b^2}=1.$$

By shifting the origin at (h,k) without rotating the coordinate axes, the above equation reduces to

$$\frac{X^2}{a^2}-\frac{Y^2}{b^2}=1$$

where, $X=X+h, y=Y+k$

2. If e_1 and e_2 are the eccentricities of a hyperbola and its conjugate, respectively, then $e_1^2+e_2^2=1$.

Proof For hyperbola $b^2=a^2(e_1^2-1)$

or $$e_1^2=1+\frac{b^2}{a^2}=\frac{a^2+b^2}{a^2} \quad \ldots \text{(i)}$$

and for conjugate hyperbola $a^2=b^2(e_2^2-1)$

or $$e_2^2=1+\frac{a^2}{b^2}=\frac{a^2+b^2}{b^2} \quad \ldots \text{(ii)}$$

From Eqs. (i) and (ii), we get

$$\frac{1}{e_1^2}+\frac{1}{e_2^2}=1 \text{ or } e_1^{-2}+e_2^{-2}=1$$

3. The foci of a hyperbola and its conjugate are concyclic and form the vertices of a square.

4. A simple method to find the coordinates of the centre of the hyperbola expressed as a general equation of degree two should be remembered as :

Let $\phi(x, y)=0$ represents a hyperbola.

Find $\frac{\partial\phi}{\partial x}$ (differentiate w.r.t x keeping y as constant) and $\frac{\partial\phi}{\partial y}$ (differentiate w.r.t. y keeping x as constant).

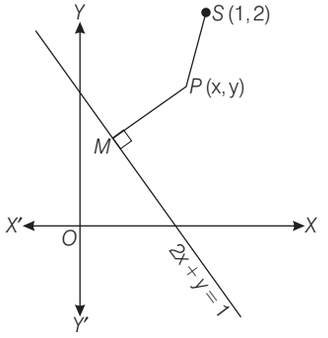
Then the point of intersection of $\frac{\partial\phi}{\partial x}=0$ and $\frac{\partial\phi}{\partial y}=0$ gives the centre of the hyperbola.

Example 2 Find the equation of the hyperbola whose directrix is $2x+y=1$, focus $(1,2)$ and eccentricity $\sqrt{3}$.

Sol. Let $P(x, y)$ be any point on the hyperbola. Draw PM perpendicular from P on the directrix.

Then, by definition $SP = e\ PM$

$\Rightarrow$ $(SP)^2 = e^2\ (PM)^2$



$$\Rightarrow (x-1)^2+(y-2)^2=3\left\{\frac{2x+y-1}{\sqrt{4+1}}\right\}^2$$

$$\Rightarrow 5\{x^2+y^2-2x-4y+5\}$$
$$=3(4x^2+y^2+1+4xy-2y-4x)$$

$$\Rightarrow 7x^2-2y^2+12xy-2x+14y-22=0$$

which is the required hyperbola.

Example 3 Find the lengths of transverse axis and conjugate axis, eccentricity, the coordinates of foci, vertices, lengths of the latusrectum and equations of the directrices of the following hyperbolas

(i) $9x^2-y^2=1$ (ii) $16x^2-9y^2=-144$

Sol. (i) The equation $9x^2-y^2=1$ can be written as

$$\frac{x^2}{(1/9)}-\frac{y^2}{1}=1.$$

This is of the form $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$

$\therefore$ $$a^2=\frac{1}{9}, b^2=1$$

$\Rightarrow$ $$a=\frac{1}{3}, b=1$$

Length of transverse axis : The length of transverse, axis $=2a=\frac{2}{3}$

Length of conjugate axis : The length of conjugate axis $=2b=2$

Eccentricity : $e=\sqrt{\left(1+\frac{b^2}{a^2}\right)}=\sqrt{1+\frac{1}{(1/9)}}=\sqrt{10}$

Foci : The coordinates of the foci are $(\pm ae, 0)$ i.e. $\left(\pm\frac{\sqrt{10}}{3}, 0\right)$.

Vertices : The coordinates of the vertices are $(\pm a, 0)$ i.e. $\left(\pm\frac{1}{3}, 0\right)$.

Length of latusrectum : The length of latusrectum

$$=\frac{2b^2}{a}=\frac{2(1)^2}{1/3}=6$$

Equation of the directrices : The equations of the directrices are

$$x=\pm\frac{a}{e}$$

i.e. $$x=\pm\frac{1/3}{\sqrt{10}}$$

or $$x=\pm\frac{1}{3\sqrt{10}}$$

(ii) The equation $16x^2 - 9y^2 = -144$ can be written as

$$\frac{x^2}{9} - \frac{y^2}{16} = -1$$

This is of the form $\frac{x^2}{a^2} - \frac{y^2}{b^2} = -1$

$\therefore \quad a^2 = 9, b^2 = 16$

$\Rightarrow \quad a = 3, b = 4$

Length of transverse axis : The length of transverse axis $= 2b = 8$.

Length of conjugate axis : The length of conjugate axis $= 2a = 6$.

Eccentricity : $e = \sqrt{\left(1 + \frac{a^2}{b^2}\right)} = \sqrt{\left(1 + \frac{9}{16}\right)} = \frac{5}{4}$

Foci : The coordinates of the foci are $(0, \pm be)$ i.e. $(0, \pm 5)$

Vertices : The coordinates of the vertices are $(0, \pm b)$ i.e. $(0, \pm 4)$.

Length of latusrectum : The length of latusrectum $= \frac{2a^2}{b}$

$$= \frac{2(3)^2}{4} = \frac{9}{2}$$

Equation of directrices : The equation of directrices are

$$y = \pm \frac{b}{e}$$

$$y = \pm \frac{4}{(5/4)}$$

$$\Rightarrow \quad y = \pm \frac{16}{5}$$

Example 4 Find the eccentricity of the hyperbola whose latusrectum is half of its transverse axis.

Sol. Let the equation of hyperbola be

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

Then, transverse axis = 2 a and latusrectum $= \frac{2b^2}{a}$

According to question $\frac{2b^2}{a} = \frac{1}{2}(2a)$

$$\Rightarrow \quad 2b^2 = a^2 \qquad (\because b^2 = a^2(e^2 - 1))$$

$$\Rightarrow \quad 2a^2(e^2 - 1) = a^2$$

$$\Rightarrow \quad 2e^2 - 2 = 1$$

$$\Rightarrow \quad e^2 = \frac{3}{2}$$

$$\therefore \quad e = \sqrt{\frac{3}{2}}$$

Hence, the required eccentricity is $\sqrt{\frac{3}{2}}$.

Example 5 Prove that the point $\left\{\frac{a}{2}\left(t + \frac{1}{t}\right), \frac{b}{2}\left(t - \frac{1}{t}\right)\right\}$ lies on the hyperbola for all values of t $(t \neq 0)$.

Sol. Let $x = \frac{a}{2}\left(t + \frac{1}{t}\right)$

$$\text{or} \quad \frac{2x}{a} = t + \frac{1}{t}$$

$$\text{or} \quad \left(\frac{2x}{a}\right)^2 = t^2 + \frac{1}{t^2} + 2 \qquad \ldots(i)$$

and let $y = \frac{b}{2}\left(t - \frac{1}{t}\right)$

$$\text{or} \quad \frac{2y}{b} = t - \frac{1}{t}$$

$$\text{or} \quad \left(\frac{2y}{b}\right)^2 = t^2 + \frac{1}{t^2} - 2 \qquad \ldots(ii)$$

Subtracting Eqs. (ii) from (i),

$$\frac{4x^2}{a^2} - \frac{4y^2}{b^2} = 4$$

$$\text{or} \quad \frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

which is hyperbola.

Example 6 Show that the equation $7y^2 - 9x^2 + 54x - 28y - 116 = 0$ represent a hyperbola. Find the coordinates of the centre, lengths of transverse and conjugate axes, eccentricity, latusrectum, coordinate of foci, vertices and equations of the directrices of the hyperbola.

Sol. We have, $7y^2 - 9x^2 + 54x - 28y - 116 = 0$

$$\text{or} \quad 7(y^2 - 4y) - 9(x^2 - 6x) - 116 = 0$$

$$\text{or} \quad 7(y^2 - 4y + 4) - 9(x^2 - 6x + 9) = 116 + 28 - 81$$

$$\text{or} \quad 7(y - 2)^2 - 9(x - 3)^2 = 63$$

$$\text{or} \quad \frac{(y-2)^2}{9} - \frac{(x-3)^2}{7} = 1$$

$$\text{or} \quad \frac{Y^2}{9} - \frac{X^2}{7} = 1$$

where $X = x - 3$ and $Y = y - 2$

This equation represents conjugate hyperbola. Comparing it with

$$\frac{Y^2}{b^2} - \frac{X^2}{a^2} = 1$$

we get, $b^2 = 9$ and $a^2 = 7$

$\therefore \quad b = 3$ and $a = \sqrt{7}$

Centre : $X = 0, Y = 0$

i.e. $x - 3 = 0, y - 2 = 0$

$\therefore$ Centre is $(3, 2)$.

Length of transverse axis : Length of transverse axis
$= 2b = 6.$

Length of conjugate axis : Length of conjugate axis
$= 2a = 2\sqrt{7}.$

Eccentricity : The eccentricity e is given by

$$e = \sqrt{1 + \frac{a^2}{b^2}} = \sqrt{1 + \frac{7}{9}} = \frac{4}{3}$$

Length of latusrectum : The length of latusrectum

$$= \frac{2a^2}{b} = \frac{2(7)}{3} = \frac{14}{3}$$

Foci : The coordinates of foci are $(0, \pm be)$

$\therefore \quad X = 0, Y = \pm be$

$\Rightarrow \quad x - 3 = 0, y - 2 = \pm 3 \times \frac{4}{3}$

or $\quad (3, 2 \pm 4)$

i.e. $\quad (3, -2)$ and $(3, 6)$

Vertices : The coordinates of vertices are $(0, \pm b)$

or $\quad X = 0, Y = \pm b$

or $\quad x - 3 = 0, y - 2 = \pm 3$ or $(3, 2 \pm 3)$

or $\quad$ vertices are $(3, -1)$ and $(3, 5)$

Equation of directrices : The equation of directrices are

$$Y = \pm \frac{b}{e}$$

$$\Rightarrow \quad y - 2 = \pm \frac{3}{4/3}$$

$$\Rightarrow \quad y = \left(2 \pm \frac{9}{4}\right)$$

i.e. $\quad y = \frac{17}{4}$ and $y = -\frac{1}{4}$

Example 7 Find the equation of the hyperbola whose foci are (6, 4) and (–4, 4) and eccentricity is 2.

Sol. The centre of the hyperbola is the mid-point of the line joining the two foci. So, the coordinates of the centre are

$$\left(\frac{6-4}{2}, \frac{4+4}{2}\right) \text{ i.e. } (1, 4)$$

Let $2a$ and $2b$ be the lengths of transverse and conjugate axes and let e be the eccentricity. Then, equation of hyperbola is

$$\frac{(x-1)^2}{a^2} - \frac{(y-4)^2}{b^2} = 1$$

$\because \quad$ Distance between the foci $= 2ae$

$$\sqrt{(6+4)^2 + (4-4)^2} = 2a \times 2$$

$\Rightarrow \quad 10 = 4a$

$\therefore \quad a = 5/2$

$\therefore \quad b^2 = a^2(e^2 - 1) = \frac{25}{4}(4 - 1) = \frac{75}{4}$

Thus, the equation of the hyperbola is

$$\frac{(x-1)^2}{\left(\frac{25}{4}\right)} - \frac{(y-4)^2}{\left(\frac{75}{4}\right)} = 1$$

or $\quad 12(x-1)^2 - 4(y-4)^2 = 75$

or $\quad 12(x^2 - 2x + 1) - 4(y^2 - 8y + 16) = 75$

or $\quad 12x^2 - 4y^2 - 24x + 32y - 127 = 0$

Example 8 *Obtain the equation of a hyperbola with coordinate axes as principal axes given that the distances of one of its vertices from the foci are 9 and 1 units.*

Sol. Let equation of hyperbola is

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \qquad \ldots(i)$$

If vertices are $A(a, 0)$ and $A'(-a, 0)$ and foci are $S(ae, 0)$ and $S'(-ae, 0)$.

Given $\quad l(S'A) = 9$ and $l(SA) = 1$

$\Rightarrow \quad a + ae = 9$ and $ae - a = 1$

or $\quad a(1 + e) = 9$ and $a(e - 1) = 1$

$\therefore \quad \frac{a(1+e)}{a(e-1)} = \frac{9}{1}$

$\Rightarrow \quad 1 + e = 9e - 9 \quad \Rightarrow \quad e = \frac{5}{4}$

$\because \quad a(1 + e) = 9$

$\therefore \quad a\left(1 + \frac{5}{4}\right) = 9 \quad \Rightarrow \quad a = 4$

$$b^2 = a^2(e^2 - 1) = 16\left(\frac{25}{16} - 1\right)$$

$\therefore \quad b^2 = 9$

From Eq. (i) equation of hyperbola is

$$\frac{x^2}{16} - \frac{y^2}{9} = 1$$

Example 9 The foci of a hyperbola coincide with the foci of the ellipse $\frac{x^2}{25} + \frac{y^2}{9} = 1$. Find the equation of the hyperbola if its eccentricity is 2.

Sol. The given ellipse is $\frac{x^2}{25} + \frac{y^2}{9} = 1$

Comparing with $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$

$\therefore \quad a^2 = 25$ and $b^2 = 9$

then $\quad$ eccentricity $e = \sqrt{1 - \frac{b^2}{a^2}} = \sqrt{1 - \frac{9}{25}} = \frac{4}{5}$

$\therefore \quad$ Foci of ellipse are $(\pm ae, 0)$ i.e. $(\pm 4, 0)$

So, the coordinates of foci of the hyperbola are $(\pm 4, 0)$.

Let e' be the eccentricity of the required hyperbola and its equation be

$$\frac{x^2}{A^2} - \frac{y^2}{B^2} = 1 \qquad \ldots(i)$$

the coordinates of foci are $(\pm Ae', 0)$

$\therefore \quad Ae' = 4 \quad \Rightarrow \quad A \times 2 = 4 \quad \Rightarrow \quad A = 2$

Also $\quad B^2 = A^2 (e'^2 - 1) \qquad (\because \text{given } e' = 2)$

$$= 4(4-1) = 12$$

Substituting the values of A and B in Eq. (i), we get

$$\frac{x^2}{4} - \frac{y^2}{12} = 1 \text{ or } 3x^2 - y^2 - 12 = 0$$

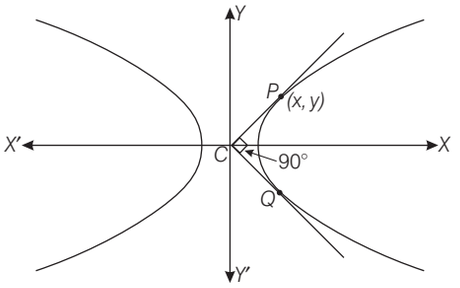
which is required hyperbola.

Example 10 If two points P and Q on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ whose centre is C, are such that CP is perpendicular to CQ, $a < b$, then prove that

$$\frac{1}{(CP)^2} + \frac{1}{(CQ)^2} = \frac{1}{a^2} - \frac{1}{b^2}.$$

Sol. Let $P(x, y)$ be any point on the given hyperbola. Let slope of CP is m, then equation of CP is $y = mx$.

Solving, $\quad y = mx \quad$ and $\quad \frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$



$$\frac{x^2}{a^2} - \frac{m^2x^2}{b^2} = 1$$

$$\therefore \qquad x^2 = \frac{a^2b^2}{(b^2 - a^2m^2)}$$

and $\qquad y^2 = m^2x^2 = \frac{a^2m^2b^2}{b^2 - a^2m^2}$

$$\therefore \qquad x^2 + y^2 = \frac{a^2b^2}{(b^2 - a^2m^2)}(1 + m^2)$$

$$\therefore \qquad (CP)^2 = x^2 + y^2 = \frac{a^2b^2(1+m^2)}{(b^2 - a^2m^2)}$$

$$\Rightarrow \qquad \frac{1}{(CP)^2} = \frac{b^2 - a^2m^2}{a^2b^2(1+m^2)} \qquad \ldots(i)$$

and equation of CQ is $\quad y = -\frac{1}{m}x$

replacing m by $-\frac{1}{m}$ in Eq. (i)

then $\quad \frac{1}{(CQ)^2} = \frac{b^2 - a^2\left(-\frac{1}{m}\right)^2}{a^2b^2\left(1 + \left(-\frac{1}{m}\right)^2\right)} = \frac{b^2m^2 - a^2}{a^2b^2(1+m^2)} \qquad \ldots(ii)$

Adding Eqs. (i) and (ii), then

$$\frac{1}{(CP)^2} + \frac{1}{(CQ)^2} = \frac{b^2(1+m^2) - a^2(1+m^2)}{a^2b^2(1+m^2)}$$

$$= \frac{b^2 - a^2}{a^2b^2} = \frac{1}{a^2} - \frac{1}{b^2}$$

Position of a Point with Respect to a Hyperbola

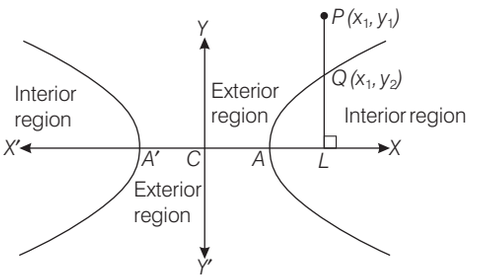
Theorem : The point (x_1, y_1) lies outside, on or inside the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

according as $\quad \frac{x_1^2}{a^2} - \frac{y_1^2}{b^2} - 1 <, =$ or > 0

Proof : Let $P \equiv (x_1, y_1)$ then $Q \equiv (x_1, y_2)$

Draw PL perpendicular to X-axis



Clearly, $PL > QL$

$$\Rightarrow \qquad y_1 > y_2$$

$$\Rightarrow \qquad \frac{y_1^2}{b^2} > \frac{y_2^2}{b^2}$$

$$\Rightarrow \qquad -\frac{y_1^2}{b^2} < -\frac{y_2^2}{b^2}$$

$$\Rightarrow \qquad \frac{x_1^2}{a^2} - \frac{y_1^2}{b^2} < \frac{x_1^2}{a^2} - \frac{y_2^2}{b^2}$$

$$\Rightarrow \qquad \frac{x_1^2}{a^2} - \frac{y_1^2}{b^2} < 1 \quad \left(\because Q(x_1, y_2) \text{ lies on } \frac{x^2}{a^2} - \frac{y^2}{b^2} = 1\right)$$

$$\Rightarrow \qquad \frac{x_1^2}{a^2} - \frac{y_1^2}{b^2} - 1 < 0$$

Thus, the point $P(x_1, y_1)$ lies outside the hyperbola. Hence the point (x_1, y_1) lies outside, on or inside the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

according as $\frac{x_1^2}{a^2} - \frac{y_1^2}{b^2} - 1 <, =$ or > 0.

Example 11 ***Find the position of the point*** $(5, -4)$ ***relative to the hyperbola*** $9x^2 - y^2 = 1$.

Sol. Since, $9(5)^2 - (-4)^2 - 1 = 225 - 16 - 1 = 208 > 0$,

So, the point $(5, -4)$ inside the hyperbola $9x^2 - y^2 = 1$.

Intersection of a Line and a Hyperbola

Let the hyperbola be $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ ...(i)

and the given line be $y = mx + c$ ...(ii)

Eliminating y from Eqs. (i) and (ii),

$$\frac{x^2}{a^2} - \frac{(mx+c)^2}{b^2} = 1 \Rightarrow b^2x^2 - a^2(mx+c)^2 = a^2b^2$$

$$\Rightarrow \quad (a^2m^2 - b^2)x^2 + 2mca^2x + a^2(b^2 + c^2) = 0 \quad \text{...(iii)}$$

Above equation being a quadratic in x gives two values of x. It shows that every straight line will cut the hyperbola in two points, may be real, coincident or imaginary, according as discriminant of Eq. (iii) $>, =, < 0$

i.e. $4m^2c^2a^4 - 4(a^2m^2 - b^2)a^2(b^2 + c^2) >, =, < 0$

or $-a^2m^2 + b^2 + c^2 >, =, < 0$

or $c^2 >, =, < a^2m^2 - b^2$ ...(iv)

Condition of Tangency : If the line (ii) touches the hyperbola (i), then Eq. (iii) has equal roots.

$\therefore$ Discriminant of Eq. (iii) $= 0$

$\Rightarrow \quad c^2 = a^2m^2 - b^2$

or $c = \pm\sqrt{(a^2m^2 - b^2)}$ ...(v)

So, the line $y = mx + c$ touches the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \quad \text{if} \quad c^2 = a^2m^2 - b^2$$

(which is condition of tangency)

Substituting the value of c from Eq. (v) in Eq. (ii)

$$y = mx \pm \sqrt{(a^2m^2 - b^2)}$$

Hence, the line $y = mx \pm \sqrt{(a^2m^2 - b^2)}$ will always be tangent to the hyperbola.

Point of contact : Substituting $c = \pm\sqrt{(a^2m^2 - b^2)}$ in Eq. (iii)

$$(a^2m^2 - b^2)x^2 \pm 2ma^2\sqrt{(a^2m^2 - b^2)}\,x + a^4m^2 = 0$$

or $(x\sqrt{(a^2m^2 - b^2)} \pm a^2m)^2 = 0$

$\therefore \quad x = \pm\frac{a^2m}{\sqrt{(a^2m^2 - b^2)}} = \pm\frac{a^2m}{c}$

From Eq. (i), $\frac{a^4m^2}{c^2} \cdot \frac{1}{a^2} - \frac{y^2}{b^2} = 1$

$\Rightarrow \quad \frac{y^2}{b^2} = \frac{a^2m^2}{c^2} - 1 = -\frac{(c^2 - a^2m^2)}{c^2} = \frac{b^2}{c^2}$

$\therefore \quad y = \pm\frac{b^2}{c}$

Hence, the point of contact is $\left(\pm\frac{a^2m}{c}, \pm\frac{b^2}{c}\right)$.

This is known as ***m*-point** on the hyperbola.

Remark

If $m = 0$, then Eq. (iii) gives $-b^2x^2 + a^2(b^2 + c^2) = 0$

$$x^2 = \frac{a^2(b^2 + c^2)}{b^2}$$

$\therefore \quad x = \pm\frac{a}{b}\sqrt{(b^2 + c^2)}$

which gives two values of x.

Example 12 Prove that the straight line $lx + my + n = 0$ touches the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ if $a^2l^2 - b^2m^2 = n^2$.

Sol. The given line is $lx + my + n = 0$ or $y = -\frac{l}{m}x - \frac{n}{m}$

Comparing this line with

$y = Mx + c$ ...(i)

$\therefore \quad M = -\frac{l}{m}$ and $c = -\frac{n}{m}$

This line (i) will touch the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \text{ if } \quad c^2 = a^2M^2 - b^2$$

$$\Rightarrow \quad \frac{n^2}{m^2} = \frac{a^2l^2}{m^2} - b^2 \text{ or } a^2l^2 - b^2m^2 = n^2$$

Example 13 Show that the line $x\cos\alpha + y\sin\alpha = p$ touches the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \quad \text{if} \quad a^2\cos^2\alpha - b^2\sin^2\alpha = p^2.$$

Sol. The given line is

$$x\cos\alpha + y\sin\alpha = p$$

$$\Rightarrow \quad y\sin\alpha = -x\cos\alpha + p$$

$$\Rightarrow \quad y = -x\cot x + p\,\text{cosec}\,\alpha$$

Comparing this line with $y = mx + c$

$$\Rightarrow \quad m = -\cot\alpha,\ c = p\,\text{cosec}\,\alpha$$

Since, the given line touches the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1, \quad \text{then} \quad c^2 = a^2m^2 - b^2$$

$$\Rightarrow \quad p^2\text{cosec}^2\alpha = a^2\cot^2\alpha - b^2$$

or $$p^2 = a^2\cos^2\alpha - b^2\sin^2\alpha$$

Example 14 For what value of λ does the line $y = 2x + \lambda$ touches the hyperbola $16x^2 - 9y^2 = 144$?

Sol. Equation of hyperbola is

$$16x^2 - 9y^2 = 144$$

or $$\frac{x^2}{9} - \frac{y^2}{16} = 1$$

Comparing this with $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, we get $a^2 = 9,\ b^2 = 16$

and comparing this line $y = 2x + \lambda$ with $y = mx + c$

$\therefore \quad m = 2$ and $c = \lambda$

If the line $y = 2x + \lambda$ touches the hyperbola

$$16x^2 - 9y^2 = 144$$

then $$c^2 = a^2m^2 - b^2$$

$$\Rightarrow \quad \lambda^2 = 9\,(2)^2 - 16 = 36 - 16 = 20$$

$$\therefore \quad \lambda = \pm 2\sqrt{5}$$

Example 15 If it possible to draw the tangent to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ having slope 2, then find its range of eccentricity.

Sol. Tangent having slope m is $y = mx \pm \sqrt{(a^2m^2 - b^2)}$

The tangent having slope 2 is $y = 2x \pm \sqrt{(4a^2 - b^2)}$, which is real if

$$4a^2 - b^2 \geq 0$$

or $$\frac{b^2}{a^2} \leq 4 \quad \text{or} \quad e^2 - 1 \leq 4 \quad \text{or} \quad e^2 \leq 5$$

or $$1 < e \leq \sqrt{5} \qquad \text{(for hyperbola } e > 1\text{)}$$

Exercise for Session 1

1. The eccentricity of the conic represented by $x^2 - y^2 - 4x + 4y + 16 = 0$ is

(a) 1 (b) $\frac{1}{2}$ (c) –1 (d) $\sqrt{2}$

2. If e_1 and e_2 are the eccentricities of the conic sections $16x^2 + 9y^2 = 144$ and $9x^2 - 16y^2 = 144$, then

(a) $e_1^2 - e_2^2 = 1$ (b) $e_1^2 + e_2^2 < 3$ (c) $e_1^2 + e_2^2 = 3$ (d) $e_1^2 + e_2^2 > 3$

3. The transverse axis of a hyperbola is of length $2a$ and a vertex divides the segment of the axis between the centre and the corresponding focus in the ratio 2 : 1, then the equation of the hyperbola is

(a) $4x^2 - 5y^2 = 4a^2$ (b) $4x^2 - 5y^2 = 5a^2$ (c) $5x^2 - 4y^2 = 4a^2$ (d) $5x^2 - 4y^2 = 5a^2$

4. The eccentricity of the hyperbola whose latusrectum is 8 and conjugate axis is equal to half of the distance between the foci, is

(a) $\frac{2}{\sqrt{3}}$ (b) $\frac{3}{\sqrt{3}}$ (c) $\frac{4}{\sqrt{3}}$ (d) $\frac{5}{\sqrt{3}}$

5. The straight line $x + y = \sqrt{2}p$ will touch the hyperbola $4x^2 - 9y^2 = 36$, if

(a) $p^2 = 2$ (b) $p^2 = 5$ (c) $5p^2 = 2$ (d) $2p^2 = 5$

6. The equation of the tangent, parallel to $y - x + 5 = 0$ drawn to $\frac{x^2}{3} - \frac{y^2}{2} = 1$ is

(a) $x - y - 1 = 0$ (b) $x - y + 2 = 0$ (c) $x + y - 1 = 0$ (d) $x + y + 2 = 0$

7. If e and e' are the eccentricities of the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ and $\frac{x^2}{b^2} - \frac{y^2}{a^2} = 1$, then the point $\left(\frac{1}{e}, \frac{1}{e'}\right)$ lies on the circle

(a) $x^2 + y^2 = 1$ (b) $x^2 + y^2 = 2$ (c) $x^2 + y^2 = 3$ (d) $x^2 + y^2 = 4$

8. If e and e' are the eccentricities of the ellipse $5x^2 + 9y^2 = 45$ and the hyperbola $5x^2 - 4y^2 = 45$ respectively, then $ee' =$

(a) -1 (b) 1 (c) -4 (d) 9

9. The equation $\frac{x^2}{10 - \lambda} + \frac{y^2}{6 - \lambda} = 1$ represents

(a) a hyperbola if $\lambda < 6$ (b) an ellipse if $\lambda > 6$ (c) a hyperbola if $6 < \lambda < 10$ (d) an ellipse if $0 < \lambda < 6$

10. The eccentricity of the hyperbola conjugate to $x^2 - 3y^2 = 2x + 8$ is

(a) $\frac{2}{\sqrt{3}}$ (b) $\sqrt{3}$ (c) 2 (d) $\sqrt{2}$

11. For hyperbola $\frac{x^2}{\cos^2\alpha} - \frac{y^2}{\sin^2\alpha} = 1$ which of the following remains constant with change in 'α'

(a) Abscissae of vertices (b) Abscissae of foci (c) Eccentricity (d) Directrix

12. If the foci of the ellipse $\frac{x^2}{16} + \frac{y^2}{b^2} = 1$ and the hyperbola $\frac{x^2}{144} - \frac{y^2}{81} = \frac{1}{25}$ coincide, then the value of b^2 is

(a) 1 (b) 5 (c) 7 (d) 9

13. Find the equation of the hyperbola whose foci are $(0, \pm\sqrt{10})$ and which passes through the point $(2, 3)$.

14. Find the equation of the hyperbola whose foci are $(10, 5)$ and $(-2, 5)$ and eccentricity 3.

15. Prove that the straight lines $\frac{x}{a} - \frac{y}{b} = m$ and $\frac{x}{a} + \frac{y}{b} = \frac{1}{m}$ always meet on a hyperbola.

16. Find the centre, eccentricity and length of axes of the hyperbola $3x^2 - 5y^2 - 6x + 20y - 32 = 0$.

17. Find the eccentricity of the hyperbola conjugate to the hyperbola $x^2 - 3y^2 = 1$.

18. For what value of λ, does the line $y = 3x + \lambda$ touch the hyperbola $9x^2 - 5y^2 = 45$?

19. Find the equation of the tangent to the hyperbola $4x^2 - 9y^2 = 1$ which is parallel to the line $4y = 5x + 7$. Also find the point of contact.

Session 2

Equations of Tangents in Different Forms, Equations of Normals in Different Forms, Pair of Tangents, Chord of Contact, Equation of the Chord Bisected at a Given Point

Equations of Tangents in Different Forms

1. Point form (first principal method) :

Theorem : The equation of the tangent to the hyperbola

$$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1 \text{ at } (x_1, y_1) \text{ is}$$

$$\frac{xx_1}{a^2}-\frac{yy_1}{b^2}=1.$$

Proof : Equation of hyperbola is

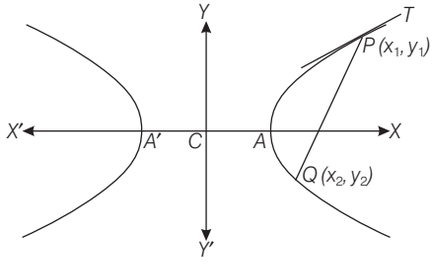
$$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1 \qquad \ldots(i)$$

Let $P \equiv (x_1, y_1)$ and $Q \equiv (x_2, y_2)$ be any two points in Eq. (i), then

$$\frac{x_1^2}{a^2}-\frac{y_1^2}{b^2}=1 \qquad \ldots(ii)$$

and

$$\frac{x_2^2}{a^2}-\frac{y_2^2}{b^2}=1 \qquad \ldots(iii)$$



Subtracting Eq. (ii) from Eq. (iii), then

$$\frac{1}{a^2}(x_2^2-x_1^2)-\frac{1}{b^2}(y_2^2-y_1^2)=0$$

$$\Rightarrow \quad \frac{(x_2-x_1)(x_2+x_1)}{a^2}-\frac{(y_2-y_1)(y_2+y_1)}{b^2}=0$$

$$\Rightarrow \quad \frac{y_2-y_1}{x_2-x_1}=\frac{b^2}{a^2}\frac{(x_1+x_2)}{(y_1+y_2)} \qquad \ldots(iv)$$

Equation of PQ is

$$y-y_1=\frac{y_2-y_1}{x_2-x_1}(x-x_1) \qquad \ldots(v)$$

From Eqs. (iv) and (v),

$$y-y_1=\frac{b^2}{a^2}\cdot\frac{(x_1+x_2)}{(y_1+y_2)}(x-x_1) \qquad \ldots(vi)$$

Now, tangent at $P, Q \to P$

i.e. $x_2 \to x_1$ and $y_2 \to y_1$, then Eq. (vi) becomes

$$y-y_1=\frac{b^2}{a^2}\cdot\frac{(2x_1)}{(2y_1)}(x-x_1)$$

or $$\frac{yy_1-y_1^2}{b^2}=\frac{xx_1-x_1^2}{a^2} \text{ or } \frac{xx_1}{a^2}-\frac{yy_1}{b^2}=\frac{x_1^2}{a^2}-\frac{y_1^2}{b^2}$$

or $$\frac{xx_1}{a^2}-\frac{yy_1}{b^2}=1 \qquad \text{[from Eq. (ii)]}$$

which is the required equation of tangent at (x_1, y_1).

Remark

The equation of tangent at (x_1, y_1) can be obtained by replacing x^2 by xx_1, y^2 by yy_1, x by $\frac{x+x_1}{2}$, y by $\frac{y+y_1}{2}$ and xy by $\frac{xy_1+x_1y}{2}$. This method is applied only when the equation of conic is a polynomial of second degree in x and y.

2. Parametric form :

Theorem : The equation of tangent to the hyperbola

$$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1 \text{ at } (a\sec\phi, b\tan\phi) \text{ is}$$

$$\frac{x}{a}\sec\phi-\frac{y}{b}\tan\phi=1$$

Proof : Since, equation of tangent at (x_1, y_1) is

$$\frac{xx_1}{a^2} - \frac{yy_1}{b^2} = 1$$

Now, replacing x_1 by $a\sec\phi$ and y_1 by $b\tan\phi$, we get

$$\frac{x}{a}\sec\phi - \frac{y}{b}\tan\phi = 1$$

Remark

The point of intersection of tangents at 'θ' and 'ϕ' on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is

$$\left(\frac{a\cos\left(\frac{\theta-\phi}{2}\right)}{\cos\left(\frac{\theta+\phi}{2}\right)}, \frac{b\sin\left(\frac{\theta+\phi}{2}\right)}{\cos\left(\frac{\theta+\phi}{2}\right)}\right)$$

Remembering method :

$\because$ Equations of chord joining 'θ' and 'ϕ' is

$$\frac{x}{a}\cos\left(\frac{\theta-\phi}{2}\right) - \frac{y}{b}\sin\left(\frac{\theta+\phi}{2}\right) = \cos\left(\frac{\theta+\phi}{2}\right)$$

or $$\frac{x}{a}\left\{\frac{\cos\left(\frac{\theta-\phi}{2}\right)}{\cos\left(\frac{\theta+\phi}{2}\right)}\right\} - \frac{y}{b}\left\{\frac{\sin\left(\frac{\theta+\phi}{2}\right)}{\cos\left(\frac{\theta+\phi}{2}\right)}\right\} = 1$$

or $$\frac{x}{a^2}\left\{\frac{a\cos\left(\frac{\theta-\phi}{2}\right)}{\cos\left(\frac{\theta+\phi}{2}\right)}\right\} - \frac{y}{b^2}\left\{\frac{b\sin\left(\frac{\theta+\phi}{2}\right)}{\cos\left(\frac{\theta+\phi}{2}\right)}\right\} = 1$$

i.e. $$\left\{\frac{a\cos\left(\frac{\theta-\phi}{2}\right)}{\cos\left(\frac{\theta+\phi}{2}\right)}, \frac{b\sin\left(\frac{\theta+\phi}{2}\right)}{\cos\left(\frac{\theta+\phi}{2}\right)}\right\}$$

3. Slope form :

Theorem : The equations of tangents of slope m to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is given by

$$y = mx \pm \sqrt{(a^2m^2 - b^2)}$$

The coordinates of the points of contact are

$$\left(\pm\frac{a^2m}{\sqrt{(a^2m^2 - b^2}}, \pm\frac{b^2}{\sqrt{(a^2m^2 - b^2)}}\right)$$

Proof : Let $y = mx + c$ be a tangent to the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \qquad \ldots(i)$$

Substituting the value of $y = mx + c$ in Eq. (i), then

$$\frac{x^2}{a^2} - \frac{(mx+c)^2}{b^2} = 1$$

or $\quad (a^2m^2 - b^2)\,x^2 + 2mca^2x + a^2(c^2 + b^2) = 0$

must have equal roots

$\therefore \qquad 4a^4m^2c^2 - 4(a^2m^2 - b^2)\,a^2(c^2 + b^2) = 0$

$[\because B^2 - 4AC = 0]$

$\Rightarrow \qquad a^2m^2c^2 - (a^2m^2 - b^2)(b^2 + c^2) = 0$

$\Rightarrow \qquad a^2m^2c^2 - a^2b^2m^2 - a^2m^2c^2 + b^4 + b^2c^2 = 0$

$\Rightarrow \qquad -a^2b^2m^2 + b^4 + b^2c^2 = 0 \Rightarrow c^2 = a^2m^2 - b^2$

$\therefore \qquad c = \pm\sqrt{(a^2m^2 - b^2)}$

Substituting this value of c in $y = mx + c$, we get

$$\boldsymbol{y = mx \pm \sqrt{(a^2m^2 - b^2)}} \qquad \ldots(ii)$$

as the required equation of tangents of hyperbola in terms of slope.

$\because$ Tangent at (x_1, y_1) to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is

$$\frac{xx_1}{a^2} - \frac{yy_1}{b^2} = 1 \qquad \ldots(iii)$$

On comparing Eqs. (ii) and (iii) we get

$$\frac{x_1/a^2}{m} = \frac{y_1/b^2}{1} = \pm\frac{1}{\sqrt{a^2m^2 - b^2}}$$

Thus, the coordinates of the points of contact are

$$\left(\frac{\pm a^2m}{\sqrt{(a^2m - b^2)}}, \pm\frac{b^2}{\sqrt{(a^2m - b^2)}}\right)$$

Remark

The equations of tangents of slope m to the hyperbola $-\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ are given by $y = mx \pm \sqrt{(b^2 - a^2m^2)}$

and the coordinates of the points of contact are

$$\left(\mp\frac{a^2m}{\sqrt{(b^2 - a^2m^2)}}, \mp\frac{b^2}{\sqrt{(b^2 - a^2m^2)}}\right)$$

Example 16 Find the equation of the tangent to the hyperbola $x^2 - 4y^2 = 36$ which is perpendicular to the line $x - y + 4 = 0$.

Sol. Let m be the slope of the tangent. Since, the tangent is perpendicular to the line $x - y + 4 = 0$

$\therefore \qquad m \times 1 = -1$

$\Rightarrow \qquad m = -1$

Since $x^2 - 4y^2 = 36$ or $\frac{x^2}{36} - \frac{y^2}{9} = 1$

Comparing this with $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$

$\therefore$ $a^2 = 36$ and $b^2 = 9$

So the equation of tangents are

$$y = (-1)\, x \pm \sqrt{36 \times (-1)^2 - 9}$$

$\Rightarrow$ $y = -x \pm \sqrt{27}$

or $x + y \pm 3\sqrt{3} = 0$

Example 17 Find the equation and the length of the common tangents to hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \quad \text{and} \quad \frac{y^2}{a^2} - \frac{x^2}{b^2} = 1.$$

Sol. Tangent at $(a \sec \phi, b \tan \phi)$ on the 1st hyperbola is

$$\frac{x}{a} \sec \phi - \frac{y}{b} \tan \phi = 1 \qquad \ldots(i)$$

Similarly tangent at any point $(b \tan\theta, a \sec \theta)$ on 2nd hyperbola is

$$\frac{y}{a} \sec \theta - \frac{x}{b} \tan\theta = 1 \qquad \ldots(ii)$$

If Eqs. (i) and (ii) are common tangents then they should be identical. Comparing the coefficients of x and y

$\Rightarrow$ $\frac{\sec \theta}{a} = -\frac{\tan \phi}{b}$

or $\sec \theta = -\frac{a}{b} \tan \phi \qquad \ldots(iii)$

and $-\frac{\tan\theta}{b} = \frac{\sec \phi}{a}$

or $\tan\theta = -\frac{b}{a} \sec \phi \qquad \ldots(iv)$

$\because$ $\sec^2\theta - \tan^2\theta = 1$

$\Rightarrow$ $\frac{a^2}{b^2} \tan^2 \phi - \frac{b^2}{a^2} \sec^2 \phi = 1$ [from Eqs. (iii) and (iv)]

or $\frac{a^2}{b^2} \tan^2 \phi - \frac{b^2}{a^2} (1 + \tan^2 \phi) = 1$

or $\left(\frac{a^2}{b^2} - \frac{b^2}{a^2}\right) \tan^2 \phi = 1 + \frac{b^2}{a^2}$

$\therefore$ $\tan^2 \phi = \frac{b^2}{a^2 - b^2}$

and $\sec^2\phi = 1 + \tan^2 \phi = \frac{a^2}{a^2 - b^2}$

Hence, the points of contact are

$$\left\{\pm \frac{a^2}{\sqrt{(a^2 - b^2)}}, \pm \frac{b^2}{\sqrt{(a^2 - b^2)}}\right\}$$

and $\left\{\mp \frac{b^2}{\sqrt{(a^2 - b^2)}}, \mp \frac{a^2}{\sqrt{(a^2 - b^2)}}\right\}$ [from Eqs. (iii) and (iv)]

Length of common tangent i.e. the distance between the above points is $\sqrt{2}\, \frac{(a^2 + b^2)}{\sqrt{(a^2 - b^2)}}$ and equation of common tangent on putting the values of $\sec \phi$ and $\tan \phi$ in Eqs. (i) is

$$\pm \frac{x}{\sqrt{(a^2 - b^2)}} \mp \frac{y}{\sqrt{(a^2 - b^2)}} = 1$$

or $x \mp y = \pm \sqrt{(a^2 - b^2)}$

Aliter : The given two hyperbolas are

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \qquad \ldots(i)$$

and $\frac{x^2}{(-b^2)} - \frac{y^2}{(-a^2)} = 1 \qquad \ldots(ii)$

we know that

$$y = mx \pm \sqrt{(a^2m^2 - b^2)} \qquad \ldots(iii)$$

is tangent to Eq. (i) for all m.

Similarly $y = m_1 x \pm \sqrt{(-b^2)\, m_1^2 - (-a^2)}$

$$y = m_1 x \pm \sqrt{(a^2 - b^2 m_1^2)} \qquad \ldots(iv)$$

will be tangent to Eq. (ii)

For common tangents to Eqs. (i) and (ii), the lines (iii) and (iv) must be identical

i.e. $m = m_1$ and $a^2m^2 - b^2 = a^2 - b^2m_1^2$

i.e. $(a^2 + b^2)(m^2 - 1) = 0$

$\Rightarrow$ $m^2 = 1 \Rightarrow m = \pm 1$

$\therefore$ The equation of common tangent lines are

$$\boldsymbol{y = \pm x \pm \sqrt{(a^2 - b^2)}} \qquad \text{[from Eq. (iii)]}$$

or $y \mp x = \pm\sqrt{(a^2 - b^2)} \qquad \ldots(v)$

Equation of tangent to Eq. (i) at (x_1, y_1) is

$$\frac{xx_1}{a^2} - \frac{yy_1}{b^2} = 1 \qquad \ldots(vi)$$

On comparing Eqs.(v) and (vi), then

$$\frac{x_1 / a^2}{\mp 1} = \frac{-y_1 / b^2}{1} = \frac{1}{\pm \sqrt{(a^2 - b^2)}}$$

i.e. $\left(\mp \frac{a^2}{\sqrt{(a^2 - b^2)}}, \mp \frac{b^2}{\sqrt{(a^2 - b^2)}}\right)$

and equation of tangent to Eq. (ii) at (x_2, y_2) is

$$\frac{xx_2}{(-b^2)} - \frac{yy_2}{(-a^2)} = 1 \qquad \ldots(vii)$$

On comparing Eqs. (v) and (vii), then

$$\frac{x_2 / (-b^2)}{\mp 1} = \frac{y_2}{1} = \frac{1}{\pm\sqrt{(a^2 - b^2)}}$$

i.e. $\left(\pm\frac{b^2}{\sqrt{(a^2-b^2)}},\pm\frac{a^2}{\sqrt{(a^2-b^2)}}\right)$

The points of contact are

$$\left(\pm\frac{a^2}{\sqrt{(a^2-b^2)}},\pm\frac{b^2}{\sqrt{(a^2-b^2)}}\right)$$

and $\left(\mp\frac{b^2}{\sqrt{(a^2-b^2)}},\mp\frac{a^2}{\sqrt{(a^2-b^2)}}\right)$

Hence, the length of common tangent is

$$\sqrt{2}\cdot\frac{(a^2+b^2)}{\sqrt{(a^2-b^2)}}$$

Example 18 *PQ* is the chord joining the points ϕ_1 and ϕ_2 on the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$. If $\phi_1-\phi_2=2\alpha$, where α is constant, prove that *PQ* touches the hyperbola

$$\frac{x^2}{a^2}\cos^2\alpha-\frac{y^2}{b^2}=1.$$

Sol. Given hyperbola is $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ ...(i)

Equation of the chord *PQ* to the hyperbola (i) is

$$\frac{x}{a}\cos\left(\frac{\phi_1-\phi_2}{2}\right)-\frac{y}{b}\sin\left(\frac{\phi_1+\phi_2}{2}\right)=\cos\left(\frac{\phi_1+\phi_2}{2}\right)$$

$$\Rightarrow\quad \frac{x}{a}\cos\alpha-\frac{y}{b}\sin\left(\frac{\phi_1+\phi_2}{2}\right)=\cos\left(\frac{\phi_1+\phi_2}{2}\right)$$

(Given $\phi_1-\phi_2=2\alpha$)

i.e. $$y=\frac{b}{a}\frac{\cos\alpha}{\sin\left(\frac{\phi_1+\phi_2}{2}\right)}x+\frac{b\cos\left(\frac{\phi_1+\phi_2}{2}\right)}{\sin\left(\frac{\phi_1+\phi_2}{2}\right)}$$ ...(ii)

Comparing this line with $y=mx+c$

$$\therefore\quad m=\frac{b}{a}\cdot\frac{\cos\alpha}{\sin\left(\frac{\phi_1+\phi_2}{2}\right)}\text{ and }c=\frac{b\cos\left(\frac{\phi_1+\phi_2}{2}\right)}{\sin\left(\frac{\phi_1+\phi_2}{2}\right)}$$

For line $y=mx+c$ to be a tangent on $\frac{x^2}{a^2}\cos^2\alpha-\frac{y^2}{b^2}=1$, we have

$$c^2=\frac{a^2}{\cos^2\alpha}m^2-b^2$$

$$\therefore\quad \text{LHS}=c^2=\frac{b^2\cos^2\left(\frac{\phi_1+\phi_2}{2}\right)}{\sin^2\left(\frac{\phi_1+\phi_2}{2}\right)}$$

and $$\text{RHS}=\frac{a^2}{\cos^2\alpha}m^2-b^2$$

$$=\frac{a^2}{\cos^2\alpha}\times\frac{b^2\cos^2\alpha}{a^2\sin^2\left(\frac{\phi_1+\phi_2}{2}\right)}-b^2$$

$$=\frac{b^2}{\sin^2\left(\frac{\phi_1+\phi_2}{2}\right)}-b^2$$

$$=\frac{b^2\cos^2\left(\frac{\phi_1+\phi_2}{2}\right)}{\sin\left(\frac{\phi_1+\phi_2}{2}\right)}$$

Hence proved.

Example 19 If the line $y=mx+\sqrt{(a^2m^2-b^2)}$ touches the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ at the point $(a\sec\theta,b\tan\theta)$, show that $\theta=\sin^{-1}\left(\frac{b}{am}\right)$.

Sol. Since $(a\sec\theta, b\tan\theta)$ lies on

$$y=mx+\sqrt{(a^2m^2-b^2)}$$

$$\therefore\quad b\tan\theta=am\sec\theta+\sqrt{(a^2m^2-b^2)}$$

$$\Rightarrow\quad (b\tan\theta-am\sec\theta)^2=a^2m^2-b^2$$

$$\Rightarrow\quad b^2\tan^2\theta+a^2m^2\sec^2\theta-2abm\tan\theta\sec\theta=a^2m^2-b^2$$

$$\Rightarrow\quad a^2m^2\tan^2\theta-2abm\tan\theta\ \theta+b^2\sec^2\theta=0$$

or $$a^2m^2\sin^2\theta-2abm\sin\theta+b^2=0\qquad(\because\cos\theta\neq0)$$

$$\therefore\quad \sin\theta=\frac{2abm\pm\sqrt{4a^2b^2m^2-4a^2b^2m^2}}{2a^2m^2}=\left(\frac{b}{am}\right)$$

$$\therefore\quad \theta=\sin^{-1}\left(\frac{b}{am}\right)$$

Example 20 If *SY* and *S′Y′* be drawn perpendiculars from foci to any tangent to a hyperbola. Prove that *Y* and *Y′* lie on the auxiliary circle and that product of these perpendiculars is constant.

Sol. Let hyperbola be

$$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$$ ...(i)

Tangent at $P(a\sec\phi, b\tan\phi)$ on Eq. (i) is

$$\frac{x}{a}\sec\phi-\frac{y}{b}\tan\phi=1$$ ...(ii)

Its slope is $\frac{(b\sec\phi)}{(a\tan\phi)}$

Equation of *SY* which is perpendicular to Eq. (i) and passes through focus *S* i.e. $(ae, 0)$ is

$$y - 0 = -\frac{a\tan\phi}{b\sec\phi}(x - ae)$$

or $$\frac{x}{b}\tan\phi + \frac{y}{a}\sec\phi = \frac{ae}{b}\tan\phi \qquad \ldots(iii)$$

$\because$ Lines (ii) and (iii) intersect at Y and in order to find its locus we have to eliminate ϕ between Eqs. (ii) and (iii), for which squaring and adding Eqs. (ii) and (iii) then, we get

$$(x^2 + y^2)\left(\frac{\sec^2\phi}{a^2} + \frac{\tan^2\phi}{b^2}\right) = 1 + \frac{a^2e^2}{b^2}\tan^2\phi$$

$$= 1 + \frac{a^2 + b^2}{b^2}\tan^2\phi = (1 + \tan^2\phi) + \frac{a^2}{b^2}\tan^2\phi$$

$$= \left(\sec^2\phi + \frac{a^2}{b^2}\tan^2\phi\right) = a^2\left(\frac{\sec^2\phi}{a^2} + \frac{\tan^2\phi}{b^2}\right)$$

$\therefore\ x^2 + y^2 = a^2$ is the required locus.

Similarly the point Y' also lies on it. Again, if p_1 and p_2 be the length of perpendiculars from $S(ae, 0)$ and $S'(-ae, 0)$ on the tangent (ii), then

$$p_1p_2 = \frac{(e\sec\phi - 1)\cdot(e\sec\phi + 1)}{\sqrt{\left(\frac{\sec^2\phi}{a^2} + \frac{\tan^2\phi}{b^2}\right)}\sqrt{\left(\frac{\sec^2\phi}{a^2} + \frac{\tan^2\phi}{b^2}\right)}}$$

$$= \frac{a^2b^2(e^2\sec^2\phi - 1)}{b^2\sec^2\phi + a^2\tan^2\phi}$$

$$= \frac{a^2b^2(e^2\sec^2\phi - 1)}{a^2(e^2 - 1)\sec^2\phi + a^2\tan^2\phi}$$

$$= \frac{b^2(e^2\sec^2\phi - 1)}{(e^2\sec^2\phi - 1)} = b^2 \qquad [(\because b^2 = a^2(e^2 - 1)]$$

Equations of Normals in Different Forms

1. Point form :

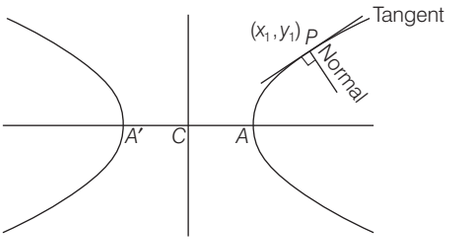
Theorem : The equation of the normal to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ at (x_1, y_1) is $\frac{a^2x}{x_1} + \frac{b^2y}{y_1} = a^2 + b^2$

Proof : Since the equation of tangent to the hyperbola

$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ at (x_1, y_1) is $\frac{xx_1}{a^2} - \frac{yy_1}{b^2} = 1$

The slope of tangent at $(x_1, y_1) = \frac{b^2x_1}{a^2y_1}$

$\therefore$ Slope of normal at $(x_1, y_1) = -\frac{a^2y_1}{b^2x_1}$



Hence, the equation of normal at (x_1, y_1)

$$y - y_1 = -\frac{a^2y_1}{b^2x_1}(x - x_1)$$

or $$\frac{a^2x}{x_1} + \frac{b^2y}{y_1} = a^2 + b^2$$

Remark

The equation of normal at (x_1, y_1) can also be obtained by this method

$$\frac{x - x_1}{a'x_1 + hy_1 + g} = \frac{y - y_1}{hx_1 + b'y_1 + f} \qquad \ldots(i)$$

a', b', g, f, h are obtained by comparing the given hyperbola with

$$a'x^2 + 2hxy + b'y^2 + 2gx + 2fy + c = 0 \qquad \ldots(ii)$$

The denominator of Eq. (i) can easily be remembered by the first two rows of this determinant

i.e. $$\begin{vmatrix} a' & h & g \\ h & b' & f \end{vmatrix}$$

Since first row is $a'(x_1) + h(y_1) + g(1)$

and second row i $h(x_1) + b'(y_1) + f(1)$

Here, hyperbola $$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

or $$\frac{x^2}{a^2} - \frac{y^2}{b^2} - 1 = 0 \qquad \ldots(iii)$$

On comparing Eqs. (ii) and (iii), we get

$$a' = \frac{1}{a^2}, b' = -\frac{1}{b^2}, g = 0, f = 0, h = 0$$

From Eq. (i), equation of normal of (iii) at (x_1, y_1) is

$$\frac{x - x_1}{\frac{1}{a^2}x_1 + 0 + 0} = \frac{y - y_1}{0 - \frac{y_1}{b^2} + 0}$$

or $$\frac{a^2x}{x_1} - a^2 = -\frac{b^2y}{y_1} + b^2$$

or $$\frac{a^2x}{x_1} + \frac{b^2y}{y_1} = a^2 + b^2$$

2. Parametric form :

Theorem : The equation of normal at $(a\sec\phi, b\tan\phi)$ to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is $ax\cos\phi + by\cot\phi = a^2 + b^2$

Proof : Since the equation of normals of the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ at (x_1, y_1) is

$$\frac{a^2x}{x_1}+\frac{b^2y}{y_1}=a^2+b^2 \qquad ...(i)$$

Replacing x_1 by $a\sec\phi$ and y_1 by $b\tan\phi$, then Eq. (i) becomes

$$\frac{a^2x}{a\sec\phi}+\frac{b^2y}{b\tan\phi}=a^2+b^2$$

or $$ax\cos\phi+by\cot\phi=a^2+b^2$$

is equation of normal at $(a\sec\phi, b\tan\phi)$.

3. Slope form :

Theorem : The equations of normals of slope m to the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ are given by

$$y=mx\mp\frac{m(a^2+b^2)}{\sqrt{(a^2-m^2b^2)}}$$

at the points $\left(\pm\frac{a^2}{\sqrt{(a^2-m^2b^2)}}, \mp\frac{mb^2}{\sqrt{(a^2-m^2b^2)}}\right)$

Proof : The equation of normal to the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ at (x_1, y_1) is

$$\frac{a^2x}{x_1}+\frac{b^2y}{y_1}=a^2+b^2 \qquad ...(i)$$

Since 'm' is the slope of the normal, then

$$m=-\frac{a^2y_1}{b^2x_1}$$

$$y_1=-\frac{b^2x_1m}{a^2} \qquad ...(ii)$$

Since (x_1, y_1) lies on $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$

$\therefore$ $$\frac{x_1^2}{a^2}-\frac{y_1^2}{b^2}=1$$

or $$\frac{x_1^2}{a^2}-\frac{b^4x_1^2m^2}{a^4b^2}=1$$

or $$x_1^2=\frac{a^4}{a^2-b^2m^2}$$

$\therefore$ $$x_1=\pm\frac{a^2}{\sqrt{(a^2-b^2m^2)}}$$

From Eq. (ii), $$y_1=\mp\frac{mb^2}{\sqrt{(a^2-b^2m^2)}}$$

$\therefore$ Equation of normal in terms of slope is

$$y-\left(\mp\frac{mb^2}{\sqrt{(a^2-m^2b^2)}}\right)=m\left(x-\left(\pm\frac{a^2}{\sqrt{(a^2-m^2b^2)}}\right)\right)$$

$\Rightarrow$ $$\boldsymbol{y=mx\mp\frac{m(a^2+b^2)}{\sqrt{(a^2-m^2b^2)}}} \qquad ...(iii)$$

Thus Eq. (iii) is a normal to the hyperbola

$$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$$

where m is the slope of the normal.

The coordinates of the point of contact are

$$\left(\pm\frac{a^2}{\sqrt{(a^2-b^2m^2)}}, \mp\frac{mb^2}{\sqrt{(a^2-b^2m^2)}}\right)$$

Comparing Eq. (iii) with $y=mx+c$

$\therefore$ $$c=\mp\frac{m(a^2+b^2)}{\sqrt{(a^2-m^2b^2)}}$$

or $$c^2=\frac{m^2(a^2+b^2)^2}{(a^2-m^2b^2)}$$

which is condition of normality, where $y=mx+c$ is the normal of

$$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$$

Remark

Normal other than transverse axis, never passes through the focus.

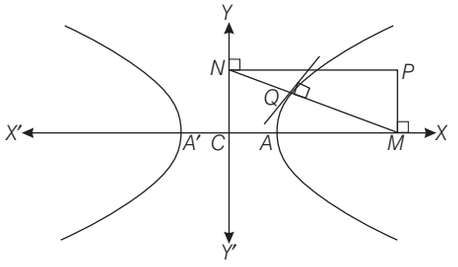
Example 21 ***A normal to the hyperbola*** $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ ***meets the axes in*** M ***and*** N ***and lines*** MP ***and*** NP ***are drawn perpendiculars to the axes meeting at*** P***. Prove that the locus of*** P ***is the hyperbola***

$$a^2x^2-b^2y^2=(a^2+b^2)^2.$$

Sol. The equation of normal at the point $(a\sec\phi, b\tan\phi)$ to the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ is

$$ax\cos\phi + by\cot\phi = a^2 + b^2 \quad \ldots(i)$$

The normal (i) meets the X-axis in $M\left(\frac{a^2+b^2}{a}\sec\phi, 0\right)$ and Y-axis in $N\left(0, \frac{a^2+b^2}{b}\tan\phi\right)$



$\therefore$ Equation of MP, the line through M and perpendicular to X axis, is

$$x = \left(\frac{a^2+b^2}{a}\right)\sec\phi$$

or $$\sec\phi = \frac{ax}{(a^2+b^2)} \quad \ldots(ii)$$

and the equation of NP, the line through N and perpendicular to the Y-axis, is

$$y = \left(\frac{a^2+b^2}{b}\right)\tan\phi$$

or $$\tan\phi = \frac{by}{(a^2+b^2)} \quad \ldots(iii)$$

The locus of the point of intersection of MP and NP will be obtained by elminating ϕ from Eqs. (ii) and (iii), we have

$$\sec^2\phi - \tan^2\phi = 1$$

$$\Rightarrow \quad \frac{a^2x^2}{(a^2+b^2)^2} - \frac{b^2y^2}{(a^2+b^2)^2} = 1$$

or $$a^2x^2 - b^2y^2 = (a^2+b^2)^2$$

is the required locus of P.

Example 22 Prove that the line $lx + my - n = 0$ will be a normal to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ if $\frac{a^2}{l^2} - \frac{b^2}{m^2} = \frac{(a^2+b^2)^2}{n^2}$.

Sol. The equation of any normal to $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is

$$ax\cos\phi + by\cot\phi = a^2 + b^2$$

or $$ax\cos\phi + by\cot\phi - (a^2+b^2) = 0 \quad \ldots(i)$$

The straight line $lx + my - n = 0$ will be a normal to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, then Eq. (i) and $lx + my - n = 0$ represent the same line

$$\frac{a\cos\phi}{l} = \frac{b\cot\phi}{m} = \frac{(a^2+b^2)}{n}$$

or $$\sec\phi = \frac{na}{l(a^2+b^2)} \text{ and } \tan\phi = \frac{nb}{m(a^2+b^2)}$$

$\because$ $$\sec^2\phi - \tan^2\phi = 1$$

$\therefore$ $$\frac{n^2a^2}{l^2(a^2+b^2)^2} - \frac{n^2b^2}{m^2(a^2+b^2)^2} = 1$$

$\Rightarrow$ $$\frac{a^2}{l^2} - \frac{b^2}{m^2} = \frac{(a^2+b^2)^2}{n^2}$$

Example 23 If the normal at `ϕ' on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ meet transverse axis at G, prove that

$$AG \cdot A'G = a^2(e^4\sec^2\phi - 1).$$

where A and A' are the vertices of the hyperbola.

Sol. The equation of normal at $(a\sec\phi, b\tan\phi)$ to the given hyperbola is $ax\cos\phi + by\cot\phi = (a^2+b^2)$

This meets the transverse axis i.e. X-axis at G. So, the coordinates of G are $\left(\left(\frac{a^2+b^2}{a}\right)\sec\phi, 0\right)$ and the coordinates of the vertices A and A' are $A(a, 0)$ and $A'(-a, 0)$ respectively.

$$\therefore AG \cdot A'G = \left(-a + \left(\frac{a^2+b^2}{a}\right)\sec\phi\right)\left(a + \left(\frac{a^2+b^2}{a}\right)\sec\phi\right)$$

$$= \left(\frac{a^2+b^2}{a}\right)^2\sec^2\phi - a^2$$

$$= (ae^2)^2\sec^2\phi - a^2 = a^2(e^4\sec^2\phi - 1)$$

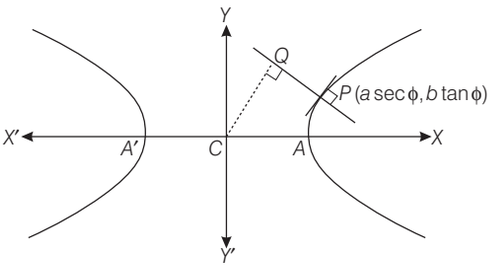
Example 24 Find the locus of the foot of perpendicular from the centre upon any normal to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$.

Sol. Normal at $P(a\sec\phi, b\tan\phi)$ is

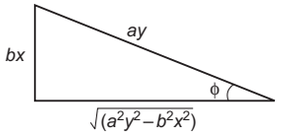
$$ax\cos\phi + by\cot\phi = a^2 + b^2 \quad \ldots(i)$$

and equation of line perpendicular to Eq. (i) and passing through origin is

$$bx - ay\sin\phi = 0 \quad \ldots(ii)$$



Eliminating ϕ from Eqs. (i) and (ii), we will get the equation of locus of Q, as from Eq. (ii),



$$\sin\phi = \frac{bx}{ay}$$

$$\therefore \quad \cos\phi = \frac{\sqrt{(a^2y^2 - b^2x^2)}}{ay}$$

$$\text{and} \quad \cot\phi = \frac{\sqrt{(a^2y^2 - b^2x^2)}}{bx}$$

From Eq. (i),

$$ax \times \frac{\sqrt{a^2y^2 - b^2x^2}}{ay} + by \times \frac{\sqrt{(a^2y^2 - b^2x^2)}}{bx} = a^2 + b^2$$

$$\Rightarrow \quad (x^2 + y^2)\sqrt{(a^2y^2 - b^2x^2)} = (a^2 + b^2)xy$$

$$\text{or} \quad (x^2 + y^2)^2(a^2y^2 - b^2x^2) = (a^2 + b^2)^2 x^2y^2$$

which is required locus.

Pair of Tangents

Theorem : The combined equation of the pair of tangents drawn from a point $P(x_1, y_1)$, lying outside the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is

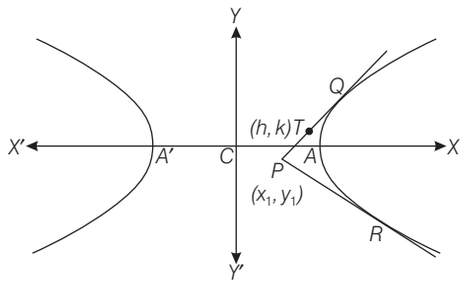
$$\left(\frac{x^2}{a^2} - \frac{y^2}{b^2} - 1\right)\left(\frac{x_1^2}{a^2} - \frac{y_1^2}{b^2} - 1\right) = \left(\frac{xx_1}{a^2} - \frac{yy_1}{b^2} - 1\right)^2$$

or $$SS_1 = T^2$$

where $$S = \frac{x^2}{a^2} - \frac{y^2}{b^2} - 1;$$

$$S_1 = \frac{x_1^2}{a^2} - \frac{y_1^2}{b^2} - 1 \text{ and } T = \frac{xx_1}{a^2} - \frac{yy_1}{b^2} - 1$$

Proof : Let $T(h, k)$ be any point on the pair of tangents PQ or PR drawn from any external point $P(x_1, y_1)$ to the hyperbola



$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

$\therefore$ Equation of PT is $$y - y_1 = \frac{k - y_1}{h - x_1}(x - x_1)$$

or $$y = \left(\frac{k - y_1}{h - x_1}\right)x + \left(\frac{hy_1 - kx_1}{h - x_1}\right)$$

which is the tangent to the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

$\therefore$ $$c^2 = a^2m^2 - b^2$$

or $$\left(\frac{hy_1 - kx_1}{h - x_1}\right)^2 = a^2\left(\frac{k - y_1}{h - x_1}\right)^2 - b^2$$

$\Rightarrow$ $$(hy_1 - kx_1)^2 = a^2(k - y_1)^2 - b^2(h - x_1)^2$$

Hence, locus of (h, k) is

$$(xy_1 - x_1y)^2 = a^2(y - y_1)^2 - b^2(x - x_1)^2$$

or $$(xy_1 - x_1y)^2 = -(b^2x^2 - a^2y^2) - (b^2x_1^2 - a^2y_1^2) - 2(a^2yy_1 - b^2xx_1)$$

or $$\left(\frac{xy_1 - x_1y}{ab}\right)^2 = -\left(\frac{x^2}{a^2} - \frac{y^2}{b^2}\right) - \left(\frac{x_1^2}{a^2} - \frac{y_1^2}{b^2}\right) + 2\left(\frac{xx_1}{a^2} - \frac{yy_1}{b^2}\right)$$

or $$-\left(\frac{xy_1 - x_1y}{ab}\right)^2 - \left(\frac{x^2}{a^2} - \frac{y^2}{b^2}\right) - \left(\frac{x_1^2}{a^2} - \frac{y_1^2}{b^2}\right) + 1 + \left(\frac{xx_1}{a^2} - \frac{yy_1}{b^2}\right)^2$$

$$= \left(\frac{xx_1}{a^2} - \frac{yy_1}{b^2}\right)^2 - 2\left(\frac{xx_1}{a^2} - \frac{yy_1}{b^2}\right) + 1$$

or $$\left(\frac{x^2}{a^2} - \frac{y^2}{b^2} - 1\right)\left(\frac{x_1^2}{a^2} - \frac{y_1^2}{b^2} - 1\right) = \left(\frac{xx_1}{a^2} - \frac{yy_1}{b^2} - 1\right)^2$$

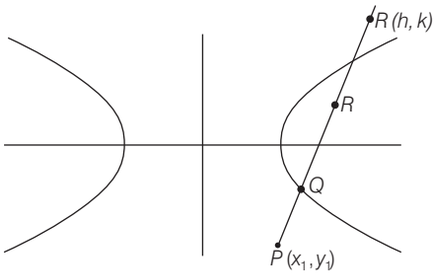
or $$SS_1 = T^2$$

Aliter :

Let the hyperbola be $$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \qquad \ldots(i)$$

Let $P(x_1, y_1)$ be any point outside the hyperbola.

Let a chord of the hyperbola through the point $P(x_1, y_1)$ cut the hyperbola at Q and R. Let $R(h, k)$ be any arbitrary point on the line PQ (R inside or outside).



Let Q divides PR in the ratio $\lambda : 1$, then coordinates of Q are

$$\left(\frac{\lambda h + x_1}{\lambda + 1}, \frac{\lambda k + y_1}{\lambda + 1}\right) \qquad (\because PQ : QR = \lambda : 1)$$

Since, Q lies on hyperbola (i), then

$$\frac{1}{a^2}\left(\frac{\lambda h + x_1}{\lambda + 1}\right)^2 - \frac{1}{b^2}\left(\frac{\lambda k + y_1}{\lambda + 1}\right)^2 = 1$$

$$\Rightarrow \quad b^2(\lambda h + x_1)^2 - a^2(\lambda k + y_1)^2 = a^2 b^2 (\lambda + 1)^2$$

$$\Rightarrow \quad (b^2h^2 - a^2k^2 - a^2b^2)\lambda^2 + 2(b^2hx_1 - a^2ky_1 - a^2b^2)\lambda + (b^2x_1^2 - a^2y_1^2 - a^2b^2) = 0 \quad \text{...(ii)}$$

Let PR will become tangent to the hyperbola (i), then roots of Eq. (ii) are equal

$$4(b^2hx_1 - a^2ky_1 - a^2b^2)^2 - 4(b^2h^2 - a^2k^2 - a^2b^2) \times (b^2x_1^2 - a^2y_1^2 - a^2b^2) = 0$$

Dividing by $4a^4b^4$

$$\therefore \quad \left(\frac{hx_1}{a^2} - \frac{ky_1}{b^2} - 1\right)^2 = \left(\frac{h^2}{a^2} - \frac{k^2}{b^2} - 1\right)\left(\frac{x_1^2}{a^2} - \frac{y_1^2}{b^2} - 1\right)$$

Hence, locus of $R(h, k)$, i.e. equation of pair of tangents from $P(x_1, y_1)$ is

$$\left(\frac{xx_1}{a^2} - \frac{yy_1}{b^2} - 1\right)^2 = \left(\frac{x^2}{a^2} - \frac{y^2}{b^2} - 1\right)\left(\frac{x_1^2}{a^2} - \frac{y^2}{b^2} - 1\right)$$

i.e. $$T^2 = SS_1 \quad \text{or} \quad SS_1 = T^2$$

Remark

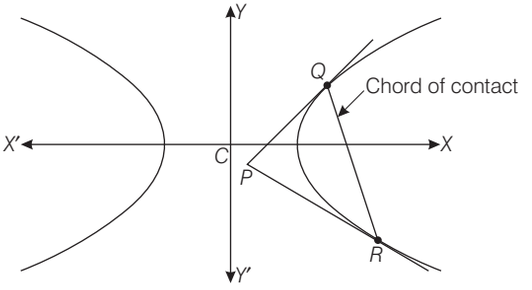
$S = 0$ is the equation of the curve, S_1 is obtained from S by replacing x by x_1 and y by y_1 and $T = 0$ is the equation of the tangent at (x_1, y_1) to $S = 0$.

Chord of Contact

Theorem : If the tangents from a point $P(x_1, y_1)$ to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ touch the hyperbola at Q and R, then the equation of the chord of contact QR is

$$\frac{xx_1}{a^2} - \frac{yy_1}{b^2} = 1$$

Proof : Let $Q \equiv (x', y')$ and $R \equiv (x'', y'')$



Now, equation of tangents PQ and PR are

$$\frac{xx'}{a^2} - \frac{yy'}{b^2} = 1 \qquad \text{...(i)}$$

and $$\frac{xx''}{a^2} - \frac{yy''}{b^2} = 1 \qquad \text{...(ii)}$$

Since, Eqs. (i) and (ii) pass through $P(x_1, y_1)$, then

$$\frac{x'x_1}{a^2} - \frac{y'y_1}{b^2} = 1 \qquad \text{...(iii)}$$

and $$\frac{x''x_1}{a^2} - \frac{y''y_1}{b^2} = 1 \qquad \text{...(iv)}$$

Hence, it is clear that $Q(x', y')$ and $R(x'', y'')$ lie on

$$\frac{xx_1}{a^2} - \frac{yy_1}{b^2} = 1 \quad \text{or} \quad T = 0$$

which is **chord of contact** QR.

Equation of the Chord Bisected at a Given Point

Theorem : The equation of the chord of the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1,$$

bisected at the point (x_1, y_1) is

$$\frac{xx_1}{a^2} - \frac{yy_1}{b^2} - 1 = \frac{x_1^2}{a^2} - \frac{y_1^2}{b^2} - 1$$

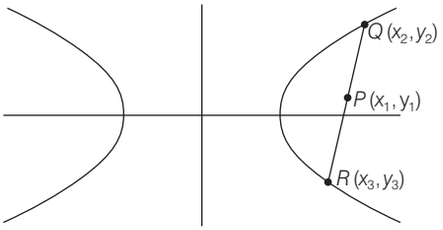
or $$T = S_1, \text{ where } T = \frac{xx_1}{a^2} - \frac{yy_1}{b^2} - 1$$

and $$S_1 = \frac{x_1^2}{a^2} - \frac{y_1^2}{b^2} - 1.$$

Proof : Since equation of the hyperbola is

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \qquad \text{...(i)}$$

Let QR be the chord of the hyperbola whose mid-point is $P(x_1, y_1)$. Since Q and R lie on the hyperbola (i).



$$\therefore \quad \frac{x_2^2}{a^2} - \frac{y_2^2}{b^2} = 1 \qquad \text{...(ii)}$$

$$\text{and} \quad \frac{x_3^2}{a^2} - \frac{y_3^2}{b^2} = 1 \qquad \text{...(iii)}$$

Subtracting Eq. (iii) from Eq. (ii),

$$\frac{1}{a^2}(x_2^2 - x_3^2) - \frac{1}{b^2}(y_2^2 - y_3^2) = 0$$

$$\Rightarrow \quad \frac{(x_2 + x_3)(x_2 - x_3)}{a^2} - \frac{(y_2 + y_3)(y_2 - y_3)}{b^2} = 0$$

$$\Rightarrow \quad \frac{y_2 - y_3}{x_2 - x_3} = \frac{b^2(x_2 + x_3)}{a^2(y_2 + y_3)}$$

$$= \frac{b^2}{a^2}\frac{(2x_1)}{(2y_1)} \qquad [P \text{ is the mid-point of } QR]$$

$$= \frac{b^2 x_1}{a^2 y_1} \qquad \text{...(iv)}$$

$\therefore$ Equation of QR is

$$y - y_1 = \frac{y_2 - y_3}{x_2 - x_3}(x - x_1)$$

$$\Rightarrow \quad y - y_1 = \frac{b^2 x_1}{a^2 y_1}(x - x_1) \qquad [\text{from Eq. (iv)}]$$

$$\Rightarrow \quad \frac{yy_1}{b^2} - \frac{y_1^2}{b^2} = \frac{xx_1}{a^2} - \frac{x_1^2}{a^2}$$

$$\Rightarrow \quad \frac{xx_1}{a^2} - \frac{yy_1}{b^2} = \frac{x_1^2}{a^2} - \frac{y_1^2}{b^2}$$

$$\Rightarrow \quad \frac{xx_1}{a^2} - \frac{yy_1}{b^2} - 1 = \frac{x_1^2}{a^2} - \frac{y_1^2}{b^2} - 1$$

$$\Rightarrow \quad T = S_1$$

Example 25 Find the locus of the mid-points of the chords of the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ which subtend a right angle at the origin.

Sol. Let (h, k) be the mid-point of the chord of the hyperbola. Then its equation is

$$\frac{hx}{a^2} - \frac{ky}{b^2} - 1 = \frac{h^2}{a^2} - \frac{k^2}{b^2} - 1$$

$$\text{or} \quad \frac{hx}{a^2} - \frac{ky}{b^2} = \frac{h^2}{a^2} - \frac{k^2}{b^2} \qquad \text{...(i)}$$

The equation of the lines joining the origin to the points of intersection of the hyperbola and the chord (i) is obtained by making homogeneous hyperbola with the help of Eq. (i)

$$\therefore \quad \frac{x^2}{a^2} - \frac{y^2}{b^2} = \frac{\left(\frac{hx}{a^2} - \frac{ky}{b^2}\right)^2}{\left(\frac{h^2}{a^2} - \frac{k^2}{b^2}\right)^2}$$

$$\Rightarrow \quad \frac{1}{a^2}\left(\frac{h^2}{a^2} - \frac{k^2}{b^2}\right)^2 x^2 - \frac{1}{b^2}\left(\frac{h^2}{a^2} - \frac{k^2}{b^2}\right)^2 y^2$$

$$= \frac{h^2}{a^4}x^2 + \frac{k^2}{b^4}y^2 - \frac{2hk}{a^2b^2}xy \qquad \text{...(ii)}$$

The lines represented by Eq. (ii) will be at right angle if

Coefficient of x^2 + Coefficient of $y^2 = 0$

$$\Rightarrow \quad \frac{1}{a^2}\left(\frac{h^2}{a^2} - \frac{k^2}{b^2}\right)^2 - \frac{h^2}{a^4} - \frac{1}{b^2}\left(\frac{h^2}{a^2} - \frac{k^2}{b^2}\right)^2 - \frac{k^2}{b^4} = 0$$

$$\Rightarrow \quad \left(\frac{h^2}{a^2} - \frac{k^2}{b^2}\right)^2 \left(\frac{1}{a^2} - \frac{1}{b^2}\right) = \frac{h^2}{a^4} + \frac{k^2}{b^4}$$

Hence, the locus of (h, k) is

$$\left(\frac{x^2}{a^2} - \frac{y^2}{b^2}\right)^2 \left(\frac{1}{a^2} - \frac{1}{b^2}\right) = \frac{x^2}{a^4} + \frac{y^2}{b^4}$$

Example 26 From the points on the circle $x^2 + y^2 = a^2$, tangents are drawn to the hyperbola $x^2 - y^2 = a^2$; prove that the locus of the middle-points of the chords of contact is the curve $(x^2 - y^2)^2 = a^2(x^2 + y^2)$.

Sol. Since any point on the circle $x^2 + y^2 = a^2$ is $(a\cos\theta, a\sin\theta)$ chord of contact of this point w.r.t. hyperbola $x^2 - y^2 = a^2$ is

$$x(a\cos\theta) - y(a\sin\theta) = a^2$$

$$\text{or} \quad x\cos\theta - y\sin\theta = a \qquad \text{...(i)}$$

If its mid-point be (h, k), then it is same as

$$T = S_1$$

$$\text{i.e.} \quad hx - ky - a^2 = h^2 - k^2 - a^2$$

$$\text{or} \quad hx - ky = h^2 - k^2 \qquad \text{...(ii)}$$

On comparing Eqs. (i) and (ii), we get

$$\frac{\cos\theta}{h} = \frac{\sin\theta}{k} = \frac{a}{(h^2 - k^2)}$$

or $(h^2 - k^2)\cos\theta = ah$ ...(iii)

and $(h^2 - k^2)\sin\theta = ak$ ...(iv)

Squaring and adding Eqs. (iii) and (iv), we get

$$(h^2 - k^2)^2 = a^2h^2 + a^2k^2$$

$$\Rightarrow \quad (h^2 - k^2)^2 = a^2(h^2 + k^2)$$

Hence, the required locus is

$$(x^2 - y^2)^2 = a^2(x^2 + y^2).$$

Example 27 Prove that the locus of the middle-points of the chords of the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ which pass through a fixed point (α, β) is a hyperbola whose centre is $\left(\frac{\alpha}{2}, \frac{\beta}{2}\right)$.

Sol. Let the mid-point of the chord be (h, k). The equation of the chord whose mid-point is (h, k) is

$$\frac{hx}{a^2} - \frac{ky}{b^2} - 1 = \frac{h^2}{a^2} - \frac{k^2}{b^2} - 1 \text{ or } \frac{hx}{a^2} - \frac{ky}{b^2} = \frac{h^2}{a^2} - \frac{k^2}{b^2}$$

It passes through (α, β), then

$$\frac{\alpha h}{a^2} - \frac{\beta k}{b^2} = \frac{h^2}{a^2} - \frac{k^2}{b^2}$$

$\therefore$ locus of (h, k) is

$$\frac{x\alpha}{a^2} - \frac{y\beta}{b^2} = \frac{x^2}{a^2} - \frac{y^2}{b^2}$$

$$\Rightarrow \quad \frac{1}{a^2}(x^2 - \alpha x) - \frac{1}{b^2}(y^2 - \beta y) = 0$$

$$\Rightarrow \quad \frac{1}{a^2}\left\{\left(x - \frac{\alpha}{2}\right)^2 - \frac{\alpha^2}{4}\right\} - \frac{1}{b^2}\left\{\left(y - \frac{\beta}{2}\right)^2 - \frac{\beta^2}{4}\right\} = 0$$

$$\text{or} \quad \frac{\left(x - \frac{\alpha}{2}\right)^2}{a^2} - \frac{\left(y - \frac{\beta}{2}\right)^2}{b^2} = \frac{1}{4}\left\{\frac{\alpha^2}{a^2} - \frac{\beta^2}{b^2}\right\} = \lambda \text{ (say)}$$

$$\therefore \quad \frac{\left(x - \frac{\alpha}{2}\right)^2}{a^2\lambda} - \frac{\left(y - \frac{\beta}{2}\right)^2}{b^2\lambda} = 1$$

The centre of this hyperbola is $\left(\frac{\alpha}{2}, \frac{\beta}{2}\right)$.

Exercise for Session 2

1. The tangents from $(1, 2\sqrt{2})$ to the hyperbola $16x^2 - 25y^2 = 400$ include between them an angle equal to

(a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{2}$

2. If $4x^2 + \lambda y^2 = 45$ and $x^2 - 4y^2 = 5$ cut orthogonally, then the value of λ is

(a) $\frac{1}{9}$ (b) $\frac{1}{3}$ (c) 9 (d) 18

3. If the tangent at the point $(2\sec\phi, 3\tan\phi)$ of the hyperbola $\frac{x^2}{4} - \frac{y^2}{9} = 1$ is parallel to $3x - y + 4 = 0$, then the value of ϕ is

(a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{3}$ (d) $\frac{5\pi}{12}$

4. If the line $2x + \sqrt{6}y = 2$ touches the hyperbola $x^2 - 2y^2 = 4$, then the point of contact is

(a) $(-2, \sqrt{6})$ (b) $(-5, 2\sqrt{6})$ (c) $\left(\frac{1}{2}, \frac{1}{\sqrt{6}}\right)$ (d) $(4, -\sqrt{6})$

5. The equation of the chord of hyperbola $25x^2 - 16y^2 = 400$, whose mid-point is (5, 3), is

(a) $115x - 47y = 434$ (b) $125x - 48y = 481$

(c) $127x - 49y = 488$ (d) $155x - 67y = 574$

6. The value of m for which $y = mx + 6$ is a tangent to the hyperbola $\frac{x^2}{100} - \frac{y^2}{49} = 1$ is

(a) $\sqrt{\left(\frac{17}{20}\right)}$ (b) $-\sqrt{\left(\frac{17}{21}\right)}$ (c) $\sqrt{\left(\frac{20}{17}\right)}$ (d) $-\sqrt{\left(\frac{21}{17}\right)}$

7. P is a point on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, N is the foot of the perpendicular from P on the transverse axis. The tangent to the hyperbola at P meets the transverse axis at T. If O is the centre of the hyperbola, then $OT \cdot ON$ is equal to

(a) a^2 (b) b^2 (c) e^2 (d) b^2/a

8. If $x = 9$ is the chord of contact of the hyperbola $x^2 - y^2 = 9$, then the equation of the corresponding pair of tangents, is

(a) $9x^2 - 8y^2 + 18x - 9 = 0$ (b) $9x^2 - 8y^2 - 18x + 9 = 0$

(c) $9x^2 - 8y^2 - 18x - 9 = 0$ (d) $9x^2 - 8y^2 + 18x + 9 = 0$

9. Let $P(a\sec\theta, b\tan\theta)$ and $Q(a\sec\phi, b\tan\phi)$, when $\theta + \phi = \frac{\pi}{2}$, be two points on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$. If (h,k) is the point of intersection of the normals at P and Q, then k is equal to

(a) $\left(\frac{a^2 + b^2}{a}\right)$ (b) $-\left(\frac{a^2 + b^2}{a}\right)$ (c) $\left(\frac{a^2 + b^2}{b}\right)$ (d) $-\left(\frac{a^2 + b^2}{b}\right)$

10. The tangent at a point P on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ passes through the point $(0, -b)$ and the normal at P passes through $(2a\sqrt{2}, 0)$; then eccentricity of the hyperbola is

(a) $\frac{5}{4}$ (b) $\frac{3}{2}$ (c) $\sqrt{2}$ (d) $2\sqrt{2}$

11. A tangent to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ cuts the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ in points P and Q. Find the locus of the mid-point of PQ.

12. A line through the origin meets the circle $x^2 + y^2 = a^2$ at P and the hyperbola $x^2 - y^2 = a^2$ at Q. Prove that the locus of the point of intersection of tangent at P to the circle with the tangent at Q to the hyperbola is the curve.

13. Normals are drawn to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ at the points $P(a\sec\theta_1, b\tan\theta_1)$ and $Q(a\sec\theta_2, b\tan\theta_2)$ meeting the conjugate axis at G_1 and G_2 respectively. If $\theta_1 + \theta_2 = \pi/2$, prove that

$$CG_1 \cdot CG_2 = \frac{a^2e^4}{(e^2 - 1)}$$

where C is the centre of the hyperbola and e is its eccentricity.

14. Chords of the hyperbola $x^2 - y^2 = a^2$ touch the parabola $y^2 = 4ax$. Prove that the locus of their middle-points is the curve $y^2(x - a) = x^3$.

Session 3

Diameter, Conjugate Diameters, Properties of Hyperbola, Intersection of Conjugate Diameters and Hyperbola, Director Circle, Asymptotes, Rectangular Hyperbola, The Rectangular Hyperbola $xy = c^2$, Reflection Property of a Hyperbola, Equation of a Hyperbola Referred to Two Perpendicular Lines

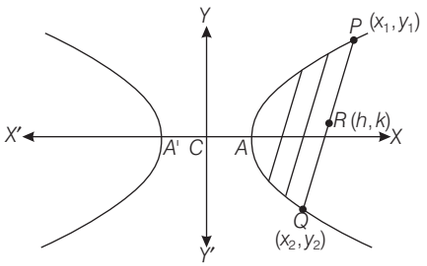
Diameter

The locus of the middle points of a system of parallel chords of a hyperbola is called a diameter and the point where the diameter intersects the hyperbola is called the vertex of the diameter.

Theorem : The equation of a diameter bisecting a system of parallel chords of slope m of the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is

$$y = \frac{b^2}{a^2 m} x$$

Proof : Let $y = mx + c$ be a system of a parallel chords to $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ for different chords. As c varies, m remain constant.



Let the extremities of any chord PQ of the set be $P(x_1, y_1)$ and $Q(x_2, y_2)$ and let its middle point be $R(h, k)$. Then solving equations

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \text{ and } y = mx + c$$

we get $$\frac{x^2}{a^2} - \frac{(mx + c)^2}{b^2} = 1$$

$$\Rightarrow \quad (a^2m^2 - b^2)\, x^2 + 2mca^2 x + a^2 (c^2 + b^2) = 0$$

Since, x_1 and x_2 be the roots of this equation, then

$$x_1 + x_2 = \frac{-2mca^2}{a^2m^2 - b^2} \quad \text{...(i)}$$

Since, (h, k) be the middle point of QR, then

$$h = \frac{x_1 + x_2}{2}$$

then from Eq. (i), $h = -\frac{mca^2}{a^2m^2 - b^2}$

but (h, k) lies on $y = mx + c$

$$\therefore \quad k = mh + c$$

or $$c = k - mh \quad \text{...(ii)}$$

From Eqs. (i) and (ii),

$$h = -\frac{ma^2 (k - mh)}{a^2m^2 - b^2}$$

$$\Rightarrow \quad a^2m^2h - b^2h = -ma^2k + m^2a^2h$$

$$\Rightarrow \quad -b^2h = -ma^2k \quad \text{or} \quad k = \frac{b^2h}{a^2m}$$

Hence, locus of $R(h, k)$ is $y = \frac{b^2 x}{a^2 m}$

which is the diameter of the hyperbola passing through (0, 0).

Aliter :

Let (h, k) be the middle-point of the chord $y = mx + c$ of the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ then

$$T = S_1$$

$$\Rightarrow \quad \frac{xh}{a^2} - \frac{yk}{b^2} = \frac{h^2}{a^2} - \frac{k^2}{b^2}$$

$$\therefore \quad \text{Slope} = \frac{hb^2}{a^2k} = m$$

$$\Rightarrow \quad k = \frac{b^2h}{a^2m}$$

Hence, the locus of mid-point is $y = \frac{b^2x}{a^2m}$.

Conjugate Diameters

Two diameters are said to be conjugate when each bisects all chords parallel to the others.

If $y = mx, y = m_1x$ be conjugate diameters, then $mm_1 = \frac{b^2}{a^2}$.

Let $y = m_1x + c$ be a set of chords parallel to $y = m_1x$, then the diameter $y = \frac{b^2}{a^2m}x$ bisects them all. But being the conjugate diameter $y = mx$ also bisects them.

Hence, these two lines must be identical

$$\therefore \quad m = \frac{b^2}{a^2m_1} \quad \Rightarrow \quad mm_1 = \frac{b^2}{a^2}$$

Properties of Hyperbola

Prop. 1. *If a pair of diameters be conjugate with respect to a hyperbola, they are conjugate with respect to its conjugate hyperbola also.*

Let $y = mx$ and $y = m_1x$ be two conjugate diameters of the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, then

$$mm_1 = \frac{b^2}{a^2} \qquad \text{...(i)}$$

Now conjugate hyperbola of $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is

$$-\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

or

$$\frac{x^2}{-a^2} - \frac{y^2}{-b^2} = 1 \qquad \text{...(ii)}$$

If $y = m_2x$ and $y = m_3x$ are the conjugate diameters of Eq. (ii), then

$$m_2m_3 = \frac{(-b^2)}{(-a^2)}$$

$$= \frac{b^2}{a^2} = mm_1 \qquad \text{[from Eq. (i)]}$$

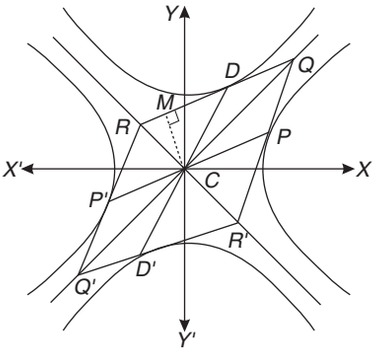
This proves the proposition.

Prop. 2. *The parallelogram formed by the tangents at the extremities of conjugate diameters of a hyperbola has its vertices lying on the asymptotes and is of constant area.*

Since, P and D lie on hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$

and its conjugate diameter $-\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$

then coordinates of P and D are $(a \sec \phi, b \tan \phi)$ and $(a \tan \phi, b \sec \phi)$ respectively.



Then $D' \equiv (-a \tan \phi, -b \sec \phi)$

and $P' \equiv (-a \sec \phi, -b \tan \phi)$

Since, equations of asymptotes CQ and CR are $y = \frac{b}{a}x$ and $y = -\frac{b}{a}x$ respectively and the equations of tangents at P, P', D and D' are

$$\frac{x}{a}\sec \phi - \frac{y}{b}\tan \phi = 1 \qquad \text{...(i)}$$

$$-\frac{x}{a}\sec \phi + \frac{y}{b}\tan \phi = 1 \qquad \text{...(ii)}$$

$$-\frac{x}{a}\tan \phi + \frac{y}{b}\sec \phi = 1 \qquad \text{...(iii)}$$

and

$$\frac{x}{a}\tan \phi - \frac{y}{b}\sec \phi = 1 \qquad \text{...(iv)}$$

respectively.

Now, the lines (i) and (ii) are parallel and so are Eqs. (iii) and (iv).

Hence these tangents form a parallelogram. Solving Eqs. (i) and (iii), we get the coordinate of Q as $[a(\sec\phi+\tan\phi), b(\sec\phi+\tan\phi)]$ which clearly lies on the asymptote $y=\frac{b}{a}x$ similarly the other points of intersection lies on the asymptotes.

The equations of PCP' and DCD' are

$$y=\frac{b}{a}\frac{\tan\phi}{\sec\phi}x \text{ or } bx\tan\phi-ay\sec\phi=0 \quad ...(v)$$

and $$y=\frac{b}{a}\frac{\sec\phi}{\tan\phi}x \text{ or } bx\sec\phi-ay\tan\phi=0 \quad ...(vi)$$

Hence by symmetry.

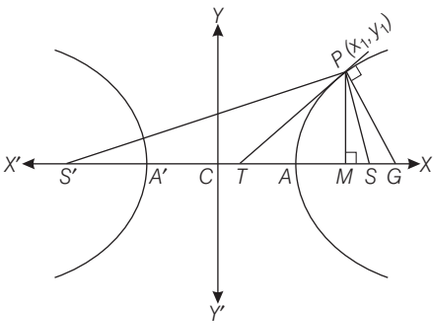
Area of parallelogram $QRQ'R'=4$ (Area of parallelogram $QDCP$)

$$=4\cdot CP\times(\text{Perpendicular length from } C \text{ on } QD)$$

$$=4\cdot\sqrt{(a^2\sec^2\phi+b^2\tan^2\phi)}\times\frac{1}{\sqrt{\frac{\tan^2\phi}{a^2}+\frac{\sec^2\phi}{b^2}}}$$

$$=4ab=\text{ Constant.}$$

Prop. 3. *If the normal at P meets the transverse axis in G, then $SG=e\cdot SP$. Prove also that the tangent and normal bisect the angle between the focal distances of P.*



Let the coordinates of P be (x_1, y_1). The equation of normal at P on the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ *is*

$$\frac{a^2x}{x_1}+\frac{b^2y}{y_1}=a^2+b^2 \quad ... (i)$$

The normal (i) meets the X-axis i.e. $y=0$ in Eq. (i), then coordinates of G are

$$\left(\frac{(a^2+b^2)}{a^2}x_1, 0\right) \text{ or } (e^2x_1, 0)$$

$\therefore$ $CG=e^2x_1$

Now $SG=CG-CS$

$$=e^2x_1-ae=e(ex_1-a)=e\cdot SP$$

Similarly, $S'G=e\cdot S'P$

$\therefore$ $\frac{SG}{S'G}=\frac{SP}{S'P}$

This relation shows that the normal PG is the external bisector of the angle SPS'. The tangent PT being perpendicular to PG is therefore the internal bisector of the angle SPS'.

Prop. 4. *If a pair of conjugate diameters meet the hyperbola in P, P′ and its conjugate in D, D′, then the asymptotes bisect PD, PD′, P′D and P′D′.*

The coordinates of four points P, D, P', D' are $(a\sec\phi, b\tan\phi)$; $(a\tan\phi, b\sec\phi)$; $(-a\sec\phi, -b\tan\phi)$;$(-a\tan\phi, -b\sec\phi)$ respectively.

If (h, k) be the middle point of PD, then

$$h=\frac{a}{2}(\sec\phi+\tan\phi)$$

and $$k=\frac{b}{2}(\tan\phi+\sec\phi)$$

$\therefore$ $\frac{h}{k}=\frac{a}{b}$

$\therefore$ Locus of mid-point (h, k) is $y=\frac{b}{a}x$ which is equation of asymptote of hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$.

Similarly other mid-points lie on the other asymptotes.

Intersection of Conjugate Diameters and Hyperbola

To prove that of a pair of conjugate diameters of a hyperbola, only one meets the curve in real points

Let $y=mx$ ...(i)

and $y=m_1x$ ...(ii)

be a pair of conjugate diameters of the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$, then

$$mm_1=\frac{b^2}{a^2} \quad ...(iii)$$

On solving Eq. (i) and the equation of hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$, we get

$$\frac{x^2}{a^2}-\frac{m^2x^2}{b^2}=1$$

or $$x^2=\frac{a^2b^2}{b^2-a^2m^2} \quad ...(iv)$$

Similarly Eq. (ii) meets the hyperbola at points whose abscissa are given by

$$x^2=\frac{a^2b^2}{b^2-a^2m_1^2} \quad ...(v)$$

The two values of x given by Eq. (iv) will be real if $b^2-a^2m^2>0$ i.e. $m<\left(\frac{b}{a}\right)$

i.e. $$\frac{b^2}{a^2m_1}<\left(\frac{b}{a}\right) \qquad \left\{\because mm_1=\frac{b^2}{a^2}\right\}$$

$\Rightarrow$ $$\frac{b}{a}<m_1 \text{ i.e. if } b^2<a^2m_1^2$$

i.e. if $b^2-a^2m_1^2<0$

Then from Eq. (v) the values of x are imaginary.

Hence, if Eq. (i) meets the hyperbola in real points then Eq. (ii) meets it in imaginary points and *vice-versa.*

Remark

If CD is the conjugate diameter of a diameter CP of the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$, where P is $(a\sec\phi, b\tan\phi)$, then equation of CP, where C is $(0,0)$ is

$$y-0=\frac{b\tan\phi-0}{a\sec\phi-0}(x-0) \Rightarrow y=\frac{b}{a}\sin\phi.x$$

Comparing this with $y=mx$

$$m=\frac{b}{a}\sin\phi$$

$\because$ $$mm'=\frac{b^2}{a^2} \Rightarrow \frac{b}{a}\sin\phi\times m'=\frac{b^2}{a^2}$$

$\therefore$ $$m'=\left(\frac{b}{a}\right)\text{cosec }\phi$$

$\therefore$ Equation of conjugate diameter is $y=m'x=(b/a)\text{cosec }\phi.x$ on solving

$$y=(b/a)\text{cosec }\phi\cdot x \quad \text{and} \quad -\frac{x^2}{a^2}+\frac{y^2}{b^2}=1.$$

Then we get coordinates of D

i.e. $D\equiv(a\tan\phi, b\sec\phi)$

Example 28 If a pair of conjugate diameters meets the hyperbola and its conjugate in P and D respectively, then prove that $CP^2-CD^2=a^2-b^2$.

Sol. $\because$ Coordinates of P and D are $(a\sec\phi, b\tan\phi)$ and $(a\tan\phi, b\sec\phi)$ respectively.

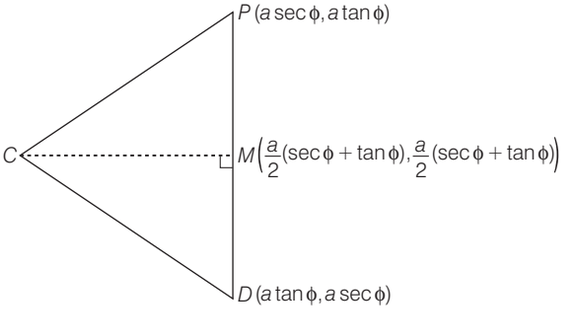
Then $(CP)^2-(CD)^2=a^2\sec^2\phi+b^2\tan^2\phi-a^2\tan^2\phi-b^2\sec^2\phi$

$=a^2(\sec^2\phi-\tan^2\phi)-b^2(\sec^2\phi-\tan^2\phi)$

$=a^2(1)-b^2(1)=a^2-b^2$

Example 29 For the hyperbola $x^2-y^2=a^2$, prove that the triangle CPD is isosceles and has constant area, where CP and CD are a pair of its conjugate diameters.

Sol. Since, CP and CD are the conjugate diameters of $x^2-y^2=a^2$, hence coordinates of P and D are $P\equiv(a\sec\phi, a\tan\phi)$, $D\equiv(a\tan\phi, a\sec\phi)$ respectively.



$\therefore$ $$CP=\sqrt{a^2(\sec^2\phi+\tan^2\phi)}=CD \qquad [\because C=0(0,0)]$$

Hence, ΔCPD is isosceles triangle.

Draw $\perp$ from C on PD, where M is the mid-point of PD

$\therefore$ $$M\equiv\left(\frac{a}{2}(\sec\phi+\tan\phi), \frac{a}{2}(\sec\phi+\tan\phi)\right)$$

$\therefore$ $$CM=\frac{|(\sec\phi+\tan\phi)|}{2}\sqrt{(a^2+a^2)}$$

and $$PD=\sqrt{[a(\sec\phi-\tan\phi)]^2+[a(\sec\phi-\tan\phi)]^2}$$

$$=|\sec\phi-\tan\phi)|\sqrt{(a^2+a^2)}$$

$\therefore$ Area of $\Delta PCD=\frac{1}{2}\cdot PD\cdot CM$

$$=\frac{1}{4}(a^2+a^2)=\frac{a^2}{2}=\text{constant}$$

Example 30 Find the condition for the lines $Ax^2+2Hxy+By^2=0$ to be conjugate diameters of $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$.

Sol. Let the lines represented by

$$Ax^2+2Hxy+By^2=0$$

are $y=mx$ and $y=m_1x$

$\therefore$ $$mm_1=\frac{A}{B} \quad ...(i)$$

But $y=mx$ and $y=m_1x$ are the conjugate diameters of

$$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$$

then $$mm_1=\frac{b^2}{a^2} \quad \ldots(ii)$$

$\therefore$ From Eqs. (i) and (ii), $\frac{A}{B}=\frac{b^2}{a^2}$

or $$a^2A=b^2B$$

which is the required condition.

Example 31 If the lines $lx+my+n=0$ passes through the extremities of a pair of conjugate diameters of the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$, show that $a^2l^2-b^2m^2=0$.

Sol. The extremities of a pair of conjugate diameters of $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ are $(a\sec\phi, b\tan\phi)$ and $(a\tan\phi, b\sec\phi)$ respectively.

According to the question, since extremities of a pair of conjugate diameters lie on $lx+my+n=0$

$\therefore$ $l(a\sec\phi)+m(b\tan\phi)+n=0$ ...(i)

$\Rightarrow$ $l(a\tan\phi)+m(b\sec\phi)+n=0$ ...(ii)

then from Eq. (i), $al\sec\phi+bm\tan\phi=-n$

or $a^2l^2\sec^2\phi+b^2m^2\tan^2\phi+2ablm\sec\phi\tan\phi=n^2$ ...(iii)

and from Eq. (ii), $al\tan\phi+bm\sec\phi=-n$

or $a^2l^2\tan^2\phi+b^2m^2\sec^2\phi+2ablm\sec\phi\tan\phi=n^2$ ...(iv)

then subtracting Eq. (iv) from Eq. (iii),

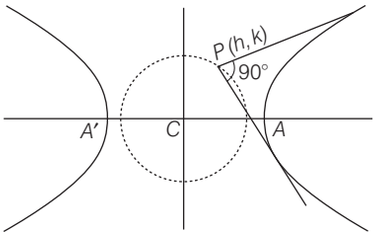
$$a^2l^2(\sec^2\phi-\tan^2\phi)+b^2m^2(\tan^2\phi-\sec^2\phi)=0$$

or $$a^2l^2-b^2m^2=0$$

Director Circle

The locus of the point of intersection of the tangents to the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$, which are perpendicular to each other is called director circle.

Let any tangent in terms of slope of hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ is



$$y=mx+\sqrt{(a^2m^2-b^2)}$$

It passes through (h, k)

$\therefore$ $$k=mh+\sqrt{(a^2m^2-b^2)}$$

or $$(k-mh)^2=a^2m^2-b^2$$

$\Rightarrow$ $$k^2+m^2h^2-2mhk=a^2m^2-b^2$$

$\Rightarrow$ $$m^2(h^2-a^2)-2hkm+k^2+b^2=0$$

It is quadratic equation in m. Let slopes of two tangents are m_1 and m_2

$\therefore$ $$m_1m_2=\frac{k^2+b^2}{h^2-a^2}$$

$$-1=\frac{k^2+b^2}{h^2-a^2} \quad (\because \text{tangents are perpendicular})$$

$\Rightarrow$ $$-h^2+a^2=k^2+b^2$$

or $$h^2+k^2=a^2-b^2$$

Hence, locus of $P(h, k)$ is

$$x^2+y^2=a^2-b^2 \qquad (a>b)$$

Aliter :

If tangents $y=mx+\sqrt{(a^2m^2-b^2)}$ ...(i)

and $$y=-\frac{x}{m}+\sqrt{\left\{a^2\left(-\frac{1}{m}\right)^2-b^2\right\}} \quad \ldots(ii)$$

touch the hyperbola and intersects at right angles

$\therefore$ From Eq. (i),

$$y-mx=\sqrt{(a^2m^2-b^2)} \quad \ldots(iii)$$

Eq. (ii) can be rewritten as

$$x+my=\sqrt{(a^2-b^2m^2)} \quad \ldots(iv)$$

Squaring and adding Eqs. (iii) and (iv), then

$$(y-mx)^2+(x+my)^2=a^2m^2-b^2+a^2-b^2m^2$$

$$(1+m^2)(x^2+y^2)=(1+m^2)(a^2-b^2)$$

Hence, $x^2+y^2=a^2-b^2$ is the **director circle** of the hyperbola.

Remarks

1. For director circle of $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$, a must be greater than b.
   If $a<b$, then director circle $x^2+y^2=a^2-b^2$ does not exist.
2. The equation of director circle of $-\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ is
   $x^2+y^2=b^2-a^2\,(b>a)$,
   If $b<a$, then director circle does not exist.

Example 32 If any tangent to the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ with centre C, meets its director circle in P and Q, show that CP and CQ are conjugate semi-diameters of the hyperbola.

Sol. Since, equation of hyperbola is

$$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1 \qquad ...(i)$$

Equation of tangent at $(a\sec\phi, b\tan\phi)$ on Eq. (i) is

$$\frac{x}{a}\sec\phi-\frac{y}{b}\tan\phi=1 \qquad ...(ii)$$

Equation of director circle of Eq. (i) is

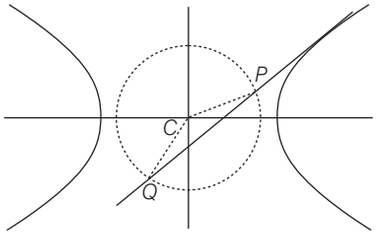
$$x^2+y^2=a^2-b^2 \qquad ...(iii)$$

Equation of lines joining the point of intersection of Eqs. (i) and (ii) to the origin is obtained by making Eq. (iii) homogeneous with the help of Eq. (ii).

$$\therefore \quad x^2+y^2=(a^2-b^2)\left(\frac{x}{a}\sec\phi-\frac{y}{b}\tan\phi\right)^2$$

or $$x^2\left(1-\frac{(a^2-b^2)\sec^2\phi}{a^2}\right)+y^2\left(1-\frac{(a^2-b^2)\tan^2\phi}{b^2}\right)+\frac{2(a^2-b^2)\sec\phi\tan\phi}{ab}xy=0 \qquad ...(iv)$$

Let m and m' represent the slopes of the lines given by Eq. (iv), then



$$mm'=\frac{1-\frac{(a^2-b^2)\sec^2\phi}{a^2}}{1-\frac{(a^2-b^2)\tan^2\phi}{b^2}}=\frac{b^2}{a^2}\cdot\frac{a^2-(a^2-b^2)\sec^2\phi}{b^2-(a^2-b^2)\tan^2\phi}$$

$$=\frac{b^2}{a^2}\cdot\frac{b^2\sec^2\phi-a^2\tan^2\phi}{b^2\sec^2\phi-a^2\tan^2\phi}=\frac{b^2}{a^2}$$

Hence, the lines CP and CQ are conjugate semi-diameters of the hyperbola.

Asymptotes

An asymptotes of any hyperbola or a curve is a straight line which touches in it two points at infinity.

Asymptotes of hyperbola : *The equations of two asymptotes of the hyperbola* $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ *are* $y=\pm\frac{b}{a}x$ *or* $\frac{x}{a}\pm\frac{y}{b}=0$.

Proof : Let $y=mx+c$ be an asymptote of the hyperbola

$$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1 \qquad ...(i)$$

Substituting the value of y in Eq. (i),

$$\frac{x^2}{a^2}-\frac{(mx+c)^2}{b^2}=1$$

or $$(a^2m^2-b^2)x^2+2a^2mcx+a^2(b^2+c^2)=0 \qquad ...(ii)$$

If the line $y=mx+c$ is an asymptote to the given hyperbola, then it touches the hyperbola at infinity. So both roots of Eq. (ii) must be infinite.

$$\therefore \quad a^2m^2-b^2=0$$

and $$-2a^2mc=0$$

then $$m=\pm\frac{b}{a} \quad \text{and} \quad c=0$$

Substituting the value of m and c in $y=mx+c$, we get

$$y=\pm\frac{b}{a}x \implies \frac{x}{a}\pm\frac{y}{b}=0$$

Aliter :

The difference between the second degree curve and pair of asymptotes is constant.

$\because$ Given hyperbola is $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$

$\therefore$ Pair of asymptotes is $\frac{x^2}{a^2}-\frac{y^2}{b^2}+\lambda=0$ ... (i)

Eq. (i) represents a pair of lines, then $\Delta=0$

$$\therefore \quad \frac{1}{a^2}\cdot\left(-\frac{1}{b^2}\right)\cdot\lambda+0-0-0-\lambda\cdot0=0$$

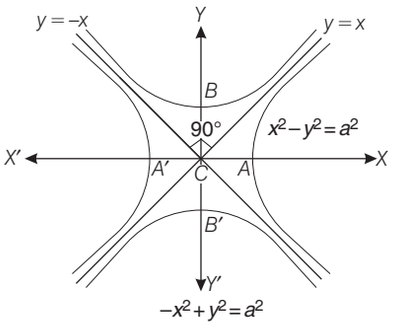
$$\therefore \quad \lambda=0$$

From Eq. (i), pair of asymptotes is $\frac{x^2}{a^2}-\frac{y^2}{b^2}=0$

or $$y=\pm\frac{b}{a}x \text{ or } \frac{x}{a}\pm\frac{y}{b}=0$$

Remarks

1. If $b=a$, then $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ reduces to $x^2-y^2=a^2$. The asymptotes of rectangular hyperbola $x^2-y^2=a^2$ are $y=\pm x$ which are at right angles.
2. A hyperbola and its conjugate hyperbola have the same asymptotes.
3. The angle between the asymptotes of $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ is $2\tan^{-1}\left(\frac{b}{a}\right)$.



4. If the angle between the asymptotes of a hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ is 2θ, then $e=\sec\theta$.

5. The asymptotes pass through the centre of the hyperbola.

6. The bisectors of the angles between the asymptotes are the coordinate axes.

7. Let $H\equiv\frac{x^2}{a^2}-\frac{y^2}{b^2}-1=0$

$$A\equiv\frac{x^2}{a^2}-\frac{y^2}{b^2}=0 \quad \text{and} \quad C\equiv\frac{x^2}{a^2}-\frac{y^2}{b^2}+1=0$$

be the equation of the hyperbola, asymptotes and the conjugate hyperbola respectively, then clearly $C+H=2A$.

Example 33 Find the asymptotes of the hyperbola $xy-3y-2x=0$.

Sol. Since equation of a hyperbola and its asymptotes differ in constant terms only,

$\therefore$ Pair of asymptotes is given by

$$xy-3y-2x+\lambda=0 \qquad \text{...(i)}$$

where, λ is any constant such that it represents two straight lines.

$\therefore$ $abc+2fgh-af^2-bg^2-ch^2=0$

$\Rightarrow$ $0+2\times-\frac{3}{2}\times-1\times\frac{1}{2}-0-0-\lambda\left(\frac{1}{2}\right)^2=0$

$\therefore$ $\lambda=6$

From Eq. (i), the asymptotes of given hyperbola are given by

$$xy-3y-2x+6=0$$

or $(y-2)(x-3)=0.$

$\therefore$ Asymptotes are $x-3=0$ and $y-2=0$.

Example 34 The asymptotes of a hyperbola having centre at the point $(1,2)$ are parallel to the lines $2x+3y=0$ and $3x+2y=0$. If the hyperbola passes through the point $(5,3)$, show that its equation is $(2x+3y-8)(3x+2y+7)=154$.

Sol. Let the asymptotes be $2x+3y+\lambda=0$ and $3x+2y+\mu=0$. Since asymptotes passes through $(1,2)$, then

$$\lambda=-8 \text{ and } \mu=-7$$

Thus, the equation of asymptotes are

$$2x+3y-8=0 \quad \text{and} \quad 3x+2y-7=0$$

Let the equation of hyperbola be

$$(2x+3y-8)(3x+2y-7)+v=0 \qquad \text{... (i)}$$

It passes through $(5,3)$, then

$$(10+9-8)(15+6-7)+v=0$$

$\Rightarrow$ $11\times14+v=0$

$\therefore$ $\gamma=-154$

Putting the value of v in Eq. (i), we obtain

$$(2x+3y-8)(3x+2y-7)-154=0$$

which is the equation of required hyperbola.

Example 35 Show that the tangent at any point of a hyperbola cuts off a triangle of constant area from the asymptotes and that the portion of it intercepted between the asymptotes is bisected at the point of contact.

Sol. Let $P(a\sec\phi,\ b\tan\phi)$ be any point on the hyperbola

$$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1 \qquad \text{... (i)}$$

Asymptotes of Eq. (i) are

$$y=\pm\frac{b}{a}x$$

Equation of tangent of Eq. (i) at $P(a\sec\phi, b\tan\phi)$ is

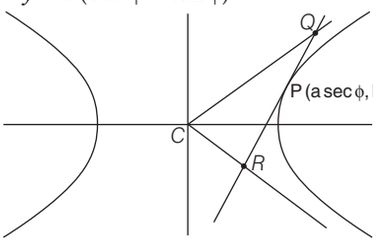
$$\frac{x}{a}\sec\phi-\frac{y}{b}\tan\phi=1 \qquad \text{... (ii)}$$

Solving Eq. (ii) and $y=\frac{b}{a}x$

We get $\frac{x}{a}(\sec\phi-\tan\phi)=(\sec^2\phi-\tan^2\phi)$

$\therefore$ $x=a(\sec\phi+\tan\phi)$

and $y=b(\sec\phi+\tan\phi)$



Let $Q\equiv[a(\sec\phi+\tan\phi), b(\sec\phi+\tan\phi)]$

Now solving Eq. (ii) and $y=-\frac{b}{a}x$

We get, $\frac{x}{a}(\sec\phi+\tan\phi)=(\sec^2\phi-\tan^2\phi)$

or $x=a(\sec\phi-\tan\phi)$

and $y=-b(\sec\phi-\tan\phi)$

Let $R\equiv[a(\sec\phi-\tan\phi), -b(\sec\phi-\tan\phi)]$

Mid-point of QR is $(a\sec\phi, b\tan\phi)$ which is coordinate of P.

Area of $\Delta CQR=\frac{1}{2}|(x_1y_2-x_2y_1)|$

$$=\frac{1}{2}|-ab-ab|=ab=\text{constant.}$$

Rectangular Hyperbola

A hyperbola whose asymptotes include a right angle is said to be rectangular hyperbola.

OR

If the lengths of transverse and conjugate axes of any hyperbola be equal, it is called **rectangular or equilateral hyperbola**.

According to the first definition

$$2\tan^{-1}\left(\frac{b}{a}\right)=\frac{\pi}{2}$$

$$\Rightarrow \quad \tan^{-1}\left(\frac{b}{a}\right)=\frac{\pi}{4} \Rightarrow \frac{b}{a}=1$$

$$a=b$$

then, $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ becomes $x^2-y^2=a^2$

According to the second definition

When $a=b, \frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ becomes

$$x^2-y^2=a^2$$

$$\text{Eccentricity, } e=\sqrt{\left(1+\frac{b^2}{a^2}\right)}=\sqrt{2}$$

Hence, $x^2-y^2=a^2$ is the general form of the equation of the rectangular hyperbola.

Remark

All the results of $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ are applicable to the hyperbola $x^2-y^2=a^2$ after changing b by a.

The Rectangular Hyperbola $xy = c^2$

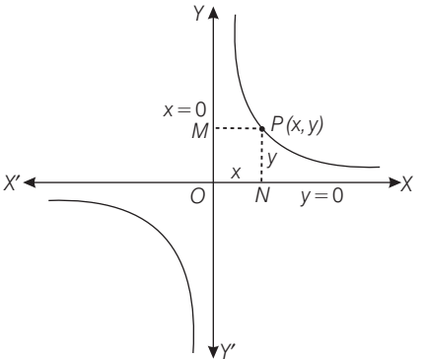
When the centre of any rectangular hyperbola be at the origin and its asymptotes coincide with the coordinate axes its, equation is $xy=c^2$.

Since, asymptotes coincides the coordinate axes.

Hence, asymptotes are $y=0$ and $x=0$.

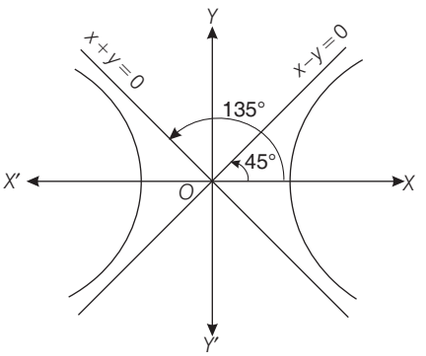
$\therefore$ Combined equation of asymptotes is $xy=0$. Now equation of any hyperbola and its asymptotes differ in respect of constant terms only.

$\therefore$ Equation of rectangular hyperbola is $xy=c^2$ where c is any constant.



Second method (By rotation of axes) :

The equation of rectangular hyperbola is $x^2-y^2=a^2$ and its asymptotes are $x-y=0$ and $x+y=0$. Since, asymptotes are inclined at 45° and 135° to the X-axis respectively.



If we rotate the axes through $\theta=-45°$ without changing the origin. Thus, when we replace (x, y) by

$$[x\cos(-45°)-y\sin(-45°), x\sin(-45)° + y\cos(-45°)]$$

i.e. $\left(\frac{x+y}{\sqrt{2}}, \frac{-x+y}{\sqrt{2}}\right)$

then equation $x^2-y^2=a^2$ reduces to

$$\left(\frac{x+y}{\sqrt{2}}\right)^2-\left(\frac{-x+y}{\sqrt{2}}\right)^2=a^2$$

or $$\frac{1}{2}\{(x+y)^2-(-x+y)^2\}=a^2$$

$$\Rightarrow \quad \frac{1}{2}(2y)(2x)=a^2$$

or $$xy=\frac{a^2}{2}=\left(\frac{a}{\sqrt{2}}\right)^2=c^2 \quad \text{(say)}$$

or $$xy=c^2$$

Study of Hyperbola $xy = c^2$

(i) Vertices : $A(c,c)$ and $A'(-c,-c)$.

(ii) Transverse axis : $y = x$.

(iii) Conjugate axis : $y = -x$.

(iv) Foci : $S(c\sqrt{2}, c\sqrt{2})$ and $S'(-c\sqrt{2}, -c\sqrt{2})$.

(v) Length of latusrectum = Length of $AA' = 2\sqrt{2}\,c$.

(vi) Equation of auxiliary circle : $x^2 + y^2 = 2c^2$.

(vii) Equation of director circle $x^2 + y^2 = 0$.

(viii) Asymptotes : $x = 0, y = 0$.

Remarks

1. The equations of the asymptotes and the conjugate hyperbola of the rectangular hyperbola $xy = c^2$, where the axes are the asymptotes, are $xy = 0$ and $xy = -c^2$ respectively.
2. The equation of a rectangular hyperbola having coordinate axes as its asymptotes is $xy = c^2$. If the asymptotes of a rectangular hyperbola are $x = \alpha$, $y = \beta$ then its equation is $(x - \alpha)(y - \beta) = c^2$ or $xy - \alpha y - \beta x + \lambda = 0$.
3. Since $x = ct$, $y = \frac{c}{t}$ satisfies $xy = c^2$

   $\therefore (x, y) = \left(ct, \frac{c}{t}\right) (t \neq 0)$ is called a 't' point on the rectangular hyperbola. The set $\left\{x = ct, y = \frac{c}{t}\right\}$ represents its parametric equations with parameter 't'.

Properties of Rectangular Hyperbola $xy = c^2$

(i) Equation of the chord joining 't_1' and 't_2' is $x + yt_1t_2 - c(t_1 + t_2) = 0$.

(ii) Equation of tangent at (x_1, y_1) is $xy_1 + x_1y = 2c^2$.

(iii) Equation of tangent at 't' is $\frac{x}{t} + yt = 2c$.

(iv) Point of intersection of tangents at 't_1' and 't_2' is $\left(\frac{2ct_1t_2}{t_1 + t_2}, \frac{2c}{t_1 + t_2}\right)$.

(v) Equation of normal at (x_1, y_1) is $xx_1 - yy_1 = x_1^2 - y_1^2$.

(vi) Equation of normal at 't' is $xt^3 - yt - ct^4 + c = 0$.

(vii) Point of intersection of normals at 't_1' and 't_2' is.

$$\left(\frac{c\{t_1t_2(t_1^2 + t_1t_2 + t_2^2) - 1\}}{t_1t_2(t_1 + t_2)}, \frac{c\{t_1^3t_2^3 + (t_1^2 + t_1t_2 + t_2^2)\}}{t_1t_2(t_1 + t_2)}\right).$$

Example 36 If the normal at the point 't_1' to the rectangular hyperbola $xy = c^2$ meets it again at the point 't_2', prove that $t_1^3t_2 = -1$.

Sol. Since, the equation of normal at $\left(ct_1, \frac{c}{t_1}\right)$ to the hyperbola $xy = c^2$ is

$$xt_1^3 - yt_1 - ct_1^4 + c = 0$$

but this passes through $\left(ct_2, \frac{c}{t_2}\right)$, then

$$ct_2t_1^3 - \frac{c}{t_2}t_1 - ct_1^4 + c = 0$$

$$\Rightarrow \quad t_2^2t_1^3 - t_1 - t_1^4t_2 + t_2 = 0$$

$$\Rightarrow \quad t_2t_1^3(t_2 - t_1) + (t_2 - t_1) = 0$$

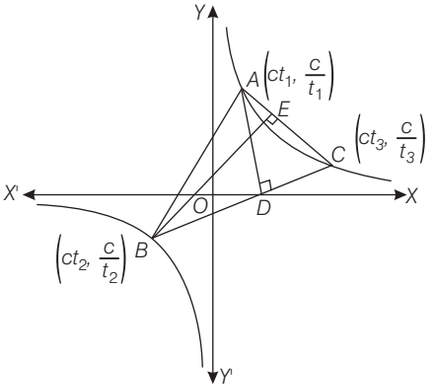
$$\Rightarrow \quad (t_1^3t_2 + 1)(t_2 - t_1) = 0$$

$$\Rightarrow \quad t_1^3t_2 + 1 = 0 \qquad [\because t_2 \neq t_1]$$

$$\therefore \quad t_1^3t_2 = -1$$

Example 37 A triangle has its vertices on a rectangular hyperbola. Prove that the orthocentre of the triangle also lies on the same hyperbola.

Sol. Let "t_1", "t_2" and "t_3" are the vertices of the triangle ABC, described on the rectangular hyperbola $xy = c^2$.



$\therefore$ Coordinates of A, B and C are $\left(ct_1, \frac{c}{t_1}\right)$, $\left(ct_2, \frac{c}{t_2}\right)$ and $\left(ct_3, \frac{c}{t_3}\right)$ respectively.

Now, slope of BC is $\frac{\frac{c}{t_3} - \frac{c}{t_2}}{ct_3 - ct_2} = -\frac{1}{t_2t_3}$

$\therefore$ Slope of AD is t_2t_3

Equation of altitude AD is

$$y - \frac{c}{t_1} = t_2t_3(x - ct_1)$$

or $t_1y - c = x\ t_1t_2t_3 - ct_1^2t_2t_3$ ...(i)

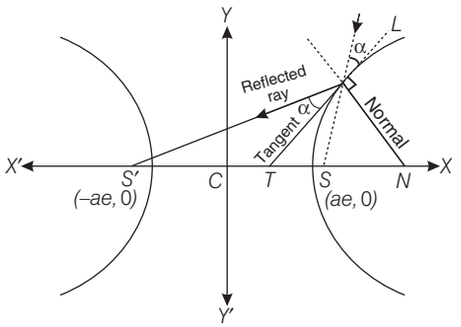
Similarly equation of altitude BE is

$$t_2y - c = x\ t_1t_2t_3 - c\ t_1t_2^2t_3 \quad ...(ii)$$

Solving Eqs. (i) and (ii), we get the orthocentre $\left(-\frac{c}{t_1t_2t_3}, -c\ t_1t_2t_3\right)$ which lies on $xy = c^2$.

Reflection Property of a Hyperbola

If an incoming light ray passing through one focus S strike convex side of the hyperbola then it will get reflected towards other focus S'.

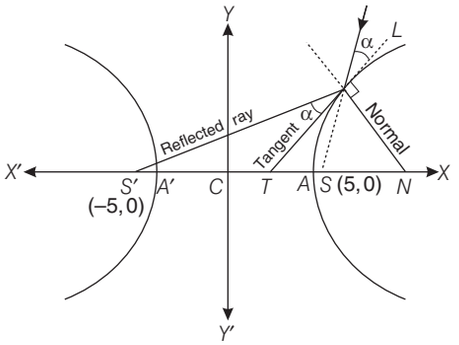


Example 38 A ray emanating from the point $(5, 0)$ is incident on the hyperbola $9x^2 - 16y^2 = 144$ at the point P with abscissa 8. Find the equation of the reflected ray after first reflection and point P lies in first quadrant.

Sol. Given, hyperbola is $9x^2 - 16y^2 = 144$. This equation can be rewritten as

$$\frac{x^2}{16} - \frac{y^2}{9} = 1 \quad ...(i)$$

Coordinates of foci are $(0, \pm\sqrt{16+9})$ i.e., $(0, \pm 5)$



Since x-coordinate of P is 8. Let y-coordinate of P is α.

$\therefore$ $(8, \alpha)$ lies on Eq. (i)

$\therefore$ $\frac{64}{16} - \frac{\alpha^2}{9} = 1$

$\Rightarrow$ $\alpha^2 = 27$

$\Rightarrow$ $\alpha = 3\sqrt{3}$ ($\because$ P lies in first quadrant)

Hence coordinate of point P is $(8, 3\sqrt{3})$.

$\because$ Equation of reflected ray passing through $P(8, 3\sqrt{3})$ and $S'(-5, 0)$.

$\therefore$ Its equation is $y - 3\sqrt{3} = \frac{0 - 3\sqrt{3}}{-5 - 8}(x - 8)$

or $13y - 39\sqrt{3} = 3\sqrt{3}x - 24\sqrt{3}$

or $3\sqrt{3}x - 13y + 15\sqrt{3} = 0.$

Equation of a Hyperbola Referred to Two Perpendicular Lines

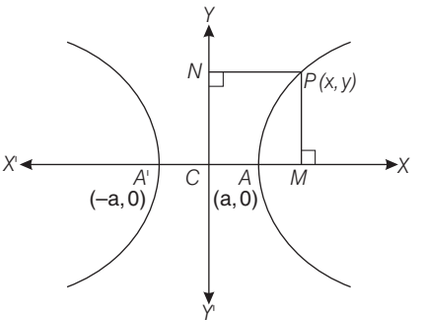
Let $P(x, y)$ be any point on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$,

then

$$PM = y \text{ and } PN = x$$

$\therefore$ $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$

$\Rightarrow$ $\frac{(PN)^2}{a^2} - \frac{(PM)^2}{b^2} = 1$

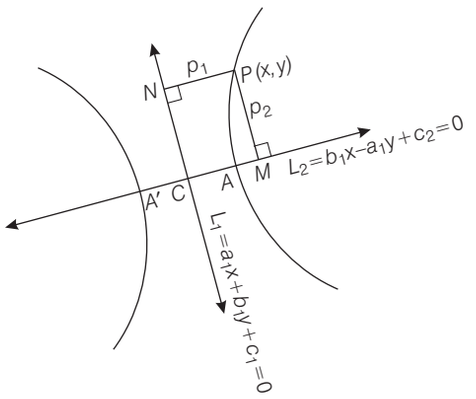


If perpendicular lines represented by

$$L_1 \equiv a_1x + b_1y + c_1 = 0$$

and $L_2 \equiv b_1x - a_1y + c_2 = 0$

then $PN = p_1 = \left(\frac{a_1x + b_1y + c_1}{\sqrt{(a_1^2 + b_1^2)}}\right)$



and $$PM = p_2 = \left(\frac{b_1 x - a_1 y + c_2}{\sqrt{(b_1^2 + a_1^2)}} \right)$$

Now equation of hyperbola becomes

$$\frac{\left(\frac{a_1 x + b_1 y + c_1}{\sqrt{(a_1^2 + b_1^2)}} \right)^2}{a^2} - \frac{\left(\frac{b_1 x - a_1 y + c_2}{\sqrt{(b_1^2 + a_1^2)}} \right)^2}{b^2} = 1$$

Then the point P describes a hyperbola in the plane of the given lines such that :

(i) Centre : The centre of the hyperbola is the point of intersection of the lines $L_1 = 0$ and $L_2 = 0$.

(ii) Transverse axis : The transverse axis lies along $L_2 = 0$.

Conjugate axis : The conjugate axis lies along $L_1 = 0$.

(iii) Length of transverse and conjugate axes : The length of transverse and conjugate axes are $2a$ and $2b$ respectively.

(iv) Foci : The foci of the hyperbola is the point of intersection of the lines

$$\frac{a_1 x + b_1 y + c_1}{\sqrt{(a_1^2 + b_1^2)}} = \pm ae \text{ and } L_2 = 0.$$

(v) Directrix : The directrices of the hyperbola are

$$\frac{a_1 x + b_1 y + c_1}{\sqrt{(a_1^2 + b_1^2)}} = \pm \frac{a}{e}$$

(vi) Latusrectum : The latusrectum of the hyperbola is $\frac{2b^2}{a}$.

Example 39 The equations of the transverse and conjugate axes of a hyperbola are respectively $3x + 4y - 7 = 0$, $4x - 3y + 8 = 0$ and their respective lengths are 4 and 6. Find the equation of the hyperbola.

Sol. The equation of the required hyperbola is

$$\frac{\left(\frac{3x + 4y - 7}{\sqrt{(3^2 + 4^2)}} \right)^2}{\left(\frac{4}{2} \right)^2} - \frac{\left(\frac{4x - 3y + 8}{\sqrt{4^2 + (-3)^2}} \right)^2}{\left(\frac{6}{2} \right)^2} = 1$$

$$\Rightarrow \quad \frac{1}{100}(3x + 4y - 7)^2 - \frac{1}{225}(4x - 3y + 8)^2 = 1$$

$$\Rightarrow \quad 9(3x + 4y - 7)^2 - 4(4x - 3y + 8)^2 = 900$$

$$\Rightarrow \quad 9(9x^2 + 16y^2 + 49 + 24xy - 42x - 56y) - 4(16x^2 + 9y^2 + 64 - 24xy + 64x - 48y) = 900$$

$$\Rightarrow \quad 17x^2 + 312xy + 108y^2 - 634x - 312y - 715 = 0.$$

Exercise for Session 3

1. The diameter of $16x^2 - 9y^2 = 144$ which is conjugate to $x = 2y$ is

(a) $y = \frac{16}{9}x$ (b) $y = \frac{32}{9}x$ (c) $x = \frac{16}{9}y$ (d) $x = \frac{32}{9}y$

2. Tangents drawn from a point on the circle $x^2 + y^2 = 9$ to the hyperbola $\frac{x^2}{25} - \frac{y^2}{16} = 1$, then tangents are at angle

(a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{2}$

3. If $H \equiv \frac{x^2}{a^2} - \frac{y^2}{b^2} - 1 = 0$, $C \equiv \frac{x^2}{a^2} - \frac{y^2}{b^2} + 1 = 0$ and $A \equiv \frac{x^2}{a^2} - \frac{y^2}{b^2} = 0$ then H, A and C are in

(a) AP (b) GP (c) HP (d) AGP

4. The angle between the asymptotes of $\frac{x^2}{4} - \frac{y^2}{9} = 1$ is equal to

(a) $\tan^{-1}\left(\frac{2}{3}\right)$ (b) $\tan^{-1}\left(\frac{3}{2}\right)$ (c) $2\tan^{-1}\left(\frac{2}{3}\right)$ (d) $2\tan^{-1}\left(\frac{3}{2}\right)$

5. If e and e_1 are the eccentricities of the hyperbolas $xy = c^2$ and $x^2 - y^2 = a^2$, then $(e + e_1)^2$ is equal to

(a) 2 (b) 4 (c) 6 (d) 8

6. The product of the lengths of perpendiculars drawn from any point on the hyperbola $\frac{x^2}{2} - y^2 = 1$ to its asymptotes is

(a) $\frac{1}{2}$ (b) 2 (c) $\frac{2}{3}$ (d) $\frac{3}{2}$

7. The number of points on hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 3$ from which mutually perpendicular tangents can be drawn to the circle $x^2 + y^2 = a^2$ is/are

(a) 0 (b) 2 (c) 3 (d) 4

8. If the sum of the slopes of the normal from a point P to the hyperbola $xy = c^2$ is equal to $\lambda (\lambda \in R^+)$, then the locus of point P is

(a) $x^2 = \lambda c^2$ (b) $y^2 = \lambda c^2$ (c) $xy = \lambda c^2$ (d) None of these

9. If $S \equiv x^2 + 4xy + 3y^2 - 4x + 2y + 1 = 0$, then the value of λ for which $S + \lambda = 0$ represents its asymptotes is

(a) 20 (b) 18 (c) -16 (d) -22

10. A ray emanating from the point $(-\sqrt{41}, 0)$ is incident on the hyperbola $16x^2 - 25y^2 = 400$ at the point P with abscissa 10. Then the equation of the reflected ray after first reflection and point P lies in second quadrant is

(a) $4\sqrt{3}x - (10 - \sqrt{41})\, y + 4\sqrt{123} = 0$ (b) $4\sqrt{3}x + (10 - \sqrt{41})\, y - 4\sqrt{123} = 0$

(c) $4\sqrt{3}x + (10 - \sqrt{41})\, y + 4\sqrt{123} = 0$ (d) $4\sqrt{3}x - (10 - \sqrt{41})\, y - 4\sqrt{123} = 0$

11. A ray of light incident along the line $3x + (5 - 4\sqrt{2})y = 15$ gets reflected from the hyperbola $\frac{x^2}{16} - \frac{y^2}{9} = 1$, then its reflected ray goes along the line

(a) $x\sqrt{2} - y + 5 = 0$ (b) $y\sqrt{2} - x + 5 = 0$ (c) $y\sqrt{2} - x - 5 = 0$ (d) None of these

12. The equations of the transverse and conjugate axes of a hyperbola are $x + 2y - 3 = 0$ and $2x - y + 4 = 0$ respectively and their respective lengths are $\sqrt{2}$ and $\frac{2}{\sqrt{3}}$. The equation of the hyperbola is

(a) $2(x + 2y - 3)^2 - 3(2x - y + 4)^2 = 5$ (b) $2(2x - y + 4)^2 - 3(x + 2y - 3)^2 = 5$

(c) $2(x + 2y - 3)^2 - 3(2x - y + 4)^2 = 1$ (d) $2(2x - y + 4)^2 - 3(x + 2y - 3)^2 = 1$

13. Find the equation of that diameter which bisects the chord $7x + y - 2 = 0$ of the hyperbola $\frac{x^2}{3} - \frac{y^2}{7} = 1$.

14. Find the equation of the hyperbola which has $3x - 4y + 7 = 0$ and $4x + 3y + 1 = 0$ for its asymptotes and which passes through the origin.

15. The asymptotes of a hyperbola are parallel to lines $2x + 3y = 0$ and $3x + 2y = 0$. The hyperbola has its centre at $(1, 2)$ and it passes through $(5, 3)$, find its equation.

16. If the pair of straight lines $Ax^2 + 2Hxy + By^2 = 0$ be conjugate diameters of the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, then prove that $Aa^2 = Bb^2$.

17. A circle cuts the rectangular hyperbola $xy = 1$ in points $(x_r, y_r), r = 1, 2, 3, 4$ then prove that $x_1x_2x_3x_4 = y_1y_2y_3y_4 = 1$.

Shortcuts and Important Results to Remember

1 If P be any point and F_1 and F_2 are any other two points then :
(a) If $|PF_1 - PF_2| < |F_1F_2|$, then the locus of P is a hyperbola.
(b) If $|PF_1 - PF_2| = |F_1F_2|$, then the locus of P is a straight line.
(c) If $|PF_1 - PF_2| > |F_1F_2|$, then the locus of P is an empty set.

2 The orthocentre of triangle inscribed in the hyperbola $xy = c^2$ lies on it.

3 Length of the chord of the rectangular hyperbola $xy = c^2$ whose middle-point is (h, k) is $2\sqrt{\left(\frac{(h^2 + k^2)(hk - c^2)}{hk}\right)}$.

4 The product of length of perpendicular drawn from any point on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ to its asymptotes is $\frac{a^2b^2}{(a^2 + b^2)}$.

5 Asymptotes are the tangents from the centre of a hyperbola.

6 If the angle between the asymptotes is 2α, then eccentricity of the hyperbola is $\sec\alpha$.

7 If the tangent and normal to a rectangular hyperbola $xy = c^2$ at a point cuts off intercepts a_1 and a_2 on one axis and b_1, b_2 on the other axis, then $a_1a_2 + b_1b_2 = 0$.

8 The equation of common tangents to $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ and $-\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ are $y = \pm x \pm \sqrt{(a^2 - b^2)}$.

9 The director circle of hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ will be imaginary if $a < b$ and will become a circle, if $a > b$ (for $a = b$, point circle).

10 The ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ and the hyperbola $\frac{x^2}{a^2 - k^2} - \frac{y^2}{k^2 - b^2} = 1$ $(a > k > b)$ are confocal and therefore orthogonal.

11 If four normals can be drawn to a hyperbola from any point and if $\alpha, \beta, \gamma, \delta$ be eccentric angles of these four co-normal points, then $\alpha + \beta + \gamma + \delta$ = odd multiple of π.

12 If α, β, γ are the eccentric angles of three points on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, the normals at which are concurrent, then $\sin(\alpha + \beta) + \sin(\beta + \gamma) + \sin(\gamma + \alpha) = 0$.

13 The locus of the foot of the perpendiculars drawn from the focus of the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ upon any tangent is its auxiliary circle i.e. $x^2 + y^2 = a^2$ and product of the perpendiculars is b^2.

14 The portion of tangent between the point of the contact and the directrix subtends a right angle at the corresponding focus.

15 The equation of the pair of asymptotes differ the hyperbola and the conjugate hyperbola by the same constant only.

16 The asymptotes pass through the centre of the hyperbola and the bisectors of the angles between the asymptotes are the axes of the hyperbola.

17 The asymptotes of a hyperbola are the diagonals of the rectangle formed by the lines drawn through the extremities of each axis parallel to the other axis.

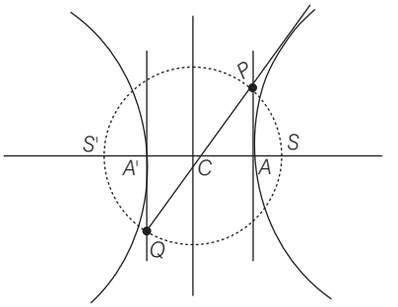
18 Perpendicular from the foci on either asymptote meet it in the same points as the corresponding directrix and the common points of intersection lie on the auxiliary circle.

19 If from any point on the asymptote a straight line be drawn perpendicular to the transverse axis, the product of the segments of this line, intercepted between the point and the curve is always equal to the square of the semi conjugate axis.

20 The tangent at any point P on a hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ with centre C, meets the asymptotes in Q and R and cuts off a ΔCQR of constant area equal to ab from the asymptotes and the portion of the tangent intercepted between the asymptotes is bisected at the point of the contact. This implies that locus of the centre of the circle circumscribing the ΔCQR in case of rectangular hyperbola is the hyperbola itself and for a standard hyperbola the locus would be the curve $4(a^2x^2 - b^2y^2) = (a^2 + b^2)^2$.

21 If a circle $x^2 + y^2 + 2gx + 2fy + c = 0$ intersects a rectangular hyperbola $xy = \lambda^2$ or $x^2 - y^2 = a^2$ at four points then the Arithmetic mean of the points of intersection lies on the middle of the line joining the centres of the circle and hyperbola.

22 The points (two) in which any tangent meets the tangents at the vertices and the foci of the hyperbola are concyclic i.e. S, P, S' and Q are lie on circle.



JEE Type Solved Examples :
Single Option Correct Type Questions

▪ This section contains 10 **multiple choice examples.** Each example has four choices (a), (b), (c) and (d) out of which **ONLY ONE** is correct.

● ***Ex. 1*** *If the eccentricity of the hyperbola* $x^2 - y^2 \sec^2\alpha = 5$ *is* $\sqrt{3}$ *times the eccentricity of the ellipse* $x^2 \sec^2\alpha + y^2 = 25$, *then a value of* α *is*

(a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$

(c) $\frac{\pi}{3}$ (d) $\frac{\pi}{2}$

Sol. (b) For the hyperbola $\frac{x^2}{5} - \frac{y^2}{5\cos^2\alpha} = 1$

we have, $e_1^2 = 1 + \frac{5\cos^2\alpha}{5} = 1 + \cos^2\alpha$ ... (i)

For the ellipse $\frac{x^2}{25\cos^2\alpha} + \frac{y^2}{25} = 1$

we have, $e_2^2 = 1 - \frac{25\cos^2\alpha}{25} = 1 - \cos^2\alpha = \sin^2\alpha$ ... (ii)

Given that, $e_1 = \sqrt{3}\, e_2$ or $e_1^2 = 3e_2^2$

$\Rightarrow$ $1 + \cos^2\alpha = 3\sin^2\alpha$ [from Eqs. (i) and (ii)]

$\Rightarrow$ $2 = 4\sin^2\alpha$

or $\sin\alpha = \frac{1}{\sqrt{2}}$

$\Rightarrow$ $\alpha = \frac{\pi}{4}$

● ***Ex. 2*** *The asymptote of the hyperbola* $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ *form with any tangent to the hyperbola a triangle whose area is* $a^2 \tan\lambda$ *in magnitude, then its eccentricity is*

(a) $\sec\lambda$ (b) $\operatorname{cosec}\lambda$

(c) $\sec^2\lambda$ (d) $\operatorname{cosec}^2\lambda$

Sol. (a) Any tangent to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ forms a triangle with the asymptotes which has constant area *ab*.

Given, $ab = a^2\tan\lambda$

or $b = a\tan\lambda$

or $b^2 = a^2\tan^2\lambda$

or $a^2(e^2 - 1) = a^2\tan^2\lambda$

or $e^2 = 1 + \tan^2\lambda = \sec^2\lambda$

$\therefore$ $e = \sec\lambda$

● ***Ex. 3*** *The equation of the chord joining two points* (x_1, y_1) *and* (x_2, y_2) *on the rectangular hyperbola* $xy = c^2$ *is*

(a) $\frac{x}{x_1 + x_2} + \frac{y}{y_1 + y_2} = 1$ (b) $\frac{x}{x_1 - x_2} + \frac{y}{y_1 - y_2} = 1$

(c) $\frac{x}{y_1 + y_2} + \frac{y}{x_1 + x_2} = 1$ (d) $\frac{x}{y_1 - y_2} + \frac{y}{x_1 - x_2} = 1$

Sol. (a) The mid-point of the chord is $\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$

$\therefore$ The equation of chord whose mid-point $\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$ is $T = S_1$

or $\frac{1}{2}\left(x\left(\frac{y_1 + y_2}{2}\right) + y\left(\frac{x_1 + x_2}{2}\right)\right) - c^2$

$= \left(\frac{x_1 + x_2}{2}\right)\left(\frac{y_1 + y_2}{2}\right) - c^2$

$\Rightarrow$ $x(y_1 + y_2) + y(x_1 + x_2) = (x_1 + x_2)(y_1 + y_2)$

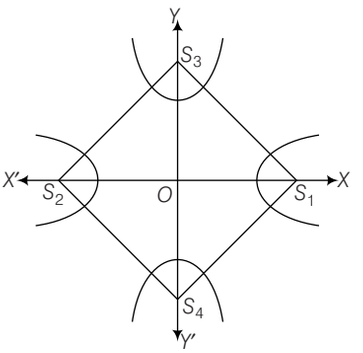
or $\frac{x}{x_1 + x_2} + \frac{y}{y_1 + y_2} = 1$

● ***Ex. 4*** *Area of quadrilateral formed with the foci of the hyperbola* $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ *and* $\frac{x^2}{a^2} - \frac{y^2}{b^2} = -1$ *is*

(a) $4(a^2 + b^2)$ (b) $2(a^2 + b^2)$

(c) $(a^2 + b^2)$ (d) $\frac{1}{2}(a^2 + b^2)$

Sol. (b) Required area $= 4 \times$ Area of $\Delta S_1 O S_3$



$= 4 \times \frac{1}{2} ae \times be_1 = (2ab)(ee_1)$ ...(i)

$\because$ $b^2 = a^2(e^2 - 1)$

$\therefore$ $e = \frac{\sqrt{(a^2 + b^2)}}{a}$ ...(ii)

and $a^2 = b^2(e_1^2 - 1)$

$$\therefore \quad e_1 = \frac{\sqrt{(a^2+b^2)}}{b} \qquad \text{...(iii)}$$

Substituting the values of e and e_1 from Eqs. (ii) and (iii) in Eq. (i), then

$$\text{Required area} = 2ab \times \frac{\sqrt{(a^2+b^2)}}{a} \times \frac{\sqrt{(a^2+b^2)}}{b}$$
$$= 2(a^2+b^2)$$

● ***Ex. 5*** *Let $P(a\sec\theta, b\tan\theta)$ and $Q(a\sec\phi, b\tan\phi)$, where $\theta+\phi=\frac{\pi}{2}$, be two points on the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$. If (h,k) is the point of intersection of normals at P and Q, then k is equal to*

(a) $\left(\frac{a^2+b^2}{a}\right)$ (b) $-\left(\frac{a^2+b^2}{a}\right)$

(c) $\left(\frac{a^2+b^2}{b}\right)$ (d) $-\left(\frac{a^2+b^2}{b}\right)$

Sol. (d) Equations of the normals at $P(\theta)$ and $Q(\phi)$ are

$$ax\cos\theta + by\cot\theta = a^2+b^2 \qquad \text{... (i)}$$

and $$ax\cos\phi + by\cot\phi = a^2+b^2 \qquad \text{... (ii)}$$

Now, dividing by $\cos\theta$ and $\cos\phi$ in Eqs. (i) and (ii) respectively, then

$$ax + by\,\text{cosec}\,\theta = (a^2+b^2)\sec\theta \qquad \text{... (iii)}$$

and $$ax + by\,\text{cosec}\,\phi = (a^2+b^2)\sec\phi \qquad \text{... (iv)}$$

Subtracting Eq. (iv) from Eq. (iii), we get

$$y = \left(\frac{a^2+b^2}{b}\right).\left(\frac{\sec\theta-\sec\phi}{\text{cosec}\,\theta-\text{cosec}\,\phi}\right)$$

$$\therefore \quad k = y$$

$$= \left(\frac{a^2+b^2}{b}\right).\left(\frac{\sec\theta-\sec\left(\frac{\pi}{2}-\theta\right)}{\text{cosec}\,\theta-\text{cosec}\left(\frac{\pi}{2}-\theta\right)}\right) \qquad \left(\because \theta+\phi=\frac{\pi}{2}\right)$$

$$= \left(\frac{a^2+b^2}{b}\right).\left(\frac{\sec\theta-\text{cosec}\,\theta}{\text{cosec}\,\theta-\sec\theta}\right) = -\left(\frac{a^2+b^2}{b}\right)$$

● ***Ex. 6*** *Let the major axis of a standard ellipse equals the transverse axis of a standard hyperbola and their director circles have radius equal to 2R and R respectively. If e_1 and e_2 are the eccentricities of the ellipse and hyperbola, then the correct relation is*

(a) $4e_1^2 - e_2^2 = 6$ (b) $e_1^2 - 4e_2^2 = 2$

(c) $4e_2^2 - e_1^2 = 6$ (d) $e_2^2 - 4e_1^2 = 2$

Sol. (c) Let equation of ellipse is

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1\,(a>b)$$

$\therefore$ Director circle is $x^2+y^2=a^2+b^2$

and $$b^2 = a^2(1-e_1^2)$$

given $$a^2+b^2=(2R)^2$$

$$\Rightarrow \quad a^2+a^2(1-e_1^2)=4R^2$$

$$\Rightarrow \quad 2-e_1^2=\frac{4R^2}{a^2} \qquad \text{... (i)}$$

and equation of hyperbola is $\frac{x^2}{a^2}-\frac{y^2}{b_1^2}=1$

$\therefore$ Director circle is $x^2+y^2=a^2-b_1^2$

and $$b_1^2 = a^2(e_2^2-1)$$

Given $$a^2-b_1^2=R^2$$

$$\Rightarrow \quad a^2-a^2(e_2^2-1)=R^2$$

$$\Rightarrow \quad 2-e_2^2=\frac{R^2}{a^2} \qquad \text{... (ii)}$$

Dividing Eq. (i) by Eq. (ii), then

$$\frac{2-e_1^2}{2-e_2^2}=4 \;\Rightarrow\; 4e_2^2-e_1^2=6$$

● ***Ex. 7*** *The tangent to the hyperbola $xy=c^2$ at point $P(t)$ intersects the X-axis at T and the Y-axis. at T′. The normal to the hyperbola at $P(t)$ intersects the X-axis at N and the Y-axis at N′. The areas of the triangles PNT and PN′T′ are Δ and Δ′ respectively, then $\frac{1}{\Delta}+\frac{1}{\Delta'}$ is*

(a) equal to 1 (b) depends on t

(c) depends on c (d) equal to 2

Sol. (c) Equation of tangent at $P\left(ct, \frac{c}{t}\right)$ is $\frac{x}{t}+ty=2c$

or $$\frac{x}{2ct}+\frac{y}{(2c/t)}=1$$

$$\therefore \quad T \equiv (2ct, 0), T' \equiv \left(0, \frac{2c}{t}\right)$$

and equation of normal at $P\left(ct, \frac{c}{t}\right)$ is

$$xt^3 - yt - ct^4 + c = 0$$

or $$\frac{x}{\left(\frac{c(t^4-1)}{t^3}\right)}+\frac{y}{\left(\frac{c(t^4-1)}{-t}\right)}=1$$

$$\therefore \quad N \equiv \left(\frac{c(t^4-1)}{t^3}, 0\right), N' \equiv \left(0, -\frac{c(t^4-1)}{t}\right)$$

$\because$ Area of triangle $PNT = \Delta$

$$\therefore \quad \Delta = \frac{1}{2}\left|\begin{vmatrix} ct-2ct & \frac{c}{t}-0 \\ \frac{c(t^4-1)}{t^3}-2ct & 0-0 \end{vmatrix}\right|$$

$$= \frac{1}{2}\left| -\frac{c}{t}\left(\frac{c(t^4-1)}{t^3} - 2ct \right) \right| = \frac{c^2}{2}\left(\frac{t^4+1}{t^4} \right)$$

and Area of $\Delta PN'T' = \Delta'$

$$\therefore \quad \Delta' = \frac{1}{2}\left| \begin{vmatrix} ct-0 & \frac{c}{t} - \frac{2c}{t} \\ 0-0 & -\frac{c(t^4-1)}{t} - \frac{2c}{t} \end{vmatrix} \right|$$

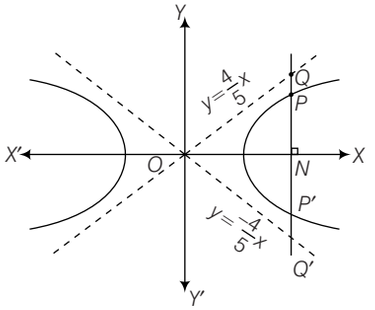
$$= \frac{1}{2}\left| ct\left(-\frac{c(t^4-1)}{t} - \frac{2c}{t} \right) \right| = \frac{c^2}{2}(t^4+1)$$

$$\therefore \quad \frac{1}{\Delta} + \frac{1}{\Delta'} = \frac{2t^4}{c^2(t^4+1)} + \frac{2}{c^2(t^4+1)} = \frac{2}{c^2}$$

● ***Ex. 8*** *Let any double ordinate PNP' of the hyperbola $\frac{x^2}{25} - \frac{y^2}{16} = 1$ be produced both sides to meet the asymptotes is Q and Q', then $(PQ)(P'Q)$ is equal to*

(a) 9 (b) 16 (c) 25 (d) 41

Sol. (b) Let $Q \equiv (x_1, y_1)$



We have $NP = \frac{4}{5}\sqrt{(x_1^2 - 25)}$

and Q is on $y = \frac{4}{5}x$

$\therefore \quad NQ = \frac{4}{5}x_1$

Now, $PQ = NQ - NP$

$$= \frac{4}{5}(x_1 - \sqrt{(x_1^2 - 25)})$$

and $P'Q = NP' + NQ = NP + NQ \quad (\because NP' = NP)$

$$= \frac{4}{5}(x_1 + \sqrt{(x_1^2 - 25)})$$

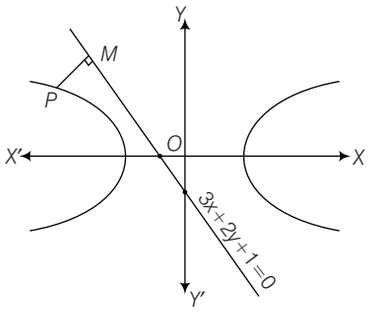
$$\therefore \quad (PQ)(P'Q) = \frac{16}{25}(x_1^2 - (x_1^2 - 25))$$

$$= \frac{16}{25} \times 25 = 16$$

● ***Ex. 9*** *The coordinates of a point on the hyperbola $\frac{x^2}{24} - \frac{y^2}{18} = 1$. Which is nearest to the line $3x + 2y + 1 = 0$ are*

(a) (6, 3) (b) (−6,−3)
(c) (6,−3) (d) (−6,3)

Sol. (d)



Let point P is nearest to the given line if the tangent at P is parallel to the given line.

Now, equation of tangent at $P(x_1, y_1)$ is

$$\frac{xx_1}{24} - \frac{yy_1}{18} = 1$$

$\therefore$ Slope of tangent at $P(x_1, y_1)$ is

$$\frac{3}{4}\frac{x_1}{y_1}$$

which must be equal to $-\frac{3}{2}$

Therefore,

$$\frac{3}{4}.\frac{x_1}{y_1} = -\frac{3}{2} \text{ or } x_1 = -2y_1 \qquad \ldots(i)$$

Also, $P(x_1, y_1)$ lies on the curve

Hence, $$\frac{x_1^2}{24} - \frac{y_1^2}{18} = 1 \qquad \ldots(ii)$$

Solving Eqs. (i) and (ii), we get two points $(6,-3)$ and $(-6,3)$ of which $(-6,3)$ is the nearest.

Aliter :

The equation of normal at $P(2\sqrt{6}\sec\theta, 3\sqrt{2}\tan\theta)$ is

$$(2\sqrt{6}\cos\theta)x + (3\sqrt{2}\cot\theta)y = 42$$

Now, this line will be perpendicular to

$$3x + 2y + 1 = 0$$

then, $(2\sqrt{6}\cos\theta) \times 3 + (3\sqrt{2}\cot\theta) \times 2 = 0$

or $$\sin\theta = -\frac{1}{\sqrt{3}}$$

$\therefore \quad \tan\theta = \frac{1}{\sqrt{2}}$ and $\sec\theta = -\frac{\sqrt{3}}{\sqrt{2}}$

Hence, $P \equiv (-6,3)$

● ***Ex. 10*** *For each positive integer n, consider the point P with abscissa n on the curve $y^2 - x^2 = 1$. If d_n represents the shortest distance from the point P to the line $y = x$, then $\lim_{n\to\infty}(n.d_n)$ has the value equal to*

(a) $\frac{1}{2\sqrt{2}}$ (b) $\frac{1}{2}$

(c) $\frac{1}{\sqrt{2}}$ (d) 0

Sol. (a) Let $P \equiv (n, \sqrt{(n^2+1)})$

$\therefore \quad d_n = \left(\frac{\sqrt{(n^2+1)} - n}{\sqrt{2}}\right)$

or $\quad n \,.\, d_n = \frac{n}{\sqrt{2}}(\sqrt{(n^2+1)} - n)$

or $\quad \lim_{n\to\infty}(n.d_n) = \frac{1}{\sqrt{2}} \lim_{n\to\infty} n(\sqrt{(n^2+1)} - n)$

$$= \frac{1}{\sqrt{2}} \lim_{n\to\infty} \frac{n(\sqrt{(n^2+1)} - n)(\sqrt{(n^2+1)} + n)}{(\sqrt{(n^2+1)} + n)}$$

$$= \frac{1}{\sqrt{2}} \lim_{n\to\infty} \frac{n(1)}{n\left(\sqrt{\left(1+\frac{1}{n^2}\right)} + 1\right)}$$

$$= \frac{1}{\sqrt{2}} \lim_{n\to\infty} \left(\frac{1}{\sqrt{\left(1+\frac{1}{n^2}\right)} + 1}\right)$$

$$= \frac{1}{\sqrt{2}} \cdot \left(\frac{1}{1+1}\right) = \frac{1}{2\sqrt{2}}$$

JEE Type Solved Examples :
More than One Correct Option Type Questions

- This section contains 5 **multiple choice examples.** Each example has four choices (a), (b), (c) and (d) out of which **MORE THAN ONE** may be correct.

● ***Ex. 11*** *If two tangents can be drawn to the different branches of hyperbola* $\frac{x^2}{1} - \frac{y^2}{4} = 1$ *from the point* (α, α^2), *then*

(a) $\alpha \in (-\infty, -2)$ (b) $\alpha \in (-2, 0)$

(c) $\alpha \in (0, 2)$ (d) $\alpha \in (2, \infty)$

Sol. (a, d) $\because (\alpha, \alpha^2)$ lie on the parabola $y = x^2$

$\therefore (\alpha, \alpha^2)$ must lie between the asymptotes of hyperbola

$\frac{x^2}{1} - \frac{y^2}{4} = 1$ in I and II quadrants.

$\because$ Asymptotes of $\frac{x^2}{1} - \frac{y^2}{4} = 1$ are $y = \pm 2x$

then $\quad 2\alpha < \alpha^2$ and $-2\alpha < \alpha^2$

$\Rightarrow \quad \alpha(\alpha - 2) > 0$ and $\alpha(\alpha + 2) > 0$

$\therefore \quad \alpha < 0$ or $\alpha > 2$ and $\alpha < -2$ or $\alpha > 0$

$\therefore \quad \alpha \in (-\infty, -2) \cup (2, \infty)$

● ***Ex. 12*** *If the ellipse* $x^2 + \lambda^2 y^2 = \lambda^2 a^2; \lambda^2 > 1$ *is confocal with the hyperbola* $x^2 - y^2 = a^2$, *then*

(a) ratio of eccentricities of ellipse and hyperbola is $1:\sqrt{3}$

(b) ratio of major axis of ellipse and transverse axis of hyperbola is $\sqrt{3}:1$

(c) The ellipse and hyperbola cuts each other orthogonally

(d) ratio of length of latusrectum of ellipse and hyperbola is 1 : 3

Sol. (a, b, c) Given ellipse is $\frac{x^2}{\lambda^2 a^2} + \frac{y^2}{a^2} = 1$; $\lambda^2 a^2 > a^2$ and let e_1 and e_2 be the eccentricities of ellipse and hyperbola, then

$$a^2 = \lambda^2 a^2 (1 - e_1^2)$$

or $\quad e_1 = \sqrt{\left(1 - \frac{1}{\lambda^2}\right)}$

and $\quad e_2 = \sqrt{2}$

Now, $\quad \lambda a e_1 = a e_2$

$\Rightarrow \quad \lambda\sqrt{\left(1 - \frac{1}{\lambda^2}\right)} = \sqrt{2}$

$\Rightarrow \quad \lambda^2 - 1 = 2$ or $\lambda = \pm\sqrt{3}$

$\therefore \quad \lambda = \sqrt{3}$ $\quad (\because \lambda > 0)$

Alternate (a) : $\frac{e_1}{e_2} = \frac{1}{\lambda} = \frac{1}{\sqrt{3}}$

Alternate (b) : $= \frac{\text{Major axis of ellipse}}{\text{Transverse axis of hyperbola}}$

$$= \frac{2\lambda a}{2a} = \lambda = \sqrt{3}$$

Alternate (c) : Equations of tangents of ellipse and hyperbola at (x_1, y_1) are

$$\frac{xx_1}{\lambda^2 a^2} + \frac{yy_1}{a^2} = 1$$

and $\quad xx_1 - yy_1 = a^2$

i.e., $\quad$ slopes are $= -\frac{x_1}{\lambda^2 y_1}$ and $\frac{x_1}{y_1}$ $\quad$ (say m_1 and m_2)

According to alternate,

$$m_1 m_2 = -\frac{x_1}{\lambda^2 y_1} \times \frac{x_1}{y_1} = -\frac{x_1^2}{\lambda^2 y_1^2}$$

$$= -\frac{\frac{2a^2}{\lambda^2+1}}{\frac{a^2(\lambda^2-1)}{(\lambda^2+1)}} = -\frac{2}{\lambda^2-1} \quad \left(\because \begin{matrix} x_1^2 = \frac{2a^2\lambda^2}{\lambda^2+1} \\ \text{and } y_1^2 = \frac{a^2(\lambda^2-1)}{(\lambda^2+1)} \end{matrix}\right)$$

$$= -\frac{2}{3-1} = -1 \qquad (\because \lambda = \sqrt{3})$$

Alternate (d) : $= \dfrac{\text{Latus reaction of ellipse}}{\text{Latus reaction of hyperbola}}$

$$= \frac{\dfrac{2a^2}{\lambda a}}{\dfrac{2a^2}{a}} = \frac{1}{\lambda} = \frac{1}{\sqrt{3}}$$

● ***Ex. 13*** *If the circle $x^2 + y^2 = a^2$ intersects the hyperbola $xy = c^2$ at four points $P(x_1, y_1), Q(x_2, y_2), R(x_3, y_3)$ and $S(x_4, y_4)$, then*

(a) $\Sigma x_1 = 0$ (b) $\Sigma y_1 = 0$

(c) $\Pi x_1 = 0$ (d) $\Pi y_1 = 0$

Sol. (a, b, c, d) Solving $x^2 + y^2 = a^2$ and $xy = c^2$,

we have, $x^2 + \dfrac{c^4}{x^2} = a^2$

or $x^4 - a^2x^2 + c^4 = 0$

or $\Sigma x_1 = 0$ and $\Pi x_1 = c^4$

Similarly, if we eliminate x, then

$$y^4 - a^2y^2 + c^4 = 0$$

or $\Sigma y_1 = 0$ and $\Pi y_1 = c^4$

● ***Ex. 14*** *A straight line touches the rectangular hyperbola $9x^2 - 9y^2 = 8$ and the parabola $y^2 = 32x$, the equation of the line is*

(a) $9x + 3y - 8 = \infty$ (b) $9x - 3y + 8 = 0$

(c) $9x + 3y + 8 = 0$ (d) $9x - 3y - 8 = 0$

Sol. (b, c) Equation of tangent to the parabola $y^2 = 32x$ is

$$y = mx + \frac{8}{m} \qquad \text{... (i)}$$

Which is also touches the hyperbola $9x^2 - 9y^2 = 8$

i.e. $x^2 - y^2 = \dfrac{8}{9}$

So that, $\left(\dfrac{8}{m}\right)^2 = \dfrac{8}{9} \times m^2 - \dfrac{8}{9}$

$\Rightarrow$ $\dfrac{8}{m^2} = \dfrac{m^2}{9} - \dfrac{1}{9}$

$\Rightarrow$ $m^4 - m^2 - 72 = 0$

$\Rightarrow$ $(m^2 - 9)(m^2 + 8) = 0$

$\therefore$ $m^2 - 9 = 0$

but $m^2 + 8 \neq 0$

$\therefore$ $m = \pm 3$

Hence, from Eq. (i), the equation of tangents are

$$y = 3x + \frac{8}{3}$$

and $y = -3x - \dfrac{8}{3}$

or $9x - 3y + 8 = 0$

and $9x + 3y + 8 = 0$

● ***Ex. 15*** *The differential equation $\dfrac{dx}{dy} = \dfrac{3y}{2x}$ represents a family of hyperbolas (except when it represents a pair of lines) with eccentricity*

(a) $\sqrt{\dfrac{7}{3}}$ (b) $\sqrt{\dfrac{5}{3}}$

(c) $\sqrt{\dfrac{3}{2}}$ (d) $\sqrt{\dfrac{5}{2}}$

Sol. (b, d) $\because \dfrac{dx}{dy} = \dfrac{3y}{2x}$

or $\int 2x\,dx = \int 3y\,dy$

or $x^2 = \dfrac{3y^2}{2} + c$

or $\dfrac{x^2}{3} - \dfrac{y^2}{2} = \dfrac{c}{3}$

or $\dfrac{x^2}{3} - \dfrac{y^2}{2} = c_1$

Case I If $c_1 > 0$, then $e = \sqrt{\left(1 + \dfrac{2}{3}\right)} = \sqrt{\dfrac{5}{3}}$

Case II If $c_1 < 0$, then $e = \sqrt{\left(1 + \dfrac{3}{2}\right)} = \sqrt{\dfrac{5}{2}}$

JEE Type Solved Examples : Paragraph Based Questions

- This section contains 2 **solved paragraphs** based upon each of the paragraph 3 **multiple choice** questions have to be answered. Each of these questions has four choices (a), (b), (c) and (d) out of which **ONLY ONE** is correct.

Paragraph I

(Q. Nos. 16 to 18)

A conic C satisfies the differential equation.
$(1+y^2)\,dx - xy\,dy = 0$ and passes through the point (1, 0).
An ellipse E which is confocal with C having its eccentricity equal to $\sqrt{\left(\frac{2}{3}\right)}$.

16. Length of latusrectum of the conic C is
(a) 1 (b) 2
(c) 3 (d) 4

17. Equations of the ellipse E is
(a) $\frac{x^2}{3}+\frac{y^2}{1}=1$ (b) $\frac{x^2}{1}+\frac{y^2}{3}=1$
(c) $\frac{x^2}{4}+\frac{y^2}{9}=1$ (d) $\frac{x^2}{9}+\frac{y^2}{4}=1$

18. Locus of the point of intersection of the perpendicular tangents to the ellipse E, is
(a) $x^2+y^2=4$ (b) $x^2+y^2=8$
(c) $x^2+y^2=10$ (d) $x^2+y^2=13$

Sol. Given differential equation is $(1+y^2)\,dx - xy\,dy = 0$

$\Rightarrow \quad \frac{dx}{x} - \frac{ydy}{(1+y^2)} = 0$ or $\frac{2dx}{x} - \frac{2y\,dy}{1+y^2} = 0$

On integrating, we have $2\ln x - \ln(1+y^2) = \ln c$

or $\ln x^2 = \ln(c(1+y^2))$ or $x^2 = c(1+y^2)$

or $\frac{x^2}{c} - \frac{y^2}{1} = 1$ (Hyperbola)

It passes through (1, 0), then $\frac{1}{c} - 0 = 1$

$\therefore \quad c = 1$

$\therefore C$ is rectangular hyperbola $x^2 - y^2 = 1$, having its eccentricity $= \sqrt{2}$ and its foci are $(\pm\sqrt{2}, 0)$.

If a is the length of semi major axis of ellipse E, then $ae = \sqrt{2}$

or $a\sqrt{\frac{2}{3}} = \sqrt{2}$ or $a = \sqrt{3}$

Now, $b^2 = a^2(1-e^2) = 3\left(1-\frac{2}{3}\right) = 1$

16. (b) Length of latusrectum of the conic C is $\frac{2(1)^2}{1} = 2$

17. (a) Equation of the ellipse E is

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1 \text{ i.e, } \frac{x^2}{3}+\frac{y^2}{1}=1$$

18. (a) Required locus is the director circle of E which is $x^2+y^2=3+1$ or $x^2+y^2=4$

Paragraph II

(Q. Nos. 19 to 21)

For the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$, the normal at point P meets the transverse axis AA' in G and the conjugate axis BB' in g and CF be perpendicular to the normal from the centre.

19. The value of $\frac{PF.PG}{(CB)^2}$ is equal to
(a) 4 (b) 3
(c) 2 (d) 1

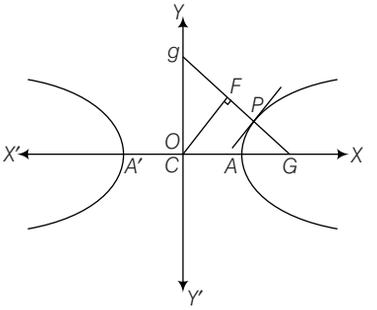
20. The value of $PF.Pg$ is equal to
(a) $(CA)^2$ (b) $(CF)^2$
(c) $(CB)^2$ (d) $CA\,.\,CB$

21. Locus of middle-point of G and g is a hyperbola of eccentricity
(a) $\frac{1}{\sqrt{(e^2-1)}}$ (b) $\frac{e}{\sqrt{(e^2-1)}}$
(c) $2\sqrt{(e^2-1)}$ (d) $\frac{e}{2}$

Sol. $C \equiv (0,0)$

$AA' = 2a,\ BB' = 2b$

$\therefore \quad CA = CA' = a$ and $CB = CB' = b$



Let $P \equiv (a\sec\theta,\ b\tan\theta)$

Equation of normals at P is

$$ax\cos\theta + by\cot\theta = a^2 + b^2 \quad \text{... (i)}$$

$\therefore \quad G \equiv \left(\frac{(a^2+b^2)}{a}\sec\theta,\ 0\right),\ g \equiv \left(0,\ \frac{(a^2+b^2)}{b}\tan\theta\right)$

Equation of CF which is perpendicular to Eq. (i) and through origin is $bx\cot\theta - ay\cos\theta = 0$

$$\therefore \quad PF = \frac{ab}{\sqrt{(b^2\sec^2\theta + a^2\tan^2\theta)}}$$

and $$PG = \sqrt{\left(a\sec\theta - \frac{a^2+b^2}{a}\sec\theta\right)^2 + (b\tan\theta - 0)^2}$$

$$= \frac{b}{a}\sqrt{(b^2\sec^2\theta + a^2\tan^2\theta)}$$

19. (d) $\because PF \,.\, PG = \frac{ab}{\sqrt{(b^2\sec^2\theta + a^2\tan^2\theta)}} \cdot \frac{b}{a}\sqrt{(b^2\sec^2\theta + a^2\tan^2\theta)}$

$$= b^2 = (CB)^2$$

$$\therefore \quad \frac{PF \,.\, PG}{(CB)^2} = 1$$

20. (a) $\because \quad Pg = \sqrt{(a\sec\theta - 0)^2 + \left(b\tan\theta - \frac{(a^2+b^2)}{b}\tan\theta\right)^2}$

$$= \sqrt{\left(a^2\sec^2\theta + \frac{a^4}{b^2}\tan^2\theta\right)}$$

$$= \frac{a}{b}\sqrt{(b^2\sec^2\theta + a^2\tan^2\theta)}$$

$$\therefore \; PF \,.\, Pg = \frac{ab}{\sqrt{(b^2\sec^2\theta + a^2\tan^2\theta)}} \times \frac{a}{b}\sqrt{(b^2\sec^2\theta + a^2\tan^2\theta)}$$

$$= a^2 = (CA)^2$$

21. (b) $\because$ Mid-point of G and g is

$$\left(\frac{(a^2+b^2)}{2a}\sec\theta,\ \frac{(a^2+b^2)}{2b}\tan\theta\right)$$

$$\therefore \quad x = \left(\frac{a^2+b^2}{2a}\right)\sec\theta,\ y = \left(\frac{a^2+b^2}{2a}\right)\tan\theta$$

$$\therefore \quad (2ax)^2 - (2by)^2 = (a^2+b^2)^2$$

or $$\frac{x^2}{\left(\frac{a^2+b^2}{2a}\right)^2} - \frac{y^2}{\left(\frac{a^2+b^2}{2b}\right)^2} = 1$$

$$\therefore \quad e_1 = \sqrt{\frac{\left(\frac{a^2+b^2}{2a}\right)^2 + \left(\frac{a^2+b^2}{2b}\right)^2}{\left(\frac{a^2+b^2}{2a}\right)^2}} = \sqrt{\left(\frac{\frac{1}{a^2}+\frac{1}{b^2}}{\frac{1}{a^2}}\right)}$$

$$= \sqrt{\frac{a^2+b^2}{2b^2}} = \sqrt{\frac{a^2+a^2(e^2-1)}{a^2(e^2-1)}} = \frac{e}{\sqrt{(e^2-1)}}$$

JEE Type Solved Examples :
Single Integer Answer Type Questions

▪ This section contains 2 **examples.** The answer to each example in **a single digit integer,** ranging from 0 to 9 (both inclusive).

● ***Ex. 22*** *The equation of transverse axis of hyperbola (passing through origin) having asymptotes* $3x - 4y - 1 = 0$ *and* $4x - 3y - 6 = 0$ *is* $ax + by - c = 0$, $a, b, c \in N$ *and g.c.d* $(a, b, c) = 1$, *then the value of* $a + b + c$ *is*

Sol. (7) Since the equation of asymptotes are

$$3x - 4y - 1 = 0 \ \text{ and } \ 4x - 3y - 6 = 0$$

$\therefore$ Equation of transverse axis is given by

$$\frac{|(3x-4y-1)|}{\sqrt{(3)^2+(-4)^2}} = \frac{|4x-3y-6|}{\sqrt{(4)^2+(-3)^2}}$$

or $$|3x - 4y - 1| = |4x - 3y - 6|$$

or $$(3x - 4y - 1) = \pm(4x - 3y - 6) \Rightarrow x + y - 5 = 0$$

and $$x - y - 7 = 0$$

$\therefore$ Transverse axis is given by $ax + by - c = 0$; $a, b, c \in N$

$\Rightarrow \quad ax + by - c \equiv x + y - 5 = 0$

$\Rightarrow \quad a = 1, b = 1, c = 5$

Hence, $\quad a + b + c = 1 + 1 + 5 = 7$

● ***Ex. 23*** *If a variable line has its intercepts on the coordinate axes are* e *and* e', *where* $\frac{e}{2}$ *and* $\frac{e'}{2}$ *are the eccentricities of a hyperbola and its conjugate hyperbola, then the line always touches the circle* $x^2 + y^2 = r^2$, *where* r *is*

Sol. (2) Since $\frac{e}{2}$ and $\frac{e'}{2}$ are the eccentricities of a hyperbola and its conjugate, we have

$$\left(\frac{e}{2}\right)^{-2} + \left(\frac{e'}{2}\right)^{-2} = 1 \ \text{ or } \ \frac{4}{e^2} + \frac{4}{(e')^2} = 1$$

or $$4 = \frac{e^2e'^2}{e^2+e'^2} \qquad \ldots (i)$$

Equations of variable line is $\frac{x}{e} + \frac{y}{e'} = 1$

i.e. $$xe' + ye - ee' = 0.$$

It is tangent to the circle $x^2 + y^2 = r^2$

$$\therefore \quad \frac{|0 - ee'|}{\sqrt{e^2+e'^2}} = r$$

$$\therefore \quad r = \frac{ee'}{\sqrt{(e^2+e'^2)}} = 2 \qquad \text{[from Eq. (i)]}$$

JEE Type Solved Examples : Matching Type Questions

- This section contain **only one example.** This example has three statements (A, B and C) given in **Column I** and four statements (p, q, r, and s) in **Column II**. Any given statment in **Column I** can have correct matching with one or more statements (s) given in **Column II.**

● ***Ex. 24*** *Match the following.*

	Column I		Column II
(A)	The locus of the point of intersection of the lines $\sqrt{3}x - y - 4\sqrt{3}t = 0$ and $\sqrt{3}tx + ty - 4\sqrt{3} = 0$ (where t is a parameter) is a hyperbola whose eccentricity is	(p)	a natural number
(B)	If the product of the perpendicular distances from any point on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ of eccentricity $e = \sqrt{3}$ from its asymptotes is equal to 6, then the length of the transverse axis of the hyperbola is	(q)	a prime number
(C)	The area of the triangle that a tangent at a point of the hyperbola $\frac{x^2}{16} - \frac{y^2}{a} = 1$ makes with its asymptotes is	(r)	a composite number
		(s)	a perfect number

Sol. (A) → (p, q); (B) → (p, r, s); (C)→ (p, r)

(A) The given lines are

$$\sqrt{3}x - y - 4\sqrt{3}t = 0 \quad \text{... (i)}$$

and $$\sqrt{3}tx + ty - 4\sqrt{3} = 0 \quad \text{... (ii)}$$

Eliminate 't' from Eqs. (i) and (ii), then

$$\frac{\sqrt{3}x - y}{4\sqrt{3}} = \frac{4\sqrt{3}}{\sqrt{3}x + y}$$

$$\Rightarrow \quad 3x^2 - y^2 = 48$$

or $$\frac{x^2}{16} - \frac{y^2}{48} = 1$$

or $$48 = 16(e^2 - 1)$$

$$\Rightarrow \quad e^2 = 4$$

$$\therefore \quad e = 2$$

(B) Here, $e = \sqrt{3}$

$$\therefore \quad b^2 = a^2(3-1) = 2a^2 \quad \text{... (i)}$$

Now, hyperbola convert in the form

$$\frac{x^2}{a^2} - \frac{y^2}{2a^2} = 1$$

Let $P(a\sec\theta, a\sqrt{2}\tan\theta)$ be any point on the hyperbola.

∵ Asymptotes of hyperbola are

$$\frac{x^2}{a^2} - \frac{y^2}{2a^2} = 0$$

or $$2x^2 - y^2 = 0$$

or $$x\sqrt{2} + y = 0$$

and $$x\sqrt{2} - y = 0$$

∵ Product of the perpendiculars from P on asymptotes =6

$$\therefore \quad \frac{|a\sqrt{2}\sec\theta + a\sqrt{2}\tan\theta|}{\sqrt{(2+1)}} \cdot \frac{|a\sqrt{2}\sec\theta - a\sqrt{2}\tan\theta|}{\sqrt{2+1}} = 6$$

or $$\frac{2a^2}{3} = 6$$

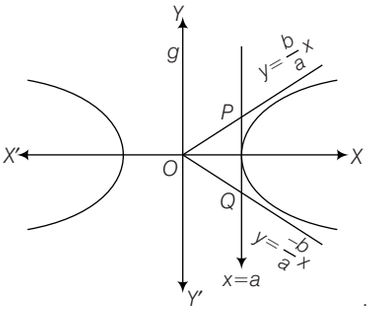
$$\therefore \quad a = 3$$

Hence, length of transverse axis $= 2a = 6$

(C) Equation of tangent at $(a, 0)$ is $x = a$

Equation of asymptotes are $y = \pm\frac{b}{a}x$

$$\therefore \quad P \equiv (a, b), Q \equiv (a, -b)$$



$\therefore$ Required area $= \frac{1}{2} \times a \times 2b$

$$= ab$$

$$= (4)(3) = 12 \quad \text{(Here } a = 4, b = 3\text{)}$$

JEE Type Solved Examples :
Statement I and II Type Questions

■ **Directions** (Ex. Nos. 25 and 26) are Assertion-Reason type examples. Each of these examples contains two statements. **Statement I** (Assertion) and **Statement II** (Reason) Each of these also has four alternative choices, only one of which is the correct answer. You have to select the correct choice as given below :

(a) Statement I is true, statement II is true; statement II is a correct explanation for statement I

(b) Statement I is true, statement II is true; statement II is not a correct explanation for statement I

(c) Statement I is true, statement II is false

(d) Statement I is false, statement II is true

● ***Ex. 25*** **Statement I** *Director circle of hyperbola* $\frac{x^2}{a^2}-\frac{y^2}{b^2}+1=0$ *is defined only when* $b \geq a$

Statement II *Director circle of hyperbola* $\frac{x^2}{25}-\frac{y^2}{9}=1$ *is* $x^2+y^2=16$.

Sol. (b) Hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}+1=0$ can be re-written as

$$\frac{x^2}{(-a)^2}-\frac{y^2}{(-b^2)}=1$$

So, the director circle will be

$$x^2+y^2=(-a^2)-(-b^2)=b^2-a^2;$$

Which will be defined only where $b \geq a$ (i.e. $b^2-a^2 \geq 0$)

$\therefore$ Statement I is true and director circle of hyperbola $\frac{x^2}{25}-\frac{y^2}{9}=1$ is $x^2+y^2=25-9=16$

$\therefore$ Statement II is true.

Hence, both statements are true but statement II is not a correct explanation of statement I.

● ***Ex. 26*** **Statement I** *If a circle* $S \equiv 0$ *intersect a hyperbola* $xy = 4$ *at four points, three of them being (2, 2), (4, 1) and (6, 2/3), then the coordinates of the fourth point are* $\left(\frac{1}{4}, 16\right)$.

Statement II *If a circle* $S \equiv 0$ *intersects a hyperbola* $xy = c^2$ *at* t_1, t_2, t_3 *and* t_4, *then* $t_1 t_2 t_3 t_4 = 1$.

Sol. (d) Let circle $S \equiv x^2 + y^2 - a^2 = 0$

and given hyperbola $xy = c^2$

Then, $x^2+\frac{c^4}{x^2}=a^2$ or $x^4-a^2x^2+c^4=0$

If four intersecting points are $\left(ct_1, \frac{c}{t_1}\right), \left(ct_2\frac{c}{t_2}\right), \left(ct_3, \frac{c}{t_3}\right)$ and $\left(ct_4, \frac{c}{t_4}\right)$, then

$$(ct_1)(ct_2)(ct_3)(ct_4)=c^4$$

$\therefore$ $t_1 t_2 t_3 t_4 = 1$

$\therefore$ Statement II is true

For the point (2, 2); $t_1 = 1$

For the point (4, 1); $t_2 = 2$

For the point (6, 2/3); $t_3 = 3$

For the point $\left(\frac{1}{4}, 16\right)$; $t_4 = \frac{1}{8}$

Now, $t_1 t_2 t_3 t_4 = \frac{3}{4} \neq 1$

$\therefore$ Statement I is false.

Subjective Type Questions

■ In this section there are 11 **subjective examples.**

● ***Ex. 27*** *PP′ is a diameter of the rectangular hyperbola* $xy = c^2$. *Show that the intersection of the tangent of P with the straight line through P′ parallel to either asymptote is the locus* $xy + 3c^2 = 0$.

Sol. The given rectangular hyperbola is

$$xy = c^2 \quad ...(i)$$

Given that PP' is a diameter of Eq. (i). Therefore, if P is the point $(ct, c/t)$ then P' is $(-ct, -c/t)$. Equation of tangent at P is

$$x + yt^2 = 2ct \quad ...(ii)$$

Asymptotes of Eq. (i) are $x = 0, y = 0$.

$\therefore$ The equation of the line through P' and parallel to the asymptote $y = 0$ is

$$y = -c/t \quad ...(iii)$$

Putting the value of t from Eq. (iii) in Eq. (ii), then

$$x + y \times \frac{c^2}{y^2} = 2c \times -\frac{c}{y}$$

or $$xy + c^2 = -2c^2$$

or $$xy + 3c^2 = 0$$

which is the required locus of the point of intersection of Eqs. (ii) and (iii).

Again the equation of the line through P' and parallel to the asymptote $x = 0$ is

$$x = -ct \qquad \text{...(iv)}$$

Putting the value of t from Eq. (iv) in Eq. (ii), we get

$$x + y\left(\frac{x^2}{c^2}\right) = 2c \times -\frac{x}{c} \quad \text{or} \quad xy + 3c^2 = 0$$

which is the required locus of the point of intersection of Eqs. (ii) and (iv).

● ***Ex. 28*** *The tangent at a point P of a rectangular hyperbola meets the asymptotes at L and M and C is the centre of the hyperbola. Prove that*

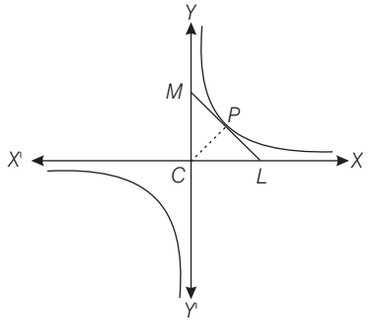
$$PL = PM = CP.$$

Sol. Since hyperbola is

$$xy = c^2 \qquad \text{....(i)}$$

Let $P\left(ct, \frac{c}{t}\right)$ be any point on Eq. (i), then equation of tangent at P on Eq. (i) is

$$x + t^2 y = 2ct \qquad \text{...(ii)}$$



Since, asymptotes of $xy = c^2$ are $x = 0$ and $y = 0$

i.e. Y-axis and X-axis.

$\because$ Tangents meet X-axis at L and Y-axis at M.

$\therefore$ Coordinates of L and M are $(2ct, 0)$ and $\left(0, \frac{2c}{t}\right)$ respectively.

The middle-point of LM is $\left(\frac{2ct+0}{2}, \frac{0+\frac{2c}{t}}{2}\right)$ i.e. $\left(ct, \frac{c}{t}\right)$.

i.e. the point of P.

$\therefore \quad PL = PM$

Also, $\quad CP = \sqrt{\left(c^2t^2 + \frac{c^2}{t^2}\right)}$

and $\quad ML = \sqrt{\left(4c^2t^2 + \frac{4c^2}{t^2}\right)} = 2CP$

$\therefore \quad CP = \frac{1}{2} ML = PL = PM$

Hence, $\quad PL = PM = CP.$

● ***Ex. 29*** *Prove that the perpendicular focal chords of a rectangular hyperbola are equal.*

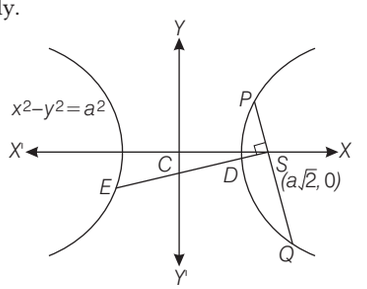
Sol. Let rectangular hyperbola is $x^2 - y^2 = a^2$.

Let equations of PQ and DE are

$$y = mx + c \qquad \text{...(i)}$$

and $\quad y = m_1 x + c_1 \qquad \text{...(ii)}$

respectively.



Be any two focal chords of any rectangular hyperbola $x^2 - y^2 = a^2$ through its focus. We have to prove $PQ = DE$.

Since, $PQ \perp DE$.

$\therefore \quad mm_1 = -1 \qquad \text{...(iii)}$

Also PQ passes through $S(a\sqrt{2}, 0)$ then from Eq. (i),

$$0 = ma\sqrt{2} + c$$

or $\quad c^2 = 2a^2m^2 \qquad \text{...(iv)}$

Let (x_1, y_1) and (x_2, y_2) be the coordinates of P and Q then

$$(PQ)^2 = (x_1 - x_2)^2 + (y_1 - y_2)^2 \qquad \text{...(v)}$$

Since, (x_1, y_1) and (x_2, y_2) lie on Eq. (i)

$\therefore \quad y_1 = mx_1 + c$ and $y_2 = mx_2 + c$

$\therefore \quad (y_1 - y_2) = m(x_1 - x_2) \qquad \text{...(vi)}$

From Eqs. (v) and (vi),

$$(PQ)^2 = (x_1 - x_2)^2 (1 + m^2) \qquad \text{...(vii)}$$

Now, solving $y = mx + c$ and $x^2 - y^2 = a^2$ then

$$x^2 - (mx + c)^2 = a^2$$

or $\quad (m^2 - 1)\, x^2 + 2mcx + (a^2 + c^2) = 0$

$\therefore \quad x_1 + x_2 = \frac{2mc}{m^2 - 1}$ and $x_1 x_2 = \frac{a^2 + c^2}{m^2 - 1}$

$\Rightarrow \quad (x_1 - x_2)^2 = (x_1 + x_2)^2 - 4x_1x_2$

$$= \frac{4m^2c^2}{(m^2-1)^2} - \frac{4(a^2 + c^2)}{(m^2 - 1)}$$

$$= \frac{4\{a^2 + c^2 - a^2m^2\}}{(m^2-1)^2}$$

$$= \frac{4a^2(m^2 + 1)}{(m^2-1)^2} \qquad [\because c^2 = 2a^2m^2]$$

From Eq. (vii), $\quad (PQ)^2 = 4a^2\left(\frac{m^2+1}{m^2-1}\right)^2$

Similarly, $\quad (DE)^2 = 4a^2\left(\frac{m_1^2+1}{m_1^2-1}\right)^2$

$$= 4a^2\left(\frac{\left(-\frac{1}{m}\right)^2+1}{\left(-\frac{1}{m}\right)^2-1}\right)^2 \qquad (\because mm_1=-1)$$

$$= 4a^2\left(\frac{m^2+1}{m^2-1}\right)^2$$

$$= (PQ)^2$$

Thus, $(PQ)^2 = (DE)^2 \Rightarrow PQ = DE.$

Hence, perpendicular focal chords of a rectangular hyperbola are equal.

● ***Ex. 30*** *The normals at three points P, Q, R on a rectangular hyperbola intersect at a point T on the curve. Prove that the centre of the hyperbola is the centroid of the triangle PQR.*

Sol. Equation of the normal at point $\left(ct, \frac{c}{t}\right)$ on $xy = c^2$ is

$$xt^3 - yt - ct^4 + c = 0$$

It will pass through the point (h, k)

$$\therefore \qquad ht^3 - kt - ct^4 + c = 0 \qquad \text{...(i)}$$

Also $T(h, k)$ lies on $xy = c^2$

$$\therefore \qquad hk = c^2$$

Therefore, $h = cq$ and $k = \frac{c}{q}$

From, $$cqt^3 - \frac{c}{q}t - ct^4 + c = 0$$

or $$qt^3 - \frac{t}{q} - t^4 + 1 = 0$$

or $$q^2t^3 - t - qt^4 + q = 0$$

or $$q(qt^3+1) - t(qt^3+1) = 0$$

or $$(q-t)(qt^3+1) = 0$$

$$q \neq t$$

$$\therefore \qquad qt^3 + 1 = 0$$

The three points other than T are given by

$$qt^3 + 1 = 0 \qquad \text{...(ii)}$$

If coordinates of $P\left(ct_1, \frac{c}{t_1}\right), Q\left(ct_2, \frac{c}{t_2}\right)$ and $R\left(ct_3, \frac{c}{t_3}\right)$

then from Eq. (ii),

$$t_1 + t_2 + t_3 = 0 \qquad \text{...(iii)}$$

$$t_1t_2 + t_2t_3 + t_3t_1 = 0 \qquad \text{...(iv)}$$

and $$t_1t_2t_3 = -1 \qquad \text{...(v)}$$

From Eq. (iii),

$$c(t_1 + t_2 + t_3) = 0$$

and from Eq. (iv),

$$t_1t_2t_3\left(\frac{1}{t_1} + \frac{1}{t_2} + \frac{1}{t_3}\right) = 0$$

or $$(-1)\left(\frac{1}{t_1} + \frac{1}{t_2} + \frac{1}{t_3}\right) = 0 \qquad \text{[from Eq. (v)]}$$

$$\therefore \qquad \frac{1}{t_1} + \frac{1}{t_2} + \frac{1}{t_3} = 0$$

or $$c\left(\frac{1}{t_1} + \frac{1}{t_2} + \frac{1}{t_3}\right) = 0$$

Hence, $c(t_1 + t_2 + t_3) = 0, c\left(\frac{1}{t_1} + \frac{1}{t_2} + \frac{1}{t_3}\right) = 0$

$\Rightarrow$ Centroid of ΔPQR is the origin.

● ***Ex. 31*** *Find the equation of the hyperbola whose asymptotes are $x + 2y + 3 = 0$ and $3x + 4y + 5 = 0$ and which passes through the point $(1, -1)$. Find also the equation of the conjugate hyperbola.*

Sol. Combined equation of asymptotes is

$$(x + 2y + 3)(3x + 4y + 5) = 0$$

or $$3x^2 + 10xy + 8y^2 + 14x + 22y + 15 = 0 \qquad \text{...(i)}$$

Also, we know that the equation of the hyperbola differs from that of asymptotes by a constant.

Let the equation of the hyperbola be

$$3x^2 + 10xy + 8y^2 + 14x + 22y + \lambda = 0 \qquad \text{...(ii)}$$

Since it passes through $(1, -1)$ then

$$3(1)^2 + 10(1)(-1) + 8(-1)^2 + 14(1) + 22(-1) + \lambda = 0$$

$\Rightarrow$ $$3 - 10 + 8 + 14 - 22 + \lambda = 0$$

$\therefore$ $$\lambda = 7$$

From Eq. (ii), equation of hyperbola is

$$3x^2 + 10xy + 8y^2 + 14x + 22y + 7 = 0 \qquad \text{...(iii)}$$

But we know that equation of conjugate hyperbola

= 2 (Combined equation of asymptotes) − (Equation of hyperbola)

$\Rightarrow$ $$6x^2 + 20xy + 16y^2 + 28x + 44y + 30$$

$$-3x^2 - 10xy - 8y^2 - 14x - 22y - 7 = 0$$

or $$3x^2 + 10xy + 8y^2 + 14x + 22y + 23 = 0.$$

● ***Ex. 32*** *A triangle is inscribed in $xy = c^2$ and two of its sides are parallel to $y = m_1x$ and $y = m_2x$ prove that the third side envelopes the hyperbola $4m_1m_2xy = c^2(m_1 + m_2)^2$.*

Sol. Let a triangle PQR be inscribed in $xy = c^2$.

Let the coordinates of the vertices of the triangle be

$$P\left(ct_1, \frac{c}{t_1}\right), Q\left(ct_2, \frac{c}{t_2}\right) \text{ and } R\left(ct_3, \frac{c}{t_3}\right)$$

Now, the equation of chord joining P and Q is

$$x + yt_1t_2 = c(t_1 + t_2) \qquad \text{...(i)}$$

and the equation of chord joining Q and R is

$$x + yt_2t_3 = c(t_2 + t_3) \qquad \text{...(ii)}$$

Let Eq. (i) be parallel to $y = m_1x$ and Eq. (ii) be parallel to $y = m_2x$.

$$\therefore \qquad m_1 = -\frac{1}{t_1 t_2} \quad \text{and} \quad m_2 = -\frac{1}{t_2 t_3}$$

$$\therefore \qquad \frac{m_1}{m_2} = \frac{t_3}{t_1} \text{ i.e. } t_3 = \left(\frac{m_1}{m_2}\right) t_1 \qquad \ldots(iii)$$

Again the equation to the third side RP is

$$x + y t_3 t_1 = c(t_3 + t_1)$$

$$x + y\left(\frac{m_1}{m_2}\right) t_1^2 = c\left(\frac{m_1}{m_2} t_1 + t_1\right)$$

or $\qquad y m_1 t_1^2 - c t_1 (m_1 + m_2) + x m_2 = 0 \qquad \ldots(iv)$

t_1 being a parameter. Since t_1 is real the envelope of Eq. (iv) is given by the discriminant of Eq. (iv) $= 0$

i.e. $\qquad c^2 (m_1 + m_2)^2 - 4 y m_1 \cdot x m_2 = 0$

or $\qquad 4 m_1 m_2 xy = c^2 (m_1 + m_2)^2.$

● ***Ex. 33*** *In both an ellipse and a hyperbola, prove that the focal distance of any point and the perpendicular from the centre upon the tangent at it meet on a circle whose centre is the focus and whose radius is the semi-transverse axis.*

Sol. Let the hyperbola be

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \qquad \ldots(i)$$

Let there be any point $P(a \sec \phi, b \tan \phi)$ on the hyperbola Eq. (i).

$\therefore$ Equation of tangent at 'P' is

$$\frac{x}{a} \sec \phi - \frac{y}{b} \tan \phi = 1 \qquad \ldots(ii)$$

Equation of focal chord SP is [if $S \equiv (-ae, 0)$]

$$y - 0 = \frac{b \tan \phi - 0}{a \sec \phi + ae}(x + ae)$$

$$\Rightarrow \qquad y = \frac{b \sin \phi (x + ae)}{(a + ae \cos \phi)} \qquad \ldots(iii)$$

Equation of line passing through (0, 0) and perpendicular to Eq. (ii) is

$$y = -\frac{a}{b} \sin \phi \cdot x \qquad \ldots(iv)$$

Let Eqs. (iii) and (iv) are passing through (h, k), then

$$k = \frac{b(h + ae) \sin \phi}{(a + ae \cos \phi)} \qquad \ldots(v)$$

$$k = -\frac{a}{b} \sin \phi \cdot h \qquad \ldots(vi)$$

From Eq. (iv), $\sin \phi = -\dfrac{bk}{ah}$

and from Eq. (v), $\cos \phi = -\left\{\dfrac{a^2 h + (h + ae) b^2}{a^2 eh}\right\}$

$$= -\left\{\frac{(a^2 + b^2)h + aeb^2}{a^2 eh}\right\}$$

$$= -\left\{\frac{a^2 e^2 h + aeb^2}{a^2 eh}\right\} = -\left\{\frac{aeh + b^2}{ah}\right\}$$

$\therefore \qquad \sin^2 \phi + \cos^2 \phi = 1$

$$\Rightarrow \qquad \frac{b^2 k^2}{a^2 h^2} + \frac{(aeh + b^2)^2}{a^2 h^2} = 1$$

$\therefore$ Locus of (h, k) is

$$b^2 y^2 + (aex + b^2)^2 = a^2 x^2$$

$$\Rightarrow \qquad b^2 y^2 + a^2 e^2 x^2 + b^4 + 2aeb^2 x = a^2 x^2$$

$$\Rightarrow \qquad b^2 y^2 + (a^2 + b^2) x^2 + b^4 + 2aeb^2 x = a^2 x^2$$

$$\Rightarrow \qquad y^2 b^2 + b^2 (x^2 + 2aex) + b^4 = 0$$

$$\Rightarrow \qquad b^2 y^2 + b^2 \{(x + ae)^2 - a^2 e^2\} + b^4 = 0$$

$$\Rightarrow \qquad b^2 y^2 + b^2 (x + ae)^2 - b^2 (a^2 + b^2) + b^4 = 0$$

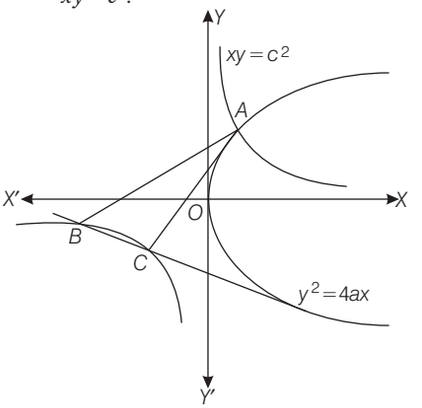
$$\Rightarrow \qquad b^2 y^2 + b^2 (x + ae)^2 - a^2 b^2 = 0$$

$$\Rightarrow \qquad (x + ae)^2 + y^2 = a^2$$

● ***Ex. 34*** *Show that an infinite number of triangles can be inscribed in the rectangular hyperbola $xy = c^2$, whose sides all touch the parabola $y^2 = 4ax$.*

Sol. From any point $A\left(ct_1, \dfrac{c}{t_1}\right)$ on the rectangular hyperbola

$$xy = c^2. \qquad \ldots(i)$$



Tangent AB and AC are drawn to the parabola $y^2 = 4ax$,

then $\qquad B \equiv \left(ct_2, \dfrac{c}{t_2}\right)$ and $\quad C \equiv \left(ct_3, \dfrac{c}{t_3}\right)$.

Then ΔABC is inscribed in the rectangular hyperbola and its sides AB and AC touch the parabola.

$\because$ BC is also a tangent to it

Equations of chords AB, BC and CA are

$$AB \equiv x + y t_1 t_2 = c(t_1 + t_2)$$

$$BC \equiv x + y t_2 t_3 = c(t_2 + t_3)$$

$$CA \equiv x + y t_3 t_1 = c(t_3 + t_1)$$

$\because$ AB is tangent to parabola $y^2 = 4ax$, its equation

$$y = -\frac{1}{t_1 t_2} x + \frac{c(t_1 + t_2)}{t_1 t_2}$$

Touching condition $c = \dfrac{a}{m}$ or $cm = a$

$$\frac{c(t_1+t_2)}{t_1t_2}\cdot\left(\frac{-1}{t_1t_2}\right)=a$$

$$\Rightarrow \quad -at_1^2t_2^2=c(t_1+t_2)$$

$$(at_1^2)\,t_2^2+ct_2+ct_1=0$$

Similarly, $(at_2^2)\,t_3^2+ct_3+ct_1=0$

Hence, $(at_1^2)\,t^2+ct+ct_1=0$ ...(ii)

and t_2 and t_3 are the roots of Eq. (ii),

$$\therefore \quad t_2+t_3=-\frac{c}{at_1^2} \quad \text{and} \quad t_2t_3=\frac{c}{at_1}$$

$$\Rightarrow \quad c=at_1t_2t_3$$

$$\therefore \quad c(t_2+t_3)=-\frac{c^2}{at_1^2}=-\frac{(at_1t_2t_3)^2}{at_1^2}=-at_2^2t_3^2$$

$$\Rightarrow \quad -at_2t_3=\frac{c(t_2+t_3)}{t_2t_3} \text{ is the condition.}$$

This proves BC to be also a tangent to the parabola. But any point A can be taken in infinite ways anywhere on the curve representing the rectangular hyperbola. Hence such triangles exist in infinite number.

● ***Ex. 35*** *A circle with centre* $(3\alpha, 3\beta)$ *and of variable radius cuts the rectangular hyperbola* $x^2-y^2=9a^2$ *at the points P, Q, R, S. Prove that the locus of the centroid of the triangle PQR is* $(x-2\alpha)^2-(y-2\beta)^2=a^2$.

Sol. The equation of the circle with centre $(3\alpha, 3\beta)$ is

$$x^2+y^2-6\alpha x-6\beta y+k=0 \quad ...(i)$$

where k is variable.

Given hyperbola is $x^2-y^2=9a^2$ ...(ii)

Eliminating y from Eq. (i) with the help of Eq. (ii), we get

$$(x^2+x^2-9a^2-6\alpha x+k)^2=36\beta^2(x^2-9a^2)$$

$$\Rightarrow \quad 4x^4-24\alpha x^3+....=0$$

this is a biquadratic equation.

Let the abscissas of four points P, Q, R and S are x_1, x_2, x_3 and x_4, then

$$x_1+x_2+x_3+x_4=6\alpha \quad ...(iii)$$

Similarly, $y_1+y_2+y_3+y_4=6\beta$ ...(iv)

If (x', y') be the centroid of the triangle PQR, then

$$x'=\frac{x_1+x_2+x_3}{3}=\frac{6\alpha-x_4}{3}$$

$$\therefore \quad -3(x'-2\alpha)=x_4$$

and $$y'=\frac{y_1+y_2+y_3}{3}=\frac{6\beta-y_4}{3}$$

$$\therefore \quad -3(y'-2\beta)=y_4$$

But $x_4^2-y_4^2=9a^2$

$$\Rightarrow \quad 9(x'-2\alpha)^2-9(y'-2\beta)^2=9a^2$$

$$\Rightarrow \quad (x'-2\alpha)^2-(y'-2\beta)^2=a^2$$

Hence, locus of centroid (x', y') is $(x-2\alpha)^2-(y-2\beta)^2=a^2$.

● ***Ex. 36*** *If the normals at* (x_i, y_i), $i=1,2,3,4$ *on the rectangular hyperbola,* $xy=c^2$, *meet at the point* (α, β) *show that*

(i) $\Sigma x_i=\alpha$ *(ii)* $\Sigma y_i=\beta$ *(iii)* $\Pi x_i=\Pi y_i=-c^4$

(iv) $\Sigma x_i^2=\alpha^2$ *(v)* $\Sigma y_i^2=\beta^2$

Sol. Let $(x_i, y_i)=\left(ct_i, \frac{c}{t_i}\right)$, $i=1,2,3,4$ are the points on the rectangular hyperbola $xy=c^2$.

Equation of normal to the hyperbola

$$xy=c^2 \text{ at } \left(ct, \frac{c}{t}\right) \text{ is}$$

$$ct^4-t^3x+ty-c=0$$

It passes through (α, β), then

$$ct^4-t^3\alpha+t\beta-c=0$$

its biquadratic equation in t. Let the roots of this equation are t_1, t_2, t_3, t_4 then

$$\Sigma t_1=\frac{\alpha}{c},$$

$$\Sigma t_1t_2=0, \Sigma t_1t_2t_3=-\beta/c, t_1t_2t_3t_4=-1$$

Now, (i) $\Sigma x_i=c\,\Sigma t_1=\alpha$

(ii) $$\Sigma y_i=c\left(\Sigma\frac{1}{t_1}\right)=c\left(\frac{\Sigma t_1t_2t_3}{t_1t_2t_3t_4}\right)=\beta$$

(iii) $\Pi x_i=c^4\Pi t_i=-c^4$

and $$\Pi y_i=c^4\left(\frac{1}{\Pi t_i}\right)=-c^4$$

(iv) $$\Sigma x_i^2=c^2(\Sigma t_1^2)=c^2\{(\Sigma t_1)^2-2\Sigma t_1t_2\}$$
$$=\alpha^2$$

(v) $$\Sigma y_i^2=(\Sigma y_1)^2-2\Sigma y_1y_2$$
$$=\beta^2-2c^2\Sigma\left(\frac{1}{t_1t_2}\right)=\beta^2-2c^2\cdot\frac{\Sigma t_1t_2}{t_1t_2t_3t_4}=\beta^2$$

● ***Ex. 37*** *If a circle cuts a rectangular hyperbola* $xy=c^2$ *in A, B, C and D and the parameters of these four points be* t_1, t_2, t_3 *and* t_4 *respectively prove the following :*

(i) $t_1t_2t_3t_4=1$, *find the value of* $\Sigma\frac{1}{t_1}$.

(ii) If H be the orthocentre of the triangle ABC, then H and D are extremities of a diameter of the rectangular hyperbola.

(iii) The centre of mean position of the four points bisects the distance between the centres of the two curves.

(iv) The centre of the circle through A, B and C is

$$\left[\frac{c}{2}\left(t_1+t_2+t_3+\frac{1}{t_1t_2t_3}\right), \frac{c}{2}\left(\frac{1}{t_1}+\frac{1}{t_2}+\frac{1}{t_3}+t_1t_2t_3\right)\right].$$

Sol. (i) Let the equation of the circle is

$$x^2 + y^2 + 2gx + 2fy + k = 0 \quad \text{...(i)}$$

and the equation of the rectangular hyperbola is

$$xy = c^2 \quad \text{...(ii)}$$

Put $x = ct$ and $y = \frac{c}{t}$ in Eq. (i)

then, $$c^2t^2 + \frac{c^2}{t^2} + 2gct + \frac{2fc}{t} + k = 0$$

$\Rightarrow$ $$c^2t^4 + 2gct^3 + kt^2 + 2fct + c^2 = 0$$

this equation being fourth degree in t. Let roots be t_1, t_2, t_3, t_4 then

$$\Sigma t_1 = -\frac{2g}{c}, \Sigma t_1t_2 = \frac{k}{c^2},$$

$$\Sigma t_1t_2t_3 = -\frac{2f}{c} \text{ and } t_1t_2t_3t_4 = 1$$

$\therefore$ $$\Sigma \frac{1}{t_1} = \frac{\Sigma t_1t_2t_3}{t_1t_2t_3t_4} = \frac{\frac{-2f}{c}}{1} = -\frac{-2f}{c}$$

(ii) Orthocentre of the ΔABC is $\left(\frac{-c}{t_1t_2t_3}, -ct_1t_2t_3\right)$

Hence orthocentre is $\left(\frac{-ct_4}{t_1t_2t_3t_4}, \frac{-ct_1t_2t_3t_4}{t_4}\right)$

i.e. $$\left(-ct_4, \frac{-c}{t_4}\right)$$

But D is $$\left(ct_4, \frac{c}{t_4}\right).$$

Hence H and D are the extremities of a diagonal of rectangular hyperbola.

(iii) The centre of the mean position of the four points is

$$\left(\frac{c}{4}(t_1 + t_2 + t_3 + t_4), \frac{c}{4}\left(\frac{1}{t_1} + \frac{1}{t_2} + \frac{1}{t_3} + \frac{1}{t_4}\right)\right)$$

i.e. $$\left(\frac{c}{4}\Sigma t_1, \frac{c}{4}\Sigma\left(\frac{1}{t_1}\right)\right)$$

i.e. $$\left(-\frac{g}{2}, -\frac{f}{2}\right)$$ [from relation Eq. (i)]

$\because$ Centres of the circle and rectangular hyperbola are $(-g, -f)$ and $(0, 0)$; mid point of centres of circle and rectangular hyperbola is $\left(\frac{-g}{2}, \frac{-f}{2}\right)$.

Hence the centre of the mean position of the four points bisects the distance between the centres of the two curves (circle and rectangular hyperbola).

(iv) Let the circle passing through ABC meet the hyperbola in fourth point D; then centre of circle is

$$(-g, -f), (-g, -f)$$

$\Rightarrow$ $$\left(\frac{c}{2}\left(\frac{-2g}{c}\right), \frac{c}{2}\left(\frac{-2f}{2}\right)\right)$$ [from Eq. (i) relation]

$\Rightarrow$ $$\left(\frac{c}{2}(t_1 + t_2 + t_3 + t_4), \frac{c}{2}\left(\frac{1}{t_1} + \frac{1}{t_2} + \frac{1}{t_3} + \frac{1}{t_4}\right)\right)$$

But $$t_1t_2t_3t_4 = 1$$

$\therefore$ $$t_4 = \frac{1}{t_1t_2t_3}$$

Hence, centre of circle is

$$\left(\frac{c}{2}\left(t_1 + t_2 + t_3 + \frac{1}{t_1t_2t_3}\right), \frac{c}{2}\left(\frac{1}{t_1} + \frac{1}{t_2} + \frac{1}{t_3} + t_1t_2t_3\right)\right).$$

Hyperbola Exercise 1 :
Single Option Correct Type Questions

■ This section contains **30 multiple choice questions.** Each question has four choices (a), (b), (c) and (d) out of which **ONLY ONE** is correct.

1. P is any point on the hyperbola $x^2 - y^2 = a^2$. If F_1 and F_2 are the foci of the hyperbola and $PF_1 \cdot PF_2 = \lambda(OP)^2$, where O is the origin, then λ is equal to
(a) 1 (b) $\sqrt{2}$ (c) 2 (d) 3

2. If the sum of the slopes of the normals from a point P to the hyperbola $xy = c^2$ is equal to $\lambda\,(\lambda \in R^+)$, then locus of point P is
(a) $x^2 - y^2 = \lambda c^2$ (b) $y^2 = \lambda c^2$
(c) $xy = \lambda c^2$ (d) $x^2 = \lambda c^2$

3. If $xy = \lambda^2 - 9$ be a rectangular hyperbola whose branches lie only in the second and fourth quadrant, then
(a) $|\lambda| \geq 3$ (b) $|\lambda| < 3$
(c) $\lambda \in R - \{-3, 3\}$ (d) None of these

4. If there are two points A and B on rectangular hyperbola $xy = c^2$ such that abscissa of A = ordinate of B, then the locus of point of intersection of tangents at A and B is
(a) $y^2 = x^2 + 2c^2$ (b) $y^2 = x^2 + \frac{c^2}{2}$
(c) $y = x$ (d) $y = 3x$

5. A series of hyperbola is drawn having a common transverse axis of length $2a$. Then the locus of a point P on each hyperbola, such that its distance from the transverse axis is equal to its distance from an asymptote, is
(a) $(x^2 - y^2)^2 = 4x^2(x^2 - a^2)$
(b) $(x^2 - y^2)^2 = x^2(x^2 - a^2)$
(c) $(x^2 - y^2)^2 = 4y^2(x^2 - a^2)$
(d) $(x^2 - y^2)^2 = y^2(x^2 - a^2)$

6. If a rectangular hyperbola $(x-1)(y-2) = 4$ cuts a circle $x^2 + y^2 + 2gx + 2fy + c = 0$ at points (3, 4) (5, 3), (2, 6) and $(-1,0)$, then the value of $(g + f)$ is equal to
(a) -8 (b) -9 (c) 8 (d) 9

7. If $f(x) = ax^3 + bx^2 + cx + d, (a, b, c, d$ are rational numbers) and roots of $f(x) = 0$ are eccentricities of a parabola and a rectangular hyperbola, then $a + b + c + d$ equals
(a) -1 (b) 0 (c) 1 (d) data inadequate

8. From a point on the line $y = x + c, c$ (parameter), tangents are drawn to the hyperbola $\frac{x^2}{2} - \frac{y^2}{1} = 1$ such that chords of contact pass through a fixed point (x_1, y_1). Then, $\frac{x_1}{y_1}$ is equal to
(a) 2 (b) 3
(c) 4 (d) None of these

9. Two conics $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ and $x^2 = -\frac{a}{b}y$ intersect, if
(a) $0 < b \leq \frac{1}{2}$ (b) $0 < a < \frac{1}{2}$
(c) $a^2 < b^2$ (d) $a^2 > b^2$

10. The number of points outside the hyperbola $\frac{x^2}{9} - \frac{y^2}{16} = 1$ from where two perpendicular tangents can be drawn to the hyperbola are
(a) 0 (b) 1
(c) 2 (d) None of these

11. Let $A \equiv (-3, 4)$ and $B \equiv (2, -1)$ be two fixed points. A point C moves such that
$$\tan\left(\frac{1}{2}\angle ABC\right) : \tan\left(\frac{1}{2}\angle BAC\right) = 3:1$$
Thus, locus of C is a hyperbola, distance between whose foci is
(a) 5 (b) $5\sqrt{2}$ (c) $\frac{5}{2}$ (d) $\frac{5}{\sqrt{2}}$

12. A point P is taken on the right half of the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ having its foci as S_1 and S_2. If the internal angle bisector of the angle $\angle S_1PS_2$ cuts the x-axis at point $Q(\alpha, 0)$, then range of α is
(a) $[-a, a]$ (b) $[0, a]$
(c) $(0, a]$ (d) $[-a, 0)$

13. If angle between asymptotes of hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is 120° and product of perpendiculars drawn from foci upon its any tangent is 9, then locus of point of intersection of perpendicular tangents of the hyperbola can be
(a) $x^2 + y^2 = 3$ (b) $x^2 + y^2 = 6$
(c) $x^2 + y^2 = 9$ (d) $x^2 + y^2 = 18$

14. If $\alpha+\beta=3\pi$, then the chord joining the points α and β for the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ passes through
(a) focus
(b) centre
(c) one of the end point of the transverse axis
(d) one of the end points of the conjugate axis

15. If the curves $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1 (a>b)$ and $x^2-y^2=c^2$ cut at right angles, then
(a) $a^2+b^2=2c^2$ (b) $b^2-a^2=2c^2$
(c) $a^2-b^2=2c^2$ (d) $a^2b^2=2c^2$

16. If chords of the hyperbola $x^2-y^2=a^2$ touch the parabola $y^2=4ax$, then the locus of the middle points of these chords is the curve
(a) $y^2(x+a)=x^3$ (b) $y^2(x-a)=x^3$
(c) $y^2(x+2a)=3x^3$ (d) $y^2(x-2a)=2x^3$

17. An ellipse has eccentricity 1/2 and one focus at the point $P(1/2,1)$. Its one directrix is the common tangent nearer to the point P, to the circle $x^2+y^2=1$ and the hyperbola $x^2-y^2=1$. The equation of the ellipse is standard form is
(a) $9x^2+12y^2=108$
(b) $9(x-1/3)^2+12(y-1)^2=1$
(c) $9(x-1/3)^2+4(y-1)^2=36$
(d) None of the above

18. The equation of the line passing through the centre of a rectangular hyperbola is $x-y-1=0$. If one of its asymptote is $3x-4y-6=0$, the equation of the other asymptote is
(a) $4x-3y+8=0$ (b) $4x+3y+17=0$
(c) $3x-2y+15=0$ (d) None of these

19. The condition that a straight line with slope m will be normal to parabola $y^2=4ax$ as well as a tangent to rectangular hyperbola $x^2-y^2=a^2$ is
(a) $m^6-4m^2+2m-1=0$ (b) $m^4+3m^3+2m+1=0$
(c) $m^6-2m=0$ (d) $m^6+4m^4+3m^2+1=0$

20. The locus of the middle points of chords of hyperbola $3x^2-2y^2+4x-6y=0$ parallel to $y=2x$ is
(a) $3x-4y=4$ (b) $3y-4x+4=0$
(c) $4x-4y=3$ (d) $3x-4y=2$

21. The coordinates of the centre of the hyperbola $x^2+3xy+2y^2+2x+3y+2=0$ is
(a) $(-1,0)$ (b) $(1,0)$ (c) $(-1,1)$ (d) $(1,-1)$

22. Let F_1, F_2 are foci of the hyperbola $\frac{x^2}{16}-\frac{y^2}{9}=1$ and F_3, F_4 are the foci of its conjugate hyperbola. If e_H and e_C are their eccentricities respectively, then the statement which holds true is
(a) their equations of their asymptotes are different
(b) $e_H>e_C$
(c) area of the quadrilateral formed by their foci is 50 sq units
(d) their auxiliary circles will have the same equation

23. Locus of the point of intersection of the tangents at the points with eccentric angles ϕ and $\frac{\pi}{2}-\phi$ on the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ is
(a) $x=a$ (b) $y=b$
(c) $x=ab$ (d) $y=ab$

24. Latusrectum of the conic satisfying the differential equation $xdy+ydx=0$ and passing through the point $(2,8)$ is
(a) $4\sqrt{2}$ (b) 8
(c) $8\sqrt{2}$ (d) 16

25. The points of the intersection of the curves whose parametric equations are $x=t^2+1, y=2t$ and $x=2s, y=\frac{2}{s}$ is given by
(a) $(1,-3)$ (b) $(2,2)$
(c) $(-2,4)$ (d) $(1,2)$

26. If the tangent and normal to a rectangular hyperbola cut off intercepts x_1 and x_2 on one axis and y_1 and y_2 on the other axis, then
(a) $x_1y_1+x_2y_2=0$ (b) $x_1y_2+x_2y_1=0$
(c) $x_1x_2+y_1y_2=0$ (d) None of these

27. The focus of rectangular hyperbola $(x-h)(y-k)=p^2$ is
(a) $(h-p,k-p)$
(b) $(h-p,k+p)$
(c) $(h+p,k-p)$
(d) None of the above

28. The equation of a hyperbola, conjugate to the hyperbola $x^2+3xy+2y^2+2x+3y=0$ is
(a) $x^2+3xy+2y^2+2x+3y+1=0$
(b) $x^2+3xy+2y^2+2x+3y+2=0$
(c) $x^2+3xy+2y^2+2x+3y+3=0$
(d) $x^2+3xy+2y^2+2x+3y+4=0$

29. If the values of m for which the line $y = mx + 2\sqrt{5}$ touches the hyperbola $16x^2 - 9y^2 = 144$ are the roots of the equation $x^2 - (a+b)x - 4 = 0$, then the value of $a + b$ is

(a) -2 (b) 0
(c) 2 (d) 4

30. Let C be a curve which is the locus of the point of intersection of lines $x = 2 + m$ and $my = 4 - m$. A circle $s = (x-2)^2 + (y+1)^2 = 25$ intersects the curve C at four points P, Q, R and S. If O is the centre of the curve C, then $(OP)^2 + (OQ)^2 + (OR)^2 + (OS)^2$ is

(a) 25 (b) 50 (c) 100 (d) 200

Hyperbola Exercise 2 : More than One Correct Option Type Questions

- This section contains **15 multiple choice questions.** Each question has four choices (a), (b), (c) and (d) out of which **MORE THAN ONE** may be correct.

31. Equation of common tangent to the parabola $y^2 = 8x$ and hyperbola $x^2 - \frac{y^2}{3} = 1$ is

(a) $2x - y + 1 = 0$ (b) $2x - y - 1 = 0$
(c) $2x + y + 1 = 0$ (d) $2x + y - 1 = 0$

32. If the foci of the ellipse $\frac{x^2}{k^2a^2} + \frac{y^2}{a^2} = 1$ and the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ coincide, then k is equal to

(a) $-\sqrt{2}$ (b) $\sqrt{2}$ (c) $-\sqrt{3}$ (d) $\sqrt{3}$

33. If $(a\sec\theta, b\tan\theta)$ and $(a\sec\phi, b\tan\phi)$ are the ends of a focal chord of $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, then $\tan\left(\frac{\theta}{2}\right)\tan\left(\frac{\phi}{2}\right)$ is equal to

(a) $\frac{e-1}{e+1}$ (b) $\frac{1-e}{1+e}$ (c) $\frac{1+e}{1-e}$ (d) $\frac{e+1}{e-1}$

34. If foci of $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ coincide with the foci of $\frac{x^2}{25} + \frac{y^2}{16} = 1$ and eccentricity of the hyperbola is 3, then

(a) $a^2 + b^2 = 9$
(b) there is no director circle to the hyperbola
(c) centre of the director circle is $(0, 0)$
(d) length of the latusrectum of the hyperbola = 16

35. The equation $16x^2 - 3y^2 - 32x - 12y - 44 = 0$ represents a hyperbola with

(a) length of the transverse axis = $2\sqrt{3}$
(b) length of the conjugate axis = 8
(c) centre at $(1, -2)$
(d) eccentricity = $\sqrt{19}$

36. If the line $ax + by + c = 0$ is normal to the hyperbola $xy = 1$, then

(a) $a > 0, b > 0$ (b) $a > 0, b < 0$
(c) $a < 0, b > 0$ (d) $a < 0, b < 0$

37. If $P(x_1, y_1), Q(x_2, y_2), R(x_3, y_3)$ and $S(x_4, y_4)$ are 4 concyclic points on the rectangular hyperbola $xy = c^2$, the coordinates of the orthocentre of the ΔPQR are

(a) $(x_4, -y_4)$ (b) (x_4, y_4)
(c) $(-x_4, -y_4)$ (d) $(-x_4, y_4)$

38. The line $y = x + 5$ touches

(a) the parabola $y^2 = 20x$
(b) the ellipse $9x^2 + 16y^2 = 144$
(c) the hyperbola $\frac{x^2}{29} - \frac{y^2}{4} = 1$
(d) the circle $x^2 + y^2 = 25$

39. The coordinates of a point common to a directrix and an asymptote of the hyperbola $x^2/25 - y^2/16 = 1$ are

(a) $(25/\sqrt{41}, 20/\sqrt{41})$ (b) $(-25/\sqrt{41}, -20/\sqrt{41})$
(c) $(25/3, 20/3)$ (d) $(-25/3, -20/3)$

40. If (5, 12) and (24, 7) are the foci of a hyperbola passing through the origin, then

(a) $e = \frac{\sqrt{386}}{12}$ (b) $e = \frac{\sqrt{386}}{13}$
(c) latusrectum = $\frac{121}{3}$ (d) latusrectum = $\frac{121}{6}$

41. For the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, let n be the number of points on the plane through which perpendicular tangents are drawn

(a) if $n = 1$, then $e = \sqrt{2}$
(b) if $n > 1$, then $0 < e < \sqrt{2}$
(c) if $n = 0$, then $e > \sqrt{2}$
(d) None of the above

42. Which of the following equations in parametric form can represent a hyperbola, where 't' is a parameter?

(a) $x = \frac{a}{2}\left(t + \frac{1}{t}\right)$ and $y = \frac{b}{2}\left(t - \frac{1}{t}\right)$

(b) $\frac{tx}{a} - \frac{y}{b} + t = 0$ and $\frac{x}{a} + \frac{ty}{b} - 1 = 0$

(c) $x = e^t + e^{-t}$ and $y = e^t - e^{-t}$

(d) $x^2 - 6 = 2\cos t$ and $y^2 + 2 = 4\cos^2\left(\frac{t}{2}\right)$

43. Equation of common tangent to the two hyperbolas $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ and $\frac{y^2}{a^2} - \frac{x^2}{b^2} = 1$ is

(a) $y = x + \sqrt{(a^2 - b^2)}$

(b) $y = x - \sqrt{(a^2 - b^2)}$

(c) $y = -x + \sqrt{(a^2 - b^2)}$

(d) $y = -x - \sqrt{(a^2 - b^2)}$

44. Given ellipse $\frac{x^2}{16} + \frac{y^2}{7} = 1$ and the hyperbola $\frac{x^2}{144} - \frac{y^2}{81} = \frac{1}{25}$, if the ordinate of one of the points of intersection is produced to cut an asymptote at P, then which of the following is true?

(a) They have the same foci

(b) Square of the ordinate of point of intersection is $\frac{63}{25}$

(c) Sum of the squares of coordinate of P is 16

(d) P lies on the auxiliary circle formed by ellipse

45. Solution of the differential equation $(1 - x^2)\frac{dy}{dx} + xy = ax$, where $a \in R$, is

(a) a conic which is an ellipse

(b) centre of the conic is $(0, a)$

(c) length of one of the principal axes is 1

(d) length of one of the principal axes is equal to 2

Hyperbola Exercise 3 : Paragraph Based Questions

- This section contains **5 paragraphs** based upon each of the paragraph 3 **multiple choice questions** have to be answered. Each of these questions has four choices (a), (b), (c) and (d) out of which **ONLY ONE** is correct.

Paragraph I

(Q. Nos. 46 to 48)

The graph of the conic $x^2 - (y-1)^2 = 1$ has one tangent line with positive slope that passes through the origin. The point of tangency being (a, b)`.

46. The value of $\sin^{-1}\left(\frac{a}{b}\right)$ is

(a) $\frac{5\pi}{12}$ (b) $\frac{\pi}{6}$ (c) $\frac{\pi}{4}$ (d) $\frac{\pi}{3}$

47. Length of the latusrectum of the conic is

(a) 1 (b) $\sqrt{2}$ (c) 2 (d) 4

48. If e be the eccentricity of the conic, then the value of $(1 + e^2 + e^4)$ is

(a) 3 (b) 7 (c) $\frac{7}{4}$ (d) 21

Paragraph II

(Q. Nos. 49 to 51)

A point P moves such that the sum of the slopes of the normals drawn from it to the hyperbola $xy = 4$ is equal to the sum of the ordinates of feet of normals. The locus of P is a curve C.

49. The equation of the curve C is

(a) $x^2 = 2y$ (b) $x^2 = 4y$

(c) $x^2 = 6y$ (d) $x^2 = 8y$

50. If the tangent to the curve C cuts the coordinate axes at A and B, then, the locus of the middle-point of AB is

(a) $x^2 + 2y = 0$ (b) $x^2 = y$

(c) $2x^2 + y = 0$ (d) $x^2 = 2y$

51. The area of the equilateral triangle inscribed in the curve C having one vertex as the vertex of curve C is

(a) $8\sqrt{3}$ sq units (b) $12\sqrt{3}$ sq units

(c) $27\sqrt{3}$ sq units (d) $48\sqrt{3}$ sq units

Paragraph III

(Q. Nos. 52 to 54)

Let $P(x, y)$ be a variable point such that

$|\sqrt{(x-1)^2 + (y-2)^2} - \sqrt{(x-5)^2 + (y-5)^2}| = 4$

which represents a hyperbola.

52. The eccentricity of the corresponding conjugate hyperbola is

(a) $\frac{5}{4}$ (b) $\frac{4}{3}$

(c) $\frac{5}{3}$ (d) $\frac{3}{2}$

53. Locus of point of intersection of two perpendicular tangents to the hyperbola is

(a) $(x-3)^2+(y-7/2)^2=\frac{1}{4}$

(b) $(x-3)^2+(y-7/2)^2=\frac{3}{4}$

(c) $(x-3)^2+(y-7/2)^2=\frac{5}{4}$

(d) $(x-3)^2+(y-7/2)^2=\frac{7}{4}$

54. If origin is shifted to point (3, 7/2) and axes are rotated in anticlockwise sense through an angle θ, so that the equation of hyperbola reduces to its standard form $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$, then θ equals

(a) $\tan^{-1}\left(\frac{4}{3}\right)$ (b) $\tan^{-1}\left(\frac{3}{4}\right)$

(c) $\tan^{-1}\left(\frac{5}{4}\right)$ (d) $\tan^{-1}\left(\frac{4}{5}\right)$

Paragraph IV

(Q. Nos. 55 to 57)

Let $P(\theta_1)$ and $Q(\theta_2)$ are the extremities of any focal chord of the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ whose eccentricity is e. Let θ be the angle between its asymptotes. Tangents are drawn to the hyperbola at some arbitrary point R. These tangent meet the coordinate axes at the points A and B respectively. The rectangle OACB (O being the origin) is completed, then

55. Locus of point *C* is

(a) $\frac{b^2}{x^2}-\frac{a^2}{y^2}=1$ (b) $\frac{b^2}{x^2}+\frac{a^2}{y^2}=1$

(c) $\frac{a^2}{x^2}+\frac{b^2}{y^2}=1$ (d) $\frac{a^2}{x^2}-\frac{b^2}{y^2}=1$

56. If $\cos^2\left(\frac{\theta_1+\theta_2}{2}\right)=\lambda\cos^2\left(\frac{\theta_1-\theta_2}{2}\right)$, then λ is equal to

(a) $\left(\frac{a^2+b^2}{a^2}\right)$ (b) $\left(\frac{a^2+b^2}{b^2}\right)$

(c) $\left(\frac{a^2+b^2}{ab}\right)$ (d) $\left(\frac{a^2+b^2}{2ab}\right)$

57. The value of $\cos\left(\frac{\theta}{2}\right)$ is

(a) $\frac{1}{2e}$ (b) $\frac{1}{e}$

(c) $\frac{1}{e^2}$ (d) $\frac{1}{2e^2}$

Paragraph V

(Q. Nos. 58 to 60)

The vertices of ΔABC lie on a rectangular hyperbola such that the orthocentre of the triangle is (2, 3) and the asymptotes of the rectangular hyperbola are parallel to the coordinate axes. The two perpendicular tangents of the hyperbola intersect at the point (1, 1).

58. The equation of the asymptotes is

(a) $xy-1=y-x$ (b) $xy+1=x+y$

(c) $xy-1=x-y$ (d) $xy+1=-x-y$

59. The equation of the rectangular hyperbola is

(a) $xy-5=y-x$

(b) $xy-1=x+y$

(c) $xy=x+y+1$

(d) $xy-11=-x-y$

60. The number of real tangents that can be drawn from the point (1, 1) to the rectangular hyperbola is

(a) 0 (b) 2

(c) 3 (d) 4

Hyperbola Exercise 4 :
Single Integer Answer Type Questions

■ This section contains **10 questions.** The answer to each question is **a single digit integer** ranging from 0 to 9 (both inclusive)

61. The ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ and the hyperbola $\frac{x^2}{A^2}-\frac{y^2}{B^2}=1$ are given to be confocal and length of minor axis of the ellipse is same as the conjugate axis of the hyperbola. If e_1 and e_2 represents the eccentricities of ellipse and hyperbola respectively, then the value of $e_1^{-2}+e_2^{-2}$ is

62. If abscissa of orthocentre of a triangle inscribed in a rectangular hyperbola $xy=4$ is $\frac{1}{2}$, then the ordinate of orthocentre of triangle is

63. Normal drawn to the hyperbola $xy=2$ at the point $P(t_1)$ meets the hyperbola again at $Q(t_2)$, then minimum distance between the point P and Q is

64. The normal at P to a hyperbola of eccentricity $\frac{3}{2\sqrt{2}}$ intersects the transverse and conjugate axes at M and N respectively. The locus of mid-point of MN is a hyperbola, then its eccentricity

65. If radii of director circle of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ and hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b_1^2}=1$ are in the ratio 1 : 3 and $4e_1^2-e_2^2=\lambda$, where e_1 and e_2 are the eccentricities of ellipse and hyperbola respectively, then the value of λ is

66. The shortest distance between the curves $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ and $4x^2+4y^2=a^2\,(b>a)$ is $f(a,b)$, then the value of $f(4,6)+f(2,3)$ is

67. ABC is a triangle such that $\angle ABC=2\angle BAC$. If AB is fixed and locus of C is a hyperbola, then the eccentricity of the hyperbola is

68. Point P lie on $2xy=1$. A triangle is constructed by P, S and S' (where S and S' are foci). The locus of ex-centre opposite S (S and P lie in first quadrant) is $(x+py)^2=(\sqrt{2}-1)^2(x-y)^2+q$, then the value of $p+q$ is

69. Chords of the circle $x^2+y^2=4$, touch the hyperbola $\frac{x^2}{4}-\frac{y^2}{16}=1$. The locus of their middle-points is the curve $(x^2+y^2)^2=\lambda x^2-16y^2$, then the value of λ is

70. Tangents are drawn from the point (α,β) to the hyperbola $3x^2-2y^2=6$ and are inclined at angles θ and ϕ to the X-axis. If $\tan\theta\,.\,\tan\phi=2$, then the value of $2\alpha^2-\beta^2$ is

Hyperbola Exercise 5 : Matching Type Questions

■ This section contains 3 **questions.** Each question has four statements (A), (B), (C) and (D) given in **Column I** and four statements (p, q, r and s) in **Column II.** Any given statement in **Column I** can have correct matching with one or move statements (*s*) given in **Column II.**

71. Match the following.

	Column I		Column II
(A)	If λ be the length of the latusrectum of the hyperbola $16x^2 - 9y^2 + 32x + 36y - 164 = 0$, then 3λ is divisible by	(p)	4
(B)	If the chord $x\cos\alpha + y\sin\alpha = p$ of the hyperbola $\frac{x^2}{16} - \frac{y^2}{18} = 1$ subtends a right angle at the centre, a circle touches the given chord and concentric with hyperbola, then the diameter of circle is divisible by	(q)	6
(C)	For the hyperbola $xy = 8$ any tangent of it at P meets coordinate axes at Q and R, then the area of triangle CQR is divisible by (where 'C' is centre of the hyperbola)	(r)	8
(D)	For the hyperbola $x^2 - 3y^2 = 9$, acute angle between its asymptotes is $\frac{\pi\lambda}{24}$, then λ is divisible by	(s)	16

72. Match the following.

	Column I		Column II
A.	If the vertex of a hyperbola bisects the distance between its centre and the corresponding focus, then the ratio of the square of its conjugate axis to the square of its transverse axis is	(p)	A Natural number
B.	With one focus of the hyperbola $\frac{x^2}{9} - \frac{y^2}{16} = 1$ as the centre, a circle is drawn which is tangent to the hyperbola with no part of the circle being outside the hyperbola. The radius of the circle is	(q)	A Prime number
C.	If S_1 and S_2 are the foci of the hyperbola whose length of the transverse axis is 4 and that of the conjugate axis is 6, and S_3 and S_4 are the foci of the conjugate hyperbola, then the area of quadrilateral $S_1S_2S_3S_4$ is	(r)	A Composite number
D.	If equation of hyperbola whose conjugate axis is 5 and distance between its foci is 13, is $ax^2 - by^2 = c$, where a and b are co-prime, then $\frac{3ab}{2c}$ is	(s)	A Perfect number

73. If e_1 and e_2 are the roots of the equation $x^2 - \lambda x + 2 = 0$

	Column I		Column II
A.	If e_1 and e_2 are the eccentricities of ellipse and hyperbola respectively, then the values of λ are	(p)	$2\sqrt{2}$
B.	If both e_1 and e_2 are the eccentricities of the hyperbolas, then the values of λ are	(q)	$2\sqrt{3}$
C.	If e_1 and e_2 are the eccentricities of the hyperbola and conjugate hyperbola, then the values of λ are	(r)	$2\sqrt{5}$
D.	If e_1 is the eccentricity of the hyperbola for which there exist infinite points from which perpendicular tangents can be drawn and e_2 is the eccentricity of the hyperbola in which no such points exist, then the values of λ are	(s)	$2\sqrt{6}$

Hyperbola Exercise 6 :
Statement I and II Type Questions

■ **Directions** (Q. Nos. 74 to 81) are Assertion-Reason type questions. Each of these questions contains two statements :
Statement I (Assertion) and **Statement II** (Reason)
Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select the correct choice as given below :

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I

(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I

(c) Statement I is true, Statement II is false

(d) Statement I is false, Statement II is true

74. **Statement I** $\frac{5}{3}$ and $\frac{5}{4}$ are the eccentricities of two conjugate hyperbolas.

Statement II If e_1 and e_2 are the eccentricities of two conjugate hyperbolas, then $e_1 e_2 > 1$.

75. **Statement I** A hyperbola and its conjugate hyperbola have the same asymptotes.

Statement II The difference between the second degree curve and pair of asymptotes is constant.

76. **Statement I** The equation of the director circle to the hyperbola $5x^2 - 4y^2 = 20$ is $x^2 + y^2 = 1$.

Statement II Director circle is the locus of the point of intersection of perpendicular tangents.

77. **Statement I** Two tangents are drawn from a point on the circle $x^2 + y^2 = 9$ to the hyperbola $\frac{x^2}{25} - \frac{y^2}{16} = 1$, then angle between tangents is $\pi / 2$.

Statement II $x^2 + y^2 = 9$ is the director circle of $\frac{x^2}{25} - \frac{y^2}{16} = 1$.

78. **Statement I** If eccentricity of a hyperbola is 2, then eccentricity of its conjugate hyperbola is $2/\sqrt{3}$.

Statement II If e and e_1 are the eccentricities of two conjugate hyperbolas, then $ee_1 > 1$.

79. **Statement I** The line $4x - 5y = 0$ will not meet the hyperbola $16x^2 - 25y^2 = 400$.

Statement II The line $4x - 5y = 0$ is an asymptote to the hyperbola.

80. **Statement I** The point $(5, -3)$ inside the hyperbola $3y^2 - 5x^2 + 1 = 0$.

Statement II The point (x_1, y_1) inside the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, then $\frac{x_1^2}{a^2} - \frac{y_1^2}{b^2} - 1 < 0$.

81. **Statement I** A hyperbola whose asymptotes include $\pi / 3$ is said to be equilateral hyperbola.

Statement II The eccentricity of an equilateral hyperbola is $\sqrt{2}$.

Hyperbola Exercise 7 :
Subjective Type Questions

■ In this section, there are **12 Subjective questions.**

82. Given the base of a triangle and the ratio of the tangent of half the base angles. Show that the vertex moves on a hyperbola whose foci are the extremities of the base.

83. A, B, C are three points on the rectangular hyperbola $xy = c^2$, find

(i) The area of the triangle ABC.

(ii) The area of the triangle formed by the tangents at A, B and C.

84. If a hyperbola be rectangular and its equation be $xy = c^2$, prove that the locus of the middle points of chords of constant length $2d$ is $(x^2 + y^2)(xy - c^2) = d^2 xy$.

85. If four points be taken on a rectangular hyperbola such that the chord joining any two is perpendicular to the chord joining the other two, and if $\alpha, \beta, \gamma, \delta$ be the inclinations to either asymptote of the straight line joining these points to the centre, prove that $\tan\alpha \tan\beta \tan\gamma \tan\delta = 1$.

86. P and Q are two variable points on the rectangular hyperbola $xy = c^2$ such that tangent at Q passes through the foot of the ordinate of P. Show that the locus of the intersection of tangents at P and Q is a hyperbola with the same asymptotes as of the given hyperbola.

87. A circle cuts two perpendicular lines so that each intercept is of given length. Prove that the locus of the centre of the circle is a rectangular hyperbola.

88. (a) Prove that any line parallel to either of the asymptotes of a hyperbola shall meet it in one point at infinity.

(b) Prove that the asymptotes of a hyperbola are the diagonals of the rectangle formed by the lines drawn parallel to the axes at the vertices of the hyperbola [i.e. at $(\pm a, 0)$ and $(0, \pm b)$].

89. Let the tangent at a point P on the ellipse meet the major axis at B and the ordinate from *it* meet the major axis at A. If Q is a point on the line AP such that $AQ = AB$, prove that the locus of Q is a hyperbola. Find the asymptotes of this hyperbola.

90. From the point (x_1, y_1) and (x_2, y_2), tangents are drawn to the rectangular hyperbola $xy = c^2$. If the conic passing through the two given points and the four points of contact is a circle, then show that $x_1 x_2 = y_1 y_2$ and $x_1 y_2 + x_2 y_1 = 4c^2$.

91. A rectangular hyperbola passes through two fixed points and its asymptotes are in given directions. Prove that its vertices lie on an ellipse and hyperbola which intersect orthogonally.

92. Let normals are drawn from (α, β) to the hyperbola $xy = 1$, and (x_i, y_i), $i = 1, 2, 3, 4$ be the feet of the co-normal points. If the algebraic sum of the perpendicular distances drawn from (x_i, y_i), $i = 1, 2, 3, 4$ onto a variable line vanishes, show that the variable line passes through the point $(\alpha/4, \beta/4)$.

93. A series of hyperbolas is drawn having a common transverse axis of length $2a$. Prove that the locus of a point P on each hyperbola such that its distance from the transverse axis is equal to its distance from on asymptote, is the curve $(x^2 - y^2)^2 = 4x^2 (x^2 - a^2)$.

Hyperbola Exercise 8 : Questions Asked in Previous 13 Year's Exams

- This section contains questions asked in **IIT-JEE, AIEEE, JEE Main & JEE Advanced** from year **2005** to **2017**.

94. The locus of a point $P(\alpha, \beta)$ moving under the condition that the line $y = \alpha x + \beta$ is a tangent to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is **[AIEEE 2005, 3M]**

(a) an ellipse
(b) a circle
(c) a parabola
(d) a hyperbola

95. Let a hyperbola passes through the focus of the ellipse $\frac{x^2}{25} + \frac{y^2}{16} = 1$. The transverse and conjugate axes of this hyperbola coincide with the major and minor axes of the given ellipse, also the product of eccentricities of given ellipse and hyperbola is 1, then **[IIT- JEE 2006, 5M]**

(a) the equation of hyperbola is $\frac{x^2}{9} - \frac{y^2}{16} = 1$
(b) the equations of hyperbola is $\frac{x^2}{9} - \frac{y^2}{25} = 1$
(c) focus of hyperbola is $(5, 0)$
(d) vertex of hyperbola is $(5\sqrt{3}, 0)$

96. A hyperbola, having the transverse axis of length $2\sin\theta$, is confocal with the ellipse $3x^2 + 4y^2 = 12$. Then, its equation is **[IIT- JEE 2007, 3M]**

(a) $x^2 \operatorname{cosec}^2\theta - y^2 \sec^2\theta = 1$
(b) $x^2 \sec^2\theta - y^2 \operatorname{cosec}^2\theta = 1$
(c) $x^2 \sin^2\theta - y^2 \cos^2\theta = 1$
(d) $x^2 \cos^2\theta - y^2 \sin^2\theta = 1$

97. Two branches of a hyperbola **[IIT- JEE 2007, 1.5M]**

(a) have a common tangent
(b) have a common normal
(c) do not have a common tangent
(d) do not have a common normal

98. For the hyperbola $\frac{x^2}{\cos^2\alpha} - \frac{y^2}{\sin^2\alpha} = 1$, which of the following remains constant when α varies **[AIEEE 2007, 3M]**

(a) abscissae of vertices (b) abscissae of foci
(c) eccentricity (d) directrix

99. Consider a branch of the hyperbola $x^2 - 2y^2 - 2\sqrt{2}x - 4\sqrt{2}y - 6 = 0$ with vertex at the point A. Let B be one of the end points of its latusrectum. If C is the focus of the hyperbola nearest to the point A, then the area of the triangle ABC is **[IIT- JEE 2008, 3M]**

(a) $1-\sqrt{\frac{2}{3}}$ (b) $\sqrt{\frac{3}{2}}-1$ (c) $1+\sqrt{\frac{2}{3}}$ (d) $\sqrt{\frac{3}{2}}+1$

100. An ellipse intersects the hyperbola $2x^2 - 2y^2 = 1$ orthogonally. The eccentricity of the ellipse is reciprocal of that of the hyperbola. If the axes of the ellipse are along the coordinate axes, then **[IIT- JEE 2009, 4M]**

(a) equation of ellipse is $x^2 + 2y^2 = 2$
(b) the foci of ellipse are $(\pm 1, 0)$
(c) equation of ellipse is $x^2 + 2y^2 = 4$
(d) the foci of ellipse are $(\pm\sqrt{2}, 0)$

Paragraph

(Q. Nos. 100 and 102)

The circle $x^2 + y^2 - 8x = 0$ *and hyperbola* $\frac{x^2}{9} - \frac{y^2}{4} = 1$ *intersect at the points A and B.*

101. Equation of a common tangent with positive slope to the circle as well as to the hyperbola is

(a) $2x - \sqrt{5}y - 20 = 0$ (b) $2x - \sqrt{5}y + 4 = 0$
(c) $3x - 4y + 8 = 0$ (d) $4x - 3y + 4 = 0$

102. Equation of the circle with AB as its diameter is

(a) $x^2 + y^2 - 12x + 24 = 0$ (b) $x^2 + y^2 + 12x + 24 = 0$
(c) $x^2 + y^2 + 24x - 12 = 0$ (d) $x^2 + y^2 - 24x - 12 = 0$ **[IIT- JEE 2010, 3 + 3M]**

103. The line $2x + y = 1$ is tangent to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$. If this line passes through the point of intersection of the nearest directrix and the X-axis, then the eccentricity of the hyperbola is **[IIT- JEE 2010, 3M]**

104. Let $P(6,3)$ be a point on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$. If the normal at the point P intersects the X-axis at $(9, 0)$, then the eccentricity of the hyperbola is **[IIT- JEE 2011, 3M]**

(a) $\sqrt{\frac{5}{2}}$ (b) $\sqrt{\frac{3}{2}}$
(c) $\sqrt{2}$ (d) $\sqrt{3}$

105. Let the eccentricity of the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ be reciprocal to that of the ellipse $x^2 + 4y^2 = 4$. If the hyperbola passes through a focus of the ellipse, then **[IIT- JEE 2011, 4M]**

(a) the equation of the hyperbola is $\frac{x^2}{3} - \frac{y^2}{2} = 1$
(b) a focus of the hyperbola is $(2,0)$
(c) the eccentricity of the hyperbola is $\sqrt{\frac{5}{3}}$
(d) the equation of the hyperbola is $x^2 - 3y^2 = 3$

106. Tangents are drawn to the hyperbola $\frac{x^2}{9} - \frac{y^2}{4} = 1$, parallel to the straight line $2x - y = 1$. The points of contact of the tangents on the hyperbola are **[IIT- JEE 2012, 4M]**

(a) $\left(\frac{9}{2\sqrt{2}}, \frac{1}{\sqrt{2}}\right)$ (b) $\left(-\frac{9}{2\sqrt{2}}, -\frac{1}{\sqrt{2}}\right)$
(c) $(3\sqrt{3}, -2\sqrt{2})$ (d) $(-3\sqrt{3}, 2\sqrt{2})$

107. Consider the hyperbola $H: x^2 - y^2 = 1$ and a circle S with centre $N(x_2, 0)$. Suppose that H and S touch each other at a point $P(x_1, y_1)$ with $x_1 > 1$ and $y_1 > 0$. The common tangent to H and S at P intersects the X-axis at point M. If (l, m) is the centroid of the triangle PMN, then the correct expression(s) is(are) **[JEE Advanced 2015, 4M]**

(a) $\frac{dl}{dx_1} = 1 - \frac{1}{3x_1^2}$ for $x_1 > 1$ (b) $\frac{dm}{dx_1} = \frac{x_1}{3(\sqrt{(x_1^2 - 1)})}$ for $x_1 > 1$
(c) $\frac{dl}{dx_1} = 1 + \frac{1}{3x_1^2}$ for $x_1 > 1$ (d) $\frac{dm}{dy_1} = \frac{1}{3}$ for $y_1 > 0$

108. The eccentricity of the hyperbola whose length of the latusrectum is equal to 8 and the length of its conjugate axis is equal to half of the distance between its foci, is **[JEE Main 2016, 4M]**

(a) $\frac{2}{\sqrt{3}}$ (b) $\sqrt{3}$
(c) $\frac{4}{3}$ (d) $\frac{4}{\sqrt{3}}$

109. A hyperbola passes through the point $P(\sqrt{2}, \sqrt{3})$ and has foci at $(\pm 2, 0)$. Then the taught to this hyperbola at P also passes through the point **[JEE Main 2017, 4M]**

(a) $(-\sqrt{2}, -\sqrt{3})$ (b) $(3\sqrt{2}, 2\sqrt{3})$
(c) $(2\sqrt{2}, 3\sqrt{3})$ (d) $(\sqrt{3}, \sqrt{2})$

110. If $2x - y + 1 = 0$ is a tangent to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{16} = 1$, then which of the following cannot be sides of a right angled triangle? **[JEE Advanced 2017, 4M]**

(a) $2a, 8, 1$ (b) $a, 4, 1$
(c) $a, 4, 2$ (d) $2a, 4, 1$

■ **Direction** (Q. No. 111 to 113) Matching the information given in the three columns of the following table. Columns 1, 2 and 3 contain conics, equations of tangents to the conics and points of contact, respectively.

[JEE Advanced 2017, (3 + 3 + 3) M]

Column 1		Column 2		Column 3	
(I)	$x^2 + y^2 = a^2$	(i)	$my = m^2x + a$	(P)	$\left(\frac{a}{m^2}, \frac{2a}{m}\right)$
(II)	$x^2 + a^2y^2 = a^2$	(ii)	$y = mx + a\sqrt{m^2+1}$	(Q)	$\left(\frac{-ma}{\sqrt{m^2+1}}, \frac{a}{\sqrt{m^2+1}}\right)$
(III)	$y^2 = 4ax$	(iii)	$y = mx + \sqrt{a^2m^2-1}$	(R)	$\left(\frac{-a^2m}{\sqrt{a^2m^2+1}}, \frac{1}{\sqrt{a^2m^2+1}}\right)$
(IV)	$x^2 - a^2y^2 = a^2$	(iv)	$y = mx + \sqrt{a^2m^2+1}$	(S)	$\left(\frac{-a^2m}{\sqrt{a^2m^2-1}}, \frac{-1}{\sqrt{a^2m^2-1}}\right)$

111. The tangent to a suitable conic (Column 1) at $(\sqrt{3}, \frac{1}{2})$ is found to be $\sqrt{3}x + 2y = 4$, then which of the following options is the only correct combination?

(a) (IV) (iii) (S)
(b) (II) (iv) (R)
(c) (IV) (iv) (S)
(d) (II) (iii) (R)

112. For $a = \sqrt{2}$, if a tangent is drawn to a suitable conic (Column 1) at the point of contact $(-1, 1)$, then which of the following options is the only correct combination for obtaining its equation?

(a) (III) (i) (P) (b) (I) (i) (P)
(c) (II) (ii) (Q) (d) (I) (ii) (Q)

113. If a tangent of a suitable conic (Column 1) is found to be $y = x + 8$ and its point of contact is (8, 16), then which of the following options is the only correct combination?

(a) (III) (i) (P) (b) (III) (ii) (Q)
(c) (II) (iv) (R) (d) (I) (ii) (Q)

Solutions

1. $\because PF_1 \cdot PF_2 = e\left(x_1 - \frac{a}{e}\right).e\left(x_1 + \frac{a}{e}\right)$

$= e^2x_1^2 - a^2$

$= 2x_1^2 - a^2$ (for rectangular hyperbola $e = \sqrt{2}$)

$= x_1^2 + x_1^2 - a^2$ ($\because P(x_1, y_1)$, $x_1^2 - y_1^2 = a^2$)

$= x_1^2 + y_1^2$

$= (OP)^2$

$\therefore \quad \lambda = 1$

2. Let the point of contact of normal from point $P(h, k)$, be $R(t)$ for the hyperbola $xy = c^2$

$\Rightarrow$ The equation of normal is

$ct^4 - xt^3 + yt - c = 0$ which gives

$ct^4 - ht^3 + kt - c = 0$ [$\because$ It passes through (h,k)]...(i)

$\Rightarrow \quad t_1^2 + t_2^2 + t_3^2 + t_4^2 = \lambda$ (given) ... (ii)

From Eq. (i),

$\Sigma t_1 = \frac{h}{c}, \Sigma t_1 t_2 = 0$

$\therefore \quad (\Sigma t_1)^2 - 2\Sigma t_1 t_2 = t_1^2 + t_2^2 + t_3^2 + t_4^2$

$\Rightarrow \quad \left(\frac{h}{c}\right)^2 - 0 = \lambda$

or $h^2 = \lambda c^2$

$\therefore$ Locus of P is $x^2 = \lambda c^2$

3. As branches lies in the second and fourth quadrant.

$\therefore$ We have $xy < 0$

$\Rightarrow \quad m^2 - 9 < 0 \Rightarrow |m| < 3$

4. Let A is (α, β), the B is (β, α)

$\because$ A and B an symmetrical about the line $y = x$.

So, tangents at A and B will be mirror images of each other about $y = x$. Thus, point of intersection will lie on $y = x$.

5. Let $P(h,k)$ be any point on any one member of hyperbola family, having equation $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$; b is any arbitrary constant, then its asymptotes are given by $y = \pm \frac{b}{a}x$, then according to question

$$|k| = \frac{\left|\pm \frac{b}{a}h - k\right|}{\sqrt{\left(\frac{b^2}{a^2} + 1\right)}}$$

$$\Rightarrow \quad k^2 = \left(\pm \frac{b}{a}h - k\right)^2 \left(\frac{a^2}{a^2 + b^2}\right)$$

or $$k^2 = \frac{(\pm bh - ak)^2}{(a^2 + b^2)} \quad \text{...(i)}$$

Further (h,k) lies on hyperbola

$$\frac{h^2}{a^2} - \frac{k^2}{b^2} = 1 \Rightarrow b = \sqrt{\left(\frac{a^2k^2}{h^2 - a^2}\right)} \quad \text{...(ii)}$$

From Eq. (i) and (ii), we get

$$(k^2 - h^2) = \pm 2h\sqrt{(h^2 - a^2)}$$

$$\Rightarrow \quad (k^2 - h^2)^2 = 4h^2(h^2 - a^2)$$

$\therefore$ Required locus is

$$(x^2 - y^2)^2 = 4x^2(x^2 - a^2)$$

6. We know that if a circle cuts a rectangular hyperbola, then arithmetic mean of points of intersections is the mid-point of centre of hyperbola and circle.

So, $$\frac{3 + 5 + 2 + (-1)}{4} = \frac{-g + 1}{2}$$

and $$\frac{4 + 3 + 6 + 0}{4} = \frac{-f + 2}{2}$$

$\therefore \quad g + f = -8$

7. We know that eccentricity of a parabola and rectangular hyperbola are 1 and $\sqrt{2}$ respectively. Also, irrational roots occur in conjugate pair, thus roots of $f(x) = 0$ are 1, $\sqrt{2}$ and $-\sqrt{2}$

$\therefore \quad f(x) = (x - 1)(x - \sqrt{2})(x + \sqrt{2})$

$= x^3 - x^2 - 2x + 2$

$\therefore \quad a + b + c + d = 1 - 1 - 2 + 2 = 0$

8. Let the point be (α, β)

$\Rightarrow \quad \beta = \alpha + c$

Chord of contact of hyperbola $T = 0$.

$\therefore \quad \frac{x\alpha}{2} - \frac{y\beta}{1} = 1$

$\Rightarrow \quad \frac{x\alpha}{2} - y(\alpha + c) = 1$

$\Rightarrow \quad \left(\frac{x}{2} - y\right)\alpha - (yc + 1) = 0$

Since, this passes through point (x_1, y_1)

$\therefore \quad x_1 = 2y_1$ and $y_1c + 1 = 0$

$\therefore \quad y_1 = \frac{x_1}{2}$

Hence, $$\frac{x_1}{y_1} = 2$$

9. Eliminating x, we have

$$\frac{y^2}{b^2} + \frac{y}{ab} + 1 = 0$$

This equation has real and distinct roots

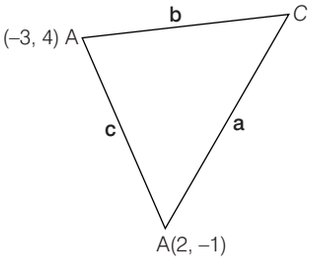
$\therefore \quad \frac{1}{a^2b^2} - \frac{4}{b^2} > 0$

i.e. $$\frac{1}{a^2} > 4 \text{ or } a^2 < \frac{1}{4}$$

$\Rightarrow \quad a < \frac{1}{2}$ and hence the conics intersect if $0 < a < \frac{1}{2}$.

10. Points from where perpendicular tangents can be drawn to the give hyperbola lie on the director circle $x^2 + y^2 = 9 - 16 = -7$ which is an imaginary circle. Hence, no point exists.

11. $\because \dfrac{\tan\left(\frac{1}{2}\angle ABC\right)}{\tan\left(\frac{1}{2}\angle BAC\right)} = \dfrac{3}{1}$



or $\dfrac{\tan\left(\frac{B}{2}\right)}{\tan\left(\frac{A}{2}\right)} = 3 \quad \text{or} \quad \dfrac{\frac{\Delta}{s(s-b)}}{\frac{\Delta}{s(s-a)}} = 3$

or $\dfrac{s-a}{s-b} = 3$

$\Rightarrow \quad s - a = 3s - 3b$

or $2s = 3b - a$

or $a + b + c = 3b - a$

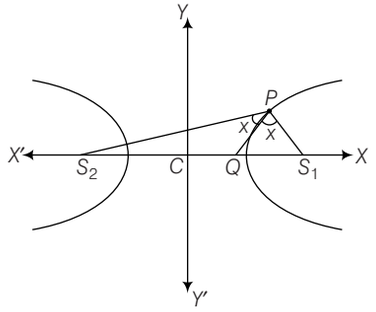
or $b - a = \dfrac{c}{2}$

or $AC - BC = \text{constant}$

$\therefore$ Locus of C is a hyperbola, whose foci are A and B.

$\therefore$ Distance between foci $= |AB| = 5\sqrt{2}$.

12.



Let $P \equiv (x_1, y_1)$

It is clear from figure

$\alpha > 0$ ... (i)

and $Q(\alpha, 0)$ out side on the hyperbola, then

$\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} - 1 \le 0$

$\Rightarrow \quad \dfrac{\alpha^2}{a^2} - 1 \le 0$

or $\alpha^2 \le a^2$

$\therefore \quad -a \le \alpha \le a$ ... (ii)

From Eqs. (i) and (ii), we get

$0 < \alpha \le a$

$\alpha \in (0, a]$

13. $\because$ Angle between asymptotes $= 2\tan^{-1}\left(\dfrac{b}{a}\right) = 120°$

or $\tan^{-1}\left(\dfrac{b}{a}\right) = 60°$

or $\dfrac{b}{a} = \sqrt{3}$

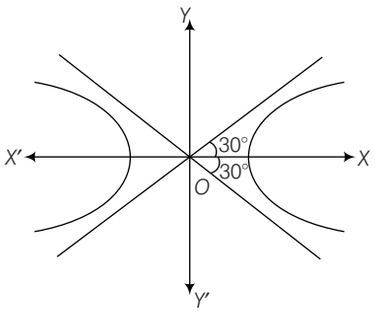
$\therefore \quad b = a\sqrt{3}$ or $b^2 = 3a^2$

$\Rightarrow \quad a^2 = 3 \qquad (\because b^2 = 9)$

Required locus is director circle of the hyperbola and which is $x^2 + y^2 = a^2 - b^2 = 3 - 9 = -6$

which is not possible.

Now, angle between asymptotes $= 2\tan^{-1}\left(\dfrac{b}{a}\right) = 60°$.



or $\tan^{-1}\left(\dfrac{b}{a}\right) = 30°$

or $\dfrac{b}{a} = \dfrac{1}{\sqrt{3}}$

or $a^2 = 3b^2 = 27 \qquad (\because b^2 = 9)$

$\therefore$ Required locus is

$x^2 + y^2 = a^2 - b^2 = 27 - 9 = 18$

14. Equation of chord joining α and β is

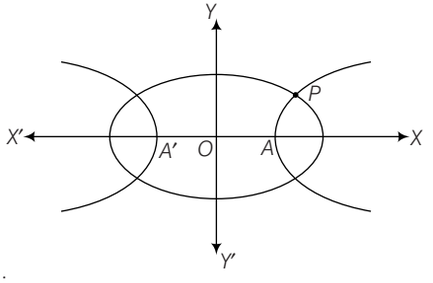
$\dfrac{x}{a}\cos\left(\dfrac{\alpha - \beta}{2}\right) - \dfrac{y}{b}\sin\left(\dfrac{\alpha + \beta}{2}\right) = \cos\left(\dfrac{\alpha + \beta}{2}\right)$

Put $\alpha + \beta = 3\pi$, then

$\dfrac{x}{a}\cos\left(\dfrac{\alpha - \beta}{2}\right) + \dfrac{y}{b} = 0$

It passes through the centre $(0, 0)$.

15. Let $P(a\cos\theta, b\sin\theta)$ on the ellipse.



$\therefore$ Equation of tangent at P on ellipse is

$\dfrac{x}{a}\cos\theta + \dfrac{y}{b}\sin\theta = 1$ ... (i)

and equation of tangent at P on $x^2 - y^2 = c^2$ is

$$x(a\cos\theta) - y(b\sin\theta) = c^2 \quad \ldots(ii)$$

Since, curves intersect at right angle, then

$$-\frac{b}{a}\cot\theta \times \frac{a}{b}\cot\theta = -1$$

$$\therefore \quad \tan^2\theta = 1 \quad \ldots(iii)$$

Since, $P(a\cos\theta, b\sin\theta)$ also lies on hyperbola

$$\therefore \quad (a\cos\theta)^2 - (b\sin\theta)^2 = c^2$$

Dividing both sides by $\cos^2\theta$, then

$$\text{or} \quad a^2 - b^2\tan^2\theta = c^2(1 + \tan^2\theta)$$

$$a^2 - b^2 = 2c^2 \quad \text{[from Eq. (iii)]}$$

16. Let mid-point of the chord is (h,k).

$\therefore$ Equation of chord of $x^2 - y^2 = a^2$ is

$$T = S_1$$

$$hx - ky = h^2 - k^2$$

$$\text{or} \quad y = \frac{h}{k}x - \frac{(h^2 - k^2)}{k}$$

which is tangent of $y^2 = 4ax$

$$\therefore \quad -\frac{(h^2 - k^2)}{k} = \frac{a}{\frac{h}{k}}$$

$$\text{or} \quad -(h^2 - k^2) = \frac{ak^2}{h}$$

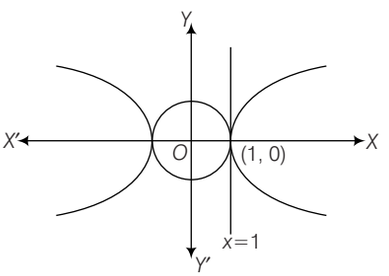
$$\text{or} \quad -h^3 + hk^2 = ak^2$$

$$\text{or} \quad k^2(h - a) = h^3$$

Hence, locus of mid-point is

$$y^2(x - a) = x^3$$

17. It is clear from the figure the common tangent to the circle $x^2 + y^2 = 1$ and hyperbola $x^2 - y^2 = 1$ is $x = 1$ (which is nearer to P (1/2, 1) and given one focus at P (1/2, 1), so the equation of the directrix is $x = 1$. Hence, the equation of the ellipse is



$$\sqrt{(x - 1/2)^2 + (y - 1)^2} = \frac{1}{2}|x - 1|$$

$$\Rightarrow \quad 9(x - 1/3)^2 + 12(y - 1)^2 = 1$$

18. Since, asymptotes of rectangular hyperbola are perpendicular to each other.

$\because$ Given asymptote is $3x - 4y - 6 = 0$

$\therefore$ Other asymptote is $4x + 3y + \lambda = 0 \quad \ldots(i)$

Given, centre of hyperbola lies on $x - y - 1 = 0$

Since, asymptotes pass through the centre of hyperbola

$\therefore$ Centre is the point of intersection of $x - y - 1 = 0$

and $3x - 4y - 6 = 0$

$\therefore$ Centre is $(-2, -3)$, also $(-2, -3)$ lies on Eq. (i)

then $\quad -8 - 9 + \lambda = 0$

$$\therefore \quad \lambda = 17$$

Hence, other asymptote is

$$4x + 3y + 17 = 0 \quad \text{[from Eq. (i)]}$$

19. Equation of normal of $y^2 = 4ax$ is

$$y = mx - 2am - am^3$$

which is tangent of $x^2 - y^2 = a^2$

$$\therefore \quad (-2am - am^3)^2 = a^2m^2 - a^2$$

$$\text{or} \quad 4m^2 + m^6 + 4m^4 = m^2 - 1$$

$$\text{or} \quad m^6 + 4m^4 + 3m^2 + 1 = 0$$

20. Let the middle-point of the chord is (h,k)

$$\therefore \quad T = S_1$$

$$3xh - 2yk + 2(x + h) - 3(y + k) = 3h^2 - 2k^2 + 4h - 6k$$

$$\text{Slope of this chord} = \frac{3h + 2}{2k + 3} = 2 \quad \text{(given)}$$

$$\text{or} \quad 3h + 2 = 4k + 6$$

$$\Rightarrow \quad 3h - 4k = 4$$

Hence, locus of middle-point is

$$3x - 4y = 4$$

21. Let $f(x, y) \equiv x^2 + 3xy + 2y^2 + 2x + 3y + 2 = 0$

$$\therefore \frac{\partial f}{\partial x} = 2x + 3y + 2 \text{ and } \frac{\partial f}{\partial y} = 3x + 4y + 3$$

For centre, $\frac{\partial f}{\partial x} = 0$ and $\frac{\partial f}{\partial y} = 0$

$$\therefore \quad 2x + 3y + 2 = 0$$

$$3x + 4y + 3 = 0$$

After solving, we get

$$x = -1, y = 0$$

$\therefore$ Coordinates of centre are $(-1, 0)$.

22. $\because$ Hyperbola is $\frac{x^2}{16} - \frac{y^2}{9} = 1 \quad \ldots(i)$

Foci are $(\pm 5, 0)$

$$F_1 \equiv (5, 0), F_2 \equiv (-5, 0)$$

Also, $\quad 4e_H = 5$

$$\therefore \quad e_H = \frac{5}{4}$$

Conjugate hyperbola of Eq. (i) is

$$-\frac{x^2}{16} + \frac{y^2}{9} = 1 \quad \ldots(ii)$$

Foci are $(0, \pm 5)$

$$F_3 \equiv (0, 5), F_4 \equiv (0, -5)$$

Also, $\quad 3e_c = 5$

$$\therefore \quad e_c = \frac{5}{3}$$

Equation of asymptotes of Eqs. (i) and (ii) are same

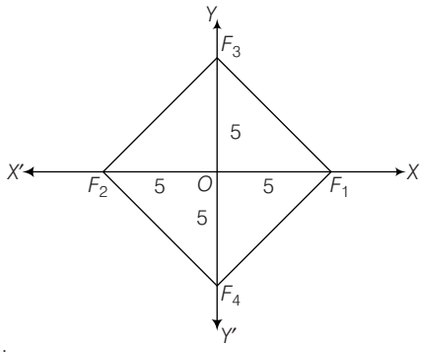
$$y = \pm\frac{3}{4}x \text{ and } e_H < e_c$$

Auxiliary circle of Eq. (i) is $x^2 + y^2 = 7$ and Eq. (ii) is

$$x^2 + y^2 = -7$$

and area of quadrilateral formed by their foci $= 4 \times \frac{1}{2} \times 5 \times 5$

$= 50$ sq units



23. Point of intersection of tangents at $(a\sec\alpha, b\tan\alpha)$ and $(a\sec\beta, b\tan\beta)$ is

$$\left(\frac{a\cos\left(\frac{\alpha-\beta}{2}\right)}{\cos\left(\frac{\alpha+\beta}{2}\right)}, \frac{b\sin\left(\frac{\alpha+\beta}{2}\right)}{\cos\left(\frac{\alpha+\beta}{2}\right)}\right)$$

Here, $\alpha = \phi, \beta = \frac{\pi}{2} - \phi$

then, point of intersection is $\left(\frac{a\cos\left(\frac{\pi}{4}-\phi\right)}{\frac{1}{\sqrt{2}}}, b\right)$

$$x = a\sqrt{2}\cos\left(\frac{\pi}{4} - \phi\right)$$

and $y = b$

$\therefore$ Required locus is $y = b$

24. $xdy + ydx = 0$

$\Rightarrow \quad d(xy) = 0$

$\therefore \quad xy = c$

which pass through (2, 8), then $2 \times 8 = c$

$\therefore \quad c = 16$

Equation of conic is $xy = 16$

$\therefore$ Length of latusrectum $= 2\sqrt{2}\,(4) = 8\sqrt{2}$

25. $x = t^2 + 1, y = 2t$

$$\Rightarrow \quad x = \left(\frac{y}{2}\right)^2 + 1$$

$$\Rightarrow \quad x = \frac{y^2}{4} + 1$$

$$\Rightarrow \quad y^2 = 4(x-1) \qquad \ldots (i)$$

Also, $x = 2s, y = \frac{2}{s}$

$$\therefore \quad xy = 4 \qquad \ldots (ii)$$

From Eqs. (i) and (ii),

$$\left(\frac{4}{x}\right)^2 = 4(x-1)$$

$$\Rightarrow \quad \frac{16}{x^2} = 4(x-1)$$

$$\Rightarrow \quad 4 = x^3 - x^2$$

$$\Rightarrow \quad x^3 - x^2 - 4 = 0$$

$$\Rightarrow \quad (x-2)(x^2 + x + 2) = 0$$

$$\therefore \quad x = 2,\ x^2 + x + 2 \neq 0$$

From Eq. (ii),

$$y = \frac{4}{2} = 2$$

Point of intersection is (2, 2)

26. Let rectangular hyperbola $xy = c^2$

Equation of tangent at 't' is

$$\frac{x}{t} + yt = 2c$$

$$\Rightarrow \quad \frac{x}{2ct} + \frac{y}{\left(\frac{2c}{t}\right)} = 1 \qquad \ldots (i)$$

and equation of normal at 't' is

$$xt^3 - yt - ct^4 + c = 0$$

$$\Rightarrow \quad xt^3 - ty = ct^4 - c$$

$$\Rightarrow \quad \frac{x}{\left(\frac{ct^4 - c}{t^3}\right)} + \frac{x}{\left(\frac{-ct^4 + c}{t}\right)} = 1 \qquad \ldots (ii)$$

From Eqs. (i) and (ii) it is clear that

$$x_1 = 2ct,\ x_2 = \left(\frac{ct^4 - c}{t^3}\right)$$

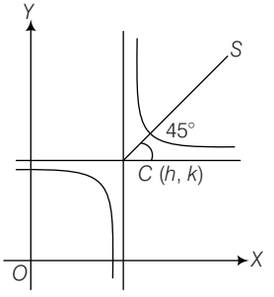
and $\quad y_1 = \frac{2c}{t}, y_2 = \left(\frac{-ct^4 + c}{t}\right)$

$\therefore \quad x_1x_2 + y_1y_2$

$$= \frac{2ct(ct^4 - c)}{t^3} + \frac{2c}{t} \cdot \frac{(-ct^4 + c)}{t}$$

$$= \frac{2c^2(t^4 - 1)}{t^2} + \frac{2c^2(t^4 - 1)}{t^2} = 0$$

27. $CS = p\sqrt{2}$



$\therefore$ Coordinate of S is either

$(h + p, k + p)$ or $(h - p, k - p)$

28. $\because H : x^2 + 3xy + 2y^2 + 2x + 3y = 0$

Let pair of asymptotes is

$$x^2 + 3xy + 2y^2 + 2x + 3y + \lambda = 0$$

$\therefore \quad \Delta = 0$

$$1\times2\times\lambda+2\times\frac{3}{2}\times1\times\frac{3}{2}-1\times\frac{9}{4}-2\times1-\lambda\times\frac{9}{4}=0$$

$$\Rightarrow\quad -\frac{\lambda}{4}+\frac{9}{2}-\frac{9}{4}-2=0$$

$$\Rightarrow\quad \frac{\lambda}{4}=\frac{9}{4}-2=\frac{1}{4}$$

$$\therefore\quad \lambda=1$$

$$A: x^2+3xy+2y^2+2x+3y+1=0$$

$$\because\quad H+C=2A$$

$$\therefore\quad C=2A-H$$

$$=x^2+3xy+2y^2+2x+3y+2$$

$\therefore$ Conjugate hyperbola is $x^2+3xy+2y^2+2x+3y+2=0$

29. The equation of the hyperbola is $\frac{x^2}{9}-\frac{y^2}{16}=1$

The equation of the tangent is

$$y=mx+\sqrt{(9m^2-16)}$$

or $\sqrt{(9m^2-16)}=2\sqrt{5}$

or $9m^2-16=20$

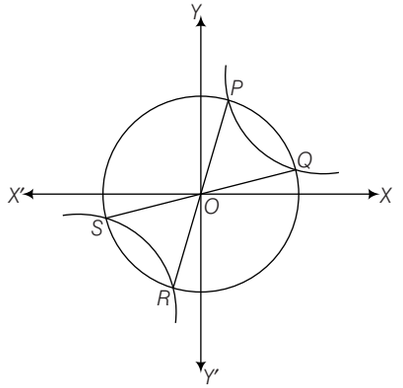
or $m^2=4$

$\therefore\quad m=\pm2$

or $a+b=$ sum of roots $=0$

30. $\because\ x-2=m$ and $y+1=\frac{4}{m}$

$\therefore\quad (x-2)(y+1)=4$



Let $x-2=X,\ y+1=Y$

$\therefore\quad XY=4$ ... (i)

and $s=(x-2)^2+(y+1)^2=25$

or $X^2+Y^2=25$

Curve C and circle are concentric, therefore,

$$(OP)^2+(OQ)^2+(OR)^2+(OS)^2=4r^2$$

$$=4(5)^2$$

$$=100$$

31. Equation of any tangent to the parabola $y^2=8x$

is $y=mx+\frac{2}{m}$ ... (i)

which is also touches the hyperbola

$\frac{x^2}{1}-\frac{y^2}{3}=1$, then $\left(\frac{2}{m}\right)^2=1\times m^2-3$

or $m^4-3m^2-4=0$

or $(m^2-4)(m^2+1)=0$

$\therefore\quad m^2-4=0$

or $m=\pm2$

From Eq. (i), common tangents are

$$y=2x+1 \text{ and } y=-2x-1$$

i.e. $2x-y+1=0$ and $2x+y+1=0$

32. Foci of the ellipse $\frac{x^2}{k^2a^2}+\frac{y^2}{a^2}=1$ are $(\pm a\sqrt{(k^2-1)},\ 0)$ and foci of the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ are $(\pm ae, 0)$, $e>1$

$\because$ Foci are coincide, then

$a\sqrt{(k^2-1)}=ae$ or $\sqrt{(k^2-1)}>1$

or $k^2-1>1$ or $k^2>2$

$\therefore\quad k<-\sqrt{2}$ or $k>\sqrt{2}$

33. Equation of chord joining θ and ϕ is

$$\frac{x}{a}\cos\left(\frac{\theta-\phi}{2}\right)-\frac{y}{b}\sin\left(\frac{\theta+\phi}{2}\right)=\cos\left(\frac{\theta+\phi}{2}\right)$$

It passes through $(kae,\ 0)$, where $k=\pm1$, then

$$\frac{\cos\left(\frac{\theta-\phi}{2}\right)}{\cos\left(\frac{\theta+\phi}{2}\right)}=\frac{1}{ke}$$

$$\Rightarrow\quad \frac{\cos\left(\frac{\theta-\phi}{2}\right)-\cos\left(\frac{\theta+\phi}{2}\right)}{\cos\left(\frac{\theta-\phi}{2}\right)+\cos\left(\frac{\theta+\phi}{2}\right)}=\frac{1-ke}{1+ke}$$

$$\therefore\quad \tan\left(\frac{\theta}{2}\right)\tan\left(\frac{\phi}{2}\right)=\frac{1-ke}{1+ke}$$

$$=\begin{cases}\frac{1-e}{1+e}, & \text{for } k=1\\ \frac{1+e}{1-e}, & \text{for } k=-1\end{cases}$$

34. $\because$ Foci of hyperbola are $(\pm3a, 0)$ and foci of ellipse are $(\pm\sqrt{(25-16)}, 0)$ i.e. $(\pm3, 0)$ according to question.

$$a=1$$

and $b^2=a^2(e^2-1)=1(9-1)=8$

Now, hyperbola is $\frac{x^2}{1}-\frac{y^2}{8}=1$

Alternate (a) $a^2+b^2=1+8=9$

Alternate (b) Director circle is $x^2+y^2=1-8=-7$

i.e. there is no director circle.

Alternate (d) Length of latusrectum $=\frac{2b^2}{a}=\frac{2(8)}{1}=16$

35. $16x^2-3y^2-32x-12y-44=0$

$$\Rightarrow\quad 16(x^2-2x)-3(y^2+4y)-44=0$$

$$\Rightarrow 16\{(x-1)^2-1\}-3\{(y+2)^2-4\}-44=0$$

$$\Rightarrow\quad 16(x-1)^2-3(y+2)^2=48$$

$$\frac{(x-1)^2}{(\sqrt{3})^2}-\frac{(y+2)^2}{4^2}=1$$

Alternate (a) : Length of transverse axis
$= 2 \times \sqrt{3} = 2\sqrt{3}$

Alternate (b) : Length of conjugate axis
$= 2 \times 4 = 8$

Alternate (c) : Centre $x - 1 = 0$

and $y + 2 = 0$, i.e. $(1, -2)$

Alternate (d) : $4^2 = (\sqrt{3})^2 (e^2 - 1)$

or $e^2 - 1 = \frac{16}{3}$

$\therefore$ $e^2 = \frac{19}{3}$

then $e = \sqrt{\frac{19}{3}}$

36. $xy = 1$

Equation of normal at 't' i.e. $\left(t, \frac{1}{t}\right)$

is $xt^3 - yt - t^4 + 1 = 0$

Slope is $t^2 = -\frac{a}{b}$,

$-\frac{a}{b} > 0 \Rightarrow \frac{a}{b} < 0$

$\therefore$ $a > 0, b < 0$

or $a < 0, b > 0$

37. P, Q, R, S lies on the circle

$$x^2 + y^2 + 2gx + 2fy + c = 0 \quad \text{... (i)}$$

and also lies on

$$xy = c^2 \quad \text{... (ii)}$$

Solving Eqs. (i) and (ii), then

$$x^2 + \left(\frac{c^2}{x}\right)^2 + 2gx + \frac{2fc^2}{x} + c = 0$$

$\Rightarrow$ $x^4 + 2gx^3 + cx^2 + 2fc^2x + c^4 = 0$

$\therefore$ $x_1 x_2 x_3 x_4 = c^4$ ... (iii)

and $P \equiv (x_1, y_1) \equiv \left(x_1, \frac{c^2}{x_1}\right)$

$Q \equiv \left(x_2, \frac{c^2}{x_2}\right)$

and $R \equiv \left(x_3, \frac{c^2}{x_3}\right)$

Let orthocentre $O \equiv (h, k)$

Then, slope of $QR \times$ slope of $OP = -1$

$$\left(\frac{\frac{c^2}{x_3} - \frac{c^2}{x_2}}{x_3 - x_2}\right) \times \left(\frac{k - \frac{c^2}{x_1}}{h - x_1}\right) = -1$$

$\Rightarrow$ $$-\frac{c^2}{x_2 x_3} \times \left(\frac{k - \frac{c^2}{x_1}}{h - x_1}\right) = -1$$

$\Rightarrow$ $$k - \frac{c^2}{x_1} = \frac{hx_2x_3}{c^2} - \frac{x_1x_2x_3}{c^2} \quad \text{... (iv)}$$

Also, slope of $PQ \times$ slope of $OR = -1$

$$k - \frac{c^2}{x_3} = \frac{h\,x_1x_2}{c^2} - \frac{x_1x_2x_3}{c^2} \quad \text{...(v)}$$

From Eqs. (iii) and (iv),

$\therefore$ $h = -\frac{c^4}{x_1x_2x_3}$ and $k = -\frac{x_1x_2x_3}{c^2}$

From Eq. (iii),

$h = -x_4$ and $k = -\frac{c^2}{x_4}$

$\therefore$ Orthocentre lies on $xy = c^2$

i.e. (x_4, y_4) and $(-x_4, -y_4)$

38. (c) $y = x + 5$

Comparing with $y = mx + c$

$\therefore$ $m = 1, c = 5$

Alternate (a) : Condition of tangency

$c = \frac{a}{m}$

$5 = \frac{5}{1}$

which is true.

Alternate (b) :

$9x^2 + 16y^2 = 144$

$\Rightarrow$ $\frac{x^2}{16} + \frac{y^2}{9} = 1$

$\because$ Condition of tangency

$c^2 = a^2m^2 + b^2$

$\Rightarrow$ $25 = 16 \times 1 + 9 = 25$

Which is true

Alternate (c) :

$\frac{x^2}{29} - \frac{y^2}{4} = 1$

$\because$ Condition of tangency

$c^2 = a^2m^2 - b^2$

$25 = 29 \times 1 - 4 = 25$

Which is true.

Alternate (d) : Now length of perpendicular from centre (0, 0) to the line $y = x + 5$ is $\frac{|5|}{\sqrt{2}}$ i.e. $\frac{5}{\sqrt{2}} \neq$ radius (5).

39. Equation of the directrices of the given hyperbola $\frac{x^2}{25} - \frac{y^2}{16} = 1$ are

$$x = \pm \frac{5 \times 5}{\sqrt{(25 + 16)}} = \pm \frac{25}{\sqrt{41}} \quad \text{... (i)}$$

Equations of the asymptotes of the given hyperbola are

$$\frac{x^2}{15} - \frac{y^2}{16} = 0 \quad \text{...(ii)}$$

The points of intersection of Eqs. (i) and (ii) are
$(\pm 25/\sqrt{41}, \pm 20/\sqrt{41})$

40. $\because |SP - S'P| = 2a$

$$\Rightarrow \quad 2a = \sqrt{(24-0)^2 + (7-0)^2} - \sqrt{(5-0)^2 + (12-0)^2}$$

$$= 25 - 13 = 12$$

$$\therefore \quad a = 6$$

and $$2ae = \sqrt{(24-5)^2 + (7-12)^2} = \sqrt{(386)}$$

$$\therefore \quad e = \frac{\sqrt{386}}{12}$$

and $$b^2 = a^2(e^2 - 1) = 36\left(\frac{386}{144} - 1\right) = \frac{121}{2}$$

$$\therefore \quad \text{Latusrectum} = \frac{2b^2}{a} = \frac{121}{6}$$

41. The locus of the point of intersection of perpendicular tangents is director circle

$$x^2 + y^2 = a^2 - b^2$$

Now, $$e^2 = 1 + \frac{b^2}{a^2}$$

if $a^2 = b^2$, there is exactly one point (centre of the hyperbola)

i.e, $$e = \sqrt{2}$$

if $$a^2 > b^2 \text{ or } \frac{b^2}{a^2} < 1$$

i.e. $$e^2 < 2$$

or $0 < e < \sqrt{2}$, there are infinite (or more than one) points on the circle.

if $$a^2 < b^2 \text{ or } \frac{b^2}{a^2} > 1$$

i.e. $$e^2 > 2$$

or $e > \sqrt{2}$, there does not exist any point on the plane.

42. **Alternate (a) :**

$$\left(\frac{2x}{a}\right)^2 - \left(\frac{2y}{b}\right)^2 = \left(t + \frac{1}{t}\right)^2 - \left(t - \frac{1}{t}\right)^2 = 4$$

$$\Rightarrow \quad \frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

Alternate (b) :

$$\because \quad \frac{tx}{a} - \frac{y}{b} + t = 0 \Rightarrow t = \frac{ay}{b(x+a)} \qquad \text{... (i)}$$

and $$\frac{x}{a} + \frac{ty}{b} - 1 = 0 \Rightarrow t = \frac{(a-x)b}{ay} \qquad \text{... (ii)}$$

From Eqs. (i) and (ii), we get

$$\frac{ay}{b(x+a)} = \frac{(a-x)b}{ay}$$

$$\Rightarrow \quad a^2y^2 = b^2(a^2 - x^2)$$

$$\Rightarrow \quad b^2x^2 + a^2y^2 = a^2b^2$$

or $$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

Alternate (c) : $x^2 - y^2 = (e^t + e^{-t})^2 - (e^t - e^{-t})^2 = 4$

Alternate (d) : $\because x^2 - 6 = 2\cos t$

$$\Rightarrow \quad x^2 - 4 = 2(1 + \cos t) = 4\cos^2\left(\frac{t}{2}\right) \qquad \text{... (i)}$$

and $$y^2 + 2 = 4\cos^2\left(\frac{t}{2}\right) \qquad \text{... (ii)}$$

From Eqs. (i) and (ii), then

$$x^2 - 4 = y^2 + 2$$

or $$x^2 - y^2 = 6$$

43. Equation of any tangent to hyperbola is

$$y = mx \pm \sqrt{(a^2m^2 - b^2)} \qquad \text{... (i)}$$

which is tangent of $-\frac{x^2}{b^2} + \frac{y^2}{a^2} = 1$

then $$a^2m^2 - b^2 = a^2 - b^2m^2$$

$$\Rightarrow \quad (a^2 + b^2)m^2 = (a^2 + b^2)$$

$$\therefore \quad m^2 = 1$$

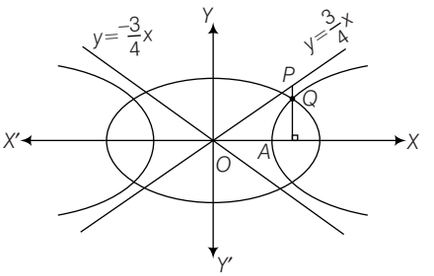
or $$m = \pm 1$$

From Eq. (i), common tangent are

$$y = \pm x \pm \sqrt{(a^2 - b^2)}$$

44. Vertices and foci of ellipse $\frac{x^2}{16} + \frac{y^2}{7} = 1$ are $(\pm 4, 0)$ and $(\pm 3, 0)$ respectively.

Vertices and foci of the hyperbola $\frac{x^2}{\left(\frac{144}{25}\right)} - \frac{y^1}{\left(\frac{81}{25}\right)} = 1$ are $\left(\pm \frac{12}{5}, 0\right)$ and $(\pm 3, 0)$, respectively.



For point of intersection

$$7\left(1 - \frac{x^2}{16}\right) = 81\left(\frac{x^2}{144} - \frac{1}{25}\right)$$

$$\Rightarrow \quad x^2 = \frac{256}{25}$$

and $$y^2 = 7\left(1 - \frac{16}{25}\right) = \frac{63}{25}$$

= square of the ordinate of point of intersection

$$y^2 \text{ for } P = \frac{9}{16}x^2 = \frac{9}{16} \times \frac{256}{25} = \frac{144}{25}$$

$\therefore$ Sum of the squares of coordinates of P is $x^2 + y^2 = 16$ which is auxiliary circle formed by ellipse.

45. $(1 - x^2)\frac{dy}{dx} + xy = ax$

or $$\frac{2dy}{(a-y)} = \frac{2x\,dx}{(1-x^2)}$$

$\Rightarrow \quad -2\ln(a-y) = -\ln(1-x^2) - \ln c$

or $\quad (a-y)^2 = c(1-x^2)$

$\Rightarrow \quad cx^2 + (y-a)^2 = c$

or $\quad \dfrac{x^2}{1} + \dfrac{(y-a)^2}{c} = 1$

for $c > 0$, ellipse and for $c < 0$, hyperbola centre of the conic is $(0, a)$ and length of one of the principal axes $= 2a = 2$

Sol. (Q. Nos. 46 to 48)

Give conic is

$$x^2 - y^2 + 2y - 2 = 0 \qquad \ldots (i)$$

Equation of tangent at (a,b) is

$$ax - by + (y + b) - 2 = 0$$

$\because$ Tangent line pass through $(0, 0)$, then

$$b = 2$$

Also, (a, b) lies on Eq. (i), then

$$a^2 - b^2 + 2b - 2 = 0$$

or $\quad a^2 - 4 + 4 - 2 = 0$

$\Rightarrow \quad a^2 = 2$

$\therefore \quad a = \pm\sqrt{2}$

46. $\because$ Slope of tangent $= \dfrac{a}{b}$

$$= \frac{\sqrt{2}}{2} \qquad \text{(for positive slope)}$$

$$= \frac{1}{\sqrt{2}}$$

$$\therefore \quad \sin^{-1}\left(\frac{a}{b}\right) = \sin^{-1}\left(\frac{1}{\sqrt{2}}\right)$$

$$= \frac{\pi}{4}$$

47. $\because$ Conic is $x^2 - (y-1)^2 = 1$

$\therefore$ Length of latusrectum $= \dfrac{2(1)^2}{1} = 2$

48. $\because$ Given curve is rectangular hyperbola

$\therefore \quad e = \sqrt{2}$

Thus, $\quad 1 + e^2 + e^4 = 1 + 2 + 4 = 7$

Sol. (Q. Nos. 49 to 51)

Any point on the hyperbola is $(2t, 2/t)$ normal at this point is

$$xt^3 - yt - 2t^4 + 2 = 0$$

If the normal passes through $P(h,k)$, then

$$2t^4 - ht^3 + kt - 2 = 0$$

The equation has roots t_1, t_2, t_3, t_4, then

$$\Sigma t_1 = \frac{h}{2}, \Sigma t_1 t_2 = 0,$$

$$\Sigma t_1 t_2 t_3 = -\frac{k}{2}, t_1 t_2 t_3 t_4 = -1$$

$\because$ Feet of normals are $\left(2t_1, \dfrac{2}{t_1}\right), \left(2t_2, \dfrac{2}{t_2}\right),$

$$\left(2t_3, \frac{2}{t_3}\right) \text{ and } \left(2t_4, \frac{2}{t_4}\right)$$

$\because$ Sum of slopes of normals = Sum of ordinates of feet of normals

$$\therefore \quad t_1^2 + t_2^2 + t_3^2 + t_4^2 = \frac{2}{t_1} + \frac{2}{t_2} + \frac{2}{t_3} + \frac{2}{t_4}$$

$$\Rightarrow \quad \Sigma t_1^2 = 2\Sigma\left(\frac{1}{t_1}\right)$$

49. $(\Sigma t_1)^2 - 2\Sigma t_1 t_2 = 2\left(\dfrac{\Sigma t_1 t_2 t_3}{t_1 t_2 t_3 t_4}\right)$

$$\Rightarrow \quad \left(\frac{h}{2}\right)^2 - 0 = 2\left(\frac{-k/2}{-1}\right) \text{ or } h^2 = 4k$$

Hence, the locus of (h, k) is $x^2 = 4y$

50. $\because$ Curve C is $x^2 = 4y$

$\therefore$ Equation of tangent at $(2t, t^2)$ is $tx = y + t^2$

$\Rightarrow \quad A \equiv (t, 0)$ and $B \equiv (0, -t^2)$

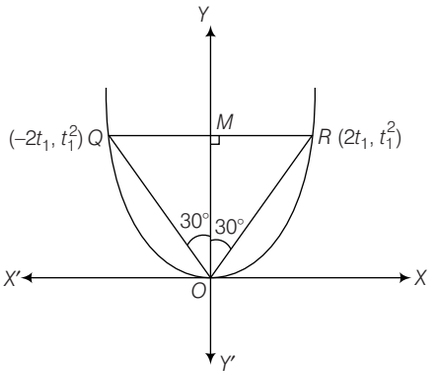
Let mid-point of AB is (h, k).

$\therefore \quad 2h = t$ and $2k = -t^2$

$\Rightarrow \quad 2k = -(2h)^2$ or $2h^2 + k = 0$

$\therefore$ Required locus is $2x^2 + y = 0$

51.



$$\therefore \quad \tan 30° = \frac{2t_1}{t_1^2} \text{ or } \frac{1}{\sqrt{3}} = \frac{2}{t_1}$$

$$\therefore \quad t_1 = 2\sqrt{3}$$

$$\Rightarrow \quad QR = 4t_1 = 8\sqrt{3}$$

Area of equilateral ΔOQR

$$= \frac{\sqrt{3}}{4}(8\sqrt{3})^2 = 48\sqrt{3} \text{ sq units}$$

Sol. (Q. Nos. 52 to 54)

$\because S_1(1,2)$ and $S_2(5, 5)$ are the foci

then $\quad S_1S_2 = 5 = 2ae \qquad \ldots (i)$

and $\quad |S'P - SP| = 2a$

Here, $\quad 2a = 4 \qquad \ldots (ii)$

From Eqs. (i) and (ii)

$$e = \frac{5}{4}$$

52. Let e' be the eccentricity of conjugate hyperbola.

$$\therefore \quad \frac{1}{e^2} + \frac{1}{e'^2} = 1$$

$$\Rightarrow \quad \frac{16}{25} + \frac{1}{e'^2} = 1 \Rightarrow \frac{1}{e'^2} = \frac{9}{25}$$

$$\therefore \quad e' = \frac{5}{3}$$

53. Locus of point of intersection of two mutually perpendicular tangents is the director circle given by

$$(x-h)^2+(y-k)^2=(a^2-b^2);$$

where $(h,\ k)$ is the centre of hyperbola given by

$$(h,k)=\left(\frac{1+5}{2},\frac{2+5}{2}\right)\equiv\left(3,\frac{7}{2}\right)$$

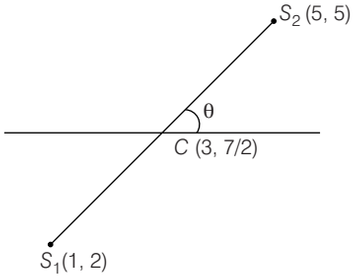
$\therefore$ $a^2=4,\ b^2=a^2(e^2-1)$

$$=4\left(\frac{25}{16}-1\right)=\frac{9}{4}$$

$\therefore$Required locus (director circle) is

$$(x-3)^2+\left(y-\frac{7}{2}\right)^2=4-\frac{9}{4}=\frac{7}{4}$$

54.



$\because$ θ should be the angle between the transverse axis and X-axis, given by

$$\tan\theta=\frac{5-2}{5-1}=\frac{3}{4}$$

$\therefore$ $\theta=\tan^{-1}\left(\frac{3}{4}\right)$

Sol. (Q. Nos. 55 to 57)

$\because$ $P(a\sec\theta_1,\ b\tan\theta_1)$ and $Q(a\sec\theta_2,\ b\tan\theta_2)$ are the extremities of focal chord, then

$$\tan\left(\frac{\theta_1}{2}\right)\tan\left(\frac{\theta_2}{2}\right)=\frac{1-e}{1+e}\text{ for focus }S(ae,0)\quad\ldots(i)$$

and $\theta=2\tan^{-1}\left(\frac{b}{a}\right)$ ... (ii)

Let $R\equiv(a\sec\phi,\ b\tan\phi)$

$\therefore$Equation of tangent at R is

$$\frac{x}{a}\sec\phi-\frac{y}{b}\tan\phi=1$$

$\therefore$ $A\equiv(a\cos\phi,0)$

and $B\equiv(0,-b\cot\phi)$

55. Let $C=(h,k)$

$\because$ $OACB$ is rectangle

$\therefore$ Mid-point of OC = mid-point of AB

$\Rightarrow$ $\left(\frac{h}{2},\frac{k}{2}\right)\equiv\left(\frac{a\cos\phi}{2},\frac{-b\cot\phi}{2}\right)$

or $h=a\cos\phi\ \Rightarrow\ \sec\phi=\frac{a}{h}$ ... (iii)

and $k=-b\cot\phi\ \Rightarrow\ \tan\phi=-\frac{b}{k}$ ... (iv)

From Eqs. (iii) and (iv), we get

$$\frac{a^2}{h^2}-\frac{b^2}{k^2}=1$$

Hence, required locus is

$$\frac{a^2}{x^2}-\frac{b^2}{y^2}=1$$

56. From Eq. (i)

$$1+\tan\left(\frac{\theta_1}{2}\right)\tan\left(\frac{\theta_2}{2}\right)=\frac{2}{1+e}$$

$\Rightarrow$ $\frac{\cos\left(\frac{\theta_1-\theta_2}{2}\right)}{\cos\left(\frac{\theta_1}{2}\right)\cos\left(\frac{\theta_2}{2}\right)}=\frac{2}{1+e}$ ... (v)

and $1-\tan\left(\frac{\theta_1}{2}\right)\tan\left(\frac{\theta_2}{2}\right)=\frac{2e}{1+e}$

$\Rightarrow$ $\frac{\cos\left(\frac{\theta_1+\theta_2}{2}\right)}{\cos\left(\frac{\theta_1}{2}\right)\cos\left(\frac{\theta_2}{2}\right)}=\frac{2e}{1+e}$ ... (vi)

From Eqs. (v) and (vi), we get

$$\frac{\cos\left(\frac{\theta_1+\theta_2}{2}\right)}{\cos\left(\frac{\theta_1-\theta_2}{2}\right)}=e\ \text{ or }\ \frac{\cos^2\left(\frac{\theta_1+\theta_2}{2}\right)}{\cos^2\left(\frac{\theta_1-\theta_2}{2}\right)}=e^2$$

or $\lambda=e^2$ (given)

$$=\frac{a^2+b^2}{a^2}$$

57. From Eq. (ii),

$$\theta=2\tan^{-1}\left(\frac{b}{a}\right)$$

$\therefore$ $\tan\left(\frac{\theta}{2}\right)=\frac{b}{a}$

$\Rightarrow$ $\cos\left(\frac{\theta}{2}\right)=\frac{1}{\sec\left(\frac{\theta}{2}\right)}=\frac{1}{\sqrt{1+\tan^2\left(\frac{\theta}{2}\right)}}$

$$=\frac{1}{\sqrt{\left(1+\frac{b^2}{a^2}\right)}}$$

$$=\frac{1}{\sqrt{1+e^2-1}}=\frac{1}{e}$$

Sol. (Q. Nos. 58 to 60)

58. $\because$ Perpendicular tangents intersect at the centre of rectangular hyperbola. Hence, centre of the hyperbola is (1, 1) and the equations of asymptotes are

$$x-1=0\text{ and }y-1=0$$

$\therefore$Pair of asymptotes is

$$(x-1)(y-1)=0$$

or $xy-x-y+1=0$

or $xy+1=x+y$

59. Let equation of the hyperbola be

$$xy - x - y + \lambda = 0$$

It passes through (2, 3), then

$$6 - 2 - 3 + \lambda = 0$$

$$\therefore \quad \lambda = -1$$

So, equation of hyperbola is

$$xy = x + y + 1$$

60. From the centre of the hyperbola, we can draw two real tangents to the rectangular hyperbola.

61. For ellipse (if $a > b$)

$$ae_1 = \sqrt{(a^2 - b^2)}$$

or $$a^2e_1^2 = a^2 - b^2$$

and for hyperbola

$$Ae_2 = \sqrt{(A^2 + B^2)}$$

$$\Rightarrow \quad = \sqrt{(A^2 + b^2)} \qquad [\because 2b = 2B \text{ (given)}]$$

or $$A^2e_2^2 = A^2 + b^2$$

$$\Rightarrow \quad \frac{1}{e_1^2} + \frac{1}{e_2^2} = \frac{a^2}{(a^2 - b^2)} + \frac{A^2}{(A^2 + b^2)} \qquad \text{... (i)}$$

Since, both the curves are confocal $\Rightarrow ae_1 = Ae_2$

or $$a^2e_1^2 = A^2e_2^2$$

$$\Rightarrow \quad a^2 - b^2 = A^2 + b^2$$

or $$A^2 = a^2 - 2b^2 \qquad \text{... (ii)}$$

From Eqs. (i) and (ii), we get

$$\frac{1}{e_1^2} + \frac{1}{e_2^2} = \frac{a^2}{a^2 - b^2} + \frac{a^2 - 2b^2}{a^2 - b^2}$$

$$= \frac{2(a^2 - b^2)}{(a^2 - b^2)} = 2$$

62. Othrocentre of triangle formed by the points $\left(ct_1, \frac{c}{t_1}\right)$, $\left(ct_2, \frac{c}{t_2}\right)$ and $\left(ct_3, \frac{c}{t_3}\right)$ on the rectangular hyperbola.

$$xy = c^2 \text{ is } \left(-\frac{c}{t_1t_2t_3}, -c\,t_1t_2t_3\right)$$

Here, $$c = 2 \text{ and } \frac{-c}{t_1t_2t_3} = \frac{1}{2} \quad \text{or} \quad t_1t_2t_3 = -2c$$

$\therefore$ Ordinate of orthocentre $= -c\,t_1t_2t_3$

$$= -c \times -2c$$

$$= 2c^2 = 2(2)^2$$

$$= 8$$

63. Since the normal drawn at $P(t_1)$ meets the hyperbola $xy = 2$ again at $Q(t_2)$, then

$$t_1^3\,t_2 = -1 \qquad \text{... (i)}$$

$\because$ $$P \equiv \left(\sqrt{2}\,t_1, \frac{\sqrt{2}}{t_1}\right) \text{ and } Q \equiv \left(\sqrt{2}\,t_2, \frac{\sqrt{2}}{t_2}\right)$$

$\therefore$ Distance $$PQ = \sqrt{(\sqrt{2}t_1 - \sqrt{2}t_2)^2 + \left(\frac{\sqrt{2}}{t_1} - \frac{\sqrt{2}}{t_2}\right)^2}$$

$$= \sqrt{2}\,|t_1 - t_2|\sqrt{\left(1 + \frac{1}{t_1^2\,t_2^2}\right)}$$

$$= \sqrt{2}\,\frac{(t_1^4 + 1)^{3/2}}{|t_1^3|} \qquad \text{[from Eq. (i)]}$$

$$= \sqrt{2}\left(t_1^2 + \frac{1}{t_1^2}\right)^{3/2} \geq \sqrt{2}\,(2)^{3/2} = 4 \quad (\because AM \geq GM)$$

$\therefore$ Distance $PQ \geq 4$

Hence, minimum distance between the points P and Q is 4.

64. Let $P(a\sec\theta, b\tan\theta)$ be a point on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ with eccentricity $e = \frac{3}{2\sqrt{2}}$

$\therefore$ $$a^2 = 8b^2 \qquad (\because b^2 = a^2(e^2 - 1)) \quad \text{...(i)}$$

$\because$ Equation of normal at P is

$$ax\cos\theta + by\cot\theta = a^2 + b^2$$

$\therefore$ $$M \equiv \left(\left(\frac{a^2 + b^2}{a}\right)\sec\theta, 0\right)$$

$$N \equiv \left(0, \left(\frac{a^2 + b^2}{b}\right)\tan\theta\right)$$

Let mid-point of MN is $R(h,k)$

$\therefore$ $$2h = \left(\frac{a^2 + b^2}{a}\right)\sec\theta \qquad \text{... (ii)}$$

and $$2k = \left(\frac{a^2 + b^2}{b}\right)\tan\theta \qquad \text{... (iii)}$$

From Eqs. (ii) and (iii), we get

$$4a^2h^2 - 4b^2k^2 = (a^2 + b^2)^2$$

$\therefore$Locus of R is

$$\frac{x^2}{\left(\frac{a^2 + b^2}{2a}\right)^2} - \frac{y^2}{\left(\frac{a^2 + b^2}{2b}\right)^2} = 1$$

which have eccentricity

$$e_1 = \sqrt{\left(1 + \frac{a^2}{b^2}\right)} = \sqrt{(1 + 8)} = 3 \qquad \text{[from Eq. (i)]}$$

65. Equations of director circle of ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \text{ is } x^2 + y^2 = a^2 + b^2$$

$\therefore$ Radius $(r_1) = \sqrt{(a^2 + b^2)}$

$$= \sqrt{a^2 + a^2(1 - e_1^2)}$$

$$= a\sqrt{(2 - e_1^2)} \qquad \text{... (i)}$$

and director circle of hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b_1^2} = 1$ is

$$x^2 + y^2 = a^2 - b_1^2$$

$\therefore$ Radius $(r_2) = \sqrt{(a^2 - b_1^2)}$

$$= \sqrt{a^2 - a^2(e_2^2 - 1)} = a\sqrt{(2 - e_2^2)} \qquad \text{... (ii)}$$

Given, $\frac{r_1}{r_2} = \frac{1}{3}$

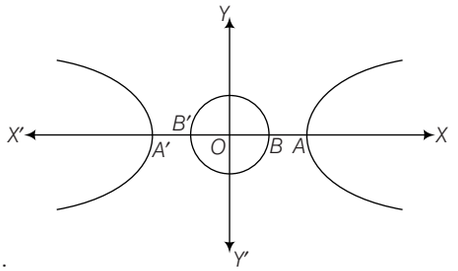
$\Rightarrow \quad \frac{a\sqrt{(2-e_1^2)}}{a\sqrt{(2-e_2^2)}} = \frac{1}{3}$ [from Eqs. (i) and (ii)]

$\Rightarrow \quad 9 - 9e_1^2 = 2 - e_2^2$

$\therefore \quad 9e_1^2 - e_2^2 = 7 = \lambda$

$\therefore \quad \lambda = 7$

66. $\because \frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ and $x^2 + y^2 = \frac{a^2}{4}$ having origin as their common centre.



So, vertex is the nearest point. Hence, shortest distance = BA

$= a - \frac{a}{2} = \frac{a}{2}$

$\therefore \quad f(a, b) = \frac{a}{2}$

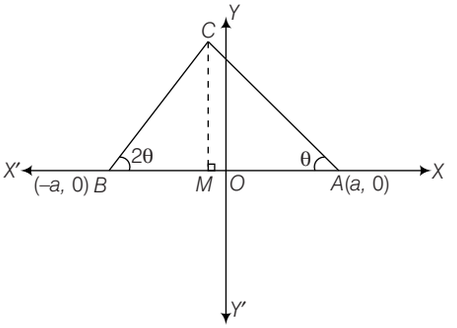
Hence, $f(4,6) + f(2,3) = \frac{4}{2} + \frac{2}{2} = 3$

67. Let $A \equiv (a, 0)$ and $B \equiv (-a, 0)$

If $C \equiv (x, y)$

$\therefore \quad \tan\theta = \frac{y}{a + x}$ ... (i)

and $\tan 2\theta = \frac{y}{a - x}$ ... (ii)



From Eq. (ii),

$\frac{2\tan\theta}{1 - \tan^2\theta} = \frac{y}{a - x}$

$\Rightarrow \quad \frac{\frac{2y}{a + x}}{1 - \left(\frac{y}{a + x}\right)^2} = \frac{y}{a - x}$ [from Eq. (i)]

or $\frac{2y(a + x)}{a^2 + x^2 + 2ax - y^2} = \frac{y}{a - x}$

$\Rightarrow \quad 2(a^2 - x^2) = a^2 + x^2 + 2ax - y^2$

or $3x^2 + 2ax - y^2 - a^2 = 0$

or $3\left(x + \frac{a}{3}\right)^2 - y^2 = \frac{2a^2}{3}$

or $\frac{\left(x + \frac{a}{3}\right)^2}{\left(\frac{2a^2}{9}\right)} - \frac{y^2}{\left(\frac{2a^2}{3}\right)} = 1$

$\therefore \quad$ Eccentricity $(e) = \sqrt{\left(\frac{\frac{2a^2}{9} + \frac{2a^2}{3}}{\frac{2a^2}{9}}\right)} = 2$

68. Let $P\left(\frac{t}{\sqrt{2}}, \frac{1}{t\sqrt{2}}\right)$ be any point on $2xy = 1$ and $S \equiv (1,1)$

and $S' \equiv (-1,-1)$

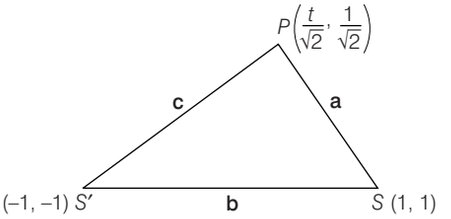
Here $t > 0$

Let $R(h, k)$ be the ex-centre of $\Delta PSS'$ opposite to vertex S.

$\Rightarrow \quad h = \frac{-a - c + \frac{tb}{\sqrt{2}}}{a + b - c}$

and $k = \frac{-a - c + \frac{b}{t\sqrt{2}}}{a + b - c}$

Here, $b = 2\sqrt{2}, a = ePM$



$= \sqrt{2}\,\frac{\left(\frac{t}{\sqrt{2}} + \frac{1}{t\sqrt{2}} - 1\right)}{\sqrt{2}} = \frac{t}{\sqrt{2}} + \frac{1}{t\sqrt{2}} - 1$

and $c = \sqrt{2}\,\frac{\left(\frac{t}{\sqrt{2}} + \frac{1}{t\sqrt{2}} + 1\right)}{\sqrt{2}}$

$= \frac{t}{\sqrt{2}} + \frac{1}{t\sqrt{2}} + 1$ ($\because$ Directrices are $x + y = \pm 1$)

$\therefore \quad h = \frac{-\sqrt{2}\left(t + \frac{1}{t}\right) + 2t}{2\sqrt{2} - 2}$

and $k = \frac{-\sqrt{2}\left(t + \frac{1}{t}\right) + \frac{2}{t}}{2\sqrt{2} - 2}$

$\therefore \quad h + k = -\left(t + \frac{1}{t}\right)$ ... (i)

and $h-k=\dfrac{t-\dfrac{1}{t}}{\sqrt{2}-1}$ ... (ii)

$\because \quad \left(t+\dfrac{1}{t}\right)^2=\left(t-\dfrac{1}{t}\right)^2+4$

$\Rightarrow \quad (h+k)^2=(\sqrt{2}-1)^2(h-k)^2+4$

$\therefore$ Locus of R is $(x+y)^2=(\sqrt{2}-1)^2(x-y)^2+4$

On comparing, we get $p=1$ and $q=4$

$\therefore \quad p+q=5$

69. Let $P(h,k)$ be the middle-point, then equation of chord whose mid-point $P(h,k)$ is

$$T=S_1$$

$\Rightarrow \quad hx+ky-4=h^2+k^2-4$

or $\quad y=-\dfrac{h}{k}x+\dfrac{(h^2+k^2)}{k}$

It will touch the hyperbola $\dfrac{x^2}{4}-\dfrac{y^2}{16}=1$, then

$$\left(\frac{h^2+k^2}{k}\right)^2=4\times\frac{h^2}{k^2}-16$$

$\Rightarrow \quad (h^2+k^2)^2=4h^2-16k^2$

$\therefore$ Locus of $P(h,k)$ is

$$(x^2+y^2)^2=4x^2-16y^2$$

$\therefore \quad \lambda=4$

70. The given hyperbola is $\dfrac{x^2}{2}-\dfrac{y^2}{3}=1$

Equation of tangents is $y=mx\pm\sqrt{(2m^2-3)}$

$\because$ Tangents from the point (α,β) will be

$$(\beta-m\alpha)^2=2m^2-3$$

or $\quad m^2(\alpha^2-2)-2m\alpha\beta+\beta^2+3=0$

$\because \quad m_1m_2=\dfrac{\beta^2+3}{\alpha^2-2} \Rightarrow \tan\theta\tan\phi=\dfrac{\beta^2+3}{\alpha^2-2}$

$\Rightarrow \quad 2=\dfrac{\beta^2+3}{\alpha^2-2}$

or $\quad 2\alpha^2-\beta^2=7$

71. **(A)** $16x^2-9y^2+32x+36y-164=0$

$\Rightarrow \quad 16(x^2+2x+1)-9(y^2-4y+4)-144=0$

or $\quad 16(x+1)^2-9(y-2)^2=144$

or $\quad \dfrac{(x+1)^2}{9}-\dfrac{(y-2)^2}{16}=1$

$\therefore \quad \lambda=$ length latusrectum $=\dfrac{2\times16}{3}=\dfrac{32}{3}$

or $\quad 3\lambda=32$

(B) Making $\dfrac{x^2}{16}-\dfrac{y^2}{18}=1$ homogeneous with the help of $x\cos\alpha+y\sin\alpha=p$, then

$$\frac{x^2}{16}-\frac{y^2}{18}=\left(\frac{x\cos\alpha+y\sin\alpha}{p}\right)^2$$

Since, these lines are perpendicular to each other, then

$$\left(\frac{1}{16}-\frac{\cos^2\alpha}{p^2}\right)+\left(-\frac{1}{18}-\frac{\sin^2\alpha}{p^2}\right)=0$$

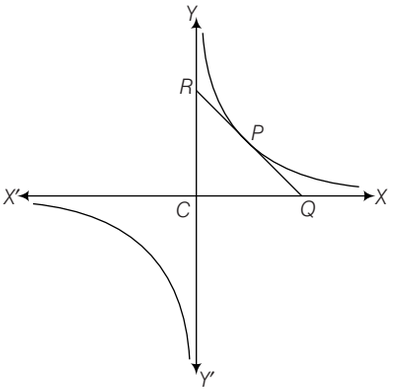
or $\quad \dfrac{1}{16}-\dfrac{1}{18}=\dfrac{1}{p^2}$

or $\quad p=\pm12$

$\therefore$ Radius of circle $=|p|=2$

Hence, diameter of the circle $=24$

(C) Any point on $xy=8$ is $P\left(\sqrt{8}\,t,\dfrac{\sqrt{8}}{t}\right)$



Equation of tangent at P

$$x\times\frac{\sqrt{8}}{t}+y\times\sqrt{8}\,t=16 \text{ or } \frac{x}{\left(\frac{16t}{\sqrt{8}}\right)}+\frac{x}{\left(\frac{16}{\sqrt{8}\,t}\right)}=1$$

$\therefore \quad CQ=\dfrac{16t}{\sqrt{8}}$ and $CR=\dfrac{16}{\sqrt{8}t}$

Hence, area of $\Delta CQR=\dfrac{1}{2}\times CQ\times CR$

$$=\frac{1}{2}\times\frac{16t}{\sqrt{8}}\times\frac{16}{\sqrt{8}t}=16$$

(D) Hyperbola is $x^2-3y^2=9$

or $\quad \dfrac{x^2}{9}-\dfrac{y^2}{3}=1$

$\because$ Angle between asymptotes

$$=2\tan^{-1}\left(\frac{\sqrt{3}}{3}\right)=2\tan^{-1}\left(\frac{1}{\sqrt{3}}\right)$$

$$=2\times\frac{\pi}{6}=\frac{\pi\lambda}{24} \qquad \text{(given)}$$

$\therefore \quad \lambda=8$

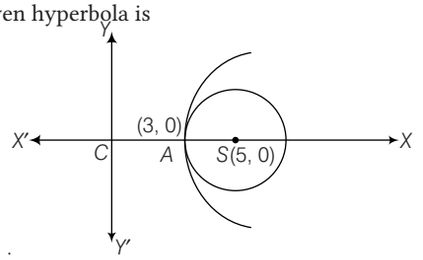
72. **(A)** Let the hyperbola be $\dfrac{x^2}{a^2}-\dfrac{y^2}{b^2}=1$

then $\quad 2a=ae$

$\Rightarrow \quad e=2$

$\therefore \quad \dfrac{(2b)^2}{(2a)^2}=\dfrac{b^2}{a^2}=e^2-1=(2)^2-1=3$

(B) Given hyperbola is



$$\frac{x^2}{9}-\frac{y^2}{16}=1 \qquad \text{... (i)}$$

or $$e^2=1+\frac{16}{9}=\frac{25}{9}$$

or $$e=\frac{5}{3}$$

Hence, its foci are $(\pm 5, 0)$

The equation of the circle with (5, 0) as centre is

$$(x-5)^2+(y-0)^2=r^2 \qquad \text{... (ii)}$$

Solving Eqs. (i) and (ii), we have

$$16x^2-9(r^2-(x-5)^2)=144$$

or $$25x^2-90x-9r^2+81=0$$

Since, the circle touches the hyperbola, the above equation must have equal roots.

Hence, $$(90)^2-4(25)(81-9r^2)=0$$

or $$r=0$$

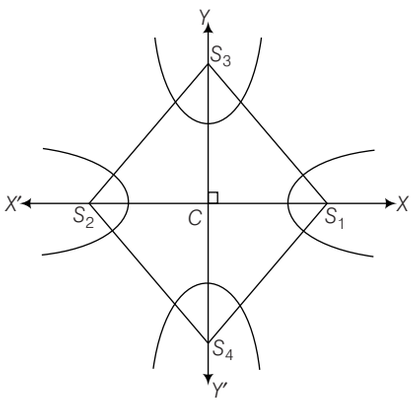
which is not possible.

Hence, the circle can not touch at two points. It can only be tangent at the vertex.

Hence, $$r=5-3=2$$

(C) Equation of hyperbola is

$$\frac{x^2}{2^2}-\frac{y^2}{3^2}=1$$



Its foci $(\pm\sqrt{(2^2+3^2)}, 0)$

or $S_1 \equiv (\sqrt{13}, 0)$ and $S_2 \equiv (-\sqrt{13}, 0)$

and equation of conjugate hyperbola is

$$-\frac{x^2}{2^2}+\frac{y^2}{3^2}=1$$

Its foci $(0, \pm\sqrt{(3^2+2^2)})$

or $S_3 \equiv (0, \sqrt{13})$ and $S_4 \equiv (0, -\sqrt{13})$

Hence, area of quadrilateral $S_1S_2S_3S_4$

$$=4\times \text{Area of } \Delta S_1CS_3$$

$$=4\times\frac{1}{2}\times CS_1\times CS_3$$

$$=2\times\sqrt{13}\times\sqrt{13}=26$$

(D) Given hyperbola is

$$ax^2-by^2=c$$

or $$\frac{x^2}{(c/a)}-\frac{y^2}{(c/b)}=1$$

$\because$ $$\sqrt{\frac{c}{b}}=\frac{5}{2} \qquad \text{...(i)}$$

and $$2\sqrt{\left(\frac{c}{a}+\frac{c}{b}\right)}=13 \qquad \text{...(ii)}$$

From Eqs. (i) and (ii)

$$2\sqrt{\left(\frac{c}{a}+\frac{25}{4}\right)}=13$$

or $$\frac{c}{a}=\frac{169}{4}-\frac{25}{4}=36 \qquad \text{... (iii)}$$

and $$\frac{c}{b}=\frac{25}{4} \qquad \text{... (iv)}$$

$\therefore$ $$\frac{a}{b}=\frac{\frac{c}{b}}{\frac{c}{a}}=\frac{25}{144}$$

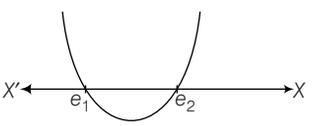
$\because$ a and b are co-prime

$\therefore$ $a=25, b=144$

and from Eq. (iii), $c=900$

Hence, $$\frac{3ab}{2c}=\frac{3\times 25\times 144}{2\times 900}=6$$

73. Let $f(x)=x^2-\lambda x+2$



$\therefore$ $$D=\lambda^2-8$$

x-coordinate of vertex $=\frac{\lambda}{2}$ and $f(1)=3-\lambda$

(A) We must have

$$e_1<1<e_2$$

then $D>0$ and $f(1)<0$

$\Rightarrow$ $\lambda^2>8$ and $3-\lambda<0$

$\Rightarrow$ $\lambda\in(-\infty, -2\sqrt{2})\cup(2\sqrt{2}, \infty)$ and $\lambda>3$

$\therefore$ $\lambda>3$

(B) $\because$ $e_1>1, e_2>1$

then $D\geq 0$ and $f(1)>0$ and $\frac{\lambda}{2}>1$

$\Rightarrow$ $\lambda\in(-\infty, -2\sqrt{2})]\cup[2\sqrt{2}, \infty)$

and $\lambda<3$ and $\lambda>2$

$\therefore$ $\lambda\in[2\sqrt{2}, 3)$

(C) We must have $\frac{1}{e_1^2}+\frac{1}{e_2^2}=1$

or $e_1^2+e_2^2=(e_1e_2)^2$

$\Rightarrow (e_1+e_2)^2-2e_1e_2=(e_1e_2)^2$

$\Rightarrow \lambda^2-4=(2)^2$ or $\lambda^2=8$

$\therefore \lambda=\pm 2\sqrt{2}$

(D) We must have $e_1<\sqrt{2}<e_2$

then $D>0$ and $f(\sqrt{2})<0$

$\Rightarrow \lambda^2>8$ and $2-\lambda\sqrt{2}+2<0$

or $\lambda\in(-\infty,-2\sqrt{2})\cup(2\sqrt{2},\infty)$

and $\lambda>2\sqrt{2}$

$\therefore \lambda>2\sqrt{2}$

74. Since, e_1 and e_2 are the eccentricities of two conjugate hyperbolas, so $e_1>1$ and $e_2>1$.

$\Rightarrow e_2e_2>1$

$\therefore$ Statement II is true.

As for e_1 and e_2 for hyperbola and its conjugate,

$$\frac{1}{e_1^2}+\frac{1}{e_2^2}=1$$

Let $e_1=\frac{5}{3}$ and $e_2=\frac{5}{4}$

Now, $\frac{1}{e_1^2}+\frac{1}{e_2^2}=\frac{9}{25}+\frac{16}{15}=1$

$\therefore$Statement I is true, but Statement II is not correct explanation of Statement I.

75. By definition, if $H(x,y)=0$

then $A_1(x,y)=H(x,y)+\lambda$

$\therefore$ Statement II is true

Since, $C(x,y)=H(x,y)+2$

$=A_1(x,y)+(2-\lambda)$

Since, for $A_1(x,y)=0$, we have $\Delta=0$ and also for $A_2(x,y)$, $\Delta=0$, So $A_1=A_2$

$\therefore$Statement I is true and Statement II is correct explanation of Statement I.

76. $\because$ Director circle is the locus of the point of intersection of perpendicular tangents.

$\therefore$ Statement II is true.

$\because$ Director circle of $5x^2-4y^2=20$

or $\frac{x^2}{4}-\frac{y^2}{5}=1$

is $x^2+y^2=4-5$ or $x^2+y^2=-1$

$\therefore$ Statement I is false.

77. Director circle of $\frac{x^2}{25}-\frac{y^2}{16}=1$ is

$$x^2+y^2=25-16=9$$

Hence, angle between tangents is $\pi/2$.

$\therefore$ Statement I and Statement II are true and Statement II is a correct explanation for Statement I.

78. The conjugate hyperbolas are

$$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1 \text{ and } \frac{y^2}{b^2}-\frac{x^2}{a^2}=1$$

then $e^2=\frac{a^2+b^2}{a^2}$ and $e_1^2=\frac{a^2+b^2}{b^2}$

$\therefore \frac{1}{e^2}+\frac{1}{e_1^2}=1$

$\because \frac{1}{2^2}+\frac{1}{\left(\frac{2}{\sqrt{3}}\right)^2}=\frac{1}{4}+\frac{3}{4}=1$ and $ee_1=\frac{4}{\sqrt{3}}>1$

$\therefore$ Statement I and Statement II are both true and Statement II is not a correct explanation of Statement I.

79. If we solve $4x-5y=0$

or $y=\frac{4}{5}x$

and $16x^2-25y^2=400$

or $\frac{x^2}{25}-\frac{y^2}{16}=1$

we get, $0=1\Rightarrow$ No solution

$\Rightarrow$ The line $y=\frac{4}{5}x$ does not meet but the line satisfies the condition of being a tangent.

$$c^2-a^2m^2+b^2=0-25\times\frac{16}{25}+16=0$$

$\Rightarrow$ It must touch the curve at infinity.

$\therefore$Statement I and Statement II are both true but Statement II is a correct explanation for Statement I.

80. The point (x_1,y_1) inside the hyperbola.

$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$, then $\frac{x_1^2}{a^2}-\frac{y_1^2}{b^2}-1>0$

$\therefore$ Statement II is false.

Also, $3y^2-5x^2+1=0$

or $5x^2-3y^2-1=0$

$\therefore$ Value of $5x^2-3y^2-1$ at $(5,-3)$ is

$5(5)^2-3(-3)^2-1$

$=125-27-1=97>0$

$\therefore$ Statement I is true.

81. If hyperbola is $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$

$\therefore$Angle between asymptotes $=2\tan^{-1}\left(\frac{b}{a}\right)$

For equilateral hyperbola $a=b$

then, angle between asymptotes

$$=2\tan^{-1}(1)=2\cdot\frac{\pi}{4}=\frac{\pi}{2}$$

$\therefore$Statement I is false.

and eccentricity $e=\sqrt{\left(\frac{a^2+b^2}{a^2}\right)}=\sqrt{\left(\frac{a^2+a^2}{a^2}\right)}=\sqrt{2}$

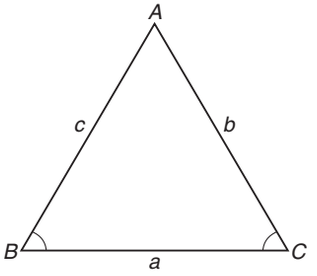
$\therefore$Statement 2 is true.

82. BC = base of the triangle = a (constant) and A is the vertex.

$$\frac{\tan(B/2)}{\tan(C/2)} = \frac{\sqrt{\frac{(s-c)(s-a)}{s(s-b)}}}{\sqrt{\frac{(s-a)(s-b)}{s(s-c)}}}$$

$$= \frac{s-c}{s-b} = \frac{2s-2c}{2s-2b}$$

$$= \frac{a+b-c}{a-b+c} = k \qquad \text{(let)}$$



By componendo and dividendo

$$\Rightarrow \qquad \frac{k-1}{k+1} = \frac{b-c}{a}$$

$$\Rightarrow \qquad b - c = a\left(\frac{k-1}{k+1}\right) = \text{ constant}$$

$$\Rightarrow \qquad CA - BA = \text{constant}$$

By the focal property the locus of A is a hyperbola whose foci are B and C.

83. Let coordinates of A, B and C on the hyperbola $xy = c^2$ are $\left(ct_1, \frac{c}{t_1}\right), \left(ct_2, \frac{c}{t_2}\right)$ and $\left(ct_3, \frac{c}{t_3}\right)$ respectively.

(i) $\therefore$ Area of triangle $ABC = \frac{1}{2}\left|\begin{vmatrix} ct_1 & \frac{c}{t_1} \\ ct_2 & \frac{c}{t_2} \end{vmatrix} + \begin{vmatrix} ct_2 & \frac{c}{t_2} \\ ct_3 & \frac{c}{t_3} \end{vmatrix} + \begin{vmatrix} ct_3 & \frac{c}{t_3} \\ ct_1 & \frac{c}{t_1} \end{vmatrix}\right|$

$$= \frac{c^2}{2}\left|\frac{t_1}{t_2} - \frac{t_2}{t_1} + \frac{t_2}{t_3} - \frac{t_3}{t_2} + \frac{t_3}{t_1} - \frac{t_1}{t_3}\right|$$

$$= \frac{c^2}{2t_1t_2t_3}\left|t_2^2t_3 - t_2^2t_3 + t_1t_2^2 - t_3^2t_1 + t_2t_3^2 - t_1^2t_2\right|$$

$$= \frac{c^2}{2t_1t_2t_3}\left|(t_1 - t_2)(t_2 - t_3)(t_3 - t_1)\right|$$

(ii) Equations of tangents at A, B, C are

$$x + yt_1^2 - 2ct_1 = 0$$

$$x + yt_2^2 - 2ct_2 = 0$$

and $$x + yt_3^2 - 2ct_3 = 0$$

$\therefore$ Required area $= \frac{1}{2|C_1C_2C_3|}\begin{vmatrix} 1 & t_1^2 & -2ct_1 \\ 1 & t_2^2 & -2ct_2 \\ 1 & t_3^2 & -2ct_3 \end{vmatrix}^2$ ... (i)

where $C_1 = \begin{vmatrix} 1 & t_2^2 \\ 1 & t_3^2 \end{vmatrix}$, $C_2 = -\begin{vmatrix} 1 & t_1^2 \\ 1 & t_3^2 \end{vmatrix}$ and $C_3 = \begin{vmatrix} 1 & t_1^2 \\ 1 & t_2^2 \end{vmatrix}$

$\therefore$ $C_1 = t_3^2 - t_2^2$, $C_2 = t_1^2 - t_3^2$ and $C_3 = t_2^2 - t_1^2$

From Eq. (i)

$$= \frac{1}{2|(t_3^2 - t_2^2)(t_1^2 - t_3^2)(t_2^2 - t_1^2)|}$$

$$4c^2 \cdot (t_1 - t_2)^2 (t_2 - t_3)^2 (t_3 - t_1)^2$$

$$= 2c^2\left|\frac{(t_1 - t_2)(t_2 - t_3)(t_3 - t_1)}{(t_1 + t_2)(t_2 + t_3)(t_3 + t_1)}\right|$$

$\therefore$ Required area is, $2c^2\left|\frac{(t_1 - t_2)(t_2 - t_3)(t_3 - t_1)}{(t_1 + t_2)(t_2 + t_3)(t_3 + t_1)}\right|$

84. Let chord be PQ and coordinates of P and Q are $\left(ct_1, \frac{c}{t_1}\right)$ and $\left(ct_2, \frac{c}{t_2}\right)$ respectively.

Now let mid-point of PQ is $M(h, k)$

$\therefore$ $$h = \frac{1}{2}(ct_1 + ct_2)$$

$\therefore$ $$t_1 + t_2 = \frac{2h}{c} \quad \text{and} \quad k = \frac{1}{2}\left\{\frac{c}{t_1} + \frac{c}{t_2}\right\}$$

or $$\frac{2k}{c} = \frac{t_1 + t_2}{t_1t_2}$$

or $$\frac{2k}{c} = \frac{\frac{2h}{c}}{t_1t_2} \qquad \left(\because t_1 + t_2 = \frac{2h}{c}\right)$$

or $$t_1t_2 = \frac{h}{k}$$

$\therefore$ $$(t_1 - t_2)^2 = (t_1 + t_2)^2 - 4t_1t_2 = \frac{4h^2}{c^2} - \frac{4h}{k}$$

$$= \frac{4h}{c^2k}(hk - c^2) \qquad \text{...(i)}$$

Since, $|PQ| = 2d$

$\therefore$ $$\sqrt{(ct_1 - ct_2)^2 + \left(\frac{c}{t_1} - \frac{c}{t_2}\right)^2} = 2d$$

or $$c^2(t_1 - t_2)^2\left\{1 + \frac{1}{t_1^2t_2^2}\right\} = (2d)^2$$

or $$c^2 \times \frac{4h}{c^2k}(hk - c^2)\left\{1 + \frac{k^2}{h^2}\right\} = 4d^2 \qquad \text{[from Eq. (i)]}$$

or $$(h^2 + k^2)(hk - c^2) = d^2hk$$

Hence, locus of the middle-point of PQ is

$$(x^2 + y^2)(xy - c^2) = d^2xy.$$

85. Let the rectangular hyperbola is

$$xy = c^2 \qquad \text{...(i)}$$

Since, the centre of hyperbola (i) is origin (0, 0) and equation of asymptotes are $x = 0$ and $y = 0$.

The equation of a line through (0, 0) and makes an angle θ with asymptote (X-axis) is $y = x \tan\theta$.

It will meet the hyperbola, where $x(x\tan\theta) = c^2$

i.e. $x = c\sqrt{\cot\theta}$

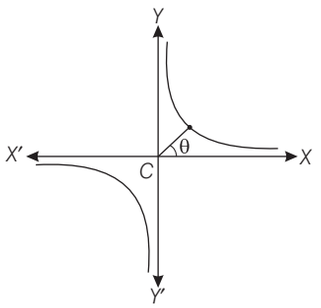
Putting $x = c\sqrt{\cot\theta}$ in (1)

then $y = c\sqrt{(\tan\theta)}$

$\therefore$ The four points are $(c\sqrt{\cot\theta}, c\sqrt{\tan\theta})$ where

$Q = \alpha, \beta, \gamma, \delta.$

The line joining the points α and β is perpendicular to the line joining the points γ and δ.



Therefore, the product of their slopes $= -1$

i.e. $$\frac{c\sqrt{\tan\beta} - c\sqrt{\tan\alpha}}{c\sqrt{\cot\beta} - c\sqrt{\cot\alpha}} \times \frac{c\sqrt{\tan\delta} - c\sqrt{\tan\gamma}}{c\sqrt{\cot\delta} - c\sqrt{\cot\gamma}} = -1$$

$\Rightarrow$ $$(-\sqrt{\tan\alpha}\sqrt{\tan\beta}) \times (-\sqrt{\tan\gamma}\sqrt{\tan\delta}) = -1$$

or $$\tan\alpha\tan\beta\tan\gamma\tan\delta = 1$$

86. Let $P\left(ct_1, \frac{c}{t_1}\right)$ and $Q\left(ct_2, \frac{c}{t_2}\right)$ be any two points on $xy = c^2$.

Then tangents at P and Q are

$$x + yt_1^2 = 2ct_1 \quad \text{...(i)}$$

and $$x + yt_2^2 = 2ct_2 \quad \text{...(ii)}$$

On solving Eqs. (i) and (ii), the point of intersection, say (h, k), is given by

$$h = \frac{2ct_1t_2}{t_1 + t_2} \quad \text{and} \quad k = \frac{2c}{t_1 + t_2} \quad \text{...(iii)}$$

The foot of the ordinate of P is $(ct_1, 0)$ and it lies on Eq. (ii) then

$$ct_1 + 0 = 2ct_2$$

$\therefore$ $$t_1 = 2t_2 \quad \text{...(iv)}$$

Then, from Eqs. (iii) and (iv),

$$h = \frac{2c \cdot 2t_2 \cdot t_2}{2t_2 + t_2} \quad \text{and} \quad k = \frac{2c}{2t_2 + t_2}$$

$\therefore$ $$h = \frac{4c}{3}t_2 \quad \text{and} \quad k = \frac{2c}{3t_2}$$

$\therefore$ $$h \cdot k = \frac{4c}{3}t_2 \times \frac{2c}{3t_2}$$

$\therefore$ $$hk = \frac{8}{9}c^2$$

$\therefore$ Locus of (h, k) is $xy = \frac{8}{9}c^2$, which is a rectangular hyperbola with the same asymptotes $x = 0$ and $y = 0$ as those of $xy = c^2$.

87. Take two given perpendicular straight lines as the coordinate axes and let the equation of variable circle be

$$x^2 + y^2 + 2gx + 2fy + c = 0 \quad \text{...(i)}$$

Suppose circle (i) make an intercept of length a on X-axis and an intercept of length b on Y-axis.

$\therefore$ $$a = 2\sqrt{(g^2 - c)}$$

and $$b = 2\sqrt{(f^2 - c)}$$

Squaring and subtracting these, we get

$$4(g^2 - c) - 4(f^2 - c) = a^2 - b^2$$

or $$g^2 - f^2 = \frac{1}{4}(a^2 - b^2)$$

or $$(-g)^2 - (-f)^2 = \frac{1}{4}(a^2 - b^2)$$

Hence locus of the centre of circle $(-g, -f)$ is

$$x^2 - y^2 = \frac{1}{4}(a^2 - b^2)$$

which is a rectangular hyperbola.

88. Let the hyperbola be

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \quad \text{...(i)}$$

Its asymptotes are

$$\frac{x}{a} - \frac{y}{b} = 0 \quad \text{and} \quad \frac{x}{a} + \frac{y}{b} = 0$$

(a) Let us take the asymptote

$$\frac{x}{a} - \frac{y}{b} = 0 \Rightarrow y = \frac{b}{a}x \quad \text{...(ii)}$$

Any line parallel to Eq. (ii) is

$$y = \frac{b}{a}x + c \quad \text{...(iii)}$$

Eliminate y from Eqs. (i) and (iii), then

$$\frac{x^2}{a^2} - \frac{1}{b^2}\left(\frac{b}{a}x + c\right)^2 = 1$$

$\Rightarrow$ $$\frac{x^2}{a^2} - \frac{1}{b^2}\left(\frac{b^2x^2}{a^2} + c^2 + \frac{2bc}{a}x\right) = 1$$

$\Rightarrow$ $$0 \cdot x^2 - \frac{2c}{ab}x - \frac{(c^2 + b^2)}{b^2} = 0$$

One root of its equation is infinite since coefficient of x^2 in it is zero. Also from Eq. (iii), when $y \to \infty$ as $x \to \infty$.

$\therefore$ Eqs. (i) and (iii) meet in one point at infinity.

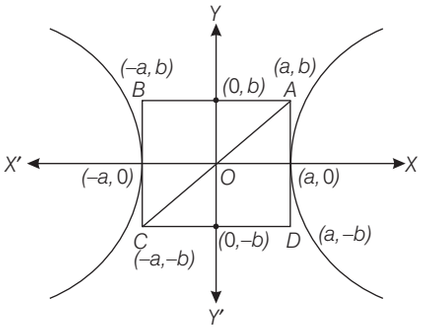
(b) Lines through $(a, 0); (-a, 0); (0, b)$ and $(0, -b)$ are parallel to the principal axes, enclose a rectangle whose vertices are $A(a, b)$, $B(-a, b)$, $C(-a, -b)$ and $D(a, -b)$. Now equation of diagonal AC is

$$y - b = \frac{b - (-b)}{a - (-a)}(x - a)$$

$\Rightarrow$ $$y - b = \frac{b}{a}(x - a)$$

$\Rightarrow$ $$y = \frac{b}{a}x$$

$\Rightarrow$ $$\frac{x}{a} - \frac{y}{b} = 0$$



i.e. The diagonal AC is one of the asymptotes of the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$. Similarly the diagonal BD is the other asymptote.

89. Let the equation of ellipse is

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \qquad ...(i)$$

Tangent to Eq. (i) at $P(a\cos\phi, b\sin\phi)$ is

$$\frac{x}{a}\cos\phi + \frac{y}{b}\sin\phi = 1$$

Coordinate of point B is

$$B \equiv (a\sec\phi, 0) \text{ and } AB = a\{\sec\phi - \cos\phi\}$$

Let coordinate of Q be (x_1, y_1) then

$$x_1 = a\cos\phi \text{ and } y_1 = a(\sec\phi - \cos\phi)$$

So $$y_1 = a\left(\frac{a}{x_1} - \frac{x_1}{a}\right)$$

$$\Rightarrow \quad x_1 y_1 = a^2 - x_1^2$$

Hence, locus of Q is $xy = a^2 - x^2$ ...(ii)

which is clearly a hyperbola.

Since, the equation of a hyperbola and its asymptotes differ in constant terms only, asymptotes of Eq. (ii) are given by $x^2 + xy - a^2 + k = 0$, k is any constant.

It represents two straight lines. The required condition for this is

$$abc + 2fgh - af^2 - bg^2 - ch^2 = 0$$

then $$k = a^2$$

$\therefore$ Asymptotes are

$$x = 0 \quad \text{and} \quad x + y = 0$$

90. The given rectangular hyperbola is

$$xy = c^2 \qquad ...(i)$$

Equations of chords of contact of (x_1, y_1) and (x_2, y_2) w.r.t., $xy = c^2$ are

$$xy_1 + x_1 y = 2c^2 \qquad ...(ii)$$

and $$xy_2 + x_2 y = 2c^2 \qquad ...(iii)$$

The equation of the conic passing through Eq. (i) with Eqs. (ii) and (iii) is

$$(xy_1 + x_1 y - 2c^2)(xy_2 + x_2 y - 2c^2) + \lambda (xy - c^2) = 0 \qquad ...(iv)$$

Now, Eq. (iv) represents a circle

$\therefore$ coefficient of x^2 = coefficient of y^2

$\therefore \quad y_1 y_2 = x_1 x_2$

and coefficient of $xy = 0$

$$\Rightarrow \quad x_1 y_2 + x_2 y_1 + \lambda = 0 \qquad ...(v)$$

Again the conic (iv) passes through (x_1, y_1) and (x_2, y_2) then

$$(2x_1 y_1 - 2c^2)(x_1 y_2 + x_2 y_1 - 2c^2) + \lambda (x_1 y_1 - c^2) = 0$$

or $$2(x_1 y_2 + x_2 y_1 - 2c^2) + \lambda = 0 \qquad (\because x_1 y_1 \neq c^2) \quad ...(vi)$$

and $$(x_2 y_1 + y_2 x_1 - 2c^2)(y_2 x_2 + x_2 y_2 - 2c^2) + \lambda (x_2 y_2 - c^2) = 0$$

$$\Rightarrow \quad 2(x_2 y_1 + x_1 y_2 - 2c^2) + \lambda = 0 \qquad (\because x_2 y_2 \neq c^2) \quad ... \text{ (vii)}$$

From Eqs. (v) and (vi), we get

$$2(-\lambda - 2c^2) + \lambda = 0$$

$$-\lambda - 4c^2 = 0$$

$\therefore \quad \lambda = -4c^2$

Then from Eq. (v)

$$x_1 y_2 + x_2 y_1 = 4c^2$$

which is the other condition.

91. Let two perpendicular asymptotes of a rectangular hyperbola are CD and CE.

Let the coordinates of A, B and C are $(a, 0)$, $(0, b)$, (α, β). OX and OY are parallel to CD and CE.

Then equations of CD and CE are

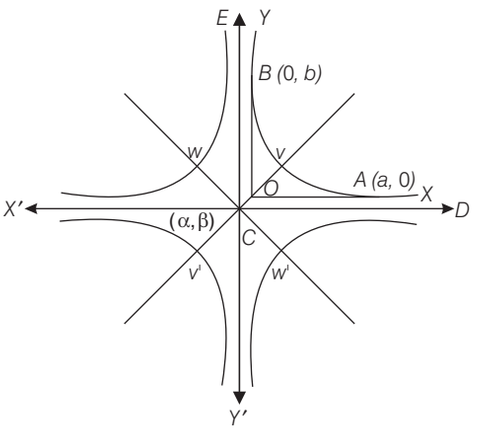
$$y - \beta = 0 \quad \text{and} \quad x - \alpha = 0$$

Thus combined equation of CD and CE is

$$(x - \alpha)(y - \beta) = 0$$

or $$xy - \alpha y - \beta x + \alpha\beta = 0$$

is the equation of asymptotes of rectangular hyperbola.



Hence, equation of rectangular hyperbola is

$$xy - \alpha y - \beta x + k = 0,$$

where k is any constant.

It passes through $A(a, 0)$ and $B(0, b)$

$\therefore \quad 0 - 0 - \beta a + k = 0$

and $$0 - \alpha b - 0 + k = 0$$

$\therefore \quad \beta = \frac{k}{a}$ and $\alpha = \frac{k}{b}$

Hence equation of rectangular hyperbola becomes

$$xy - k\left(\frac{x}{a} + \frac{y}{b} - 1\right) = 0 \qquad ...(i)$$

Eq. (i) represents two sets of rectangular hyperbolas whose vertices lie on the straight lines VCV' and WCW' both passing through (α, β) inclined at 45° and 135° to OX.

Then $\alpha = \frac{k}{b}, \beta = \frac{k}{a}$ and their equations are

$$y - \beta = \pm (x - \alpha)$$

$$\Rightarrow \quad y - \frac{k}{a} = \pm \left(x - \frac{k}{b} \right)$$

or $$x + y = k \left(\frac{1}{a} + \frac{1}{b} \right)$$

and $$x - y = k \left(\frac{1}{b} - \frac{1}{a} \right) \quad \text{...(ii)}$$

or $$k = \frac{ab\,(x + y)}{(a + b)}$$

and $$k = \frac{ab\,(x - y)}{(a - b)}$$

Putting in Eq. (i) then

$$\frac{x^2}{a} + \frac{y^2}{b} - x - y = 0$$

and $$\frac{x^2}{b} - \frac{y^2}{a} - x + y = 0$$

Differentiating these equations, we get

$$\frac{2x}{a} + \frac{2y}{b}\frac{dy}{dx} - 1 - \frac{dy}{dx} = 0$$

and $$\frac{2x}{b} - \frac{2y}{a}\frac{dy}{dx} - 1 + \frac{dy}{dx} = 0$$

$\therefore$ Slopes of lines are

$$m_1 = \frac{dy}{dx} = \frac{b\,(a - 2x)}{a\,(2y - b)}$$

and $$m_2 = \frac{dy}{dx} = \frac{a\,(2x - b)}{b\,(2y - a)}$$

At $(0, 0)$ $\quad m_1 = -1 \quad$ and $\quad m_2 = 1$

$\therefore \quad m_1 m_2 = -1$

which shows that curves intersect orthogonally.

92. Equation of the normal to the hyperbola $xy = 1$ at t is

$$xt^3 - yt - t^4 + 1 = 0 \quad \text{...(i)}$$

$\because$ It passes through (α, β)

$\therefore \quad t^4 - \alpha t^3 + \beta t - 1 = 0$

If foot of the co-normal points are

$$\left(t_1, \frac{1}{t_1} \right), \left(t_2, \frac{1}{t_2} \right), \left(t_3, \frac{1}{t_3} \right) \text{and} \left(t_4, \frac{1}{t_4} \right)$$

$\therefore \quad t_1 + t_2 + t_3 + t_4 = \alpha$

$\Rightarrow \quad x_1 + x_2 + x_3 + x_4 = \alpha$

and $$\frac{1}{t_1} + \frac{1}{t_2} + \frac{1}{t_3} + \frac{1}{t_4} = \beta$$

$\Rightarrow \quad y_1 + y_2 + y_3 + y_4 = \beta$

Let the variable line be

$$px + qy + r = 0 \quad \text{...(ii)}$$

Since, algebraic sum of perpendicular distances from $(x_1, y_1), (x_2, y_2), (x_3, y_3)$ and (x_4, y_4) to Eq. (ii) is zero.

$$\left(\frac{px_1 + qy_1 + r}{\sqrt{(p^2 + q^2)}} \right) + \left(\frac{px_2 + qy_2 + r}{\sqrt{p^2 + q^2}} \right) + \left(\frac{px_3 + qy_3 + r}{\sqrt{(p^2 + q^2)}} \right) + \left(\frac{px_4 + qy_4 + r}{\sqrt{(p^2 + q^2)}} \right) = 0$$

$$\Rightarrow \quad p\,(x_1 + x_2 + x_3 + x_4) + q\,(y_1 + y_2 + y_3 + y_4) + 4r = 0$$

$$\Rightarrow \quad p \left(\frac{x_1 + x_2 + x_3 + x_4}{4} \right) + q \left(\frac{y_1 + y_2 + y_3 + y_4}{4} \right) + r = 0$$

$$\Rightarrow \quad p \cdot \frac{\alpha}{4} + q \cdot \frac{\beta}{4} + r = 0$$

$\therefore$ Eq. (ii) passes through $\left(\frac{\alpha}{4}, \frac{\beta}{4} \right)$.

93. Let the equation of hyperbola is

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

whose asymptotes are

$$\frac{x}{a} + \frac{y}{b} = 0$$

and $$\frac{x}{a} - \frac{y}{b} = 0$$

Let there be any point $P\,(h, k)$ on the hyperbola

$k =$ distance of P from transverse axis

$h =$ distance of P from any asymptotes

$$\text{say} \left(\frac{x}{a} - \frac{y}{b} = 0 \right)$$

$\therefore \quad k = \frac{bh - ak}{\sqrt{(a^2 + b^2)}}$

Squaring $(a^2 + b^2)\,k^2 = b^2h^2 + a^2k^2 - 2ab\,hk$

$\Rightarrow \quad b\,(h^2 - k^2) = 2ahk$

$\Rightarrow \quad (h^2 - k^2) = \frac{2ahk}{b}$

Squaring $\quad (h^2 - k^2)^2 = 4a^2h^2 \left(\frac{k^2}{b^2} \right)$

$$= 4a^2h^2 \left(\frac{h^2}{a^2} - 1 \right) \qquad \left\{ \because \frac{h^2}{a^2} - \frac{k^2}{b^2} = 1 \right\}$$

$\Rightarrow \quad (h^2 - k^2)^2 = 4h^2(h^2 - a^2)$

Hence locus of $P\,(h, k)$ is

$$(x^2 - y^2)^2 = 4x^2(x^2 - a^2).$$

94. Tangent to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is

$$y = mx \pm \sqrt{a^2m^2 - b^2}$$

Given that $y = \alpha x + \beta$ is the tangent of hyperbola

$\Rightarrow \quad m = \alpha$ and $a^2m^2 - b^2 = \beta^2$

$\therefore \quad a^2\alpha^2 - b^2 = \beta^2$

Locus is $a^2x^2 - y^2 = b^2$ which is hyperbola.

95. For the given ellipse $\frac{x^2}{25}+\frac{y^2}{16}=1$

$$\Rightarrow \qquad e=\sqrt{\left(1-\frac{16}{25}\right)}=\frac{3}{5}$$

$\Rightarrow$ Eccentricity of hyperbola $=\frac{5}{3}$

Let the hyperbola be $\frac{x^2}{A^2}-\frac{y^2}{B^2}=1$ then

$$B^2=A^2\left(\frac{25}{9}-1\right)=\frac{16}{9}A^2$$

$\therefore \frac{x^2}{A^2}-\frac{9y^2}{16A^2}=1$, As it passes through focus of ellipse i.e. $(3,0)$

$\therefore$ We get $A^2=9\Rightarrow B^2=16$

$\therefore$ Equation of hyperbola is $\frac{x^2}{9}-\frac{y^2}{16}=1$, focus of hyperbola is $(5, 0)$, vertex of hyperbola is $(3, 0)$.

96. The length of transverse axis $=2\sin\theta=2a$

$$\Rightarrow \qquad a=\sin\theta$$

Also for ellipse $3x^2+4y^2=12$

or $$\frac{x^2}{4}+\frac{y^2}{3}=1,\ a^2=4,\ b^2=3$$

$$e=\sqrt{1-\frac{b^2}{a^2}}=\sqrt{1-\frac{3}{4}}=\frac{1}{2}$$

$\therefore$ Focus of ellipse $=\left(2\times\frac{1}{2},0\right)\Rightarrow(1,0)$

As hyperbola is confocal with ellipse, focus of hyperbola $=(1,0)$

$$\Rightarrow \qquad ae=1\ \Rightarrow \sin\theta\times e=1$$

$$\Rightarrow \qquad e=\operatorname{cosec}\theta$$

$$\therefore \qquad b^2=a^2(e^2-1)$$

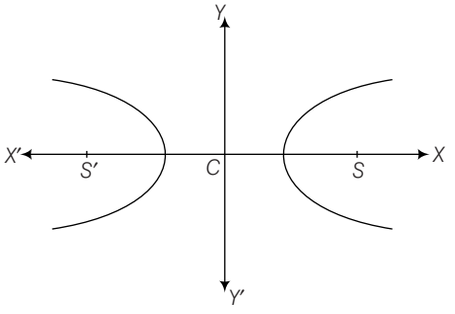
$$=\sin^2\theta(\operatorname{cosec}^2\theta-1)=\cos^2\theta$$

$\therefore$Equation of hyperbola is

$$\frac{x^2}{\sin^2\theta}-\frac{y^2}{\cos^2\theta}=1$$

or, $$x^2\operatorname{cosec}^2\theta-y^2\sec^2\theta=1$$

97. Two branches of hyperbola have no common tangent but have a common normal joining SS'.



98. Given, equation of hyperbola is

$$\frac{x^2}{\cos^2\alpha}-\frac{y^2}{\sin^2\alpha}=1$$

Here, $a^2=\cos^2\alpha$ and $b^2=\sin^2\alpha$

$$\because \qquad b^2=a^2(e^2-1)$$

$$\therefore \qquad \sin^2\alpha=\cos^2\alpha\,(e^2-1)$$

or $\sin^2\alpha+\cos^2\alpha=\cos^2\alpha\,.\,e^2$

or $e^2=1+\tan^2\alpha=\sec^2\alpha\Rightarrow e=\sec\alpha$

$$\therefore \qquad ae=\cos\alpha\,.\,\frac{1}{\cos\alpha}=1$$

Coordinates of foci are $(\pm ae, 0)$ i.e. $(\pm 1,0)$

Hence, abscissae of foci remain constant, when α varies.

99. The given hyperbola is

$$x^2-2y^2-2\sqrt{2}x-4\sqrt{2}y-6=0$$

$$\Rightarrow\ (x^2-2\sqrt{2}x+2)-2(y^2+2\sqrt{2}y+2)=6+2-4$$

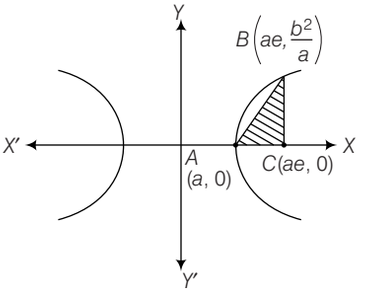
$$\Rightarrow \qquad (x-\sqrt{2})^2-2(y+\sqrt{2})^2=4$$

$$\Rightarrow \qquad \frac{(x-\sqrt{2})^2}{2^2}-\frac{(y+\sqrt{2})^2}{(\sqrt{2})^2}=1$$

$$\therefore \qquad a=2,\ b=\sqrt{2}\ \Rightarrow e=\sqrt{\left(1+\frac{2}{4}\right)}=\sqrt{\frac{3}{2}}$$

Clearly, ΔABC is a right triangle.

$$B\left(ae,\frac{b^2}{a}\right)$$



$$\therefore \quad \text{Area of } (\Delta ABC)=\frac{1}{2}\times AC\times BC$$

$$=\frac{1}{2}\times(ae-a)\times\frac{b^2}{a}$$

$$=\frac{1}{2}(e-1)\,b^2=\frac{1}{2}\left(\sqrt{\frac{3}{2}}-1\right).2$$

$$=\left(\sqrt{\frac{3}{2}}-1\right)$$

100. The given hyperbola is

$$x^2-y^2=\frac{1}{2} \qquad \ldots (i)$$

which is rectangular hyperbola

$$\therefore \qquad e=\sqrt{2}$$

Let the ellipse be $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$

Its eccentricity $=\frac{1}{\sqrt{2}}$

$$\therefore \qquad b^2=a^2(1-e^2)=a^2\left(1-\frac{1}{2}\right)=\frac{a^2}{2}$$

So, the equation of ellipse becomes

$$x^2 + 2y^2 = a^2 \quad \text{... (ii)}$$

Let the hyperbola (i) and ellipse (ii) intersect each other at $P(x_1, y_1)$.

$\therefore$ (Slope of hyperbola (i) at (x_1, y_1)) $\times$ (Slope of ellipse (ii) at $(x_1, y_1) = -1$

$$\Rightarrow \quad \frac{x_1}{y_1} \times \frac{-x_1}{2y_1} = -1$$

or $$x_1^2 = 2y_1^2 \quad \text{... (iii)}$$

Also (x_1, y_1) lies on $x^2 - y^2 = \frac{1}{2}$

$$\therefore \quad x_1^2 - y_1^2 = \frac{1}{2} \quad \text{... (iv)}$$

From Eqs. (iii) and (iv), we get $y_1^2 = \frac{1}{2}$ and $x_1^2 = 1$

and (x_1, y_1) lies on ellipse $x^2 + 2y^2 = a^2$

$$\therefore \quad x_1^2 + 2y_1^2 = a^2$$

$$\Rightarrow \quad 1 + 1 = a^2 \text{ or } a^2 = 2$$

$\therefore$ Equation of ellipse is $x^2 + 2y^2 = 2$

whose foci $(\pm 1, 0)$.

Sol. (Q. Nos. 101 and 102)

The intersection points of given circle

$$x^2 + y^2 - 8x = 0 \quad \text{... (i)}$$

and hyperbola

$$4x^2 - 9y^2 = 36 \quad \text{... (ii)}$$

can be obtained by solving these equations substituting value of y^2 from Eq. (i) in Eq. (ii), we get

$$4x^2 - 9(8x - x^2) = 36$$

$$\Rightarrow \quad 13x^2 - 72x - 36 = 0$$

$$\Rightarrow \quad x = 6, -\frac{6}{13}$$

$$\Rightarrow \quad y^2 = 12, -\frac{660}{169} \quad \text{(not possible)}$$

$\therefore A(6, 2\sqrt{3})$ and $B(6, -2\sqrt{3})$ are points of intersection.

101. Equation of tangent to hyperbola having slope m is

$$y = mx + \sqrt{(9m^2 - 4)} \quad \text{... (i)}$$

Equation of tangent to circle is

$$y = m(x - 4) + \sqrt{(16m^2 + 16)} \quad \text{... (ii)}$$

Eqs. (i) and (ii) will be identical, then

$$m = \frac{2}{\sqrt{5}}$$

So, equation of common tangents

$$y = \frac{2x}{\sqrt{5}} + \sqrt{\left(\frac{36}{5} - 4\right)}$$

$$\Rightarrow \quad y = \frac{2x}{\sqrt{5}} + \frac{4}{\sqrt{5}}$$

or $2x - \sqrt{5}y + 4 = 0$

102. Equation of circle with AB as its diameter is

$$(x - 6)(x - 6) + (y - 2\sqrt{3})(y + 2\sqrt{3}) = 0$$

$$\Rightarrow \quad x^2 + y^2 - 12x + 24 = 0$$

103. $\because$ line $2x + y = 1$ is tangent to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$

$$\therefore \quad (1)^2 = a^2(-2)^2 - b^2$$

$$\Rightarrow \quad 4a^2 - b^2 = 1 \quad \text{... (i)}$$

Intersection point of nearest directrix $x = \frac{a}{e}$ and X-axis is $\left(\frac{a}{e}, 0\right)$

As, $2x + y = 1$ passes through $\left(\frac{a}{e}, 0\right)$

$$\therefore \quad \frac{2a}{e} + 0 = 1 \Rightarrow a = \frac{e}{2} \quad \text{... (ii)}$$

and $$b^2 = a^2(e^2 - 1) = \frac{e^2}{4}(e^2 - 1) \quad \text{... (iii)}$$

Substituting the values of a and b from Eqs. (ii) and (iii) in Eq. (i), then

$$e^2 - \frac{e^2}{4}(e^2 - 1) = 1$$

$$\Rightarrow \quad (e^2 - 4)(e^2 - 1) = 0$$

$$\therefore \quad e^2 = 4, e^2 \neq 1 \quad (\because e > 1)$$

Hence, $$e = 2$$

104. Equation of normal at P (6, 3) is

$$\frac{a^2 x}{6} + \frac{b^2 y}{3} = a^2 + b^2$$

$\because$ Normal intersects the X-axis at (9, 0), then

$$\frac{9a^2}{6} + 0 = a^2 + b^2 \Rightarrow 3a^2 = 2a^2 + 2b^2$$

or $$a^2 = 2b^2$$

or $$a^2 = 2a^2(e^2 - 1)$$

$$\therefore \quad e^2 = \frac{3}{2}$$

Hence, $$e = \sqrt{\frac{3}{2}}$$

105. Given, ellipse is $x^2 + 4y^2 = 4$

or $$\frac{x^2}{4} + \frac{y^2}{1} = 1$$

$$\therefore \quad e = \sqrt{\left(1 - \frac{1}{4}\right)} = \frac{\sqrt{3}}{2}$$

and foci are $(\pm\sqrt{3}, 0)$

$\therefore$ Eccentricity of hyperbola $= \frac{2}{\sqrt{3}} = e_1$

and $$b^2 = a^2(e_1^2 - 1) = a^2\left(\frac{4}{3} - 1\right) = \frac{a^2}{3}$$

then equation of hyperbola becomes

$$x^2 - 3y^2 = a^2$$

which pass through $(\pm\sqrt{3}, 0)$

$$3 - 0 = a^2$$

$$\Rightarrow \quad a^2 = 3$$

$\therefore$Equation of hyperbola is

$$x^2 - 3y^2 = 3$$

and foci of hyperbola are $\left(\pm\sqrt{3} \times \frac{2}{\sqrt{3}}, 0\right)$ i.e., $(\pm 2, 0)$

106. Equation of tangent at (x_1, y_1) is

$$\frac{xx_1}{9} - \frac{yy_1}{4} = 1 \quad \text{... (i)}$$

Equation of line parallel to

$$2x - y = \lambda \quad \text{... (ii)}$$

$\because$ Line (ii) is tangent of $\frac{x^2}{9} - \frac{y^2}{4} = 1$, then

$$\lambda^2 = 9 \times 2^2 - 4$$

$$\therefore \quad \lambda = \pm 4\sqrt{2}$$

From Eq. (ii), Equation of tangent is

$$2x - y = \pm 4\sqrt{2} \quad \text{... (iii)}$$

Comparing Eqs. (i) and (iii), we get $\frac{x_1}{18} = \frac{y_1}{4} = \pm \frac{1}{4\sqrt{2}}$

or $\quad x_1 = \pm \frac{9}{2\sqrt{2}}$ and $y_1 = \pm \frac{1}{\sqrt{2}}$

Hence, points of contact of the tangents on the hyperbola are $\left(\frac{9}{2\sqrt{2}}, \frac{1}{\sqrt{2}}\right)$ and $\left(-\frac{9}{2\sqrt{2}}, -\frac{1}{\sqrt{2}}\right)$

107. $H : x^2 - y^2 = 1$

S : Circle with centre $N(x_2, 0)$

Common tangent to H and S at $P(x_1, y_1)$ is

$$xx_1 - yy_1 = 1 \Rightarrow m_1 = \frac{x_1}{y_1}$$

Also radius of circle S with centre $N(x_2, 0)$ through point of contact (x_1, y_1) is perpendicular to tangent.

$$\therefore \quad m_1 m_2 = -1 \Rightarrow \frac{x_1}{y_1} \times \frac{0 - y_1}{x_2 - x_1} = -1$$

$$\Rightarrow \quad x_1 = x_2 - x_1 \text{ or } x_2 = 2x_1$$

M is the point of intersection of tangent at P and X-axis

$$\therefore \quad M\left(\frac{1}{x_1}, 0\right)$$

$\because$ Centroid of ΔPMN is (ℓ, m)

$$\therefore \quad x_1 + \frac{1}{x_1} + x_2 = 3\ell \text{ and } y_1 = 3 \text{ m}$$

Using $x_2 = 2x_1$,

$$\Rightarrow \quad \frac{1}{3}\left(3x_1 + \frac{1}{x_1}\right) = l \text{ and } \frac{y_1}{3} = m$$

$$\therefore \quad \frac{dl}{dx_1} = 1 - \frac{1}{3x_1^2}, \frac{dm}{dy_1} = \frac{1}{3}$$

Also, (x_1, y_1) lies on H,

$$\therefore \quad x_1^2 - y_1^2 = 1 \text{ or } y_1 = \sqrt{(x_1^2 - 1)}$$

$$\therefore \quad m = \frac{1}{3}\sqrt{(x_1^2 - 1)}$$

$$\therefore \quad \frac{dm}{dx_1} = \frac{x_1}{3\sqrt{(x_1^2 - 1)}}$$

108. $\because \frac{2b^2}{a} = 8$ and $2b = \frac{1}{2}(2ae)$

$$\Rightarrow \quad b^2 = 4a \text{ and } b = \frac{1}{2}ae \text{ or } b^2 = \frac{1}{4}a^2e^2$$

$$\Rightarrow \quad a^2(e^2 - 1) = \frac{1}{4}a^2e^2 \Rightarrow 4e^2 - 4 = e^2 \text{ or } e^2 = \frac{4}{3}$$

$$\therefore \quad e = \frac{2}{\sqrt{3}}$$

$$\Rightarrow \quad b^2 = 4a \text{ and } b = \frac{1}{2}ae \text{ or } b^2 = \frac{1}{4}a^2e^2$$

109. Let Equation of hyperbola is $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$

When it passes through $P(\sqrt{2}, \sqrt{3})$, then $\frac{2}{a^2} - \frac{3}{b^2} = 1$

$$\Rightarrow \quad 2b^2 - 3a^2 = a^2b^2 \quad \text{...(i)}$$

and $ae = 2 \Rightarrow a^2 + b^2 = 4$ ...(ii)

From Eqs. (i) and (ii), we get $2(4 - a^2) - 3a^2 = a^2(4 - a^2)$

$$\Rightarrow \quad a^2 - 9a^2 + 8 = 0 \Rightarrow (a^2 - 1)(a^2 - 8) = 0$$

$$\therefore \quad a^2 = 1 \qquad (\because a^2 \neq 8)$$

From Eq. (ii), $b^2 = 3$

$\therefore$ Equation of Hyperbola is $\frac{x^2}{1} - \frac{y^2}{3} = 1$

Equation of tangent at $P(\sqrt{2}, \sqrt{3})$ is $\frac{x\sqrt{2}}{1} - \frac{y\sqrt{3}}{3} = 1$

Which is passes through $(2\sqrt{2}, 3\sqrt{2})$

110. (a,b,c) $\because 2x - y + 1 = 0$ is a tangent of $\frac{x^2}{a^2} - \frac{y^2}{16} = 1$, then

$$(1)^2 = a^2(2)^2 - 16 \text{ or } (2a)^2 = (1)^2 + (4)^2$$

$\therefore 2a$, 4, 1 are the sides of a right angled triangle.

Sol. (Q. Nos. 111-113)

I. $x^2 + y^2 = a^2$

Equations of tangents in terms of slopes are

$$y = mx + a\sqrt{(m^2 + 1)} \text{ (ii)}$$

and points of contact in terms of slopes are

$$\left(\frac{-ma}{\sqrt{(m^2 + 1)}}, \frac{a}{\sqrt{(m^2 + 1)}}\right) \text{(Q)}$$

$\therefore$ I (ii) (Q) (Ans. Q.No. 112) (Here, $a = \sqrt{2}$, $m = \pm 1$)

II. $x^2 + a^2y^2 = a^2$ or $\frac{x^2}{a^2} + \frac{y^2}{1^2} = 1$

Equations of tangents in terms of slopes are

$$y = mx + \sqrt{(a^2m^2 + 1)} \text{ (iv)}$$

and points of contact in terms of slopes are

$$\left(\frac{-a^2m}{\sqrt{(a^2m^2 + 1)}}, \frac{1}{\sqrt{(a^2m^2 + 1)}}\right) \text{ (R)}$$

$\therefore$ II (iv) (R) (Ans. Q.No. 111) (Here, $a = 2$, $m = \frac{-\sqrt{3}}{2}$)

III. $y^2 = 4ax$

Equation of tangent in terms of slopes are

$$y = mx + \frac{a}{m} \text{ or } my = m^2x + a \quad \text{(i)}$$

and points of contact in terms of slopes are

$$\left(\frac{a}{m^2}, \frac{2a}{m}\right) \text{ (P)}$$

$\therefore$ III (i) (P) (Ans. Q.No. 113) (Here, $a = 8$, $m = 1$)

PREFACE

"YOU CAN DO ANYTHING IF YOU SET YOUR MIND TO IT, I TEACH CALCULUS TO JEE ASPIRANTS BUT BELIEVE THE MOST IMPORTANT FORMULA IS
COURAGE + DREAMS = SUCCESS"

It is a matter of great pride and honour for me to have received such an overwhelming response to the previous editions of this book from the readers. In a way, this has inspired me to revise this book thoroughly as per the changed pattern of JEE Main & Advanced. I have tried to make the contents more relevant as per the needs of students, many topics have been re-written, a lot of new problems of new types have been added in etcetc. All possible efforts are made to remove all the printing errors that had crept in previous editions. The book is now in such a shape that the students would feel at ease while going through the problems, which will in turn clear their concepts too.

A Summary of changes that have been made in Revised & Enlarged Edition

- Theory has been completely updated so as to accommodate all the changes made in JEE Syllabus & Pattern in recent years.
- The most important point about this new edition is, now the whole text matter of each chapter has been divided into small sessions with exercise in each session. In this way the reader will be able to go through the whole chapter in a systematic way.
- Just after completion of theory, Solved Examples of all JEE types have been given, providing the students a complete understanding of all the formats of JEE questions & the level of difficulty of questions generally asked in JEE.
- Along with exercises given with each session, a complete cumulative exercises have been given at the end of each chapter so as to give the students complete practice for JEE along with the assessment of knowledge that they have gained with the study of the chapter.
- Last 10 Years questions asked in JEE Main & Adv, IIT-JEE & AIEEE have been covered in all the chapters.

However I have made the best efforts and put my all calculus teaching experience in revising this book. Still I am looking forward to get the valuable suggestions and criticism from my own fraternity i.e. the fraternity of JEE teachers.

I would also like to motivate the students to send their suggestions or the changes that they want to be incorporated in this book. All the suggestions given by you all will be kept in prime focus at the time of next revision of the book.

Amit M. Agarwal

CONTENTS

1. ESSENTIAL MATHEMATICAL TOOLS 1-24

LEARNING PART

Session 1
- Basic Definitions

Session 2
- Intervals
- Modulus or Absolute Value Function

Session 3
- Number Line Rule
- Wavy Curve Method

Session 4
- Quadratic Expression
- Non-Negative Function

PRACTICE PART
- Chapter Exercises

2. DIFFERENTIATION 25-96

LEARNING PART

Session 1
- Geometrical Meaning of the Derivative
- Derivative of *f* (*x*) from the First Principle or ab-Initio Method
- Rules of Differentiation

Session 2
- Chain Rule

Session 3
- Differentiation of Implicit Functions

Session 4
- Differentiation of Inverse Trigonometric Functions
- Graphical Approach for Differentiation of Inverse

Session 5
- Differentiation of a function in Parametric Form

Session 6
- Logarithmic Differentiation
- Differentiation of Infinite Series

Session 7
- Differentiation of a Function w.r.t. Another Function

Session 8
- Higher Derivatives of a Function

Session 9
- Differentiation of a function given in the form of a Determinant

Session 10
- Derivation form inverse function

PRACTICE PART
- JEE Type Examples
- Chapter Exercises

3. FUNCTIONS 97-200

LEARNING PART

Session 1
- Functions

Session 2
- Domain
- Algebraic Functions

Session 3
- Transcendental Functions

Session 4
- Piecewise Functions

Session 5
- Range

Session 6
- Odd and Even Functions

Session 7
- Periodic Functions

Session 8
- Mapping Functions

Session 9
- Identical Functions

Session 10
- Composite Functions

Session 11
- Inverse of a Function

Session 12
- Miscellaneous Problems of Functions

PRACTICE PART
- JEE Type Examples
- Chapter Exercises

4. GRAPHICAL TRANSFORMATIONS 201-244

LEARNING PART

Session 1
- When $f(x)$ Vertically transforms to $f(x) \pm a$

Session 2
- When $f(x)$ horizontally transforms to $f(x \pm a)$, where a is any positive constant
- When $f(x)$ transforms to a $f(x)$ or $\frac{1}{d} f(x)$
- When $f(x)$ transforms to $f(ax)$ or $f(x/a)$
- When $f(x)$ Transforms to $f(-x)$
- When $f(x)$ Transforms to $-f(x)$

Session 3
- To draw $y = |f(x)|$, when $y = f(x)$ is given
- To draw $y = f(|x|)$, when $f(x)$ is given
- $f(x)$ Transforms to ïf (ïxï), i.e. $f(x) \rightarrow |f(|x|)|$
- To draw the graph of $|y| = f(x)$ when $y = f(x)$ is given

Session 4
- To draw $y = f([x])$ when the graph of $y = f(x)$ is given
- When $f(x)$ transforms to $y = f(\{x\})$ where $\{\times\}$ denotes fractional part of x, i.e. $\{x\} = x - [x]$ or $f(x) \rightarrow f(\{x\})$
- When $f(x)$ and $g(x)$ are two functions and are transformed to their sum
- When $f(x)$ transforms to $f(x) \rightarrow \frac{1}{f(x)} = h(x)$

- To draw the graph for $y=f(x) \times \sin x$ when graph of $y = f(x)$ is given
- When $f(x)$ and $g(x)$ are given, then find $h(x) = \max(f(x), g(x))$ or $h(x) = \min(f(x), g(x))$

PRACTICE PART
- JEE Type Examples
- Chapter Exercises

5. LIMITS 245-310

LEARNING PART

Session 1
- Definition of Limits
- Indeterminant Form
- L'Hospital's Rule
- Evaluation of Limit

Session 2
- Trigonometric Limits

Session 3
- Logarithmic Limits
- Exponential Limits

Session 4
- Miscellaneous Form

Session 5
- Left Hand and Right Hand Limit

Session 6
- Use of Standard Theorems/Results
- Use of Newton-Leibnitz's Formula in Evaluating the Limit

PRACTICE PART
- JEE Type Examples
- Chapter Exercises

6. CONTINUITY AND DIFFERENTIABILITY 311-396

LEARNING PART

Session 1
- Continuous Function
- Continuity of a Function at a Point

Session 2
- Continuity in an Interval or Continuity at End Points

Session 3
- Discontinuity of a Function

Session 4
- Theorems on Continuity
- Continuity of Composite Function

Session 5
- Intermediate Value Theorem

Session 6
- Differentiability : Meaning of Derivative

Session 7
- Differentiability in an Interval

PRACTICE PART
- JEE Type Examples
- Chapter Exercises

7. *dy/dx* AS A RATE MEASURER & TANGENTS, NORMALS 397-458

LEARNING PART

Session 1
- Derivative as the Rate of Change
- Velocity and Acceleration in Rectilinear Motion

Session 2
- Differential and Approximation
- Geometrical Meaning of Dx, Dy, dx and dt

Session 3
- Slope of Tangent and Normal
- Equation of Tangent
- Equation of Normal

Session 4
- Angle of Intersection of Two Curves
- Length of Tangent, Subtangent, Normal and Subnormal

Session 5
- Rolle's Theorem
- Lagrange's Mean Value Theorem

Session 6
- Application of Cubic Functions

PRACTICE PART
- JEE Type Examples
- Chapter Exercises

8. MONOTONICITY, MAXIMA AND MINIMA 459-550

LEARNING PART

Session 1
- Monotonicity

Session 2
- Critical Points

Session 3
- Comparison of Functions Using Calculus

Session 4
- Introduction to Maxima and Minima
- Methods of Finding Extrema of Continuous Functions
- Convexity/Concavity and Point of Inflection
- Concept of Global Maximum/Minimum

Session 5
- Maxima and Minima of Discontinuous Functions

PRACTICE PART
- JEE Type Examples
- Chapter Exercises

SYLLABUS

JEE MAIN

Limit, Continuity and Differentiability
Real valued functions, algebra of functions, polynomials, rational, trigonometric, logarithmic and exponential functions, inverse functions. Graphs of simple functions. Limits, continuity and differentiability.

Differentiation of the sum, difference, product and quotient of two functions. Differentiation of trigonometric, inverse trigonometric, logarithmic exponential, composite and implicit functions derivatives of order upto two. Rolle's and Lagrange's Mean Value Theorems. Applications of derivatives: Rate of change of quantities, monotonic - increasing and decreasing functions, Maxima and minima of functions of one variable, tangents and normals.

JEE ADVANCED

Differential Calculus
Real valued functions of a real variable, into, onto and one-to-one functions, sum, difference, product and quotient of two functions, composite functions, absolute value, polynomial, rational, trigonometric, exponential and logarithmic functions.

Limit and continuity of a function, limit and continuity of the sum, difference, product and quotient of two functions, l'Hospital rule of evaluation of limits of functions.

Even and odd functions, inverse of a function, continuity of composite functions, intermediate value property of continuous functions.

Derivative of a function, derivative of the sum, difference, product and quotient of two functions, chain rule, derivatives of polynomial, rational, trigonometric, inverse trigonometric, exponential and logarithmic functions.

Derivatives of implicit functions, derivatives up to order two, geometrical interpretation of the derivative, tangents and normals, increasing and decreasing functions, maximum and minimum values of a function, applications of Rolle's Theorem and Lagrange's Mean Value Theorem.

Arihant on Your Mobile !
Exercises with this symbol can be practised on your mobile. See title inside to activate for free.

Session 1

Basic Definitions

(i) **Natural Numbers** The set of numbers $\{1, 2, 3, 4, \ldots\ldots\}$ is called natural numbers and it is **denoted by N**.
i.e. $N = \{1, 2, 3, 4, \ldots\ldots\}$

(ii) **Whole Numbers** The set of numbers $\{0, 1, 2, 3, 4, ...\}$ is called whole numbers and it is **denoted by W.**
i.e. $W = \{0, 1, 2, 3, 4, \ldots\ldots\}$

(iii) **Integers** The set of numbers $\{\ldots\ldots, -3, -2, -1, 0, 1, 2, 3, \ldots\ldots\}$ is called integers and it is **denoted by I or Z,**
i.e. I (or Z) $= \{\ldots\ldots, -4, -3, -2, -1, 0, 1, 2, 3, 4, \ldots\ldots\}$
where we represent;

(a) **Positive integers** by $I^+ = \{1, 2, 3, 4, \ldots\ldots\}$ = natural numbers.

(b) **Negative integers** by $I^- = \{\ldots\ldots, -4, -3, -2, -1\}$

(c) **Non-negative integers** $\{0, 1, 2, 3, 4, \ldots\ldots\}$ = whole numbers

(d) **Non-positive integers** $\{\ldots\ldots, -3, -2, -1, 0\}$

(iv) **Rational Numbers** All the numbers of the form $\frac{a}{b}$, where a and b are integers and $b \neq 0$ are called rational numbers and their set is **denoted by Q**.
i.e. $Q = \left\{\frac{a}{b} : a, b \in I \text{ and } b \neq 0 \text{ and HCF of } a,b \text{ is } 1\right\}$.

Remarks

(a) Every integer is a rational number as it can be written as $\frac{a}{b}$ (where $b = 1$)

(b) All recurring decimals are rational numbers.
For example, $\frac{1}{3} = 0.3333\ldots\ldots$

(v) **Irrational Numbers** Those values which neither terminate nor could be expressed as recurring decimals are called irrational numbers, i.e. they can't be expressed as $\frac{a}{b}$ form and are **denoted by Q^C** (i.e. complement of Q).
e.g. $\sqrt{2}, 1+\sqrt{2}, \frac{1}{\sqrt{2}}, \frac{-3}{\sqrt{2}}, \frac{2}{\sqrt{2}}, \sqrt{3}, 1+\sqrt{3}, \pm\frac{1}{\sqrt{3}}, \pi, \ldots$ etc.

Remark

The set of rational and irrational numbers cannot be expressed in roster form.

(vi) **Prime Numbers** A counting number is called a prime number when it has exactly two factors, 1 and itself.
e.g. 2, 3, 5, 7, 11, 13, 17, … etc

Remarks

(a) 2 is the only even number which is prime.
(b) A prime is always greater than 1.

How to test a number is prime or not

Let given number be p, then
Find whole number x such that $x > \sqrt{p}$.
Take all prime numbers less than or equal to x.
If none of these divides with p exactly, then p is a prime otherwise p is non-prime.
e.g. Let $p = 193$; clearly, $14 > \sqrt{193}$
Prime numbers upto 14 are 2, 3, 5, 7, 11, 13.
No one of these divides 193 exactly.
Hence, 193 is a prime number.

(vii) **Co-prime Numbers** Two natural numbers are said to be co-primes, if their HCF is 1.
e.g. (7, 9), (15, 16) are called co-prime numbers.

Remark

Co-prime numbers may or may not be prime.

(viii) **Twin Prime** A prime number that is either 2 less or 2 more than another prime number, i.e. a twin prime is a prime that has a prime gap of two.
e.g. (3, 5), (5, 7), (11,13), (17, 19), (29, 31),… are called twin prime pairs.

(ix) **Composite Numbers** Composite numbers are non-prime natural numbers. They must have atleast one factor apart from 1 and itself.
e.g. 4, 6, 8, 9,… are called composite numbers.

Remarks

(a) Composite numbers can be both even or odd.
(b) 1 is neither prime nor composite number.

(x) **Real Numbers** The set which contains both rational and irrational numbers is called the real numbers and is **denoted by R**.
i.e. $R = Q \cup Q^C$
$R = \{x : x \in Q \text{ or } x \in Q^C\}$

$$\therefore \quad R = \left\{ \ldots\ldots, -2, -1, 0, 1, 2, 3, \ldots\ldots, \frac{5}{6}, \frac{3}{4}, \frac{7}{9}, \frac{1}{3}, \frac{1}{7}, \frac{1}{5}, \ldots\ldots, \sqrt{2}, \sqrt{3}, \pi, \ldots\ldots \right\}$$

Remarks

(i) As from above definitions;

$$N \subset W \subset I \subset Q \subset R,$$

It could be shown that real numbers can be expressed on number line with respect to origin as

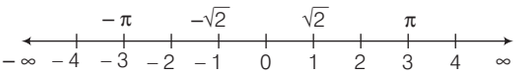

Figure 1.1

(ii) The sum, difference, product and quotient of two rational numbers is a rational number.

(iii) The sum, difference, product and quotient of two irrational numbers need not be irrational.

(iv) The sum, difference, product and quotient of a non-zero rational and an irrational number is always irrational.

Exercise for Session 1

■ **Directions** (Q. Nos. 1 to 6) *State whether following statements are True/False.*

1. All the rational numbers are irrational also.

2. All the integers are irrational also.

3. Irrational numbers are real numbers also.

4. Zero is a natural number.

5. Sum of two natural numbers is a rational number.

6. A positive integer is a natural number also.

■ **Directions** (Q. Nos. 7 to 10) *These questions have only one option correct.*

7. Sum of two rational numbers is

(a) rational (b) irrational
(c) Both (a) and (b) (d) None of these

8. Sum of two irrational numbers is

(a) rational (b) irrational
(c) real (d) None of these

9. Product of two rational numbers is

(a) always rational (b) rational or irrational
(c) always irrational (d) None of these

10. If *a* is an irrational number which is divisible by *b*, then the number *b*

(a) must be rational (b) must be irrational
(c) may be rational or irrational (d) None of these

Session 2

Intervals, Modulus or Absolute Value Function

Intervals

The set of numbers between any two real numbers is called intervals. The types of interval discussed below.

(i) **Open-Open Interval** If a and b are real numbers and $a < b$, then the set of all real numbers x such that $a < x < b$ is called open-open interval. It is denoted by (a, b) or $]a,\ b[$.

i.e. If $a < x < b \Rightarrow x \in]a, b[$ or $x \in (a, b)$

Figure 1.2

e.g. $1 < x < 2$

$\Rightarrow \quad x \in (1, 2)$ or $x \in]1, 2[$ (using above definition)

Note At $\pm\infty$ brackets are always open.

(ii) **Open-Closed Interval** If a and b are real numbers and $a < b$, then the set of all real numbers x such that $a < x \leq b$ is called open-closed interval. Here, a is excluded and b is included.

i.e. If $a < x \leq b$

$\Rightarrow \quad x \in]a, b]$ or $x \in (a, b]$

Figure 1.3

(iii) **Closed-Open Interval** If a and b are real numbers and $a < b$, then the set of all real 'x' such that $a \leq x < b$ is called closed-open interval.

Here, a is included and b is excluded.

i.e. If $a \leq x < b$

$\Rightarrow \quad x \in [a, b[$

or $x \in [a, b)$

Figure 1.4

(iv) **Closed-Closed Interval** If a and b are real numbers and $a < b$, then the set of all real 'x' such that $a \leq x \leq b$ is called closed-closed interval. Here, a and b both are included.

i.e. If $a \leq x \leq b \Rightarrow x \in [a, b]$

Figure 1.5

Example 1 Solve $2x + 1 > 3$.

Sol. Here, $2x + 1 > 3$ or $2x > 2$ or $x > 1$, i.e. $x \in (1, \infty)$

This solution can be graphed on a real line as;

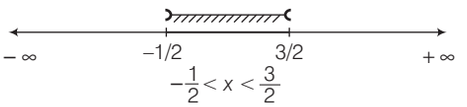
Example 2 Solve $-2 < 2x - 1 < 2$.

Sol. Here, $-2 < 2x - 1 < 2$

or $-1 < 2x < 3$

or $-\frac{1}{2} < x < \frac{3}{2}$, i.e. $x \in \left(-\frac{1}{2}, \frac{3}{2}\right)$

This solution can be graphed on a real line as;



Example 3 Solve the following inequations.

(i) $\frac{3(x-2)}{5} \geq \frac{5(2-x)}{3}$ (ii) $\frac{2x-3}{4} + 9 \geq 3 + \frac{4x}{3}$

Sol. (i) We have, $\frac{3(x-2)}{5} \geq \frac{5(2-x)}{3}$

$\Rightarrow \quad 3(3x - 6) \geq 5(10 - 5x)$

$\Rightarrow \quad 9x - 18 \geq 50 - 25x$

$\Rightarrow \quad 34x \geq 68 \Rightarrow x \geq 2$

Hence, the solution set is $x \in [2, \infty)$ and graphically it could be shown as

(ii) We have, $\frac{2x-3}{4} + 9 \geq 3 + \frac{4x}{3}$

$\Rightarrow \quad \frac{2x-3}{4} - \frac{4x}{3} \geq 3 - 9$

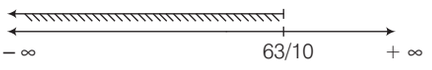
$$\Rightarrow \quad \frac{3(2x-3)-16x}{12} \geq -6 \quad \Rightarrow \quad \frac{-10x-9}{12} \geq -6$$

$$\Rightarrow \quad -10x-9 \geq -72 \quad \Rightarrow \quad -10x \geq -63$$

As we know the inequality sign changes, if multiplied by (–ve).

$$\therefore \quad 10x \leq 63 \quad \text{or} \quad x \leq \frac{63}{10}$$

Hence, the solution set of the given inequation is $\left(-\infty, \frac{63}{10}\right]$. Graphically it could be shown as



Example 4 Solve for x.

$$\frac{4}{x+1} \leq 3 \leq \frac{6}{x+1}, (x>0)$$

Sol. Consider the first inequality

$$\frac{4}{x+1} \leq 3 \Rightarrow 4 \leq 3(x+1)$$

$$\Rightarrow \quad 4 \leq 3x+3$$

$$\Rightarrow \quad 4-3 \leq 3x \Rightarrow 3x \geq 1$$

$$\Rightarrow \quad x \geq \frac{1}{3} \qquad \text{...(i)}$$

Again, $3 \leq \frac{6}{x+1} \Rightarrow 3(x+1) \leq 6$

$$\Rightarrow \quad 3x+3 \leq 6 \quad \Rightarrow \quad 3x \leq 6-3$$

$$\Rightarrow \quad 3x \leq 3$$

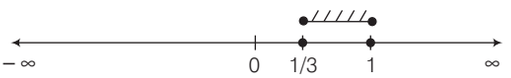
$$\Rightarrow \quad x \leq 1 \qquad \text{...(ii)}$$

Combining the results (i) and (ii), we have

$$\frac{1}{3} \leq x \leq 1, \quad \text{i.e.} \quad x \in \left[\frac{1}{3}, 1\right]$$

Hence, the solution set of the given in equations is $\left[\frac{1}{3}, 1\right]$.

Graphically, it could be shown as



Modulus or Absolute Value Function

The function defined by $f(x) = |x| = \begin{cases} x, x \geq 0 \\ -x, x < 0 \end{cases}$ is called modulus function. This always gives a positive result.

As we know modulus means numerical value,

i.e. $|3| = |-3| = 3,$

$$|-2| = 2, |-1.3291| = 1.3291\ldots\ldots \text{ etc.}$$

or it is the distance defined with respect to origin, as $|x| = 1$ means distance covered is one unit on right hand side or left hand side of origin shown as:

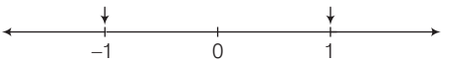


Figure 1.6

$$\therefore \quad |x| = 1 \Rightarrow x = \pm 1$$

Again, $|x| < 1$ means distance covered is less than one unit on right hand side or left hand side of origin shown as:

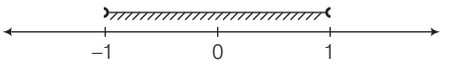

Figure 1.7

Similarly, $|x| > 1$ means distance covered is more than one unit on right hand side or left hand side of origin shown as:

Figure 1.8

Graphical Representation of Modulus

As we define,

$$y = |x| = \begin{cases} x, & x \geq 0 \\ -x, & x < 0 \end{cases}$$

This behaviour is due to two straight lines represented by modulus.

For plotting the graph of the modulus function, we put

x	0	1	2	–1	–2
y	0	1	2	1	2

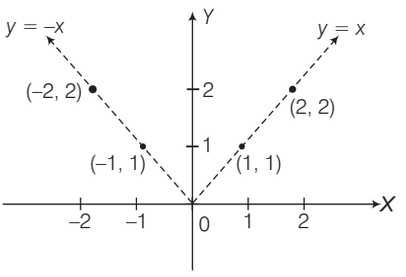

Figure 1.9

Now, we consider the following cases

***Case* I** When $x \geq 0$

Equation of the straight line, passing through (0, 0) and (1, 1) is

$$\frac{y-y_1}{x-x_1}=\frac{y_2-y_1}{x_2-x_1},\ \text{i.e.}\ \frac{y-0}{x-0}=\frac{1-0}{1-0}$$

$\Rightarrow \quad y = x$, when $x \geq 0$

***Case* II** When $x \leq 0$

Equation of the straight line passing through $(-1, 1)$ and $(-2, 2)$

$$\frac{y-y_1}{x-x_1}=\frac{y_2-y_1}{x_2-x_1}$$

i.e. $\quad \frac{y-1}{x+1}=\frac{2-1}{-2+1} \Rightarrow -y+1=x+1 \quad \text{or} \quad y=-x$

when $x \leq 0$.

Thus for every modulus function it exhibits two values, which could be shown graphically.

Similarly, $\quad y=|x-1|=\begin{cases}(x-1), & x \geq 1\\ -(x-1), & x \leq 1\end{cases}$

Remarks

(a) Every modulus function exhibits two values which are represented by +ve and –ve, signs but it only gives the positive outcomes. So, students shouldn't get confused by + ve or –ve, signs as these signs are in different intervals, but the outcomes are positive.

(b) Modulus function is never negative, thus $|x| \geq 0$ for any real x and $|x| \not< 0$.

Example 5 Explain the following :

(i) $|x|=5$ (ii) $|x|=-5$

(iii) $|x|<5$ (iv) $|x|<-5$

(v) $|x|>-5$ (vi) $|x|>5$

Sol. (i) If $|x|=5$

$\Rightarrow x = \pm 5$, which means, x is at a distance of 5 units from 0, which is certainly 5 and − 5.

Aliter

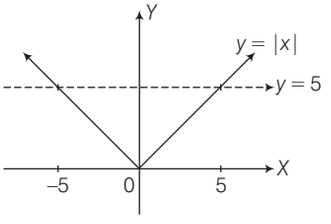
$|x| = 5$.

Here, students are advised to consider two different functions, as

$$y = |x| \ \text{ and } \ y = 5.$$

Now, we plot graph of these two equations.

which intersect at two points, i.e. $x = 5$ and $x = -5$.



$\therefore \quad |x| = 5$ possess two solutions $x = 5$ and $x = -5$.

(ii) If $|x|=-5$

$\Rightarrow \quad x$ has no solution.

As $|x|$ is always positive or zero, it can never be negative.

$\therefore \quad$ RHS < LHS

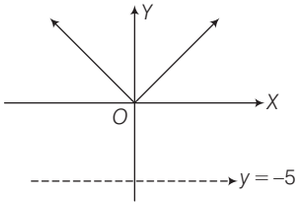
or given relation has no solution.

Aliter

Same as in (i), plotting the graph of $y = |x|$ and $y = -5$.

The two graphs do not intersect.

$\therefore$ No solution.

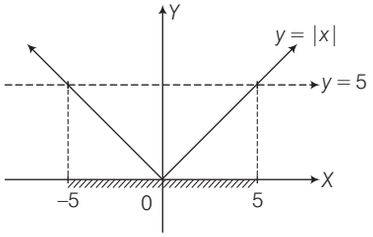


(iii) $|x|< 5$

It means that x is the number, which is at distance less than 5 from 0.

Hence, $\quad -5 < x < 5$

Aliter $|x| < 5$. Plotting the graph of we have $y = |x|$ and $y = 5$.



We see that, $|x| < 5$, when $-5 < x < 5$

(iv) $|x|< -5$

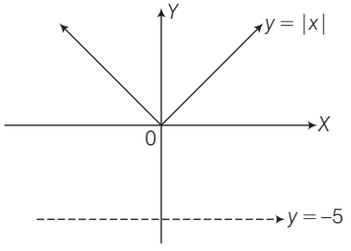
which shows no solution.

As LHS is non-negative and RHS is negative or $|x|<-5$ does not possess any solution.

Aliter $|x| < -5$.

Plotting the graph of $y = |x|$ and $y = -5$.

We see that, $|x| < -5$ is not possible as $|x| > -5$, for all $x \in R$.



$\therefore \quad |x| < -5 \Rightarrow$ No solution.

(v) $|x| > -5$ We know, here LHS ≥ 0 and RHS < 0

So, LHS > RHS

i.e. above statement is true for all real x.

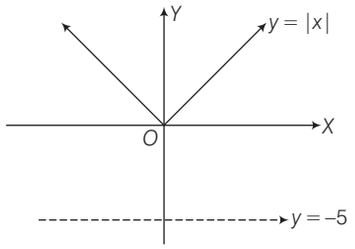
(as we know that non-negative number is always greater than negative).

Aliter

Here, $|x| > -5$

Plotting the graph of $y = |x|$ and $y = -5$.

We see that, $|x| > -5$, for all $x \in$ real number.



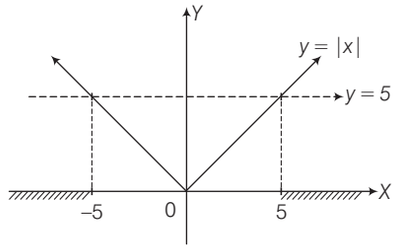
(vi) $|x| > 5$

It means that x is the number which is at distance greater than 5 from 0. Hence, $x < -5$ or $x > 5$

Aliter

$|x| > 5$

Plotting the graph of $y = |x|$ and $y = 5$. We have



We see that, $x < -5$ or $x > 5$.

Generalized Results

(i) For any real number x, we have $x^2 = |x|^2$

(ii) For any real number x, we have $\sqrt{x^2} = |x|$

(iii) If $a < 0$, then

(a) $x^2 \leq a^2 \Leftrightarrow |x| \leq a \Leftrightarrow -a \leq x \leq a$

(b) $x^2 < a^2 \Leftrightarrow |x| < a \Leftrightarrow -a < x < a$

(c) $x^2 \geq a^2 \Leftrightarrow |x| \geq a \Leftrightarrow x \leq -a$ or $x \geq a$

(d) $x^2 > a^2 \Leftrightarrow |x| > a \Leftrightarrow x < -a$ or $x > a$

(e) $a^2 \leq x^2 \leq b^2 \Leftrightarrow a \leq |x| \leq b$

$\Leftrightarrow x \in [-b, -a] \cup [a, b]$

(f) $a^2 < x^2 < b^2 \Leftrightarrow a < |x| < b$

$\Leftrightarrow x \in (-b, -a) \cup (a, b)$

(iv) If $a < 0$, then

$|x| \leq a \Rightarrow$ No solution.

$|x| \geq a \Rightarrow$ All real numbers solutions.

(v) $|x + y| = |x| + |y| \Leftrightarrow (x \geq 0$ and $y \geq 0)$ or $(x \leq 0$ and $y \leq 0) \Leftrightarrow xy \geq 0$.

(vi) $|x - y| = |x| - |y| \Leftrightarrow (x \geq 0, y \geq 0$ and $|x| \geq |y|)$ or $(x \leq 0, y \leq 0$ and $|x| \geq |y|)$

(vii) $|x \pm y| \leq |x| + |y|$ (viii) $|x \pm y| \geq \big||x| - |y|\big|$

Example 6 Solve for x, where

(i) $f(x) = |x| \geq 0$ (ii) $f(x) = |x| > 0$

Sol. (i) $f(x) = |x| \geq 0$

As we know modulus is non-negative quantity.

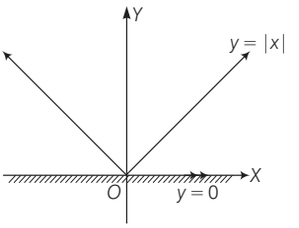
(i.e. It is always greater than equal to zero)

$\therefore$ $x \in R$ is the required solution.

Aliter $f(x) = |x| \geq 0$.

Plotting two graphs $y = |x|$ and $y = 0$.

From graph $|x| \geq 0$, for all $x \in R$.



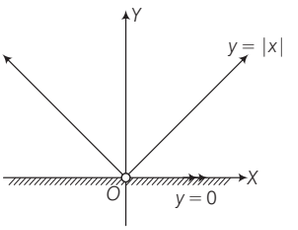
(ii) $f(x) = |x| > 0$

Here equal sign is absent, so we have to exclude those value of x for which $|x| = 0$.

$\therefore$ $x \in R$ except $x = 0$ or $x \in R - \{0\}$ is the required solution.

Aliter $f(x) = |x| > 0$.

Plotting two graphs $y = |x|$ and $y = 0$.



From graph $|x| > 0$, for all $x \in R$ except 0.

$\therefore$ $x \in R - \{0\}$.

Example 7 *Solve* $|x - 3| < 5$.

Sol. $|x - 3| < 5$

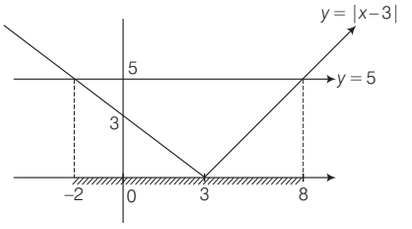
$\Rightarrow -5 < x - 3 < 5$

$\Rightarrow -5 + 3 < x < 5 + 3$

$\Rightarrow -2 < x < 8$ or $x \in]-2, 8[$ or $x \in (-2, 8)$

Aliter For $|x-3|<5$.

Plotting two graphs $y=|x-3|$ and $y=5$



From graph, $-2<x<8$; $\therefore\ x\in(-2,8)$.

Example 8 Solve $|x-1|\le 2$.

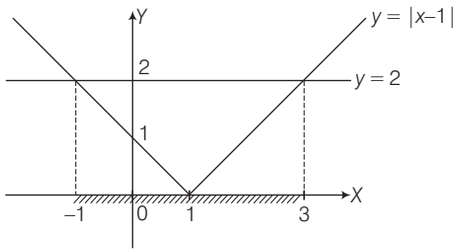
Sol. $|x-1|\le 2$

$\Rightarrow\ -2\le x-1\le 2\ \Rightarrow\ -2+1\le x\le 2+1$

$\Rightarrow\ -1\le x\le 3$ or $x\in[-1,3]$

Aliter For $|x-1|\le 2$.

Plotting two graphs $y=|x-1|$ and $y=2$



From graph, $-1\le x\le 3$

$\therefore\ x\in[-1,3]$

Example 9 Solve $1\le|x-1|\le 3$.

Sol. Here, $1\le|x-1|\le 3$

$\Rightarrow\ -3\le(x-1)\le -1$ or $1\le(x-1)\le 3$

$[\because a\le|x|\le b\Rightarrow x\in[-b,-a]\cup[b,a]]$

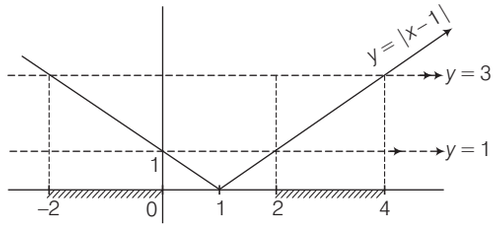
i.e. the distance covered between 1 unit to 3 units.

$\Rightarrow\ -2\le x\le 0$ or $2\le x\le 4$

Hence, the solution set of the given inequation is $x\in[-2,0]\cup[2,4]$.

Aliter Here, $1\le|x-1|\le 3$

Plotting three graphs $y=1$, $y=|x-1|$ and $y=3$.



From graph, $-2\le x\le 0$ or $2\le x\le 4$.

$\therefore\ x\in[-2,0]\cup[2,4]$

Example 10 Solve $|x-1|\le 5, |x|\ge 2$.

Sol. Here, $|x-1|\le 5$ and $|x|\ge 2$

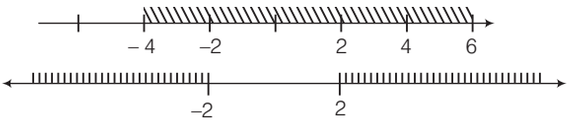
i.e. $(-5\le x-1\le 5)$

$\Rightarrow\ (-4\le x\le 6)$ ...(i)

Similarly, $(x\le -2$ or $x\ge 2)$

$\Rightarrow\ (x\le -2$ or $x\ge 2)$ ...(ii)

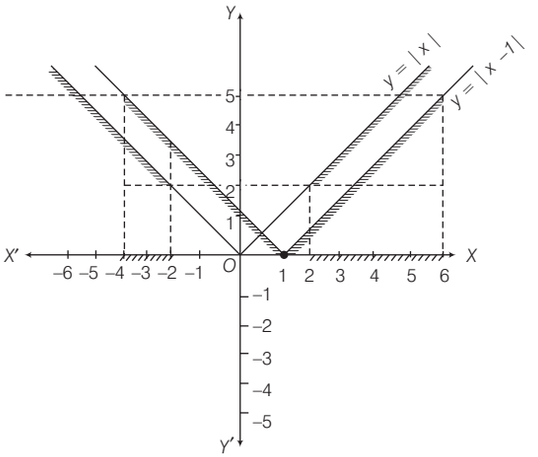
From Eqs. (i) and (ii) could be graphically shown as



Thus, the shaded portion, i.e. common to both Eqs. (i) and (ii) is the required region $x\in[-4,-2]\cup[2,6]$.

Aliter Here, $|x-1|\le 5$ and $|x|\ge 2$.

Take $(y=|x-1|, y=5)$ and $(y=|x|, y=2)$ on graph and take common.



From the graph, $-4\le x\le -2$

or $2\le x\le 6$

$\therefore\ x\in[-4,-2]\cup[2,6]$

Example 11 *Solve* $\left|\frac{2}{x-4}\right|>1,\ x\ne 4$.

Sol. We have, $\left|\frac{2}{x-4}\right|>1$, where $x\ne 4$ ...(i)

$\Rightarrow\ \frac{2}{|x-4|}>1$ $\left[\because\left|\frac{a}{b}\right|=\frac{|a|}{|b|}\text{ and }|2|=2\right]$

$\Rightarrow\ 2>|x-4|$

$\Rightarrow\ |x-4|<2$

$\Rightarrow\ -2<x-4<2$

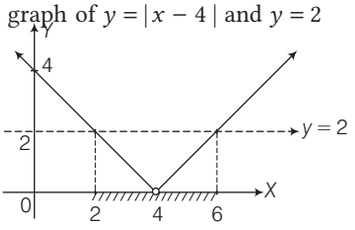
$\Rightarrow\ 2<x<6$

$\therefore\ x\in(2,6)$, but $x\ne 4$ [from Eq. (i)]

Hence, the solution set of the given inequation is $x \in (2, 4) \cup (4, 6)$.

Aliter $\left|\frac{2}{x-4}\right| > 1,\ x \neq 4 \implies |x-4| < 2$

Plotting the graph of $y = |x-4|$ and $y = 2$



From graph, $2 < x < 6, x \neq 4$

i.e. $x \in (2, 6) - \{4\}$

Note

Students should always remember that they have to compare the solution set with the initial condition.

Example 12 *Solve* $|x-1|+|x-2| \geq 4$.

Sol. On the LHS of the given inequation, we have two modulus, so we should define each modulus i.e. by equating it to zero.

i.e. $|x-1| = \begin{cases} (x-1), & x \geq 1 \\ -(x-1), & x < 1 \end{cases}$

and $|x-2| = \begin{cases} (x-2), & x \geq 2 \\ -(x-2), & x < 2 \end{cases}$

Thus, it gives three cases :

***Case* I** When $-\infty < x < 1$

i.e. $|x-1|+|x-2| \geq 4$

$\Rightarrow$ $-(x-1)-(x-2) \geq 4$

$\Rightarrow$ $-2x+3 \geq 4 \implies -2x \geq 1$

$\Rightarrow$ $x \leq -\frac{1}{2}$ ...(i)

But $-\infty < x < 1$

$\therefore$ Solution set is $x \in \left(-\infty, -\frac{1}{2}\right]$.

***Case* II** When $1 \leq x \leq 2$

i.e. $|x-1|+|x-2| \geq 4$

$\Rightarrow$ $(x-1)-(x-2) \geq 4$

$\Rightarrow$ $1 \geq 4$, which is meaningless.

$\therefore$ No solution for $x \in [1, 2]$. ...(ii)

***Case* III** When $2 < x < \infty$

i.e. $|x-1|+|x-2| \geq 4$

$\Rightarrow$ $(x-1)+(x-2) \geq 4$

$\Rightarrow$ $2x-3 \geq 4$

$\Rightarrow$ $x \geq 7/2$

But $2 < x < \infty$

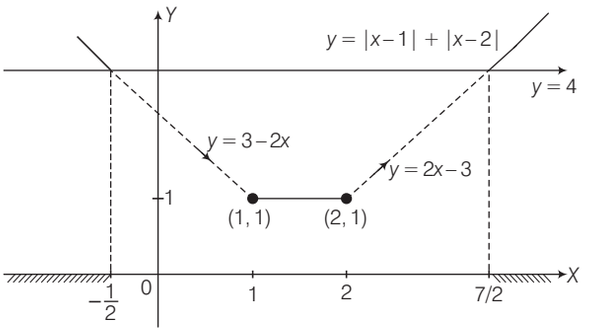
$\therefore$ Solution set is $\left[\frac{7}{2}, \infty\right)$. ...(iii)

From Eqs. (i), (ii) and (iii), we get

$$x \in \left(-\infty, -\frac{1}{2}\right] \cup \left[\frac{7}{2}, \infty\right)$$

Aliter

Plotting two graphs $y = |x-1|+|x-2|$ and $y = 4$ shown below.



From graph, $x \leq -\frac{1}{2}$ or $x \geq \frac{7}{2}$

$\therefore$ $x \in \left(-\infty, -\frac{1}{2}\right] \cup \left[\frac{7}{2}, \infty\right)$

Exercise for Session 2

■ **Directions** (Q. Nos. 1 to 5) *Solve the following inequalities for real values of x.*

1. $|x-1| < 2$
2. $|x-3| > 5$
3. $0 < |x-1| < 3$
4. $|x-1| + |2x-3| = |3x-4|$
5. $\left|\frac{x-3}{x^2-4}\right| \leq 1$

Session 3

Number Line Rule, Wavy Curve Method

Number Line Rule

It is used to solve algebraic inequalities using following steps:

(i) Factorize numerator as well as denominator.

(ii) Now, check the coefficients of x and make them positive.

(iii) Put only odd power factors in numerator and denominator and put them equal to zero separately and find the value of x.

(*As for polynomial function only numerator* $= 0$, *denominator* $\neq 0$).

(iv) Plot these points on number line in increasing order.

(v) Start number line from right to left taking sign of $f(x)$.

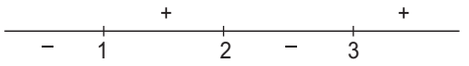
(vi) Check your answer so that it should not contain a point for which $f(x)$ doesn't exist.

Example 13 Find the interval in which $f(x)$ is positive or negative: $f(x) = (x-1)(x-2)(x-3)$.

Sol. Here, $f(x) = (x-1)(x-2)(x-3)$ has all factors with odd powers, so put them as zero.

i.e. $x-1=0, x-2=0, x-3=0$, we get $x = 1, 2, 3$ [using step (iii)]

Using steps (iv) and (v), plotting on number line, we get



$f(x) > 0$ when $1 < x < 2$ and $x > 3$

$f(x) < 0$ when $x < 1$ and $2 < x < 3$

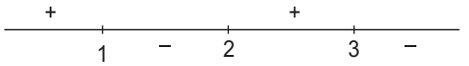
Example 14 Solve $f(x) = \dfrac{(x-1)(2-x)}{(x-3)} \geq 0$.

Sol. Here, $f(x) = \dfrac{(x-1)(2-x)}{(x-3)} \geq 0$

or $f(x) = -\dfrac{(x-1)(x-2)}{(x-3)}$, which gives

$x - 3 \neq 0$ or $x \neq 3$ ...(i)

Using number line rule as shown in the figure,



which shows $f(x) \geq 0$ when $x \leq 1$ or $2 \leq x < 3$

i.e. $x \in (-\infty, 1] \cup [2, 3)$. (as $x \neq 3$)

Example 15 ***Find the values of*** x ***for which***

$$f(x) = \frac{(2x-1)(x-1)^2(x-2)^3}{(x-4)^4} > 0.$$

Sol. $f(x) = \dfrac{(2x-1)(x-1)^2(x-2)^3}{(x-4)^4}$, which gives $x \neq 4$ ...(i)

As denominator $\neq 0$ and $x \neq 1$, as at $x = 1$, $f(x)$ has even powers.

Putting zero to $(2x-1)$ and $(x-2)^3$ as they have odd powers and neglecting $(x-1)^2$ and $(x-4)^4$ on number line as shown in figure.

which shows $f(x) > 0$ when $x < 1/2$ or $x > 2$ but except for 4 and 1.

$\therefore$ $x \in (-\infty, 1/2) \cup (2, \infty) - \{4\}$

Example 16 Find the value of x for which

$$f(x) = \frac{(x-2)^2(1-x)(x-3)^3(x-4)^2}{(x+1)} \leq 0.$$

Sol. Here, $f(x) = \dfrac{(x-2)^2(1-x)(x-3)^3(x-4)^2}{(x+1)}$

or $f(x) = -\dfrac{(x-2)^2(x-1)(x-3)^3(x-4)^2}{(x+1)}, (x \neq -1)$ ...(i)

Putting zero to $(x-1), (x-3)^3, (x+1)$ as having odd powers and neglecting $(x-2)^2, (x-4)^2$, we get

$f(x) \leq 0$ when $-1 < x \leq 1$ or $3 \leq x < \infty$ or $f(x) = 0$ at $x = 2$

or $x \in (-1, 1] \cup [3, \infty) \cup \{2\}$ [using Eq. (i) as $x \neq -1$]

Example 17 Solve $\dfrac{|x|-1}{|x|-2} \geq 0$; $x \in R$, $x \neq \pm 2$

Sol. We have, $\dfrac{|x|-1}{|x|-2} \geq 0 \Rightarrow \dfrac{y-1}{y-2} \geq 0$; where $y = |x|$

$\Rightarrow$ $y \leq 1$ or $y > 2$ using number line rule

$\Rightarrow$ $|x| \leq 1$ or $|x| > 2$

$\Rightarrow$ $(-1 \leq x \leq 1)$ or $(x < -2$ or $x > 2)$

$\Rightarrow \quad x \in [-1, 1] \cup (-\infty, -2) \cup (2, \infty)$

Hence, the solution set is

$x \in (-\infty, -2) \cup [-1, 1] \cup (2, \infty)$.

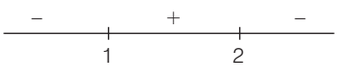
Example 18 Solve $\dfrac{-1}{|x|-2} \geq 1$, where $x \in R$, $x \neq \pm 2$.

Sol. We have, $\dfrac{-1}{|x|-2} \geq 1$

$\Rightarrow \quad \dfrac{-1}{|x|-2} - 1 \geq 0 \Rightarrow \dfrac{-1-(|x|-2)}{|x|-2} \geq 0$

$\Rightarrow \quad \dfrac{1-|x|}{|x|-2} \geq 0 \Rightarrow \dfrac{-(|x|-1)}{(|x|-2)} \geq 0$

Using number line rule,



$\Rightarrow \quad 1 \leq |x| < 2 \Rightarrow x \in (-2, -1] \cup [1, 2)$

$\{\because a \leq |x| < b \Leftrightarrow x \in (-b, -a] \cup [a, b)\}$

Hence, the solution set is $(-2, -1] \cup [1, 2)$.

Example 19 Solve $\dfrac{|x+3|+x}{x+2} > 1$.

Sol. Here, $\dfrac{|x+3|+x}{x+2} - 1 > 0 \Rightarrow \dfrac{|x+3|+x-x-2}{x+2} > 0$

$\Rightarrow \quad \dfrac{|x+3|-2}{x+2} > 0$ ...(i)

Now, two cases arise :

***Case* I** When $x + 3 \geq 0$, i.e. $x \geq -3$ ...(ii)

$\Rightarrow \quad \dfrac{x+3-2}{x+2} > 0 \Rightarrow \dfrac{x+1}{x+2} > 0$

$\Rightarrow \quad x \in (-\infty, -2) \cup (-1, \infty)$ using number line rule as shown in the figure.

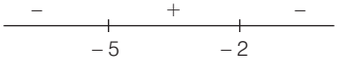
But $x \geq -3$ [from Eq. (ii)]

$\Rightarrow \quad x \in [-3, -2) \cup (-1, \infty)$ ...(a)

***Case* II** When $x + 3 < 0$, i.e. $x < -3$ ...(iii)

$\Rightarrow \quad \dfrac{-(x+3)-2}{x+2} > 0 \Rightarrow \dfrac{-(x+5)}{(x+2)} > 0$

$\Rightarrow x \in (-5, -2)$ using number line rule as shown in the figure.



But $x < -3$ [from Eq. (iii)]

$\therefore \quad x \in (-5, -3)$ ...(b)

Thus, from Eqs. (a) and (b), we have

$x \in [-3, -2) \cup (-1, \infty) \cup (-5, -3)$

$\Rightarrow \quad x \in (-5, -2) \cup (-1, \infty)$

Wavy Curve Method

The method of intervals (or wavy curve) is used for solving inequalities of the form :

$$f(x) = \frac{(x-a_1)^{n_1}(x-a_2)^{n_2} \ldots (x-a_k)^{n_k}}{(x-b_1)^{m_1}(x-b_2)^{m_2} \ldots (x-b_p)^{m_p}} > 0$$

$(< 0, \leq 0 \text{ or } \geq 0)$

where $n_1, n_2, \ldots\ldots, n_k$ and $m_1, m_2, \ldots\ldots, m_p$ are natural numbers.

$a_1, a_2, \ldots\ldots, a_k$; $b_1, b_2, \ldots\ldots, b_p$ are any real numbers such that $a_i \neq b_j$, where $i = 1, 2, 3, \ldots, k$ and $j = 1, 2, 3, \ldots, p$

It consists of the following statements :

1. All zeros of the function $f(x)$ (the values of x corresponding to numerator = 0) contained on the left hand side of the inequality should be marked on the number line with inked (black) circles.
2. All points of discontinuities of the function $f(x)$ (the values of x corresponding to denominator = 0) contained on the left hand side of the inequality should be marked on the number line with uninked (white) circles.
3. Check the value of $f(x)$ for any real number greater than the rightmost marked number on the number line.
4. From right to left, beginning above the number line (in case of value of $f(x)$ is positive in step (iii) otherwise from below the number line), a wavy curve should be drawn to pass through all the marked points so that when it passes through a simple point, the curve intersects the number line and when passing through a double point, the curve remains located on one side of the number line.
5. The appropriate intervals are chosen in accordance with the sign of inequality (the function $f(x)$ is positive whenever the curve is situated above the number line, it is negative if the curve is found below the number line). Their union just represents the solution of the inequality.

Remarks

(a) Points of discontinuity will never be include in the answers.

(b) If asked to find the intervals where $f(x)$ is non-negative or non-positive, then make the intervals closed, corresponding to the roots of the numerator and let it remain open corresponding to the roots of denominator.

Example 20 *Let* $f(x) = \dfrac{(x-1)^3(x+2)^4(x-3)^5(x+6)}{x^2(x-7)^3}$.

Solve the following inequalities :

(i) $f(x) > 0$ (ii) $f(x) \geq 0$

(iii) $f(x) < 0$ (iv) $f(x) \leq 0$

Sol. Given, $f(x)=\dfrac{(x-1)^3(x+2)^4(x-3)^5(x+6)}{x^2(x-7)^3}$

Put numerator = 0

$\Rightarrow \quad (x-1)^3(x+2)^4(x-3)^5(x+6)=0$

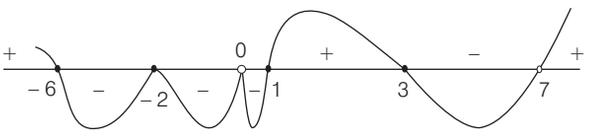
$\Rightarrow \quad x=1,-2,3,-6$

Again, put denominator = 0

$\Rightarrow \quad x^2(x-7)^3=0$

$\Rightarrow \quad x=0,\ 7$

We mark on the number line zeros of the function: $1,-2,3$ and -6 (with black circles) and the points of discontinuities 0 and 7 (with white circles). Isolate the double points: -2 and 0 and draw the curve of signs.



From the graph, we get

(i) if $f(x)>0$, then $x\in(-\infty,-6)\cup(1,3)\cup(7,\infty)$

(ii) if $f(x)\geq 0$, then $x\in(-\infty,-6]\cup\{-2\}\cup[1,3]\cup(7,\infty)$

(iii) if $f(x)<0$, then $x\in(-6,-2)\cup(-2,0)\cup(0,1)\cup(3,7)$

(iv) if $f(x)\leq 0$, then $x\in[-6,0)\cup(0,1]\cup[3,7)$

Example 21 *Let*

$$f(x)=\frac{\left(\sin x-\frac{1}{2}\right)(\ln x-1)^2(x-2)(\tan x-\sqrt{3})}{(e^x-e^2)(x-3)^2\cdot\cos x}$$

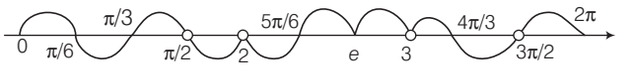
Solve the following inequalities for $x\in[0,2\pi]$ **:**

(i) $f(x)>0$ (ii) $f(x)\geq 0$

(iii) $f(x)<0$ (iv) $f(x)\leq 0$

Sol. Clearly, $x\neq 2,3,\dfrac{\pi}{2},\dfrac{3\pi}{2}$ and $f(x)=0$

for $x=\dfrac{\pi}{6},\dfrac{\pi}{3},\dfrac{5\pi}{6},e,\dfrac{4\pi}{3}$



Now, sign of $f(x)$ will not change around $x=2,e,3$.

Then, for $f(x)>0$

$$\left(\sin x-\frac{1}{2}\right)(\tan x-\sqrt{3})>0$$

$$\Rightarrow \quad x\in\left(0,\frac{\pi}{6}\right)\cup\left(\frac{\pi}{3},\frac{\pi}{2}\right)\cup\left(\frac{5\pi}{6},\frac{4\pi}{3}\right)\cup\left(\frac{3\pi}{2},2\pi\right)-\{e,3\}$$

Hence, solution of

(i) $f(x)>0$ is $x\in\left(0,\dfrac{\pi}{6}\right)\cup\left(\dfrac{\pi}{3},\dfrac{\pi}{2}\right)\cup\left(\dfrac{5\pi}{6},\dfrac{4\pi}{3}\right)\cup\left(\dfrac{3\pi}{2},2\pi\right)-\{e,3\}$

(ii) $f(x)\geq 0$ is $x\in\left(0,\dfrac{\pi}{6}\right]\cup\left[\dfrac{\pi}{3},\dfrac{\pi}{2}\right)\cup\left[\dfrac{5\pi}{6},\dfrac{4\pi}{3}\right]\cup\left(\dfrac{3\pi}{2},2\pi\right)-\{3\}$

(iii) $f(x)<0$ is $x\in\left(\dfrac{\pi}{6},\dfrac{\pi}{3}\right)\cup\left(\dfrac{\pi}{2},\dfrac{5\pi}{6}\right)\cup\left(\dfrac{4\pi}{3},\dfrac{3\pi}{2}\right)-\{2\}$

(iv) $f(x)\leq 0$ is $x\in\left[\dfrac{\pi}{6},\dfrac{\pi}{3}\right]\cup\left(\dfrac{\pi}{2},\dfrac{5\pi}{6}\right]\cup\left[\dfrac{4\pi}{3},\dfrac{3\pi}{2}\right)\cup\{e\}-\{2\}$

Example 22 Let

$$f(x)=\frac{(\cos x+|\cos x|)\left(\sin x-\frac{3}{2}\right)^3(\tan x-1)^5}{(\cos x-2)^2(\tan x-\sqrt{3})^3}$$

Find the interval of $x\in\left(\dfrac{-\pi}{2},\dfrac{\pi}{2}\right)$ for which

(i) $f(x)>0$ (ii) $f(x)<0$

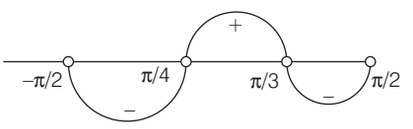
Sol. For $x\in\left(\dfrac{-\pi}{2},\dfrac{\pi}{2}\right)$

$\cos x>0$ for all $x \ \Rightarrow\ |\cos x|=\cos x$

$\Rightarrow \quad \cos x+|\cos x|=2\cos x$

$\therefore \quad f(x)=\dfrac{2\cos x\left(\sin x-\frac{3}{2}\right)^3(\tan x-1)^5}{(\cos x-2)^2(\tan x-\sqrt{3})^3}$

Critical points $\cos x=0\Rightarrow x=\dfrac{\pi}{2}$ (not in domain)



$\sin x=\dfrac{3}{2}$ (not possible)

$\tan x=1\Rightarrow x=\dfrac{\pi}{4}\ \Rightarrow \cos x=2$ (not possible)

$\tan x=\sqrt{3}\Rightarrow x=\dfrac{\pi}{3}\cdot$

Then, $f(x)>0\Rightarrow x\in\left(\dfrac{\pi}{4},\dfrac{\pi}{3}\right)$

and $f(x)<0\Rightarrow x\in\left(\dfrac{-\pi}{2},\dfrac{\pi}{4}\right)\cup\left(\dfrac{\pi}{3},\dfrac{\pi}{2}\right)$

Exercise for Session 3

■ **Directions** (Q. Nos. 1 to 5) *Solve the following inequalities.*

1. $\frac{x-2}{x+2} > \frac{2x-3}{4x-1}$

2. $\frac{2x-1}{2x^3+3x^2+x} > 0$

3. $\frac{4x}{x^2+3} \geq 1$

4. $\frac{(x-1)(x+1)(x+4)(x+6)}{7x^2+8x+4} > 0$

5. $\frac{x}{x^2-5x+9} \leq 1$

6. Solution of inequality $|x-1| < 0$ is

(a) $x = 0$
(b) $x = 1$
(c) $x \neq 1$
(d) No solution

7. Solution of inequality $x^2 + x + |x| + 1 \leq 0$ is

(a) (1, 2)
(b) (0, 1)
(c) No solution
(d) None of these

8. Solution of inequality $|x+3| > |2x-1|$ is

(a) $\left(-\frac{2}{3}, 4\right)$
(b) $(4, \infty)$
(c) $\left(-\frac{2}{3}, 1\right)$
(d) None of these

9. Solution of inequality $\left|x + \frac{1}{x}\right| < 4$ is

(a) $(2-\sqrt{3}, 2+\sqrt{3}) \cup (-2-\sqrt{3}, -2+\sqrt{3})$
(b) $R - (2-\sqrt{3}, 2+\sqrt{3})$
(c) $R - (-2-\sqrt{3}, 2+\sqrt{3})$
(d) None of these

10. The solution of $|x^2 + 3x| + x^2 - 2 \geq 0$ is

(a) $(-\infty, 1)$
(b) (0, 1)
(c) $\left(-\infty, -\frac{2}{3}\right] \cup \left[\frac{1}{2}, \infty\right)$
(d) None of these

11. The solution of $||x|-1| < |1-x|, x \in R$ is

(a) (–1, 1)
(b) $(0, \infty)$
(c) $(-1, \infty)$
(d) None of these

12. The solution of $2^x + 2^{|x|} \geq 2\sqrt{2}$ is

(a) $(-\infty, \log_2(\sqrt{2}+1))$
(b) $(0, \infty)$
(c) $\left(\frac{1}{2}, \log_2(\sqrt{2}-1)\right)$
(d) $(-\infty, \log_2(\sqrt{2}-1)] \cup \left[\frac{1}{2}, \infty\right)$

Session 4

Quadratic Expression, Non-negative Functions

Quadratic Expression

The expression $ax^2 + bx + c$ is said to be a real quadratic expression in x, where a, b, c are real and $a \neq 0$. Let $f(x) = ax^2 + bx + c$, where $a, b, c \in R\,(a \neq 0)$. $f(x)$ can be rewritten as

$$f(x) = a\left\{\left(x + \frac{b}{2a}\right)^2 + \frac{4ac - b^2}{4a^2}\right\} = a\left[\left(x + \frac{b}{2a}\right)^2 - \frac{D}{4a^2}\right]$$

where $D = b^2 - 4ac$ is the **discriminant** of the quadratic expression.

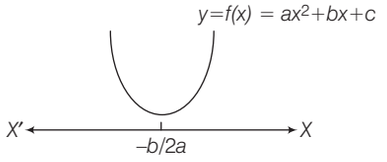
Therefore, $y = f(x)$ represents a parabola whose axis is parallel to the Y-axis, with vertex at $A\left(-\frac{b}{2a}, \frac{-D}{4a}\right)$.

Graph for Quadratic Expressions

That if $a > 0$, the parabola will be concave upwards and if $a < 0$, the parabola will be concave downwards and it depends on the sign of $b^2 - 4ac$ that the parabola cuts the X-axis at two points $(b^2 - 4ac > 0)$, touches the X-axis $(b^2 - 4ac = 0)$ or never intersects with the X-axis $(b^2 - 4ac < 0)$.

This gives rise to the following cases:

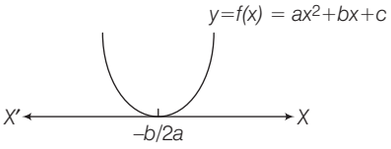
(i) If $a > 0$ and $b^2 - 4ac < 0$.



$\Leftrightarrow \quad f(x) > 0, \forall\ x \in R$

In this case the parabola always remains concave upwards and above the X-axis.

(ii) If $a > 0$ and $b^2 - 4ac = 0$.



$\Leftrightarrow \quad f(x) \geq 0, \forall\ x \in R$

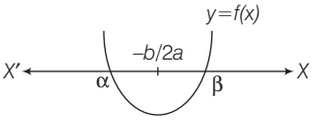
In this case the parabola touches the X-axis and remains concave upwards.

(iii) If $a > 0$ and $b^2 - 4ac > 0$.

Let $f(x) = 0$ has two real roots α and $\beta\,(\alpha < \beta)$.

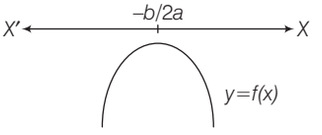
Then, $f(x) > 0, \forall\ x \in (-\infty, \alpha) \cup (\beta, \infty)$,

$f(x) < 0, \forall\ x \in (\alpha, \beta)$ and $f(x) = 0$ for $x \in \{\alpha, \beta\}$.



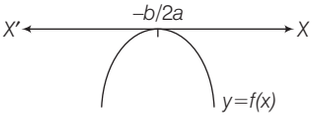
In this case the parabola cuts the X-axis at two points α and β and remains concave upwards.

(iv) If $a < 0$ and $b^2 - 4ac < 0 \ \Leftrightarrow\ f(x) < 0, \forall\ x \in R$



In this case the parabola remains concave downwards and always below the X-axis.

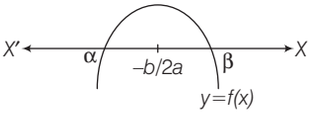
(v) If $a < 0$ and $b^2 - 4ac = 0$.



$\Leftrightarrow \quad f(x) \leq 0, \forall\ x \in R$

In this case the parabola touches the X-axis and remains concave downwards.

(vi) If $a < 0$ and $b^2 - 4ac > 0$.



Let $f(x) = 0$ have two real roots α and $\beta\,(\alpha < \beta)$.

Then, $f(x) < 0, \forall\ x \in (-\infty, \alpha) \cup (\beta, \infty)$,

$f(x) > 0, \forall\ x \in (\alpha, \beta)$ and $f(x) = 0$ for $x \in \{\alpha, \beta\}$.

In this case the parabola cuts the X-axis at two points α and β and remains concave downwards.

Quick and Important Results for Characteristic Expression

1. The expression $ax^2 + bx + c$ will be at same sign for all real values of x, iff $D < 0$.
2. $ax^2 + bx + c$ will always be positive iff $D < 0$ and $a > 0$.
3. $ax^2 + bx + c$ will always be negative iff $D < 0$ and $a < 0$.
4. If $D > 0$, then sign of the expression between the roots will be opposite to that of a.
5. If $a > 0$, then minima of $f(x)$ occurs at $x = \frac{-b}{2a}$ and if $a < 0$, then maxima of $f(x)$ occurs at $x = \frac{-b}{2a}$ and maximum or minimum value of $f(x)$ will be given by $\left(\frac{-D}{4a}\right)$.
6. If $f(x) = 0$ has two distinct real roots, then $a \cdot f(d) < 0$ if and only if d lies between the roots and $a \cdot f(d) > 0$ if and only if d lies outside the roots.

Example 23 ***Find*** a ***for which*** $3x^2 + ax + 3 > 0$, $\forall\, x \in R$.

Sol. Here, $3x^2 + ax + 3 > 0, \forall\, x \in R$

$\Rightarrow \quad D < 0 \quad [\because \text{if } f(x) > 0 \text{ and } a > 0, \text{ then } D < 0]$

$\Rightarrow \quad (a)^2 - 4(3)(3) < 0 \quad \Rightarrow \quad a^2 - 36 < 0$

$\Rightarrow (a-6)(a+6) < 0$, using number line rule as shown in figure,

which shows $-6 < a < 6$ or $a \in (-6, 6)$

Example 24 ***Find*** a ***for which*** $ax^2 + x - 1 < 0$, $\forall\, x \in R$ ***?***

Sol. Here, $ax^2 + x - 1 < 0, \forall\, x \in R$

$\Rightarrow \quad a < 0 \quad \text{and} \quad D < 0 \quad [\because a < 0, D < 0, \text{ so } f(x) < 0]$

$\Rightarrow \quad a < 0 \quad \text{and} \quad 1 + 4a < 0$

$\Rightarrow \quad a < 0 \quad \text{and} \quad a < -1/4$

$\therefore \quad a \in (-\infty, -1/4)$

Non-negative Functions

The sum of several non-negative terms is zero if and only if each term is zero.

i.e. $a^2 + b^2 + c^2 = 0$

if $a = b = c$

Example 25 Solve $(x+1)^2 + (x^2 + 3x + 2)^2 = 0$.

Sol. Here, $(x+1)^2 + (x^2 + 3x + 2)^2 = 0$ if and only if each term is zero simultaneously,

$(x+1) = 0$ and $(x^2 + 3x + 2) = 0 \Rightarrow (x+1)(x+2) = 0$

i.e. $x = -1$ and $x = -1, -2$

$\therefore$ The common solution is $x = -1$.

Hence, solution of the above equation is $x = -1$.

Example 26 Solve $|x+1| + \sqrt{x-1} = 0$.

Sol. Here, $|x+1| + \sqrt{x-1} = 0$, where each term is non-negative.

$\therefore \quad |x+1| = 0$ and $\sqrt{x-1} = 0$

should be zero simultaneously.

i.e. $x = -1$ and $x = 1$, which is not possible.

$\therefore$ There is no x for which each term is zero simultaneously. Hence, there is no solution.

Example 27 Solve

$$|x^2 - 1| + (x-1)^2 + \sqrt{x^2 - 3x + 2} = 0.$$

Sol. Here, each of the term is non-negative, thus each term must be zero simultaneously.

i.e. $(x^2 - 1) = 0, (x-1)^2 = 0$ and $x^2 - 3x + 2 = 0$

$\Rightarrow \quad x = \pm 1, \; x = 1$ and $x = 1, 2$

The common solution is $x = 1$.

Therefore, $\boldsymbol{x = 1}$ is the solution of above equation.

Example 28 Let $f(x) = x$ and $g(x) = |x|$ be two real-valued functions, $\phi(x)$ be a function satisfying the condition;

$[\phi(x) - f(x)]^2 + [\phi(x) - g(x)]^2 = 0$. Then, find $\phi(x)$.

Sol. Here, $[\phi(x) - f(x)]^2 + [\phi(x) - g(x)]^2 = 0$ is only possible, if $\phi(x) - f(x) = 0$ and $\phi(x) - g(x) = 0$

$\Rightarrow \quad \phi(x) = f(x) = g(x)$ or $\phi(x) = x = |x|$,

which is only possible, if x is non-negative.

Therefore, $\phi(x) = x, \forall\, x \in [0, \infty)$

Exercise for Session 4

1. Find all values of 'm' for which $(2m-3)x^2 + 2mx + 4 < 0$ for all real x.
2. If $ax^2 - bx + 5 = 0$ does not have two distinct real roots, then find the minimum value of $5a + b$.
3. If $a, b, c \in R, a \neq 0$ and the quadratic equation, $ax^2 + bx + c = 0$ has no real root, then show that $a(a + b + c) > 0$.
4. If $x, y \in [0, 10]$, then find the number of solutions (x, y) of the inequation $3^{\sec^2 x - 1} \cdot \sqrt{9y^2 - 6y + 2} \leq 1$.

Essential Mathematical Tools Exercise 1 : Subjective Questions

■ **Directions** (Q. Nos. 1 to 11) *Solve each of the following system of equations :*

1. For $a<0$, determine all solutions of the equation $x^2-2a|x-a|-3a^2=0$.

2. Solve $|x^2+4x+3|+2x+5=0$.

3. Solve $|x^2-3x-4|=9-|x^2-1|$.

4. Solve $2^{|x+1|}-2^x=|2^x-1|+1$.

5. Find the set of all real 'a' such that $5a^2-3a-2, a^2+a-2$ and $2a^2+a-1$ are the lengths of the sides of a triangle?

6. Solve $(x+3)^5-(x-1)^5\geq 244$.

7. Solve $||x-2|-1|\geq 3$.

8. Solve $1\leq\dfrac{3x^2-7x+8}{x^2+1}\leq 2$.

9. Let $f(x)=\dfrac{2x}{2x^2+5x+2}$ and $g(x)=\dfrac{1}{x+1}$.
Find the set of real values of x for which $f(x)>g(x)$.

10. For $x\in R, ||x||$ is defined as follows;

$$||x||=\begin{cases}x+1, & 0\leq x<2\\ |x-4|, & 2\leq x\end{cases}$$

Then, solve the equation, $||x||^2+x=||x||+x^2$.

11. Solve the inequality $|x-1|+|2-x|>3+x$.

12. Solve the equation

$$\sqrt{x^2+12y}+\sqrt{y^2+12x}=33,\ x+y=23.$$

13. Solve the equation

$$\sqrt{2x-1}+\sqrt{3x-2}=\sqrt{4x-3}+\sqrt{5x-4}.$$

14. If x, y and z are three real numbers such that $x+y+z=4$ and $x^2+y^2+z^2=6$, then show that each of x, y and z lies in the closed interval $\left[\dfrac{2}{3},2\right]$.

15. If $\{(\alpha+1)(\beta-1)+(\beta+1)(\alpha-1)\}a+(\alpha-1)(\beta-1)=0$ and $a(\alpha+1)(\beta+1)-(\alpha-1)(\beta-1)=0$

Also, let $A=\left\{\dfrac{\alpha+1}{\alpha-1},\dfrac{\beta+1}{\beta-1}\right\}$

and $B=\left\{\dfrac{2\alpha}{\alpha+1},\dfrac{2\beta}{\beta+1}\right\}$. If $A\cap B\neq\phi$, then find all the permissible values of the parameter 'a'.

16. Solve $\left|\dfrac{x-1}{3+2x-8x^2}\right|+|1-x|=\dfrac{(x-1)^2}{|3+2x-8x^2|}+1$

17. Let $f(x)=(x^2-2|x|)(2|x|-2)-9\dfrac{(2|x|-2)}{x^2-2|x|}$.
Solve the following inequalities

(i) $f(x)>0$ (ii) $f(x)\geq 0$

(iii) $f(x)<0$ (iv) $f(x)\leq 0$

18. Solve the inequality $\left|1-\dfrac{|x|}{1+|x|}\right|\geq\dfrac{1}{2}$.

Essential Mathematical Tools Exercise 2 : More Than One Correct Option Type Questions

19. If $\cos x-y^2-\sqrt{y-x^2-1}\geq 0$, then

(a) $y\geq 1$ (b) $x\in R$ (c) $y=1$ (d) $x=0$

20. If $(\sin\alpha)x^2-2x+b\geq 2$ for all real values of $x\leq 1$ and $\alpha\in\left(0,\dfrac{\pi}{2}\right)\cup\left(\dfrac{\pi}{2},\pi\right)$, then the possible real values of b is/are

(a) 2 (b) 3 (c) 4 (d) 5

21. If $|ax^2+bx+c|\leq 1$ for all x is [0, 1], then

(a) $|a|\leq 8$

(b) $|b|\leq 8$

(c) $|c|\leq 1$

(d) $|a|+|b|+|c|\leq 17$

Essential Mathematical Tools Exercise 3 : Passage Based Questions

Passage I

(Q. Nos. 22 to 24)

Let $f(x) = ax^2 + bx + c$; $a, b, c \in R$

It is given $|f(x)| \le 1, \forall\ |x| \le 1$.

Now, answer the following questions.

22. The possible value of $|a + c|$, if $\frac{8}{3}a^2 + 2b^2$ is maximum, is given by
(a) 1 (b) 0 (c) 2 (d) 3

23. The possible value of $|a + b|$, if $\frac{8}{3}a^2 + 2b^2$ is maximum, is given by
(a) 1 (b) 0 (c) 2 (d) 3

24. The possible maximum value of $\frac{8}{3}a^2 + 2b^2$ is given by
(a) 32 (b) $\frac{32}{3}$ (c) $\frac{2}{3}$ (d) $\frac{16}{3}$

Passage II

(Q. Nos. 25 to 27)

Consider the equation $|2x| - |x - 4| = x + 4$.

25. The least integer satisfying the equation, is
(a) − 4 (b) 4 (c) 5 (d) − 5

26. Total number of prime numbers less than 20 satisfying the equation, is
(a) 3 (b) 4 (c) 5 (d) 6

27. If P = greatest composite number less than 34 satisfying the given equation, then P^{2007} has the digit on its units place as
(a) 8 (b) 1
(c) 7 (d) 0

Passage III

(Q. Nos. 28 to 30)

Consider a number $N = 2\,1\,P\,5\,3\,Q\,4$.

28. The number of ordered pairs (P, Q) so that the number 'N' is divisible by 9, is
(a) 11 (b) 12
(c) 10 (d) 8

29. The number of values of Q so that the number 'N' is divisible by 8, is
(a) 4 (b) 3
(c) 2 (d) 6

30. The number of ordered pairs (P, Q) so that the number 'N' is divisible by 44, is
(a) 2 (b) 3 (c) 4 (d) 5

Passage IV

(Q. Nos. 31 to 35)

Consider the nine digit number $n = 7\,3\,\alpha\,4\,9\,6\,1\,\beta\,0$.

31. If p is the number of all possible distinct values of $(\alpha - \beta)$, then p is equal to
(a) 17 (b) 18 (c) 19 (d) 20

32. If q is the number of all possible values of β for which the given number is divisible by 8, then q is equal to
(a) 2 (b) 3 (c) 4 (d) 5

33. The number of ordered pairs (α, β) for which the given number is divisible by 88, is
(a) 1 (b) 2 (c) 3 (d) 4

34. The number of possible values of $(\alpha + \beta)$ for which the given number is divisible by 6, is
(a) 3 (b) 4 (c) 6 (d) 7

35. The number of possible values of β for which $i^N = 1$ (where $i = \sqrt{-1}$), is
(a) 2 (b) 3 (c) 4 (d) 5

Passage V

(Q. Nos. 36 to 38)

The set of integers can be classified into k classes, according to the remainder obtained when they are divided by k (where k is a fixed natural number). The classification enables is solving even some more difficult problems of number theory e.g.

(i) *even, odd classification is based on whether remainder is* 0 *or* 1 *when divided by* 2.

(ii) *when divided by* 3, *the remainder may be* 0, 1, 2. *Thus, there are three classes.*

36. The remainder obtained, when the square of an integer is divided by 3, is
(a) 0, 1 (b) 1, 2 (c) 0, 2 (d) 0, 1, 2

37. $n^2 + n + 1$ is never divisible by
(a) 2 (b) 3
(c) 111 (d) None of these

38. If n is odd, $n^5 - n$ is not divisible by
(a) 16 (b) 15 (c) 240 (d) 720

Essential Mathematical Tools Exercise 4 : Single Integer Answer Type Questions

39. The number of solutions of the equation $|x-1|-|2x-5| \geq 4$

40. The number of integral solution of the equation $|x^2-7| \leq 9$ are

41. The number of solutions of the system of equation $x+2y=6$ and $|x-3|=y$ is/are

Solutions

1. For $a < 0, |x - a| = \begin{cases} (x-a), & x \geq a \\ (a-x), & x \leq a \end{cases}$.

***Case* I** $x \geq a$

$$x^2 - 2a(x-a) - 3a^2 = 0$$

$\Rightarrow$ $x^2 - 2ax - a^2 = 0$

$\Rightarrow$ $x^2 - 2ax + a^2 = 2a^2$

$\Rightarrow$ $(x-a)^2 = 2a^2 \Rightarrow x = \pm\sqrt{2}a + a$

$\Rightarrow$ $x = a(1+\sqrt{2}), a(1-\sqrt{2})$

Since, $x \geq a$ and $a < 0$

$\therefore$ Neglecting $\{a(1+\sqrt{2})\} \Rightarrow x = a(1-\sqrt{2})$

***Case* II** $x \leq a$

$\Rightarrow$ $x^2 + 2a(x-a) - 3a^2 = 0 \Rightarrow x^2 + 2ax = 5a^2$

$\Rightarrow$ $(x+a)^2 = 6a^2 \Rightarrow x = -a \pm \sqrt{6}a$

$\therefore$ $x = a(\sqrt{6}-1), -a(\sqrt{6}+1)$

Since, $x \leq a$ and $a < 0$

$\therefore$ Neglecting $\{-a(\sqrt{6}+1)\} \Rightarrow x = a(\sqrt{6}-1)$

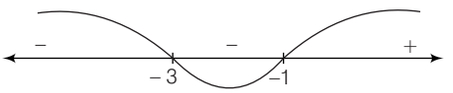
Hence, $x \in \{a(1-\sqrt{2}), a(\sqrt{6}-1)\}$.

2. $|x^2 + 4x + 3| + 2x + 5 = 0$

Take two cases, i.e. $|x^2 + 4x + 3| = \pm(x^2 + 4x + 3)$

***Case* I** $x^2 + 4x + 3 \geq 0$

$$(x+3)(x+1) \geq 0$$



$\Rightarrow$ $x \notin (-3, -1)$

or $x \in (-\infty, -3] \cup [-1, \infty)$

$\Rightarrow$ $x^2 + 4x + 3 + 2x + 5 = 0$

$\Rightarrow$ $x^2 + 6x + 8 = 0$

$\Rightarrow$ $(x+4)(x+2) = 0$

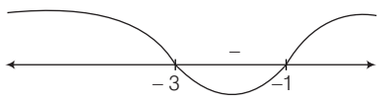
$\Rightarrow$ $x = -2, -4$.

But $x \notin (-3, -1)$

$\therefore$ Neglecting $x = -2$

$\Rightarrow$ $x = -4$ ...(i)

***Case* II** $x^2 + 4x + 3 \leq 0$



$$(x+3)(x+1) \leq 0$$

$\Rightarrow$ $x \in [-3, -1]$

$\Rightarrow$ $x^2 + 4x + 3 - 2x - 5 = 0$

$\Rightarrow$ $x^2 + 2x - 2 = 0$

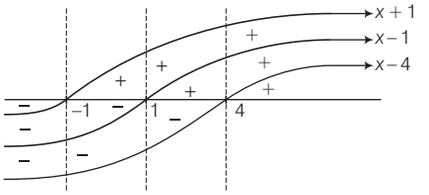
$\Rightarrow$ $x = -1 \pm \sqrt{3}$, as $x \in [-3, -1]$

$\therefore$ Neglecting $x = -1 + \sqrt{3} \Rightarrow x = -1 - \sqrt{3}$ ...(ii)

$\therefore$ $x \in \{-4, -1 - \sqrt{3}\}$.

3. $|x^2 - 3x - 4| + |x^2 - 1| = 9$

$\Rightarrow$ $|x+1|\{|x-4| + |x-1|\} = 9$



***Case* I** $x \geq 4$

$$(x+1)\{x - 4 + x - 1\} = 9$$

$\Rightarrow$ $(x+1)(2x-5) = 9$

$\Rightarrow$ $2x^2 - 3x - 14 = 0$

$\Rightarrow$ $x = \frac{7}{2}, -2$

[neglecting both as $x \geq 4$]

***Case* II** $1 < x < 4$

$\Rightarrow$ $(x+1)\{4 - x + x - 1\} = 9$

$\Rightarrow$ $(x+1) \cdot 3 = 9$

$\Rightarrow$ $x = 2 \in (1, 4)$ ...(i)

***Case* III** $-1 < x < 1$

$$(x+1)\{4 - x + 1 - x\} = 9$$

$\Rightarrow$ $(x+1)(5-2x) = 9$

$\Rightarrow$ $2x^2 - 3x + 4 = 0$, having imaginary roots.

$\therefore$ No solution.

***Case* IV** $x \leq -1$

$$-(x+1)\{4 - x + 1 - x\} = 9$$

$$(x+1)(2x-5) = 9 \Rightarrow x = -2, \frac{7}{2}\cdot$$

As $x \leq -1$,

$\therefore$ $x = -2$, neglecting $x = \frac{7}{2}$. ...(ii)

Thus, from Eqs. (i) and (ii), we get $x \in \{-2, 2\}$.

4. $2^{|x+1|} - 2^x = |2^x - 1| + 1$

***Case* I** $x \geq 0$

$$2^{x+1} - 2^x = 2^x - 1 + 1 \Rightarrow 2^x \cdot 2 = 2 \cdot 2^x$$

i.e. true for all $x \geq 0$ ...(i)

***Case* II** $-1 \leq x \leq 0$

$$2^{+x+1} - 2^x = 1 - 2^x + 1$$

$\Rightarrow$ $2^{x+1} = 2$

$\Rightarrow$ $x = 0$ ...(ii)

***Case* III** $x \leq -1$

$\Rightarrow$ $2^{-x-1} - 2^x = 1 - 2^x + 1$

$\Rightarrow$ $2^{-x-1} = 2$

$\Rightarrow$ $x = -2$ ...(iii)

Thus, from Eqs. (i), (ii) and (iii), we get $x \in \{-2\} \cup [0, \infty)$.

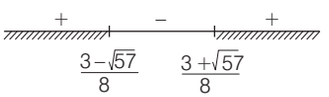
5. If $5a^2-3a-2, a^2+a-2, 2a^2+a-1$ are lengths of sides of triangle, then sum of any two sides must be greater than third side.

***Case* I** $(5a^2-3a-2)+(a^2+a-2)>2a^2+a-1$

$\Rightarrow \quad 6a^2-2a-4>2a^2+a-1$

$\Rightarrow \quad 4a^2-3a-3>0$

$\Rightarrow \left\{a-\left(\frac{3+\sqrt{57}}{8}\right)\right\}\left\{a-\left(\frac{3-\sqrt{57}}{8}\right)\right\}>0$



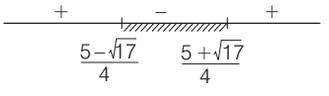
$\Rightarrow \quad a\in\left(-\infty, \frac{3-\sqrt{57}}{8}\right)\cup\left(\frac{3+\sqrt{57}}{8}, \infty\right)$ ...(i)

***Case* II** $(a^2+a-2)+(2a^2+a-1)>5a^2-3a-2$

$\Rightarrow \quad 3a^2+2a-3>5a^2-3a-2$

$\Rightarrow \quad 2a^2-5a+1<0$

$\Rightarrow \left\{a-\left(\frac{5+\sqrt{17}}{4}\right)\right\}\left\{a-\left(\frac{5-\sqrt{17}}{4}\right)\right\}<0$



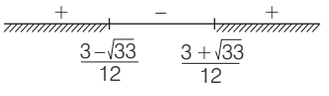
$\Rightarrow \quad a\in\left(\frac{5-\sqrt{17}}{4}, \frac{5+\sqrt{17}}{4}\right)$ ...(ii)

***Case* III** $(5a^2-3a-2)+(2a^2+a-1)>(a^2+a-2)$

$\Rightarrow \quad 7a^2-2a-3>a^2+a-2$

$\Rightarrow \quad 6a^2-3a-1>0$

$\Rightarrow \quad \left\{a-\left(\frac{3+\sqrt{33}}{12}\right)\right\}\left\{a-\left(\frac{3-\sqrt{33}}{12}\right)\right\}>0$



$\Rightarrow \quad a\in\left(-\infty, \frac{3-\sqrt{33}}{12}\right)\cup\left(\frac{3+\sqrt{33}}{12}, \infty\right)$ ...(iii)

From Eqs. (i), (ii) and (iii), we get

$$a\in\left(\frac{3+\sqrt{57}}{8}, \frac{5+\sqrt{17}}{4}\right)$$

6. $(x+3)^5-(x-1)^5\geq 244$

Let $y=\frac{(x+3)+(x-1)}{2}\Rightarrow y=x+1$

$\therefore \quad (y+2)^5-(y-2)^5\geq 244$

$\Rightarrow \quad 2\{{}^5C_1\cdot y^4\cdot 2+{}^5C_3\cdot y^2\cdot 2^3+{}^5C_5\cdot 2^5\}\geq 244$

$\Rightarrow \quad 2\{10y^4+80y^2+32\}\geq 244$

$\Rightarrow \quad 4\{5y^4+40y^2+16\}\geq 244$

$\Rightarrow \quad 5y^4+40y^2+16\geq 61$

$\Rightarrow \quad y^4+8y^2-9\geq 0$

$\Rightarrow \quad (y^2+9)(y^2-1)\geq 0$

$\Rightarrow \quad y^2\geq 1$

i.e. $\quad y\leq -1$ or $y\geq 1$

$\Rightarrow \quad x+1\leq -1$ or $x+1\geq 1$

$\Rightarrow \quad x\in(-\infty,-2]\cup[0,\infty)$

7. $||x-2|-1|\geq 3$

$\Rightarrow \quad |x-2|-1\leq -3$ or $|x-2|-1\geq 3$

$\Rightarrow \quad |x-2|\leq -2$ or $|x-2|\geq 4$

$\Rightarrow$ No solution or $x-2\leq -4$ or $x-2\geq 4$

$\Rightarrow \quad x\leq -2$ or $x\geq 6$

$\Rightarrow \quad x\in(-\infty,-2]\cup[6,\infty)$

8. $1\leq\frac{3x^2-7x+8}{x^2+1}\leq 2$

$\Rightarrow \quad 2x^2-7x+7\geq 0$ and $x^2-7x+6\leq 0$

$\Rightarrow \quad x\in R$ and $x\in[1,6]$

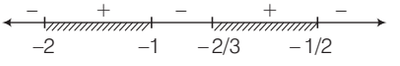
$\therefore \quad x\in[1,6]$

9. $f(x)>g(x)\Rightarrow \frac{2x}{2x^2+5x+2}>\frac{1}{x+1}$

$\Rightarrow \quad \frac{2x}{(2x+1)(x+2)}-\frac{1}{(x+1)}>0$

$\Rightarrow \quad \frac{2x^2+2x-(2x^2+5x+2)}{(2x+1)(x+2)(x+1)}>0$

$\Rightarrow \quad \frac{-(3x+2)}{(2x+1)(x+2)(x+1)}>0$



$\Rightarrow \quad x\in(-2,-1)\cup(-2/3,-1/2)$

10. $||x||^2+x=||x||+x^2$.

***Case* I** When $0\leq x<2$

$\Rightarrow \quad (x+1)^2+x=(x+1)+x^2$

$\Rightarrow \quad x^2+2x+1+x=x^2+x+1$

$\Rightarrow \quad 2x=0$

$\Rightarrow \quad x=0$ ...(i)

***Case* II** When $x\geq 2$

$\Rightarrow \quad (x-4)^2+x=|x-4|+x^2$

Now, if $2\leq x\leq 4$

$\Rightarrow \quad (x^2-8x+16)+x=4-x+x^2$

$\Rightarrow \quad 6x=12$

$\Rightarrow \quad x=2$ ...(ii)

Again, if $x\geq 4$

$\Rightarrow \quad (x-4)^2+x=x-4+x^2$

$\Rightarrow \quad x^2-8x+16+x=x^2+x-4$

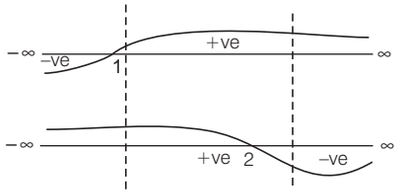
$\Rightarrow \quad 8x=20$

$\Rightarrow \quad x=\frac{5}{2}$,

but $x\geq 4$.

$\therefore$ Only two solutions $x=0$ and 2.

11. The points $x = 1$ and $x = 2$ divide the number axis into three intervals as follows :



We solve the inequality on each intervals.

If $x < 1$, then $x - 1 < 0$ and $2 - x > 0$.

$\therefore \quad |x-1| + |2-x| > 3 - x$

$\Rightarrow \quad 1 - x + 2 - x > 3 + x$

$\Rightarrow \quad 3 - 2x > 3 + x$

$\Rightarrow \quad x < 0 \quad ...(i)$

If $1 \le x \le 2$, then $x - 1 \ge 0$ and $2 - x \ge 0$, we have

$x - 1 + 2 - x > 3 + x$

$\Rightarrow \quad 1 > 3 + x \Rightarrow x < -2$

The system of inequalities obtained has no solution, for $1 \le x \le 2$. If $x > 2$, then $x - 1 > 0$ and $2 - x < 0$, we have

$x - 1 + x - 2 > 3 + x$

$\Rightarrow \quad 2x - 3 > 3 + x \Rightarrow x > 6$

Combining the solutions obtained on all parts of the domain of admissible values of the given inequality, we get the solution set $(-\infty, 0) \in (6, \infty)$.

12. Here, $\sqrt{x^2 + 12(23 - x)} + \sqrt{(23 - x)^2 + 12x} = 33 \ (\because y = 23 - x)$

$\Rightarrow \quad \sqrt{x^2 - 12x + 276} + \sqrt{x^2 - 34x + 529} = 33$

Let $\quad a = \sqrt{x^2 - 12x + 276}$

and $\quad b = \sqrt{x^2 - 34x + 529} \quad ...(i)$

$\Rightarrow \quad a + b = 33$ and $a^2 - b^2 = 11(2x - 23)$

$a - b = \dfrac{2x - 23}{3}$

$\therefore \quad a = \dfrac{x + 38}{3} \quad ...(ii)$

$\Rightarrow \quad x^2 - 12x + 276 = \left(\dfrac{x+38}{3}\right)^2$ [using Eqs. (i) and (ii)]

$\Rightarrow \quad 8x^2 - 184x + 1040 = 0 \Rightarrow x = 13, 10$

$\Rightarrow \quad y = 10, 13$

$\therefore$ (13, 10) and (10, 13) are the required solutions.

13. Here, $u + v = p + q \quad ...(i)$

Where $u = \sqrt{2x - 1}$, $v = \sqrt{3x - 2}$, $p = \sqrt{4x - 3}$,

$q = \sqrt{5x - 4}$

$\therefore \quad u^2 - v^2 = 1 - x$

$p^2 - q^2 = 1 - x \Rightarrow u^2 - v^2 = p^2 - q^2$

$\Rightarrow \quad u - v = p - q \quad ...(ii)$ {using Eq. (i), $u + v = p + q$}

$\therefore$ From Eqs. (i) and (ii), we get

$2u = 2p \Rightarrow 2x - 1 = 4x - 3$

or $\quad x = 1$, which clearly satisfies

$\sqrt{2x - 1} + \sqrt{3x - 2} = \sqrt{4x - 3} + \sqrt{5x - 4}$

$\therefore \quad x = 1$ is the required solution.

14. Here, $x^2 + y^2 + (4 - x - y)^2 = 6 \quad (\because z = 4 - x - y)$

$x^2 + (y - 4)x + (y^2 + 5 - 4y) = 0$

Since, x is real.

$\Rightarrow \quad D \ge 0$

$\Rightarrow \quad (y - 4)^2 - 4(y^2 - 4y + 5) \ge 0$

$\Rightarrow \quad -3y^2 + 8y - 4 \ge 0$

$\Rightarrow \quad -(3y - 2)(y - 2) \ge 0$

$\Rightarrow \quad \dfrac{2}{3} \le y \le 2$

Similarly, we can show that x, y and $z \in \left[\dfrac{2}{3}, 2\right]$.

15. Here, $\dfrac{\alpha + 1}{\alpha - 1} + \dfrac{\beta + 1}{\beta - 1} = -\dfrac{1}{a}$ and $\dfrac{(\alpha + 1)(\beta + 1)}{(\alpha - 1)(\beta - 1)} = \dfrac{1}{a}$

Now, the quadratic $x^2 - \left(-\dfrac{1}{a}\right)x + \dfrac{1}{a} = 0$ has roots $\left(\dfrac{\alpha + 1}{\alpha - 1} \text{ and } \dfrac{\beta + 1}{\beta - 1}\right)$

$\Rightarrow \quad ax^2 + x + 1 = 0 \quad ...(i)$

Let $\quad x = \dfrac{2\alpha}{\alpha + 1} \Rightarrow \alpha = \dfrac{x}{2 - x} \Rightarrow \dfrac{\alpha + 1}{\alpha - 1} = \dfrac{1}{x - 1}$

Now, replacing x by $\dfrac{1}{x - 1}$ in Eq. (i), we get a quadratic whose roots are $\dfrac{2\alpha}{\alpha + 1}$ and $\dfrac{2\beta}{\beta + 1}$.

$\dfrac{a}{(x - 1)^2} + \dfrac{1}{(x - 1)} + 1 = 0$

$\Rightarrow \quad x^2 - x + a = 0 \quad ...(ii)$

Hence, Eqs. (i) and (ii) are the two quadratics whose roots are elements of set 'A' and set 'B', respectively.

$\therefore$ They must have a root in common as $A \cap B \ne \phi$

***Case* I** Both roots are common.

$\Rightarrow \quad \dfrac{a}{1} = \dfrac{1}{-1} = \dfrac{1}{a}$

$\Rightarrow \quad a = -1$ and $a^2 = 1 \Rightarrow a = -1$

***Case* II** For a common root,

$\dfrac{x^2}{a + 1} = \dfrac{x}{1 - a^2} = \dfrac{1}{-(a + 1)}$

$\Rightarrow \quad a = 1 \pm i$

$\therefore \quad a \in \{-1, 1 + i, 1 - i\}$

16. Here, $\left|\dfrac{x - 1}{3 + 2x - 8x^2}\right| + |1 - x| = \dfrac{(x - 1)^2}{|3 + 2x - 8x^2|} + 1$

Let $\quad a = \dfrac{x - 1}{3 + 2x - 8x^2}; \ b = (x - 1)$,

then $\quad |a| + |b| = |ab| + 1$

$\Rightarrow \quad |ab| - |a| - |b| + 1 = 0$

$\Rightarrow \quad (|a| - 1)(|b| - 1) = 0$

$\therefore \quad |a| = 1$ or $|b| = 1$

When $|a|=1$

$\Rightarrow \quad \left|\dfrac{x-1}{3+2x-8x^2}\right|=1$

$\dfrac{x-1}{3+2x-8x^2}=1 \quad \text{or} \quad \dfrac{x-1}{3+2x-8x^2}=-1$

$\Rightarrow \quad x-1=3+2x-8x^2$

or $\quad x-1=-3-2x+8x^2$

$\Rightarrow \quad 8x^2-x-4=0 \text{ or } 8x^2-3x-2=0$

$\Rightarrow \quad x=\dfrac{1\pm\sqrt{1+128}}{16} \text{ or } x=\dfrac{3\pm\sqrt{9+64}}{16}$

$\Rightarrow \quad x=\dfrac{1\pm\sqrt{129}}{16} \quad \text{or} \quad x=\dfrac{3\pm\sqrt{73}}{16} \qquad ...(i)$

Again, when $|b|=1, |x-1|=1$

$\Rightarrow \quad x-1=1 \text{ or } x-1=-1$

$\Rightarrow \quad x=0 \text{ or } x=2 \qquad ...(ii)$

From Eqs. (i) and (ii), solution set is

$$x\in\left\{0,2,\ \frac{1\pm\sqrt{129}}{16},\frac{3\pm\sqrt{73}}{16}\right\}$$

17. We have, $f(x)=(x^2-2|x|)(2|x|-2)-9\cdot\dfrac{(2|x|-2)}{x^2-2|x|}$

$$=(2|x|-2)\left\{x^2-2|x|-\frac{9}{x^2-2|x|}\right\}$$

$$=(2|x|-2)\left\{\frac{(x^2-2|x|)^2-9}{x^2-2|x|}\right\}$$

$$=\frac{(2|x|-2)(x^2-2|x|+3)(x^2-2|x|-3)}{x^2-2|x|}$$

$$=\frac{(2|x|-2)\{(|x|-1)^2+2\}\{(|x|+1)(|x|-3)\}}{x^2-2|x|}$$

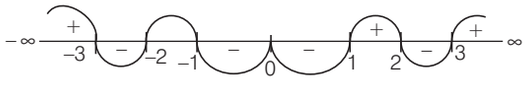
Taking, $\quad N^r=0 \Rightarrow |x|=1,3$

$\Rightarrow \quad x=\pm1,\pm3 \text{ and } D^r=0$

$\Rightarrow \quad |x|(|x|-2)=0$

$\Rightarrow \quad 0,\pm2$

We mark these roots on a number line :



From the wavy curve method, we have

(i) $f(x)>0 \Rightarrow x\in(-\infty,-3)\cup(-2,-1)\cup(1,2)\cup(3,\infty)$

(ii) $f(x)\geq0 \Rightarrow x\in(-\infty,-3]\cup(-2,-1]\cup[1,2)\cup[3,\infty)$

(iii) $f(x)<0 \Rightarrow x\in(-3,-2)\cup(-1,0)\cup(0,1)\cup(2,3)$

(iv) $f(x)\leq0 \Rightarrow x\in[-3,-2)\cup[-1,0)\cup(0,1]\cup(2,3]$

18. The domain of admissible values of this inequality consists of all the real numbers. The inequality is equivalent to the collection of two systems :

$$\begin{cases}\left|1-\dfrac{x}{1+x}\right| \geq \dfrac{1}{2}\\ x \geq 0\end{cases}, \quad \begin{cases}\left|1-\dfrac{-x}{1-x}\right| \geq \dfrac{1}{2}\\ x \leq 0\end{cases}$$

We solve the first system :

$$\begin{cases}\left|1-\dfrac{x}{1+x}\right| \geq \dfrac{1}{2}\\ x \geq 0\end{cases} \Leftrightarrow \begin{cases}\dfrac{1}{1+x} \geq \dfrac{1}{2}\\ x \geq 0\end{cases}$$

$$\Leftrightarrow \quad \begin{cases}\dfrac{2-1-x}{1+x} \geq 0\\ x \geq 0\end{cases} \Leftrightarrow \begin{cases}\dfrac{1-x}{1+x}\\ x\geq0\end{cases} \Leftrightarrow 0\leq x\leq1$$

Again, we solve the second system. Its first inequality is equivalent to the inequality $\left|\dfrac{1}{1-x}\right|\geq\dfrac{1}{2}$.

If $x<0$, then $1-x>0$ and consequently the second system is equivalent to the system

$$\begin{cases}\dfrac{1}{1-x} \geq \dfrac{1}{2}\\ x \leq 0\end{cases} \Leftrightarrow \begin{cases}\dfrac{2-1+x}{1-x} \geq 0\\ x \leq 0\end{cases}$$

$$\Leftrightarrow \quad \begin{cases}\dfrac{1+x}{1-x} \geq 0\\ x \leq 0\end{cases} \Leftrightarrow -1\leq x<0$$

Thus, the set of all solutions of the original inequality consists of the numbers belonging to the interval $[-1,1]$.

19. Given, $\cos x-y^2-\sqrt{y-x^2-1}\geq0 \qquad ...(i)$

Clearly, $\sqrt{y-x^2-1}$ is defined when $y-x^2-1\geq0$

or $y\geq x^2+1$. So, minimum value of y is 1.

From Eq. (i), we have $\cos x-y^2\geq\sqrt{y-x^2-1}$

where $\cos x-y^2\leq0$ [as when $\cos x$ is maximum $(=1)$ and y^2 is minimum $(=1)$. So, $\cos x-y^2$ is maximum.]

Also, $\quad \sqrt{y-x^2-1}\geq0$

Hence, $\quad \cos x-y^2=\sqrt{y-x^2-1}=0$

$\Rightarrow \quad y=1 \text{ and } \cos x=1,\ y=x^2+1$

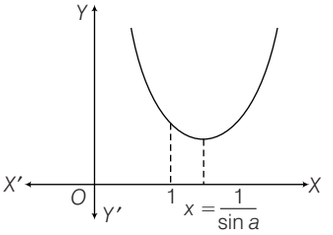
$\Rightarrow \quad x=0,\ y=1$

20. Given, $(\sin\alpha)x^2-2x+b\geq2$

Let $f(x)=(\sin\alpha)x^2-2x+b-2$

Abscissa of the vertex is given by $x=\dfrac{1}{\sin\alpha}>1$

The graph of $f(x)=(\sin\alpha)x^2-2x+b-2, \forall x\leq1$ is shown in the figure.



Therefore, minimum of $f(x)=(\sin\alpha)x^2-2x+b-2$ must be greater than zero but minimum is at $x=1$.

i.e. $\quad \sin\alpha-2+b-2\geq0,$

$\Rightarrow \quad b\geq4-\sin\alpha,\ \alpha\in(0,\pi)-\left\{\dfrac{\pi}{2}\right\}$

21. Given, $|ax^2 + bx + c| \le 1, \forall x \in [0,1]$ ...(i)

Putting successively $x = 0,\ 1$ and $\frac{1}{2}$ in Eq. (i), we get

$$-1 \le c \le 1 \quad \text{...(ii)}$$

$$-1 \le a + b + c \le 1 \quad \text{...(iii)}$$

$$-4 \le a + 2b + 4c \le 4 \quad \text{...(iv)}$$

From Eqs. (ii), (iii) and (iv), we get

$$|b| \le 8 \text{ and } |a| \le 8$$

$$\Rightarrow \quad |a| + |b| + |c| \le 17$$

Sol. (Q. Nos. 22-24)

$$|f(1) - f(0)| \le 2 \qquad (\because \text{if } |u| \le 1, |v| \le 1, \text{ then } |u - v| \le 2)$$

$$\Rightarrow \quad |a + b| \le 2 \qquad \{\because f(1) = a + b + c \text{ and } f(0) = c\}$$

$$\Rightarrow \quad (a + b)^2 \le 4$$

Also, $|f(-1) - f(0)| \le 2$

$$\Rightarrow \quad |a - b| \le 2 \qquad [\because f(-1) = a - b + c \text{ and } f(0) = c]$$

$$\Rightarrow \quad (a - b)^2 \le 4$$

Now, $4a^2 + 3b^2 = 2(a + b)^2 + 2(a - b)^2 - b^2$

$$\le 2 \times 4 + 2 \times 4 - b^2 \le 16 - b^2 \le 16$$

$\Rightarrow$ Maximum value of $4a^2 + 3b^2 = 16$, when $b = 0$

$$\Rightarrow \quad |a + b| + |a - b| = 4 \Rightarrow |a| = 2$$

Also, $|f(1) - f(0)| = |a + c - c| = |a| = 2$

$$\Rightarrow \quad |a + c| = |c| = 1$$

$\therefore$ The possible values of (a, b, c) are $(2, 0, -1)$ or $(-2, 0, 1)$

Also, $\frac{8}{3}a^2 + 2b^2 = \frac{2}{3}(4a^2 + 3b^2) \le \frac{2}{3}(16)$

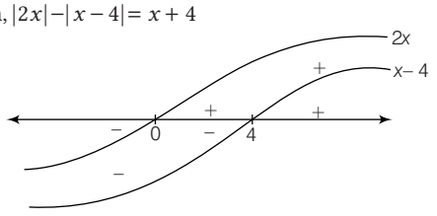
22. $|a + c| = 1$, when $\frac{8a^2}{3} + 2b^2$ is maximum.

23. $|a + b| = 2$, when $\frac{8a^2}{3} + 2b^2$ is maximum.

24. The maximum value of $\frac{8a^2}{3} + 2b^2$ is $\frac{32}{3}$.

Sol. (Q. Nos. 25-27)

25. Given, $|2x| - |x - 4| = x + 4$



***Case* I** When, $-\infty < x \le 0$

$$-2x - 4 + x = x + 4$$

$$\Rightarrow \quad -2x = 8 \Rightarrow x = -4$$

***Case* II** When, $0 < x < 4$

$$2x - (4 - x) = x + 4$$

$$\Rightarrow \quad 2x = 8 \Rightarrow x = 4$$

***Case* III** When, $4 \le x < \infty$

$$2x - x + 4 = x + 4$$

$$\Rightarrow \quad x + 4 = x + 4 \Rightarrow x \in R$$

Solution of the given equation is $\{-4\} \cup [4, \infty)$.

$\therefore$ Least integer $= -4$.

26. Prime numbers less than 20 satisfying the equation are 5, 7, 11, 13, 17, 19 i.e. 6 prime number.

27. $P = 33,\ P^{2007} = (33)^{2007}$ = number has 7 at its units place.

Sol. (Q. Nos. 28-30)

28. Sum of digits $= P + Q + 15$

N is divisible by 9, if $P + Q + 15 = 18, 27$

$$\Rightarrow \quad P + Q = 3 \quad \text{...(i)}$$

or $\quad P + Q = 12 \quad \text{...(ii)}$

$$P = 0, 1, 2, 3, 4, 5, 6, 7, 8, 9$$

From Eq. (i), we get $\left.\begin{matrix} P = 0, Q = 3 \\ P = 1, Q = 2 \\ P = 2, Q = 1 \\ P = 3, Q = 0 \end{matrix}\right\}$ Number of ordered pairs is 4.

From Eq. (ii), we get

$$\left.\begin{matrix} P = 3, Q = 9 \\ P = 4, Q = 8 \\ \ldots\ \ \ldots \\ P = 8, Q = 4 \\ P = 9, Q = 3 \end{matrix}\right\} \text{ Number of ordered pairs is 7.}$$

Total number of ordered pairs is 11.

29. N is divisible by 8, if $Q = 0, 4, 8$

Number of values of Q is 3.

30. $S_O = P + 9$

$S_E = Q + 6$

$$S_O - S_E = P - Q + 3$$

N is divisible is 11, if

$$P - Q + 3 = 0, 11$$

$$P - Q = -3 \quad \text{...(i)}$$

or $\quad P - Q = 8 \quad \text{...(ii)}$

N is divisible by 4, if

$$Q = 0, 2, 4, 6, 8$$

From Eq. (i), $\quad Q = 0, \quad P = -3$ (not possible)

$$Q = 2, \quad P = -1 \quad \text{(not possible)}$$

$$Q = 4, \quad P = 1$$

$$Q = 6, \quad P = 1$$

$$Q = 8, \quad P = 5$$

$\therefore$ Number of ordered pairs is 3.

From Eq. (ii), $\quad Q = 0 \quad P = 8$

$$Q = 2 \quad P = 10 \quad \text{(not possible)}$$

Similarly, $\quad Q \ne 4, 6, 8$

$\therefore$ Number of ordered pairs is 1.

$\therefore$ Total number of ordered pairs, so that the number N is divisible by 44 is 4.

Sol. (Q. Nos. 31-35)

31. If $\alpha = 0$, then the possible values of $\alpha - \beta$ are

$$\{0, -1, -2, -3, \ldots, -9\}$$

If $\alpha = 1$, then the possible values of $\alpha - \beta$ are

$$\{1, 0, -1, -2, -3, \ldots, -8\}$$

If $\alpha = 2$, then the possible values of $\alpha - \beta$ are

$$\{2, 1, 0, -1, -2, -3, \ldots, -7\} \text{ and so on}$$

If $\alpha = 9$, then the possible values of $\alpha - \beta$ are

$\{9, 8, 7, 6, 5, 4, 3, 2, 1, 0\}$

Thus, in all the values of $\alpha - \beta$ are

$\{-9, -8, -7, -6, -5, -4, -3, -2, -1, 0, 1, 2, 3, \ldots, 9\}$

$\therefore$ Total number of values of $\alpha - \beta$ is 19.

$\therefore \quad p = 19$

32. Number N is divisible by 8, if $100 + 10\beta$ is divisible by 8.

$\therefore$ Possible values of β are 2, 6.

$\therefore \quad q = 2$

33. $N = 7\ 3\ \alpha\ 4\ 9\ 6\ 1\ \beta\ 0$

N is divisible by 88, if N is divisible by 8 as well as 11.

N is divisible by 8, then $\beta = 2, 6$

For divisibility by 11,

$S_O = 17 + \alpha,\ S_E = 13 + \beta$

$S_O - S_E = (17 + \alpha) - (13 + \beta) = \alpha - \beta + 4$

$\alpha - \beta + 4$ be the integer lying between -5 and 13.

But, $\alpha - \beta + 4$ is divisible by 11, so $\alpha - \beta + 4 = 0,\ 11$

***Case* I** $\alpha - \beta + 4 = 0$

when $\beta = 2, \alpha = -2$ (rejected)

when $\beta = 6, \alpha = 2$

***Case* II** $\alpha - \beta + 4 = 11$ when $\alpha = 9, \beta = 2$

when $\beta = 6, \alpha = 13$ (rejected)

$\therefore \quad (\alpha, \beta) = (9, 2)\ (2, 6)$

$\therefore$ Number of ordered pairs are 2.

34. N is divisible by 6, if it is divisible is 2 and 3.

$N = 7\ 3\ \alpha\ 4\ 9\ 6\ 1\ \beta\ 0$ is divisible by 2 for all values of α and β.

$30 \le (30 + \alpha + \beta) \in I \le 48$

But $30 + \alpha + \beta$ is divisible by 3, if

$30 + \alpha + \beta = 30, 33, 36, 39, 42, 45, 48$

$\alpha + \beta = 0, 3, 6, 9, 12, 15, 18$

Number of possible values of $(\alpha + \beta)$ is equal to 7.

35. $i^N = 1 \Rightarrow N$ must be divisible by 4.

$\Rightarrow \beta = 0, 2, 4, 6, 8$

Number of possible values of β is 5.

Sol. (Q. Nos. 36-38)

36. Let $n = 3k + 4,\ r = 0, 1, 2$

$n^2 = 9k^2 + 6kr + r^2 = 3m + r^2$

$r^2 = 0, 1, 4$

$\therefore$ Remainder = 0 or 1.

37. (a) $n^2 + n + 1$ is an odd number.

(b) when $n = 1$, $n^2 + n + 1$ is divisible by 3.

(c) $111 = 10^2 + 10 + 1 \quad \therefore$ when $n = 10$

$n^2 + n + 1$ is divisible by 111.

38. n = odd

Let $n = 2k + 1$

$n^5 - n = n(n^4 - 1) = n(n-1)(n+1)(n^2 + 1)$

$= (2k + 1)(2k)(2k + 2)(4k^2 + 4k + 2)$

$= 8(k)(k + 1)(2k + 1)(2k^2 + 2k + 1)$

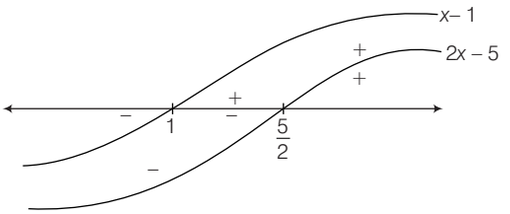
which is divisible by 15, 16 and 240 but not divisible by 720

When $n = 5 \Rightarrow n(n^4 - 1)$

$= 5(5^4 - 1) = 5(625 - 1) = 5 \times 624 = 3120,$

which is not divisible by 720.

39. Given, $|x-1| - |2x-5| \ge 4$



***Case* I** When, $x < 1$

$1 - x - (5 - 2x) \ge 4 \Rightarrow x - 4 \ge 4 \Rightarrow x \ge 8$

but $x < 1$

$\Rightarrow$ No solution

***Case* II** $1 \le x \le 5/2$

$x - 1 + 2x - 5 \ge 4$

$\Rightarrow \quad 3x - 6 \ge 4 \Rightarrow 3x \ge 10$

$\Rightarrow \quad x \ge \frac{10}{3}$ but $1 \le x \le 5/2$

$\Rightarrow$ No such x exist.

***Case* III** $x \ge 5/2$

$\Rightarrow \quad x - 1 - (2x - 5) \ge 4 \Rightarrow x - 1 - 2x + 5 \ge 4$

$\Rightarrow \quad -x + 4 \ge 4 \Rightarrow x \le 0$

$\Rightarrow$ No such x exist.

$\therefore$ Number of solution is 0.

40. Given, $|x^2 - 7| \le 9$

$\Rightarrow \quad -9 \le x^2 - 7 \le 9 \Rightarrow -2 \le x^2 \le 16$

$\Rightarrow \quad 0 \le x^2 \le 16 \Rightarrow 0 \le |x| \le 4$

$\Rightarrow \quad x \in [-4, 4]$

Hence, number of integral solution 9.

41. System of equations are $x + 2y = 6$ and $|x - 3| = y$

***Case* I** When $x \ge 3$, $x + 2y = 6$ and $x - 3 = y$

Solving these equations, we get $x = 4, y = 1$

***Case* II** When $x < 3$, $x + 2y = 6$ and $3 - x = y$

Solving these equations, we get $x = 0, y = 3$

Hence, two solutions are (0,3) and (4,1).

Session 1

Geometrical Meaning of the Derivative, Derivative of *f*(*x*) from the First Principle or *ab*-Initio Method, Rules of Differentiation

Derivative is the instantaneous rate of change of a function with respect to dependent variable. Also, the derivative is the slope of tangent to a curve at a point.

Geometrical Meaning of the Derivative

Let us consider a function $y = f(x)$ in a rectangular coordinate system. We also consider a point $P(x, y)$ on the curve. If a point corresponding to an increased value of the argument $x + \Delta x$ is considered, its ordinate value is given by $y + \Delta y = f(x + \Delta x)$.

In figure, the point $(x + \Delta x, y + \Delta y)$ is represented by A.

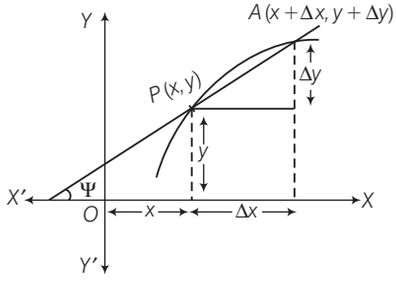

Figure 2.1

Here, PA is the secant to the curve.

Now, as $\Delta x \to 0$, $\Delta y \to 0 \Rightarrow PA \to 0$

(i.e. the distance PA tends to zero or to a single point P)

$\Rightarrow \lim\limits_{\Delta x \to 0}$ (slope of chord PA) $\to$ (slope of tangent at P).

or $$\tan\psi = \lim_{\Delta x \to 0} \tan\theta$$

$$\Rightarrow \lim_{\Delta x \to 0} \frac{\Delta y}{\Delta x} = \frac{dy}{dx} \quad \text{or} \quad f'(x)$$

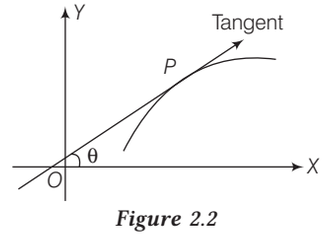

Figure 2.2

which means that **the value of the derivative $f'(x)$ for a given value of x is equal to the tangent of the angle formed by the tangent line to the graph of the function $y = f(x)$ at the point $P(x, y)$ with the positive X-axis.**

Relation between *dy*/*dx* and *dx*/*dy*

Let x and y be two variables connected by a relation of the form $f(x, y) = 0$.

Let Δx be a small change in x and Δy be a small change in y, then

$$\frac{dy}{dx} = \lim_{\Delta x \to 0} \frac{\Delta y}{\Delta x} \quad \text{and} \quad \frac{dx}{dy} = \lim_{\Delta y \to 0} \frac{\Delta x}{\Delta y}$$

Now, $$\frac{\Delta y}{\Delta x} \cdot \frac{\Delta x}{\Delta y} = 1$$

$$\Rightarrow \lim_{\Delta x \to 0} \left(\frac{\Delta y}{\Delta x} \cdot \frac{\Delta x}{\Delta y} \right) = 1$$

$$\Rightarrow \lim_{\Delta x \to 0} \frac{\Delta y}{\Delta x} \cdot \lim_{\Delta y \to 0} \frac{\Delta x}{\Delta y} = 1 \qquad [\because \Delta x \to 0 \Leftrightarrow \Delta y \to 0]$$

$$\Rightarrow \frac{dy}{dx} \cdot \frac{dx}{dy} = 1$$

So, $$\frac{dy}{dx} = \frac{1}{dx/dy}$$

Derivatives of *f*(*x*) from the First Principle

or ab-Initio Method or Delta Method or By Definition

If $f(x)$ is differentiable function, then

$$\lim_{\Delta x \to 0} \frac{\Delta y}{\Delta x} = \lim_{\Delta x \to 0} \frac{f(x + \Delta x) - f(x)}{\Delta x} = f'(x) = \frac{dy}{dx}$$

Simply, $$f'(x) = \lim_{h \to 0} \frac{f(x + h) - f(x)}{h}$$

Example 1 Differentiate the following functions w.r.t. x using first principle.

(i) $f(x)=\tan x$ (ii) $f(x)=e^{2x}$

(iii) e^{x^2} (iv) $\sqrt{\sin x}$

Sol. (i) Let $f(x)=\tan x$

Then, $f(x+h)=\tan(x+h)$

$$\therefore \quad \frac{d}{dx}(\tan x)=\lim_{h\to 0}\frac{f(x+h)-f(x)}{h}$$

$$=\lim_{h\to 0}\frac{\tan(x+h)-\tan(x)}{h}$$

$$=\lim_{h\to 0}\frac{\tan(x+h-x)\cdot[1+\tan x\cdot\tan(x+h)]}{h}$$

$[\because \tan A-\tan B=\tan(A-B)\cdot(1+\tan A\tan B)]$

$$=\lim_{h\to 0}\frac{\tan h}{h}\cdot(1+\tan^2 x) \quad \left[\because \lim_{h\to 0}\frac{\tan h}{h}=1\right]$$

$$=\sec^2 x$$

$$\therefore \quad \frac{d}{dx}(\tan x)=\sec^2 x$$

(ii) Let $f(x)=e^{2x} \Rightarrow f(x+h)=e^{2(x+h)}$

$$\therefore \quad \frac{d}{dx}(f(x))=\lim_{h\to 0}\frac{f(x+h)-f(x)}{h}$$

$$\Rightarrow \frac{d}{dx}(e^{2x})=\lim_{h\to 0}\frac{e^{2(x+h)}-e^{2x}}{h}=\lim_{h\to 0}e^{2x}\cdot\frac{(e^{2h}-1)}{h}$$

$$=e^{2x}\cdot\left(\lim_{h\to 0}\frac{e^{2h}-1}{2h}\right)\times 2=2e^{2x} \quad \left[\because \lim_{x\to 0}\frac{e^x-1}{x}=1\right]$$

$$\therefore \quad \frac{d}{dx}(e^{2x})=2e^{2x}$$

(iii) Let $f(x)=e^{x^2} \Rightarrow f(x+h)=e^{(x+h)^2}$

$$\therefore \quad \frac{d}{dx}f(x)=\lim_{h\to 0}\frac{f(x+h)-f(x)}{h}=\lim_{h\to 0}\frac{e^{(x+h)^2}-e^{x^2}}{h}$$

$$=\lim_{h\to 0}\frac{e^{x^2+h^2+2hx}-e^{x^2}}{h}$$

$$=\lim_{h\to 0}\frac{e^{x^2}\cdot e^{h^2+2hx}-e^{x^2}}{h}=\lim_{h\to 0}e^{x^2}\left(\frac{e^{h^2+2hx}-1}{h}\right)$$

$$=e^{x^2}\lim_{h\to 0}\left(\frac{e^{h^2+2hx}-1}{h^2+2hx}\right)\times\left(\frac{h^2+2hx}{h}\right)$$

$$=e^{x^2}\lim_{t\to 0}\left(\frac{e^t-1}{t}\right)\lim_{h\to 0}(h+2x), \text{ where } t=h^2+2hx$$

$$=e^{x^2}\times 1\times\lim_{h\to 0}(h+2x) \quad \left[\because \lim_{x\to 0}\frac{e^x-1}{x}=1\right]$$

$$=e^{x^2}\times 2x=2xe^{x^2}$$

(iv) Let $f(x)=\sqrt{\sin x}$

$\Rightarrow f(x+h)=\sqrt{\sin(x+h)}$

$$\therefore \quad \frac{d}{dx}f(x)=\lim_{h\to 0}\frac{f(x+h)-f(x)}{h}=\lim_{h\to 0}\frac{\sqrt{\sin(x+h)}-\sqrt{\sin x}}{h}$$

$$=\lim_{h\to 0}\frac{\sin(x+h)-\sin x}{h\,(\sqrt{\sin(x+h)})+\sqrt{\sin x}}$$

[rationalising the numerator]

$$=\lim_{h\to 0}\frac{2\sin\left(\frac{h}{2}\right)\cos\left(\frac{2x+h}{2}\right)}{h\,(\sqrt{\sin(x+h}+\sqrt{\sin x})}$$

$$\left[\because \sin C-\sin D=2\cos\left(\frac{C+D}{2}\right)\sin\left(\frac{C-D}{2}\right)\right]$$

$$=\lim_{h/2\to 0}\frac{\sin h/2}{h/2}\lim_{h\to 0}\frac{\cos(x+h/2)}{\sqrt{\sin(x+h)}+\sqrt{\sin x}}$$

[as $h\to 0\Rightarrow h/2\to 0$]

$$=1\cdot\frac{\cos x}{2\sqrt{\sin x}}=\frac{\cos x}{2\sqrt{\sin x}}$$

Differential Coefficients of Standard Functions

(i) $\frac{d}{dx}(\text{constant})=0$ (ii) $\frac{d}{dx}(x^n)=nx^{n-1}$

(iii) $\frac{d}{dx}(|x|)=\frac{x}{|x|}$ (iv) $\frac{d}{dx}(e^x)=e^x$

(v) $\frac{d}{dx}(a^x)=a^x\log a$ (vi) $\frac{d}{dx}(\log_e|x|)=\frac{1}{x}$

(vii) $\frac{d}{dx}(\log_a|x|)=\frac{1}{x\log_e a}$ (viii) $\frac{d}{dx}(\sin x)=\cos x$

(ix) $\frac{d}{dx}(\cos x)=-\sin x$ (x) $\frac{d}{dx}(\tan x)=\sec^2 x$

(xi) $\frac{d}{dx}(\cot x)=-\text{cosec}^2 x$ (xii) $\frac{d}{dx}(\sec x)=\sec x\tan x$

(xiii) $\frac{d}{dx}(\text{cosec } x)=-\text{cosec } x\cot x$

(xiv) $\frac{d}{dx}(\sin^{-1}x)=\frac{1}{\sqrt{1-x^2}}$, $-1<x<1$ or $|x|<1$

(xv) $\frac{d}{dx}(\cos^{-1}x)=\frac{-1}{\sqrt{1-x^2}}$, $-1<x<1$ or $|x|<1$

(xvi) $\frac{d}{dx}(\tan^{-1}x)=\frac{1}{1+x^2}$, $-\infty<x<\infty$ or $x\in R$

(xvii) $\frac{d}{dx}(\sec^{-1}x)=\frac{1}{|x|\sqrt{x^2-1}}$, $|x|>1$ or $x\in R-[-1,1]$

(xviii) $\frac{d}{dx}(\cot^{-1}x)=\frac{-1}{1+x^2}$, $-\infty<x<\infty$ or $x\in R$

(xix) $\frac{d}{dx}(\text{cosec}^{-1}x)=\frac{-1}{|x|\sqrt{x^2-1}}$, $|x|>1$ or $x\in R-[-1,1]$

Rules for Differentiation

Here, we will discuss some rules which are related to differentiation.

Differentiation of Sum and Difference of Functions

When a function is expressed as sum or difference of two or more functions then, to find the derivative of function, we need to differentiate each term seperately. i.e.

If $y = u(x) \pm v(x) \pm w(x) \pm \ldots$, then

$$\frac{dy}{dx} = \frac{du(x)}{dx} \pm \frac{dv(x)}{dx} \pm \frac{dw(x)}{dx} \pm \ldots$$

is known as term-by-term differentiation.

Example 2 *If* $y = \sin x + e^x$, *then find* $\frac{dy}{dx}$.

Sol. Here, $y = \sin x + e^x$

On differentiating both sides w.r.t. x, we get

$$\frac{dy}{dx} = \frac{d}{dx}(\sin x + e^x)$$

$$\Rightarrow \quad \frac{dy}{dx} = \frac{d}{dx}\sin x + \frac{d}{dx}e^x$$

$$\Rightarrow \quad \frac{dy}{dx} = \cos x + e^x$$

Example 3 *If* $y = x^2 + \sin^{-1} x + \log_e x$, *then find* $\frac{dy}{dx}$.

Sol. Here, $y = x^2 + \sin^{-1} x + \log_e x$

On differentiating, we get

$$\frac{dy}{dx} = \frac{d}{dx}(x^2) + \frac{d}{dx}(\sin^{-1} x) + \frac{d}{dx}(\log_e x)$$

$$\Rightarrow \quad \frac{dy}{dx} = 2(x)^{2-1} + \frac{1}{\sqrt{1-x^2}} + \frac{1}{x}$$

$$\therefore \quad \frac{dy}{dx} = 2x + \frac{1}{\sqrt{1-x^2}} + \frac{1}{x}$$

Example 4 If $y = \log_{10} x + \log_e 10 + \log_x x + \log_{10} 10$, then find $\frac{dy}{dx}$.

Sol. Here, $y = \log_{10} x + \log_e 10 + \log_x x + \log_{10} 10$

$$\Rightarrow \quad y = \log_{10} x + \log_e 10 + 1 + 1 \qquad [\because \log_a a = 1]$$

$$\Rightarrow \quad y = \log_{10} x + \log_e 10 + 2$$

On differentiating, we get

$$\frac{dy}{dx} = \frac{d}{dx}(\log_{10} x) + \frac{d}{dx}(\log_e 10) + \frac{d}{dx}(2)$$

$$= \frac{1}{x \log_e 10} + 0 + 0$$

$$= \frac{1}{x \log_e 10}$$

Example 5 *If* $y = x^{-1/2} + \log_5 x + \frac{\sin x}{\cos x} + 2^x$, *then find* $\frac{dy}{dx}$.

Sol. Here, $y = x^{-1/2} + \log_5 x + \tan x + 2^x$

On differentiating, we get

$$\frac{dy}{dx} = \frac{d}{dx}(x)^{-1/2} + \frac{d}{dx}(\log_5 x) + \frac{d}{dx}\tan x + \frac{d}{dx}(2^x)$$

$$= -\frac{1}{2}(x)^{-1/2-1} + \frac{1}{x \log_e 5} + \sec^2 x + 2^x \log 2$$

$$= -\frac{1}{2}x^{-3/2} + \frac{1}{x \log_e 5} + \sec^2 x + 2^x \log 2$$

Differentiation of a Function Multiplied with a Constant

If a function multiplied by a constant, then the derivative of constant times a function is the constant times the derivative of the function. i.e.

If $y = k f(x)$, then on differentiating, we get

$$\frac{dy}{dx} = k \cdot \frac{d}{dx} f(x)$$

Example 6 If $y = m^2 \sec^{-1} x$, then find $\frac{dy}{dx}$.

Sol. Here, $y = m^2 \sec^{-1} x$

On differentiating, we get

$$\frac{dy}{dx} = m^2 \frac{d}{dx}\sec^{-1} x$$

$$= m^2 \times \frac{1}{|x|\sqrt{x^2-1}}$$

$$= \frac{m^2}{|x|\sqrt{x^2-1}}$$

Example 7 If $y = \log x^3 + 3\sin^{-1} x + kx^2$, then find $\frac{dy}{dx}$.

Sol. Here, $y = \log x^3 + 3\sin^{-1} x + kx^2$

On differentiating, we get

$$\frac{dy}{dx} = \frac{d}{dx}[\log x^3] + \frac{d}{dx}[3\sin^{-1} x] + \frac{d}{dx}[kx^2]$$

$$= 3\frac{d}{dx}[\log x] + 3\frac{d}{dx}(\sin^{-1} x) + k\frac{d}{dx}(x^2)$$

$$[\because \log x^n = n\log x]$$

$$= 3\cdot\frac{1}{x} + 3\cdot\frac{1}{\sqrt{1-x^2}} + k(2x) = \frac{3}{x} + \frac{3}{\sqrt{1-x^2}} + 2kx$$

Product Rule

If $u(x)$ and $v(x)$ are two differentiable functions, then $u(x)\cdot v(x)$ is also differentiable.

If $y = u(x)\cdot v(x)$, then

$$\frac{dy}{dx} = \left\{\frac{d}{dx}u(x)\right\}\cdot v(x) + u(x)\cdot\left\{\frac{d}{dx}v(x)\right\}.$$

which is known as product rule.

i.e. **derivative of product of two functions**

= (first function) × (derivative of second function) + (second function) × (derivative of first function)

Example 8 ***If*** $y = e^x \sin x$, ***then find*** $\frac{dy}{dx}$.

Sol. Here, $y = e^x \sin x$

On differentiating, we get

$$\frac{dy}{dx} = \left\{\frac{d}{dx}(e^x)\right\}\cdot\sin x + e^x\cdot\left\{\frac{d}{dx}(\sin x)\right\}$$

$$= e^x\cdot\sin x + e^x\cdot\cos x = e^x(\sin x + \cos x)$$

Example 9 ***If*** $y = e^x \tan x + x\cdot\log_e x$, ***then find*** $\frac{dy}{dx}$.

Sol. Here, $y = e^x \tan x + x\cdot\log_e x$

On differentiating, we get

$$\frac{dy}{dx} = \frac{d}{dx}(e^x \tan x) + \frac{d}{dx}(x\log x)$$

$$= \left\{\frac{d}{dx}e^x\right\}\cdot\tan x + e^x\cdot\left\{\frac{d}{dx}\tan x\right\} + \left\{\frac{d}{dx}x\right\}\cdot\log x + x\cdot\left\{\frac{d}{dx}\log x\right\}$$

$$= e^x\cdot\tan x + e^x\cdot\sec^2 x + 1\cdot\log x + x\cdot\frac{1}{x}$$

Hence, $\frac{dy}{dx} = e^x(\tan x + \sec^2 x) + (\log x + 1)$

Differentiation of Product of More than Two Functions

(i) If 3 functions are involved, then remember

$$D\{f(x)\cdot g(x)\cdot h(x)\} = f(x)\cdot g(x)\cdot h'(x) + f(x)\cdot g'(x)\cdot h(x) + f'(x)\cdot g(x)\cdot h(x)$$

(ii) The result can be generalised to product of n terms as

$$D\{f_1(x) f_2(x) f_3(x)\ldots f_n(x)\} = [f_1'(x)\cdot f_2(x)\cdot f_3(x)\ldots f_n(x)] + [f_1(x)\cdot f_2'(x) f_3(x)\ldots f_n(x)] + [f_1(x) f_2(x) f_3'(x)\ldots f_n(x)] + \ldots + [f_1(x)\ f_2(x) f_3(x)\ldots f_n'(x)]$$

Example 10 ***Let*** f, g ***and*** h ***be differentiable functions. If*** $f(0) = 1, g(0) = 2, h(0) = 3$ ***and the derivative of their pairwise product at*** $x = 0$ ***are*** $(fg)'(0) = 6$; $(gh)'(0) = 4$ ***and*** $(hf)'(0) = 5$***, then compute the value of*** $(fgh)'(0)$.

Sol. We know that, $(fgh)' = \frac{(fg)'h + (gh)'f + (hf)'g}{2}$

$$\therefore\quad (fgh)'(0) = \frac{\left[\begin{array}{r}(fg)'(0)\cdot h(0) + (gh)'(0)\cdot f(0)\\ + (hf)'(0)\cdot g(0)\end{array}\right]}{2}$$

$$= \frac{(6)\cdot(3) + (4)\cdot(1) + (5)\cdot(2)}{2} = 16$$

Example 11 ***If*** $y = (1+x)(1+x^2)(1+x^4)\ldots(1+x^{2n})$, ***then find*** $\frac{dy}{dx}$ ***at*** $x = 0$.

Sol. Here, $y = (1+x)(1+x^2)(1+x^4)\ldots(1+x^{2n})$

On differentiating, we get

$$\frac{dy}{dx} = (1)(1+x^2)(1+x^4)\ldots(1+x^{2n}) + (1+x)(2x)(1+x^4)\ldots(1+x^{2n}) + (1+x)(1+x^2)(4x^3)\ldots(1+x^{2n}) + \ldots + (1+x)(1+x^2)(1+x^4)(1+x^8)\ldots(1+x^{2n-1})\times 2n\cdot x^{2n-1}$$

Now, $\left(\frac{dy}{dx}\right)_{x=0} = 1$

Quotient Rule

If $u(x)$ and $v(x)$ are two differentiable functions such that $v(x) \neq 0$, then $\frac{u(x)}{v(x)}$ is also differentiable.

If $y = \frac{u(x)}{v(x)}$, then

$$\frac{dy}{dx} = \frac{\left\{\frac{d}{dx}u(x)\right\}\cdot v(x) - \left\{\frac{d}{dx}v(x)\right\}\cdot u(x)}{\{v(x)\}^2}$$

is known as the quotient rule of differentiation.

Reader's can learn the given formula in following ways

Derivative of quotient of two functions

$$= \frac{\textbf{(denominator)} \times \textbf{(derivative of numerator)} - \textbf{(numerator)} \times \textbf{derivative of denominator}}{\textbf{(denominator)}^2}$$

Example 12 *If* $y = \frac{x}{x^2+1}$, *then find* $\frac{dy}{dx}$.

Sol. Here, $y = \frac{x}{x^2+1}$

On differentiating, we get

$$\frac{dy}{dx} = \frac{(x^2+1)\frac{d}{dx}(x) - x\frac{d}{dx}(x^2+1)}{(x^2+1)^2}$$

$$= \frac{(x^2+1)\cdot 1 - x\cdot(2x)}{(x^2+1)^2} = \frac{1-x^2}{(1+x^2)^2}$$

Example 13 If $y = \frac{x\sin x}{\log_e x}$, then find $\frac{dy}{dx}$.

Sol. Here, $y = \frac{x\sin x}{\log_e x}$

On differentiating, we get

$$\frac{dy}{dx} = \frac{\log_e x\frac{d}{dx}(x\sin x) - x\sin x\frac{d}{dx}(\log_e x)}{(\log_e x)^2}$$

$$= \frac{\log_e x(x\cos x + \sin x) - x\sin x\left(\frac{1}{x}\right)}{(\log_e x)^2}$$

$$= \frac{\log_e x\,(x\cos x + \sin x) - \sin x}{(\log_e x)^2}$$

Example 14 If $y = \frac{3a^2x - x^3}{a^3 - 3ax^2}$, then find $\frac{dy}{dx}$.

Sol. Here, $y = \frac{3a^2x - x^3}{a^3 - 3ax^2}$

On differentiating, we get

$$\frac{dy}{dx} = \frac{\left[(a^3-3ax^2)\frac{d}{dx}(3a^2x - x^3) - (3a^2x - x^3)\frac{d}{dx}(a^3 - 3ax^2)\right]}{(a^3-3ax^2)^2}$$

$$= \frac{(a^3 - 3ax^2)(3a^2 - 3x^2) - (3a^2\,x - x^3)(-6ax)}{(a^3 - 3ax^2)^2}$$

$$= \frac{3ax^4 + 6a^3x^2 + 3a^5}{(a^3 - 3ax^2)^2}$$

Example 15 *If* $y = \frac{e^x - \tan x}{x^n + \cot x}$, *then find* $\frac{dy}{dx}$.

Sol. Here, $y = \frac{e^x - \tan x}{x^n + \cot x}$

On differentiating, we get

$$\frac{dy}{dx} = \frac{\left[(x^n + \cot x)\frac{d}{dx}(e^x - \tan x) - (e^x - \tan x)\frac{d}{dx}(x^n + \cot x)\right]}{(x^n + \cot x)^2}$$

$$\therefore \quad \frac{dy}{dx} = \frac{\left[(e^x - \sec^2 x)(x^n + \cot x) - (e^x - \tan x)(nx^{n-1} - \operatorname{cosec}^2 x)\right]}{(x^n + \cot x)^2}$$

Example 16 *If* $y = \frac{\log x}{x} + e^x \sin x + \log_5 x$, *then find* $\frac{dy}{dx}$.

Sol. Here, $y = \frac{\log x}{x} + e^x \sin x + \log_5 x$

On differentiating, we get

$$\frac{dy}{dx} = \frac{d}{dx}\left(\frac{\log x}{x}\right) + \frac{d}{dx}(e^x \sin x) + \frac{d}{dx}(\log_5 x)$$

$$= \frac{\left\{\frac{d}{dx}(\log x)\right\}\cdot x - \log x\left\{\frac{d}{dx}x\right\}}{x^2} + \left\{\frac{d}{dx}e^x\right\}\cdot\sin x + e^x\cdot\left\{\frac{d}{dx}\sin x\right\} + \frac{1}{x\log_e 5}$$

$$= \frac{\frac{1}{x}\cdot x - \log x\cdot 1}{x^2} + e^x\sin x + e^x\cdot\cos x + \frac{1}{x\log_e 5}$$

Hence, $\frac{dy}{dx} = \left(\frac{1 - \log x}{x^2}\right) + e^x(\sin x + \cos x) + \frac{1}{x\log_e 5}$

Remark

While applying the quotient rule, think twice and check whether your function could be simplified prior to differentiation. (See Examples 17 and 18).

Example 17 If $y=\dfrac{x^4+x^2+1}{x^2+x+1}$ and $\dfrac{dy}{dx}=ax+b$, then find a and b.

Sol. Here, $y=\dfrac{x^4+x^2+1}{x^2+x+1}$

$$\Rightarrow \quad y=\frac{x^4+2x^2+1-x^2}{x^2+x+1}=\frac{(x^2+1)^2-x^2}{(x^2+x+1)}$$

$$\therefore \quad y=\frac{(x^2+x+1)(x^2-x+1)}{(x^2+x+1)}$$

$$[\because a^2-b^2=(a+b)(a-b)]$$

$$\Rightarrow \quad y=x^2-x+1 \Rightarrow \frac{dy}{dx}=2x-1$$

$$\Rightarrow \quad ax+b=2x-1 \qquad \left[\because \frac{dy}{dx}=ax+b\right]$$

$$\therefore \quad a=2, b=-1$$

Example 18 ***If*** $y=\dfrac{\sec x+\tan x-1}{(-\sec x)+\tan x+1}$, ***then find*** $\dfrac{dy}{dx}$ ***at*** $x=\dfrac{\pi}{4}$.

Sol. Here, $y=\dfrac{\sec x+\tan x-1}{-\sec x+\tan x+1}$

$$\Rightarrow \quad y=\frac{(\sec x+\tan x)-(\sec^2 x-\tan^2 x)}{-\sec x+\tan x+1}$$

$$(\because \sec^2 x-\tan^2 x=1)$$

$$\Rightarrow \quad y=\frac{(\sec x+\tan x)\{1-\sec x+\tan x\}}{\tan x-\sec x+1}$$

$$\Rightarrow \quad y=\sec x+\tan x \Rightarrow \frac{dy}{dx}=\sec x\tan x+\sec^2 x$$

$$\therefore \quad \left(\frac{dy}{dx}\right)_{\text{at } x=\frac{\pi}{4}}=\sqrt{2}+2$$

Example 19 If $y=\dfrac{\tan^{-1}x-\cot^{-1}x}{\tan^{-1}x+\cot^{-1}x}$, then find $\left(\dfrac{dy}{dx}\right)$ at $x=-1$.

Sol. Here, $y=\dfrac{\tan^{-1}x-\cot^{-1}x}{\tan^{-1}x+\cot^{-1}x}$, as $\tan^{-1}x+\cot^{-1}x=\dfrac{\pi}{2}$

$$\therefore \quad y=\frac{\tan^{-1}x-(\pi/2-\tan^{-1}x)}{(\pi/2)}$$

$$\Rightarrow \quad y=\frac{2}{\pi}\left[2\tan^{-1}x-\frac{\pi}{2}\right] \Rightarrow \frac{dy}{dx}=\frac{2}{\pi}\left[\frac{2}{1+x^2}\right]$$

$$\therefore \quad \left(\frac{dy}{dx}\right)_{x=-1}=\frac{2}{\pi}$$

Exercise for Session 1

■ **Directions** (Q. Nos. 1 to 9) *Differentiate the following functions w.r.t. x.*

1. $e^{x\log a}+e^{a\log x}+e^{a\log a}$

2. $\sqrt{\dfrac{1-\cos 2x}{1+\cos 2x}}$

3. $\log_3 x+3\log_e x+2\tan x$

4. $|x|+a_0x^n+a_1x^{n-1}+a_2x^{n-2}+\ldots+a_{n-1}x+a_n$

5. $\sec^{-1}\left(\dfrac{x+1}{x-1}\right)+\sin^{-1}\left(\dfrac{x-1}{x+1}\right)$

6. $x^n\log_a x\,e^x$

7. $\dfrac{2^x\cot x}{\sqrt{x}}$

8. $\dfrac{\sin x-x\cos x}{x\sin x+\cos x}$

9. If $y=1+\dfrac{x}{1!}+\dfrac{x^2}{2!}+\dfrac{x^3}{3!}+\dfrac{x^4}{4!}+\ldots\infty$, then find the value of $\dfrac{dy}{dx}$.

10. Find the values of 'x' for which the rate of change of $\dfrac{x^4}{4}+\dfrac{x^3}{3}-x$ is more than the rate of change of $\dfrac{x^4}{4}$.

Session 2

Chain Rule (Derivative of Composite Function)

Chain Rule

(Derivative of Composite Function)

If $u(x)$ and $v(x)$ are differentiable functions, then $uov(x)$ or $u[v(x)]$ is also differentiable.

If $y\,[uov(x)] = [u\{v(x)\}]$, then

$$\frac{dy}{dx} = \frac{du\{v(x)\}}{d\{v(x)\}} \times \frac{d}{dx} v(x)$$

is known as chain rule. Or

If $y = f(u)$ and $u = g(x)$, then $\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx}$

The chain rule can be extended as follows

If $y\,[uovow(x)] = u\,[v\{w(x)\}]$, then

$$\frac{dy}{dx} = \frac{du[v\{w(x)\}]}{dv\{w(x)\}} \times \frac{dv\{w(x)\}}{dw(x)} \times \frac{dw(x)}{dx}$$

Example 20 *If* $y = \log(\sin x)$*, then find* $\frac{dy}{dx}$.

Sol. Here, $y = \log(\sin x)$

On differentiating, we get

$$\frac{dy}{dx} = \frac{d[\log(\sin x)]}{d(\sin x)} \times \frac{d}{dx}(\sin x) = \frac{1}{\sin x} \times \cos x$$

[by chain rule]

Hence, $\frac{dy}{dx} = \cot x$

Aliter

Here, $y = \log(\sin x)$

Put $\sin x = u$, we have, $y = \log u$ where $u = \sin x$

On differentiating, we get

$$\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx}$$ [by chain rule]

$$\frac{dy}{dx} = \frac{d}{dx}(\log u) \cdot \frac{d}{dx}(\sin x)$$

$$= \frac{1}{u} \times \cos x$$

$$\frac{dy}{dx} = \frac{1}{\sin x} \times \cos x = \cot x \qquad [\because u = \sin x]$$

Example 21 If $y = e^{(\tan^{-1} x)^3}$, then find $\frac{dy}{dx}$.

Sol. Here, $y = e^{(\tan^{-1} x)^3}$

On differentiating, we get

$$\frac{dy}{dx} = \frac{d\{e^{(\tan^{-1} x)^3}\}}{d\{(\tan^{-1} x)^3\}} \cdot \frac{d\{(\tan^{-1} x)^3\}}{d(\tan^{-1} x)} \cdot \frac{d(\tan^{-1} x)}{dx}$$

$$= e^{(\tan^{-1} x)^3} \cdot 3(\tan^{-1} x)^2 \cdot \frac{1}{1+x^2}$$ [by chain rule]

Aliter

Here, $y = e^{(\tan^{-1} x)^3}$

Put $(\tan^{-1} x) = v$ and $(\tan^{-1} x)^3 = u$

$\Rightarrow$ $u = v^3$

$\therefore$ $y = e^u$, $u = v^3$ and $v = \tan^{-1} x$

On differentiating, we get

$$\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dv} \cdot \frac{dv}{dx}$$

$$\frac{dy}{dx} = \frac{d}{du} e^u \times \frac{d(v)^3}{dv} \times \frac{d}{dx} \tan^{-1} x = e^u \cdot 3v^2 \cdot \frac{1}{1+x^2}$$

$$= e^{(\tan^{-1} x)^3} \cdot (3\tan^{-1} x)^2 \cdot \frac{1}{1+x^2}$$

Example 22 If $y = \log_e(\tan^{-1}\sqrt{1+x^2})$, then find $\frac{dy}{dx}$.

Sol. Here, $y = \log_e(\tan^{-1}\sqrt{1+x^2})$

On differentiating, we get

$$\frac{dy}{dx} = \frac{d[\log_e(\tan^{-1}\sqrt{1+x^2})]}{d(\tan^{-1}\sqrt{1+x^2})} \cdot \frac{d(\tan^{-1}\sqrt{1+x^2})}{d(\sqrt{1+x^2})} \cdot \frac{d(\sqrt{1+x^2})}{d(1+x^2)} \cdot \frac{d(1+x^2)}{dx}$$

$$= \frac{1}{\tan^{-1}(\sqrt{1+x^2})} \cdot \frac{1}{1+(\sqrt{1+x^2})^2} \cdot \frac{1}{2\sqrt{1+x^2}} \cdot 2x$$

$$= \frac{x}{\tan^{-1}(\sqrt{1+x^2})(2+x^2)\sqrt{1+x^2}}$$

Aliter

Here, $y = \log_e(\tan^{-1}\sqrt{1+x^2})$

Put $1+x^2=w, \sqrt{1+x^2}=v$

$\Rightarrow \quad v=\sqrt{w}$ and $\tan^{-1}\sqrt{1+x^2}=u$

$\Rightarrow \quad u=\tan^{-1}v$

$\therefore \quad y=\log u, u=\tan^{-1}v$

$v=\sqrt{w}$ and $w=1+x^2$

On differentiating, we get

$$\frac{dy}{dx}=\frac{dy}{du}\cdot\frac{du}{dv}\cdot\frac{dv}{dw}\cdot\frac{dw}{dx}$$

$$=\frac{d}{du}(\log u)\times\frac{d}{dv}\tan^{-1}v\cdot\frac{d}{dw}\sqrt{x}\cdot\frac{d}{dx}(1+x^2)$$

$$=\frac{1}{u}\times\frac{1}{1+v^2}\times\frac{1}{2\sqrt{w}}\times(2x)$$

$$=\frac{1}{\tan^{-1}\sqrt{1+x^2}}\times\frac{1}{2+x^2}\times\frac{1}{2\sqrt{1+x^2}}\times(2x)$$

$$=\frac{1}{\tan^{-1}\sqrt{1+x^2}}\times\frac{1}{2+x^2}\times\frac{x}{\sqrt{1+x^2}}$$

$$=\frac{x}{(\tan^{-1}\sqrt{1+x^2})(2+x^2)\sqrt{1+x^2}}$$

Example 23 *If* $y=e^{ax}\cdot\cos(bx+c)$, *then find* $\frac{dy}{dx}$.

Sol. Here, $y=e^{ax}\cdot\cos(bx+c)$

On differentiating, we get

$$\frac{dy}{dx}=\left\{\frac{d}{dx}(e^{ax})\right\}\cdot\cos(bx+c)+e^{ax}\cdot\left\{\frac{d}{dx}\{\cos(bx+c)\}\right\}$$

$$=\frac{d(e^{ax})}{d(ax)}\cdot\frac{d(ax)}{dx}\cdot\cos(bx+c)+e^{ax}\cdot\frac{d\cos(bx+c)}{d(bx+c)}\cdot\frac{d(bx+c)}{dx}$$

$$=e^{ax}\cdot a\cdot\cos(bx+c)+e^{ax}\cdot\{-\sin(bx+c)\}\cdot b$$

$$=ae^{ax}\cos(bx+c)-be^{ax}\sin(bx+c)$$

Remark

From now and onwards, we apply chain rule directly.

Example 24 *Differentiate the following w.r.t.* x.

(i) $\sqrt{\log\left\{\sin\left(\frac{x^2}{3}-1\right)\right\}}$ (ii) $\log_e\left(\frac{x+\sqrt{x^2-a^2}}{x-\sqrt{x^2-a^2}}\right)$

Sol. (i) Let $y=\sqrt{\log\left\{\sin\left(\frac{x^2}{3}-1\right)\right\}}$

On differentiating, we get

$$\frac{dy}{dx}=\frac{1}{2\sqrt{\log\left\{\sin\left(\frac{x^2}{3}-1\right)\right\}}}\times\frac{1}{\sin\left(\frac{x^2}{3}-1\right)}\times\cos\left(\frac{x^2}{3}-1\right)\times\frac{2x}{3}$$

$$=\frac{x\cot\left(\frac{x^2}{3}-1\right)}{3\log\left\{\sin\left(\frac{x^2}{3}-1\right)\right\}}$$

(ii) Let $y=\log_e\left(\frac{x+\sqrt{x^2-a^2}}{x-\sqrt{x^2-a^2}}\right)$

$$\Rightarrow y=\log(x+\sqrt{x^2-a^2})-\log(x-\sqrt{x^2-a^2})$$

$$\left[\because \log\frac{a}{b}=\log a-\log b\right]$$

On differentiating, we get

$$\frac{dy}{dx}=\left(\frac{1}{x+\sqrt{x^2-a^2}}\right)\left(1+\frac{2x}{2\sqrt{x^2-a^2}}\right)-\left[\left(\frac{1}{x-\sqrt{x^2-a^2}}\right)\left(1-\frac{2x}{2\sqrt{x^2-a^2}}\right)\right]$$

$$=\frac{1}{\sqrt{x^2-a^2}}+\frac{1}{\sqrt{x^2-a^2}}=\frac{2}{\sqrt{x^2-a^2}}$$

Exercise for Session 2

■ **Directions** (Q. Nos. 1 to 19) *Differentiate the following w.r.t. x.*

1. $(x^2+x+1)^4$
2. $\sqrt{x^2+x+1}$
3. $\sin^3 x$
4. $\frac{1}{\sqrt{a^2-x^2}}$
5. $e^{x\sin x}$
6. $\sin^{-1}\left(\frac{a+b\cos x}{b+a\cos x}\right), b>a>1$
7. e^{e^x}
8. $\log(x+\sqrt{a^2+x^2})$

9. $\log\left(\frac{a + b \sin x}{a - b \sin x}\right)$

10. $\log\sqrt{\frac{1+\sin x}{1-\sin x}}$

11. $\frac{e^x + \log x}{\sin 3x}$

12. $\sin(m \sin^{-1} x), |x| < 1$

13. $a^{(\sin^{-1} x)^2}, |x| < 1$

14. $e^{\cos^{-1}(\sqrt{1-x^2})}, |x| < 1$

15. $\frac{x \sin^{-1} x}{\sqrt{1-x^2}} + \log\sqrt{1-x^2}, |x| < 1$

16. $\log_{10} x + \log_x 10 + \log_x x + \log_{10} 10$

17. $5^{3-x^2} + (3 - x^2)^5$

18. $\frac{\sqrt{a^2+x^2} + \sqrt{a^2-x^2}}{\sqrt{a^2+x^2} - \sqrt{a^2-x^2}}$

19. $\sqrt{4 + \sqrt{4 + \sqrt{4 + x^2}}}$

Multiple Choice Questions

20. The differential coefficient of $f(\log_e x)$ w.r.t. x, where $f(x) = \log_e x$, is

(a) $\frac{x}{\log_e x}$ (b) $\frac{1}{x}\log_e x$ (c) $\frac{1}{x \log_e x}$ (d) None of these

21. If $f(x) = \log_e |x|, x \neq 0$, then $f'(x)$ is equal to

(a) $\frac{1}{|x|}$ (b) $\frac{1}{x}$ (c) $-\frac{1}{x}$ (d) None of these

22. Let $f(x) = \sin x$, $g(x) = x^2$ and $h(x) = \log x$. If $F(x) = h(f(g(x)))$, then $F'(x)$ is

(a) $2x \cot x^2$ (b) $2 \operatorname{cosec}^3 x$ (c) $-2 \operatorname{cosec}^2 x$ (d) None of these

23. If $f(x) = \cos x \cdot \cos 2x \cdot \cos 4x \cdot \cos 8x \cdot \cos 16x$, then $f'\left(\frac{\pi}{4}\right)$ is

(a) $\sqrt{2}$ (b) $\frac{1}{\sqrt{2}}$ (c) 1 (d) None of these

24. If $y = f\left(\frac{3x+4}{5x+6}\right)$ and $f'(x) = \tan x^2$, then $\frac{dy}{dx}$ is equal to

(a) $-2\tan\left(\frac{3x+4}{5x+6}\right)^2 \cdot \frac{1}{(5x+6)^2}$ (b) $f\left(\frac{3\tan x^2 + 3}{5\tan x^2 + 6}\right)\tan x^2$

(c) $2x \tan\left(\frac{3x+4}{5x+6}\right)$ (d) $\tan x^2$

25. If $y = |\cos x| + |\sin x|$, then $\frac{dy}{dx}$ at $x = \frac{2\pi}{3}$ is

(a) $\frac{1}{2}(\sqrt{3}+1)$ (b) $2(\sqrt{3}-1)$ (c) $\frac{1}{2}(\sqrt{3}-1)$ (d) None of these

26. If $f'(x) = \sin x + \sin 4x \cdot \cos x$, then $f'\left(2x^2 + \frac{\pi}{2}\right)$ is

(a) $4x\{\cos(2x^2) - \sin 8x^2 \cdot \sin 2x^2\}$ (b) $4x\{\cos(2x^2) + \sin 8x^2 \cdot \cos 2x^2\}$

(c) $\{\cos(2x^2) - \sin 8x^2 \cdot \sin 2x^2\}$ (d) None of these

27. If $f'(x) = \sqrt{2x^2 - 1}$ and $y = f(x^2)$, then $\frac{dy}{dx}$ at $x = 1$, is

(a) 1 (b) –1 (c) –2 (d) 2

Session 3

Differentiation of Implicit Functions

Differentiation of Implicit Functions

In previous rules, we have studied functions in which y was only expressed in terms of x without complication called **explicit functions**.

But, if the relation between the variables x and y are given by an equation and this equation is not immediately solvable for y, then y is called an **implicit function** of x.

Implicit functions are given by $\phi(x, y) = 0$.

In this case, to find $\frac{dy}{dx}$, we differentiate both sides of the given relation with respect to x and collect the terms containing $\frac{dy}{dx}$ to the left hand side and transpose the other terms to the right hand side. Now, divide both sides by coefficient of $\frac{dy}{dx}$.

Shortcut for Differentiation of Implicit Functions

(Only to be Applied while Solving Objective MCQs)

For implicit function put; $\frac{d}{dx}\{f(x, y)\} = \frac{-\partial f / \partial x}{\partial f / \partial y}$,

where $\frac{\partial f}{\partial x}$ is a **partial differentiation** of given function w.r.t. x (i.e. differentiating f w.r.t. x keeping y as constant) and $\frac{\partial f}{\partial y}$ means partial differentiation of given function w.r.t. y (i.e. differentiating f w.r.t. y keeping x as constant). In simple words, we write this method as for implicit functions

$$\frac{dy}{dx} = \frac{\text{Differentiation of function w.r.t. } x \text{ keeping } y \text{ as constant}}{\text{Differentiation of function w.r.t. } y \text{ keeping x as constant}}$$

Example 25 *If* $x^2 + y^2 + xy = 2$, *then find* $\frac{dy}{dx}$.

Sol. Here, $x^2 + y^2 + xy = 2$

Differentiating both sides, we get

$$\frac{d}{dx}(x^2) + \frac{d}{dx}(y^2) + \frac{d}{dx}(xy) = \frac{d}{dx}(2)$$

$$\Rightarrow \quad 2x + 2y\frac{dy}{dx} + \left\{\frac{dx}{dx}\right\}y + x\left\{\frac{d}{dx}y\right\} = 0$$

$$\Rightarrow \quad 2x + 2y\frac{dy}{dx} + 1 \cdot y + x \cdot \frac{dy}{dx} = 0$$

$$\Rightarrow \quad (2y + x)\frac{dy}{dx} = -(2x + y)$$

$$\Rightarrow \quad \frac{dy}{dx} = -\frac{(2x + y)}{(2y + x)}$$

Aliter

Put $f = x^2 + y^2 + xy - 2$

Now, $\frac{dy}{dx} = \frac{-\frac{\partial f}{\partial x}}{\frac{\partial f}{\partial y}}$ ...(i)

where, $\frac{\partial f}{\partial x} = 2x + 0 + y - 0 = 2x + y$

and $\frac{\partial f}{\partial y} = 2y + x$

Substituting in Eq. (i), we get

$$\frac{dy}{dx} = -\frac{(2x + y)}{(2y + x)}$$

Example 26 If $y = x \cos y + y \cos x$, then find $\frac{dy}{dx}$.

Sol. Here, $y = x \cos y + y \cos x$

Differentiating both the sides, we get

$$\frac{dy}{dx} = \left\{\frac{d}{dx}(x)\right\}\cos y + x\left\{\frac{d}{dx}(\cos y)\right\} + y\left\{\frac{d}{dx}(\cos x)\right\} + \left\{\frac{d}{dx}(y)\right\} \cdot \cos x$$

$$\Rightarrow \quad \frac{dy}{dx} = 1 \cdot \cos y + x(-\sin y)\frac{dy}{dx} + y(-\sin x) + \frac{dy}{dx}(\cos x)$$

$$\Rightarrow \quad \frac{dy}{dx}(1 + x \sin y - \cos x) = \cos y - y \sin x$$

$$\therefore \quad \frac{dy}{dx} = \frac{\cos y - y \sin x}{1 + x \sin y - \cos x}$$

Aliter

Let $f = x\cos y + y\cos x - y \Rightarrow \dfrac{\partial f}{\partial x} = \cos y - y\sin x$

and $\dfrac{\partial f}{\partial y} = -x\sin y + \cos x - 1$

$$\therefore \quad \frac{dy}{dx} = \frac{-\left(\dfrac{\partial f}{\partial x}\right)}{\left(\dfrac{\partial f}{\partial y}\right)} = \frac{-(\cos y - y\sin x)}{(-x\sin y + \cos x - 1)}$$

or $$\frac{dy}{dx} = \frac{\cos y - y\sin x}{1 + x\sin y - \cos x}$$

Example 27 ***If*** $y\sqrt{1-x^2} + x\sqrt{1-y^2} = 1$, ***when*** $|x| < 1$ ***and*** $|y| < 1$, ***then find*** $\dfrac{dy}{dx}$.

Sol. Here, $y\sqrt{1-x^2} + x\sqrt{1-y^2} = 1$, $|x| < 1$ and $|y| < 1$

Let $x = \sin\theta$, $y = \sin\phi$, then

$$\sin\phi\sqrt{1-\sin^2\theta} + \sin\theta\sqrt{1-\sin^2\phi} = 1$$

$$\Rightarrow \quad \sin\phi\cos\theta + \sin\theta\cos\phi = 1$$

$$\Rightarrow \quad \sin(\theta + \phi) = 1$$

$$\Rightarrow \quad \theta + \phi = \sin^{-1}(1)$$

$$\Rightarrow \quad \sin^{-1}x + \sin^{-1}y = \sin^{-1}(1)$$

$$\left[\because \sin\theta = x \Rightarrow \theta = \sin^{-1}x \text{ and } \sin\phi = y \Rightarrow \phi = \sin^{-1}y\right]$$

Differentiating both the sides, we get

$$\frac{1}{\sqrt{1-x^2}} + \frac{1}{\sqrt{1-y^2}}\cdot\frac{dy}{dx} = 0$$

Hence, $$\frac{dy}{dx} = -\sqrt{\frac{1-y^2}{1-x^2}}$$

Aliter

Let $f = y\sqrt{1-x^2} + x\sqrt{1-y^2} - 1$

$$\Rightarrow \quad \frac{\partial f}{\partial x} = \frac{-xy}{\sqrt{1-x^2}} + \sqrt{1-y^2} \text{ and } \frac{\partial f}{\partial y} = \sqrt{1-x^2} - \frac{xy}{\sqrt{1-y^2}}$$

$$\therefore \quad \frac{dy}{dx} = \frac{-\left(\dfrac{\partial f}{\partial x}\right)}{\left(\dfrac{\partial f}{\partial y}\right)} = -\frac{[\sqrt{1-x^2}\sqrt{1-y^2} - xy]/\sqrt{1-x^2}}{[\sqrt{1-x^2}\sqrt{1-y^2} - xy]/\sqrt{1-y^2}}$$

$$\Rightarrow \quad \frac{dy}{dx} = -\frac{\sqrt{1-y^2}}{\sqrt{1-x^2}}$$

Example 28 If $\sqrt{1-x^6} + \sqrt{1-y^6} = a^3(x^3 - y^3)$, then prove that $\dfrac{dy}{dx} = \dfrac{x^2}{y^2}\sqrt{\dfrac{1-y^6}{1-x^6}}$.

Sol. Here, $\sqrt{1-x^6} + \sqrt{1-y^6} = a^3(x^3 - y^3)$

Let $x^3 = \sin\theta$, $y^3 = \sin\phi$, then we get

$$\sqrt{1-\sin^2\theta} + \sqrt{1-\sin^2\phi} = a^3(\sin\theta - \sin\phi)$$

$$\Rightarrow \quad \cos\theta + \cos\phi = a^3(\sin\theta - \sin\phi)$$

$$\Rightarrow 2\cos\left(\frac{\theta+\phi}{2}\right)\cdot\cos\left(\frac{\theta-\phi}{2}\right) = a^3\left[2\cos\left(\frac{\theta+\phi}{2}\right)\sin\left(\frac{\theta-\phi}{2}\right)\right]$$

$$\Rightarrow \quad \cos\left(\frac{\theta-\phi}{2}\right) = a^3\sin\left(\frac{\theta-\phi}{2}\right) \quad \Rightarrow \quad \cot\left(\frac{\theta-\phi}{2}\right) = a^3$$

$$\Rightarrow \quad \theta - \phi = 2\cot^{-1}(a^3)$$

or $$\sin^{-1}x^3 - \sin^{-1}y^3 = 2\cot^{-1}(a^3)$$

$$\left[\because \cos C + \cos D = 2\cos\left(\frac{C+D}{2}\right)\cos\left(\frac{C-D}{2}\right)\right.$$

$$\left.\text{and } \sin C - \sin D = 2\cos\left(\frac{C+D}{2}\right)\sin\left(\frac{C-D}{2}\right)\right]$$

Differentiating both the sides, we get

$$\frac{1}{\sqrt{1-x^6}}\cdot 3x^2 - \frac{1}{\sqrt{1-y^6}}\cdot 3y^2\cdot\frac{dy}{dx} = 0$$

Hence, $$\frac{dy}{dx} = \frac{x^2\sqrt{1-y^6}}{y^2\sqrt{1-x^6}}$$

Example 29 If $y = \sqrt{\sin x + \sqrt{\sin x + \sqrt{\sin x + \ldots\infty}}}$, where $\sin x > 0$, then find $\dfrac{dy}{dx}$.

Sol. We have, $y = \sqrt{\sin x + \sqrt{\sin x + \sqrt{\sin x + \ldots\infty}}}$

$$\Rightarrow \quad y = \sqrt{(\sin x) + y}$$

$$\Rightarrow \quad y^2 = \sin x + y$$

Differentiating both the sides, we get

$$2y\frac{dy}{dx} = \cos x + \frac{dy}{dx}$$

$$\Rightarrow (2y-1)\frac{dy}{dx} = \cos x \Rightarrow \frac{dy}{dx} = \frac{\cos x}{2y-1}$$

Remark

In above examples, it is advised to use $\dfrac{dy}{dx} = -\left(\dfrac{\partial f/\partial x}{\partial f/\partial y}\right)$

Exercise for Session 3

1. If $\log(x^2 + y^2) = 2\tan^{-1}\left(\frac{y}{x}\right)$, then show that $\frac{dy}{dx} = \frac{x + y}{x - y}$.

2. If $x\sqrt{1+y} + y\sqrt{1+x} = 0$, then prove that $\frac{dy}{dx} = \frac{-1}{(x+1)^2}$.

3. If $\cos^{-1}\left(\frac{x^2 - y^2}{x^2 + y^2}\right) = \tan^{-1} a$, then prove that $\frac{dy}{dx} = \frac{y}{x}$.

4. If $\sin y = x \sin(a + y)$, then prove that $\frac{dy}{dx} = \frac{\sin^2(a+y)}{\sin a}$.

5. If $x^2 + y^2 = t - \frac{1}{t}$ and $x^4 + y^4 = t^2 + \frac{1}{t^2}$, then prove that $\frac{dy}{dx} = \frac{1}{x^3 y}$.

Multiple Choice Questions

6. If $\sin(xy) + \cos(xy) = 0$, then $\frac{dy}{dx}$ is

(a) $\frac{y}{x}$ (b) $-\frac{y}{x}$

(c) $-\frac{x}{y}$ (d) $\frac{x}{y}$

7. If $ax^2 + 2hxy + by^2 = 0$, then $\frac{dy}{dx}$ is

(a) $\frac{y}{x}$ (b) $\frac{x}{y}$

(c) $-\frac{x}{y}$ (d) None of these

8. If $x^2 \cdot e^y + 2xye^x + 13 = 0$, then $\frac{dy}{dx}$ is

(a) $\frac{-2xe^{y-x} - 2y(x+1)}{x(xe^{y-x} + 2)}$ (b) $\frac{2xe^{x-y} + 2y(x+1)}{x(xe^{y-x} + 2)}$

(c) $\frac{-2xe^{x-y} + 2y(x+1)}{x(xe^{y-x} + 2)}$ (d) None of these

9. If $\log(x + y) = 2xy$, then $y'(0)$ is

(a) 1 (b) -1 (c) 2 (d) 0

10. If $x\log_e y + y\log_e x = 5$, then $\frac{dy}{dx}$ is

(a) $-\frac{y}{x}\left(\frac{x\log y + y}{x + y\log x}\right)$ (b) $-\frac{x}{y}\left(\frac{x\log y + y}{x - y\log x}\right)$

(c) $-\frac{y}{x}\left(\frac{x\log y - y}{x + y\log x}\right)$ (d) None of these

Session 4

Differentiation of Inverse Trigonometric Functions

Differentiation of Inverse Trigonometric Functions

Inverse trigonometric functions are continuous functions, their domain and range are shown in the table given below.

S. No.	Function	Domain	Range	Principal value branch
1.	$\sin^{-1} x$	$[-1, 1]$	$\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$	$-\frac{\pi}{2} \le y \le \frac{\pi}{2}$, where $y = \sin^{-1} x$
2.	$\cos^{-1} x$	$[-1, 1]$	$[0, \pi]$	$0 \le y \le \pi$, where $y = \cos^{-1} x$
3.	$\tan^{-1} x$	R	$\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$	$-\frac{\pi}{2} < y < \frac{\pi}{2}$, where $y = \tan^{-1} x$
4.	$\text{cosec}^{-1} x$	$(-\infty, -1] \cup [1, \infty)$	$\left[-\frac{\pi}{2}, \frac{\pi}{2}\right] - \{0\}$	$-\frac{\pi}{2} \le y \le \frac{\pi}{2}$, where $y = \text{cosec}^{-1} x$, $y \ne 0$
5.	$\sec^{-1} x$	$(-\infty, -1] \cup [1, \infty)$	$[0, \pi] - \left\{\frac{\pi}{2}\right\}$	$0 \le y \le \pi$, where $y = \sec^{-1} x$, $y \ne \frac{\pi}{2}$
6.	$\cot^{-1} x$	R	$(0, \pi)$	$0 < y < \pi$, where $y = \cot^{-1} x$

To differentiate inverse trigonometric functions, we need to know some basic trigonometric identities and substitution, they can help you finding the differentiation of inverse trigonometric functions.

Useful Trigonometric Identities

(i) $\sin 2x = 2 \sin x \cos x$

(ii) $\cos 2x = 2\cos^2 x - 1, \cos 2x = 1 - 2\sin^2 x$

(iii) $\sin 2x = \dfrac{2 \tan x}{1 + \tan^2 x}$

(iv) $\cos 2x = \dfrac{1 - \tan^2 x}{1 + \tan^2 x}$

(v) $\tan 2x = \dfrac{2 \tan x}{1 - \tan^2 x}$, where $x \ne (2n + 1)\dfrac{\pi}{4}$

(vi) $\sin 3x = 3 \sin x - 4 \sin^3 x$

$= 4 \sin (60° - A) \cdot \sin A \cdot \sin (60° + A)$

(vii) $\cos 3x = 4 \cos^3 x - 3 \cos x$

$= 4 \cos (60° - A) \cdot \cos A \cdot \cos (60° + A)$

(viii) $\tan 3x = \dfrac{3 \tan x - \tan^3 x}{1 - 3 \tan^2 x}$

$= \tan (60° - A) \cdot \tan A \cdot \tan (60° + A)$

(ix) $\cos A \cdot \cos 2A \cdot \cos 2^2 A \ldots \cos 2^{n-1} A = \dfrac{\sin 2^n A}{2^n \sin A}$

Remark

If no branch of an inverse trigonometric function is mentioned, then it means that the principal value branch of the function have to be taken.

Substitutions for Inverse Trigonometric Functions

S.No.	Expression	Substitutions
1.	$\sqrt{a^2 - x^2}$	$x = a\sin\theta$ or $a\cos\theta$
2.	$\sqrt{a^2 + x^2}$	$x = a\tan\theta$ or $a\cot\theta$
3.	$\sqrt{x^2 - a^2}$	$x = a\sec\theta$ or $a\text{cosec}\,\theta$
4.	$\sqrt{\frac{a+x}{a-x}}$ or $\sqrt{\frac{a-x}{a+x}}$	$x = a\cos\theta$ or $a\cos 2\theta$
5.	$\sqrt{(a-x)(x-b)}$ or $\sqrt{\frac{a-x}{x-b}}$ or $\sqrt{\frac{x-b}{a-x}}$	$x = a\cos^2\theta - b\sin^2\theta$
6.	$\sqrt{(x-a)(x-b)}$ or $\sqrt{\frac{x-a}{x-b}}$ or $\sqrt{\frac{x-b}{a-x}}$	$x = a\sec^2\theta + b\tan^2\theta$
7.	$\sqrt{2ax - x^2}$	$x = a(1 - \cos\theta)$

Example 30 If $y=\sec^{-1}(\sqrt{1+x^2})$, when $-1<x<1$, then find $\frac{dy}{dx}$.

Sol. Here, $y=\sec^{-1}(\sqrt{1+x^2})$,

put $x=\tan\theta$

$\Rightarrow$ $y=\sec^{-1}(\sqrt{\sec^2\theta})$

$=\sec^{-1}(\sec\theta)=\theta=\tan^{-1}x$

$\therefore$ $\frac{dy}{dx}=\frac{1}{1+x^2}$

Example 31 If $y=\tan^{-1}\sqrt{\frac{1-x}{1+x}}$, then find $\frac{dy}{dx}$, when $-1<x<1$.

Sol. Here, $y=\tan^{-1}\sqrt{\frac{1-x}{1+x}}$, put $x=\cos\theta$

$\Rightarrow$ $y=\tan^{-1}\sqrt{\frac{1-\cos\theta}{1+\cos\theta}}$

$\Rightarrow$ $y=\tan^{-1}\sqrt{\frac{2\sin^2\theta/2}{2\cos^2\theta/2}}$

$\Rightarrow$ $y=\tan^{-1}|\tan\theta/2|$ $\left[\because -1<\cos\theta<1\Rightarrow 0<\theta<\pi,\ \therefore 0<\frac{\theta}{2}<\frac{\pi}{2}\right]$

$\therefore$ $y=\tan^{-1}(\tan\theta/2)$

$[\because \tan^{-1}(\tan x)=x,\ -\pi/2<x<\pi/2]$

$\Rightarrow$ $y=\frac{\theta}{2}\Rightarrow y=\frac{1}{2}\cos^{-1}x$

$\therefore$ $\frac{dy}{dx}=-\frac{1}{2\sqrt{1-x^2}}$

Example 32 If $y=\tan^{-1}\sqrt{\frac{1-\cos x}{1+\cos x}}$, then find $\frac{dy}{dx}$, when $0<x<\frac{\pi}{2}$.

Sol. Here, $y=\tan^{-1}\sqrt{\frac{1-\cos x}{1+\cos x}}$

$\Rightarrow$ $y=\tan^{-1}\sqrt{\frac{2\sin^2 x/2}{2\cos^2 x/2}}=\tan^{-1}\sqrt{\tan^2 x/2}$

$\Rightarrow$ $y=\tan^{-1}(\tan x/2)$

$\Rightarrow$ $y=\frac{x}{2}$ $\left[\because \tan^{-1}(\tan x)=x,\ -\frac{\pi}{2}<x<\frac{\pi}{2}\right]$

Hence, $\frac{dy}{dx}=\frac{1}{2}$

Example 33 ***If*** $y=\tan^{-1}\left(\frac{\sqrt{1+x^2}-1}{x}\right)$, ***then find*** $\frac{dy}{dx}$ ***when*** $-1\le x\le 1$.

Sol. Here, $y=\tan^{-1}\left(\frac{\sqrt{1+x^2}-1}{x}\right)$, let $x=\tan\theta$

$\Rightarrow$ $y=\tan^{-1}\left(\frac{\sqrt{1+\tan^2\theta}-1}{\tan\theta}\right)$

$\Rightarrow$ $y=\tan^{-1}\left(\frac{\sec\theta-1}{\tan\theta}\right)$

$\Rightarrow$ $y=\tan^{-1}\left(\frac{1-\cos\theta}{\sin\theta}\right)=\tan^{-1}\left(\frac{2\sin^2\frac{\theta}{2}}{2\sin\frac{\theta}{2}\cos\frac{\theta}{2}}\right)$

$\Rightarrow$ $y=\tan^{-1}\left(\tan\frac{\theta}{2}\right)=\frac{\theta}{2}$

$\Rightarrow$ $y=\frac{1}{2}\tan^{-1}x\ \Rightarrow\ \frac{dy}{dx}=\frac{1}{2(1+x^2)}$

Example 34 ***Find*** $\frac{dy}{dx}$, ***if*** $y=\tan^{-1}\left(\frac{a\cos x-b\sin x}{b\cos x+a\sin x}\right)$, ***where*** $-\frac{\pi}{2}<x<\frac{\pi}{2}$ ***and*** $\frac{a}{b}\tan x>-1$.

Sol. Here, $y=\tan^{-1}\left(\frac{a\cos x-b\sin x}{b\cos x+a\sin x}\right)$

$\Rightarrow$ $y=\tan^{-1}\left(\frac{\frac{a}{b}-\tan x}{1+\frac{a}{b}\tan x}\right)$

$=\tan^{-1}\left(\frac{a}{b}\right)-\tan^{-1}(\tan x)=\tan^{-1}\left(\frac{a}{b}\right)-x$

$\Rightarrow$ $\frac{dy}{dx}=0-1=-1$

Example 35 ***Find*** $\frac{dy}{dx}$ ***for the function***

$$y=\sin^{-1}\left(\frac{5x+12\sqrt{1-x^2}}{13}\right).$$

Sol. Here, $y=\sin^{-1}\left(\frac{5x+12\sqrt{1-x^2}}{13}\right)$

Put $x=\sin\theta, 5=r\cos\phi$ and $12=r\sin\phi$

$\Rightarrow$ $r=\sqrt{(r\cos\phi)^2+(r\sin\phi)^2}$

$=\sqrt{(5)^2+(12)^2}=\sqrt{25+144}=\sqrt{169}=13$

$\phi=\tan^{-1}\left(\frac{12}{5}\right)$

$$\therefore \quad y = \sin^{-1}\left[\frac{r\cos\phi\sin\theta + r\sin\phi\cos\theta}{13}\right]$$

$$\Rightarrow \quad y = \sin^{-1}(\sin(\theta+\phi)) = \theta + \phi$$

$$\Rightarrow \quad y = \sin^{-1}x + \tan^{-1}\left(\frac{12}{5}\right)$$

$$\left[\because \theta = \sin^{-1}x \text{ and } \phi = \tan^{-1}\left(\frac{12}{5}\right)\right]$$

$$\therefore \quad \frac{dy}{dx} = \frac{1}{\sqrt{1-x^2}}$$

Example 36 Find $\frac{dy}{dx}$, for $y = \tan^{-1}\sqrt{\frac{a-x}{a+x}}$, where $-a < x < a$.

Sol. Here, $y = \tan^{-1}\sqrt{\frac{a-x}{a+x}}$, where $-a < x < a$

Put $x = a\cos\theta \Rightarrow \theta = \cos^{-1}\frac{x}{a}$

$$\therefore \quad y = \tan^{-1}\left\{\sqrt{\frac{a-a\cos\theta}{a+a\cos\theta}}\right\}$$

$$\Rightarrow \quad y = \tan^{-1}\left\{\sqrt{\frac{1-\cos\theta}{1+\cos\theta}}\right\}$$

$$\Rightarrow \quad y = \tan^{-1}\left\{\sqrt{\tan^2\frac{\theta}{2}}\right\}$$

$$\Rightarrow \quad y = \tan^{-1}\left|\tan\frac{\theta}{2}\right|$$

Also, $-a < x < a \Rightarrow -1 < \cos\theta < 1$

$$\Rightarrow \quad \theta \in (0,\pi) \Rightarrow \frac{\theta}{2} \in \left(0, \frac{\pi}{2}\right)$$

$$\therefore \quad y = \tan^{-1}\left|\tan\frac{\theta}{2}\right| = \tan^{-1}\left(\tan\frac{\theta}{2}\right) = \frac{\theta}{2}$$

$$\Rightarrow \quad y = \frac{1}{2}\cos^{-1}\frac{x}{a}$$

$$\therefore \quad \frac{dy}{dx} = -\frac{1}{2}\times\frac{1}{\sqrt{1-\frac{x^2}{a^2}}}\frac{d}{dx}\left(\frac{x}{a}\right) = -\frac{1}{2\sqrt{a^2-x^2}}$$

Graphical Approach for Differentiation of Inverse Trigonometric Functions

In this section, we are going to introduce, graphs of some important inverse trigonometric functions which are highly useful in differential calculus.

Example 37 Sketch the graph for $y = \sin^{-1}(\sin x)$ and hence find $\frac{dy}{dx}$.

Sol. As, $y = \sin^{-1}(\sin x)$ is periodic with period 2π.

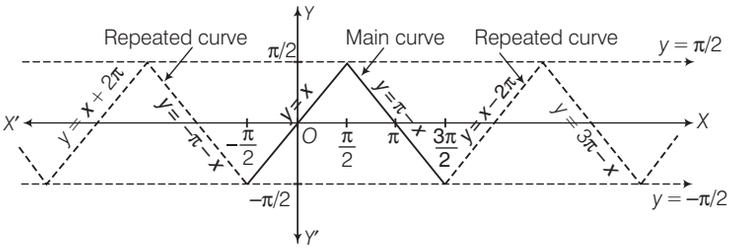
$\therefore$ To draw this graph we should draw the graph for one interval of length 2π and repeat it for entire values of x.

As we know,

$$\sin^{-1}(\sin x) = \begin{cases} x, & -\frac{\pi}{2} \le x \le \frac{\pi}{2} \\ (\pi - x), & -\frac{\pi}{2} \le \pi - x < \frac{\pi}{2} \end{cases} \quad \left(\text{i.e. } \frac{\pi}{2} \le x \le \frac{3\pi}{2}\right)$$

$$\text{or} \quad \sin^{-1}(\sin x) = \begin{cases} x, & -\frac{\pi}{2} \le x \le \frac{\pi}{2} \\ \pi - x, & \frac{\pi}{2} \le x \le \frac{3\pi}{2} \end{cases}$$

which is defined for the interval of length 2π, plotted as;



Thus, the graph for $y = \sin^{-1}(\sin x)$, is a straight line up and a straight line down with slopes 1 and −1 respectively lying between $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$.

$$\text{Thus, } \frac{dy}{dx} = \begin{cases} 1, & \left(2n-\frac{1}{2}\right)\pi < x < \left(2n+\frac{1}{2}\right)\pi \\ -1, & \left(2n+\frac{1}{2}\right)\pi < x < \left(2n+\frac{3}{2}\right)\pi \\ \text{does not exist}, & x = \left\{(2n+1)\frac{\pi}{2}; n \in I\right\} \end{cases}$$

Remark

Students are advised to learn the definition of $\sin^{-1}(\sin x)$ as

$$y = \sin^{-1}(\sin x) = \begin{cases} x + 2\pi, & -\frac{5\pi}{2} \le x \le -\frac{3\pi}{2} \\ -\pi - x, & -\frac{3\pi}{2} \le x \le -\frac{\pi}{2} \\ x, & -\frac{\pi}{2} \le x \le \frac{\pi}{2} \\ \pi - x, & \frac{\pi}{2} \le x \le \frac{3\pi}{2} \\ x - 2\pi & \frac{3\pi}{2} \le x \le \frac{5\pi}{2} \end{cases} \text{... and so on}$$

Example 38 Sketch the graph for $y = \cos^{-1}(\cos x)$ and hence find $\frac{dy}{dx}$.

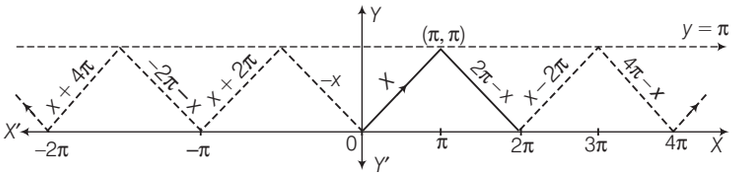
Sol. As, $y = \cos^{-1}(\cos x)$ is periodic with a period 2π.

$\therefore$ To draw this graph, we should draw the graph for one interval of length 2π and repeat it for entire values of x of length 2π.

As we know, $\cos^{-1}(\cos x) = \begin{cases} x, & 0 \le x \le \pi \\ 2\pi - x, & 0 \le 2\pi - x \le \pi \end{cases}$

or $\cos^{-1}(\cos x) = \begin{cases} x, & 0 \le x \le \pi \\ 2\pi - x, & \pi \le x \le 2\pi \end{cases}$

Thus, it has been defined for $0 < x < 2\pi$ that has length 2π. So, its graph could be plotted as



Thus, the curve $y = \cos^{-1}(\cos x)$ and hence

$$\frac{dy}{dx} = \begin{cases} \text{does not exist}, & x = \{n\pi, n \in I\} \\ 1, & 2n\pi < x < (2n+1)\pi \\ -1, & (2n+1)\pi < x < (2n+2)\pi \end{cases}$$

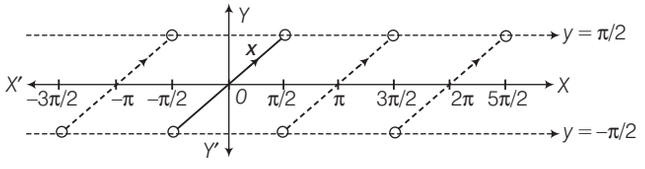
Example 39 Sketch the graph for $y = \tan^{-1}(\tan x)$ and hence find $\frac{dy}{dx}$.

Sol. As, $y = \tan^{-1}(\tan x)$ is periodic with period π.

$\therefore$ To draw this graph we should draw the graph for one interval of length π and repeat it for entire values of x.

As we know, $\tan^{-1}(\tan x) = \left\{ x, -\frac{\pi}{2} < x < \frac{\pi}{2} \right\}$

Thus, it has been defined for $-\frac{\pi}{2} < x < \frac{\pi}{2}$ that has length π. So, its graph could be plotted as



Thus, the curve for $y = \tan^{-1}(\tan x)$, where y is not defined for $x \in (2n+1)\frac{\pi}{2}$.

and hence $\frac{dy}{dx} = \begin{cases} 1, & \left(2n - \frac{1}{2}\right)\pi < x < \left(2n + \frac{1}{2}\right)\pi \\ \text{does not exit}, & x = (2n+1)\frac{\pi}{2} \end{cases}$

Example 40 ***Sketch the graphs for***

(i) $y = \sin(\sin^{-1} x)$ *(ii)* $y = \cos(\cos^{-1} x)$

(iii) $y = \tan(\tan^{-1} x)$ *(iv)* $y = \text{cosec}(\text{cosec}^{-1} x)$

(v) $y = \sec(\sec^{-1} x)$

(vi) $y = \cot(\cot^{-1} x)$ and hence find $\frac{dy}{dx}$

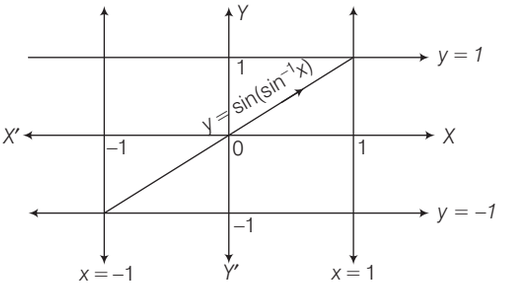
Sol. As we know, all the above mentioned six curves are non-periodic, but have restricted domains and ranges.

So, we shall first define each curve for its domain and range and then sketch the curves.

(i) **Sketch for the curve $y = \sin(\sin^{-1} x)$**

We know that, domain $x \in [-1, 1]$, i.e. $-1 \le x \le 1$ and range $y = x \Rightarrow y \in [-1, 1]$.

Hence, we should sketch $y = \sin(\sin^{-1} x)$ only when $x \in [-1, 1]$ and $y = x$. So, its graph could be plotted as shown in the figure.



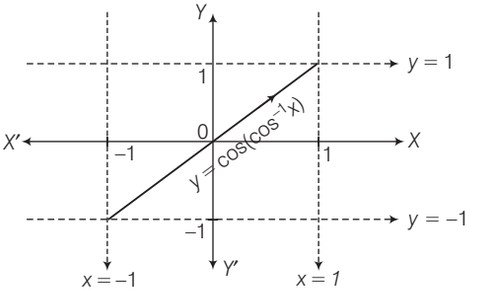
Thus, $y = \sin(\sin^{-1} x) = x, -1 \le x \le 1$.

$\Rightarrow \quad \frac{dy}{dx} = 1, \ -1 < x < 1.$

(ii) **Sketch for the curve $y = \cos(\cos^{-1} x)$**

We know that, domain $x \in [-1, 1]$, i.e. $-1 \le x \le 1$ and range $y = x \Rightarrow y \in [-1, 1]$.

Hence, we should sketch $y = \cos(\cos^{-1} x) = x$ only when $x \in [-1, 1]$. So, its graph could be plotted as shown in the figure.



Thus, $y = \cos(\cos^{-1} x) = x, -1 \le x \le 1$

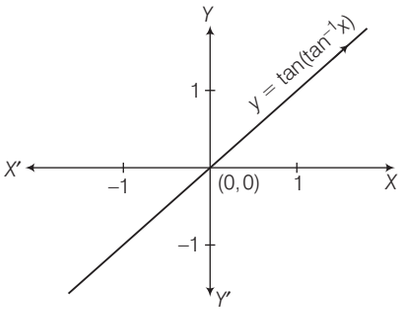
$\Rightarrow \quad \frac{dy}{dx} = 1, \ -1 < x < 1.$

(iii) **Sketch for the curve $y = \tan(\tan^{-1} x)$**

We know that, domain $x \in R$, i.e. $-\infty < x < \infty$
and range $y = x \Rightarrow y \in R$.

Hence, we should sketch $y = \tan(\tan^{-1} x) = x$,
$\forall\ x \in R$.

So, its graph could be plotted as shown in the figure.

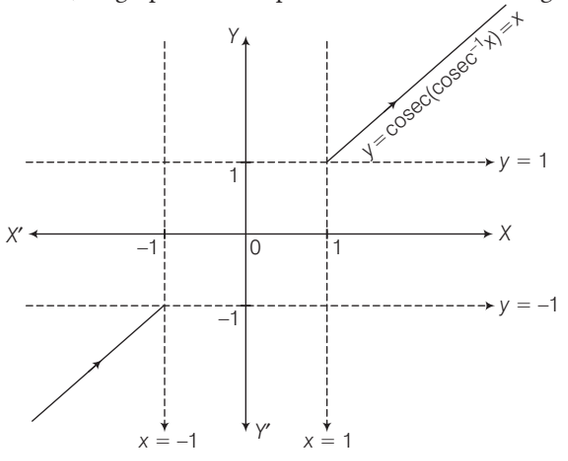


Thus, $y = \tan(\tan^{-1} x) = x,\ x \in R$

$\Rightarrow \quad \dfrac{dy}{dx} = 1,\ x \in R$

(iv) **Sketch for the curve $y = \text{cosec}(\text{cosec}^{-1} x)$**

We know that, domain $\in R - (-1, 1)$
(i.e. $-\infty < x \le -1$ or $1 \le x < \infty$)
and range $y = x \Rightarrow y \in R - (-1, 1)$.
Hence, we should sketch
$y = \text{cosec}(\text{cosec}^{-1} x) = x$ only when
$x \in (-\infty, -1] \cup [1, \infty)$.
So, its graph could be plotted as shown in the figure.



Thus, $y = \text{cosec}(\text{cosec}^{-1} x) = x,\ |x| \ge 1$

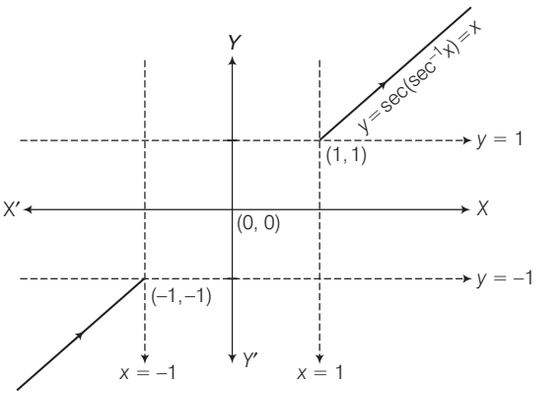
$\Rightarrow \quad \dfrac{dy}{dx} = 1,\ |x| > 1$

(v) **Sketch for the curve $y = \sec(\sec^{-1} x)$**

We know that, domain $\in R - (-1, 1)$
(i.e. $-\infty < x \le -1$ or $1 \le x < \infty$)
and range $y = x$
$\Rightarrow \quad y \in R - (-1, 1)$
Hence, we should sketch $y = \sec(\sec^{-1} x) = x$, only when

$$x \in (-\infty, -1] \cup [1, \infty)$$

So, its graph could be plotted as shown in the figure.

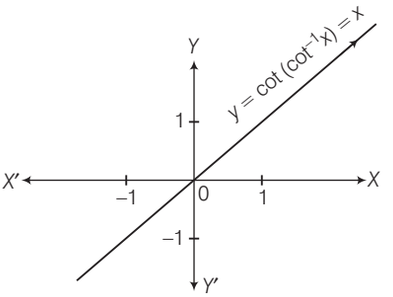


Thus, $y = \sec(\sec^{-1} x) = x,\ |x| \ge 1$

$\Rightarrow \quad \dfrac{dy}{dx} = 1,\ |x| > 1$

(vi) **Sketch for the curve $y = \cot(\cot^{-1} x)$**

We know that, domain $\in R$ (i.e. $-\infty < x < \infty$)
and range $y = x$
$\Rightarrow \quad y = R$.
Hence, we should sketch
$y = \cot(\cot^{-1} x) = x,\ \forall\ x \in R$.
So, its graph could be plotted as shown in the figure.



Thus, $y = \cos(\cot^{-1} x) = x,\ x \in R$

$\Rightarrow \quad \dfrac{dy}{dx} = 1,\ x \in R$.

Exercise for Session 4

1. If $y = \tan^{-1}\left(\frac{1-\cos x}{\sin x}\right)$, then $\frac{dy}{dx}$ is

(a) $\begin{cases} \frac{1}{2}, & x \in R - \{n\pi\}; \quad n \in I \\ -\frac{1}{2}, & x = \{n\pi\}; \qquad n \in I \end{cases}$

(b) $\begin{cases} \frac{1}{2}, & x \in R - \{n\pi\}; \quad n \in I \\ \text{does not exist}, & x = \{n\pi\}; \qquad n \in I \end{cases}$

(c) $\begin{cases} -\frac{1}{2}, & x \in R - \{n\pi\}; \quad n \in I \\ \text{does not exist}, & x = \{n\pi\}; \qquad n \in I \end{cases}$

(d) None of these

2. If $y = \cos^{-1}\left(\frac{x - x^{-1}}{x + x^{-1}}\right)$, then $\frac{dy}{dx}$ is

(a) $\begin{cases} \frac{2}{1+x^2}, & x > 0 \\ -\frac{2}{1+x^2}, & x < 0 \end{cases}$

(b) $\begin{cases} \frac{2}{1+x^2}, & x > 0 \\ \text{does not exist}, & x = 0 \\ \frac{-2}{1+x^2}, & x < 0 \end{cases}$

(c) $\begin{cases} \frac{2}{1+x^2}, & x < 0 \\ \text{does not exist}, & x = 0 \\ \frac{-2}{1+x^2}, & x > 0 \end{cases}$

(d) None of these

3. If $y = \tan^{-1}\left\{\frac{\sqrt{1+\sin x} + \sqrt{1-\sin x}}{\sqrt{1+\sin x} - \sqrt{1-\sin x}}\right\}$, then $\frac{dy}{dx}$ is

(a) $\begin{cases} \frac{1}{2}, & \cos\frac{x}{2} > \sin\frac{x}{2} \\ -\frac{1}{2}, & \cos\frac{x}{2} < \sin\frac{x}{2} \\ \text{does not exist}, & x = \{n\pi\}; n \in \text{integer} \end{cases}$

(b) $\begin{cases} -\frac{1}{2}, & \cos\frac{x}{2} > \sin\frac{x}{2} \\ \frac{1}{2}, & \cos\frac{x}{2} < \sin\frac{x}{2} \\ \text{does not exist}, & x = \{n\pi\}; n \in \text{integer} \end{cases}$

(c) $\begin{cases} -\frac{1}{2}, & \cos\frac{x}{2} \geq \sin\frac{x}{2} \\ \frac{1}{2}, & \cos\frac{x}{2} < \sin\frac{x}{2} \end{cases}$

(d) None of these

4. If $y = \cot^{-1}(\cot x)$, then $\frac{dy}{dx}$ is

(a) $1, x \in R$

(b) $1, x \in R - \{n\pi\}$

(c) $\begin{cases} 1, & x \in R - \{n\pi\} \\ \text{does not exist}, & x \in \{n\pi\}; n \in \text{integer} \end{cases}$

(d) None of these

5. Sketch the graph for

(i) $y = \sin^{-1}\left(\frac{2x}{1+x^2}\right)$

(ii) $y = \cos^{-1}\left(\frac{1-x^2}{1+x^2}\right)$

(iii) $y = \tan^{-1}\left(\frac{2x}{1-x^2}\right)$

(iv) $y = \tan^{-1}\left(\frac{3x - x^3}{1-3x^2}\right)$

(v) $y = \sin^{-1}(3x - 4x^3)$

(vi) $y = \cos^{-1}(4x^3 - 3x)$

Session 5

Differentiation of a Function in Parametric Form

Differentiation of a Function in Parametric Form

Until now we have differentiate the variable y w.r.t. x, but what can we do if the variable x and y are depend on third variable 't' (say) i.e. $x = g(t), y = f(t)$. In such case x and y are called parametric functions and t is called parameter.

In this case to find $\frac{dy}{dx}$, we first obtain the relationship between x and y by eliminating the parameter t, then we differentiate w.r.t. x. But always, it is not possible to eliminate t, then we use the following formula

$$\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{f'(t)}{g'(t)}$$

Example 41 If $x = e^{-t^2}$ and $y = \tan^{-1}(2t+1)$, then find $\frac{dy}{dx}$.

Sol. Here, $x = e^{-t^2}$

On differentiating both sides, we get

$$\frac{dx}{dt} = e^{-t^2} \cdot (-2t) \text{ and } y = \tan^{-1}(2t+1)$$

On differentiating both sides, we get

$$\frac{dy}{dt} = \frac{1}{1+(2t+1)^2}(2)$$

$$\therefore \quad \frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{\frac{2}{1+(4t^2+4t+1)}}{-\frac{2t}{e^{t^2}}}$$

Hence, $$\frac{dy}{dx} = \frac{-e^{t^2}}{2t(2t^2+2t+1)}$$

Example 42 If $x = a(\theta - \sin\theta)$, $y = a(1-\cos\theta)$, then find $\frac{dy}{dx}$.

Sol. Here, $x = a(\theta - \sin\theta)$

On differentiating both the sides, we get

$$\frac{dx}{d\theta} = a(1-\cos\theta)$$

and $y = a(1-\cos\theta)$

On differentiating both sides, we get

$$\frac{dy}{d\theta} = a(\sin\theta)$$

So, $$\frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = \frac{a\sin\theta}{a(1-\cos\theta)} = \frac{2\sin\frac{\theta}{2}\cos\frac{\theta}{2}}{2\sin^2\frac{\theta}{2}} = \cot\frac{\theta}{2}$$

Example 43 If $x = \sqrt{a^{\sin^{-1}t}}$, $y = \sqrt{a^{\cos^{-1}t}}$, $a > 0$ and $-1 < t < 1$. Show that $\frac{dy}{dx} = -\frac{y}{x}$.

Sol. Given, $x = \sqrt{a^{\sin^{-1}t}}$ and $y = \sqrt{a^{\cos^{-1}t}}$

$$\Rightarrow \quad \frac{dx}{dt} = \frac{1}{2}(a^{\sin^{-1}t})^{-\frac{1}{2}} \frac{d}{dt}(a^{\sin^{-1}t})$$

$$\Rightarrow \quad \frac{dx}{dt} = \frac{1}{2}(a^{\sin^{-1}t})^{-\frac{1}{2}} \cdot a^{\sin^{-1}t} \log_e a \times \frac{1}{\sqrt{1-t^2}} = \frac{x \log_e a}{2\sqrt{1-t^2}}$$

Again, $$\frac{dy}{dt} = \frac{1}{2}(a^{\cos^{-1}t})^{-1/2} \frac{d}{dt}(a^{\cos^{-1}t})$$

$$= \frac{1}{2}(a^{\cos^{-1}t})^{-1/2} \cdot a^{\cos^{-1}t} \log_e a \times \left(\frac{1}{\sqrt{1-t^2}}\right) = \frac{-y \log_e a}{2\sqrt{1-t^2}}$$

So, $$\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = -\frac{y}{x}$$

Aliter

We have, $xy = \sqrt{a^{\sin^{-1}t}} \cdot \sqrt{a^{\cos^{-1}t}} = \sqrt{a^{\sin^{-1}t + \cos^{-1}t}} = \sqrt{a^{\pi/2}}$

$$\Rightarrow \quad x^2y^2 = a^{\pi/2} \qquad \left[\because \sin^{-1}x + \cos^{-1}x = \frac{\pi}{2}\right]$$

On differentiating, we get

$$2xy^2 + 2x^2y\frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = -\frac{y}{x}$$

Example 44 If $x = a\left(\cos t + \frac{1}{2}\log \tan^2 t\right)$ and $y = a \sin t$, then find $\frac{dy}{dx}$ at $t = \frac{\pi}{4}$.

Sol. Here, $x = a\left(\cos t + \frac{1}{2}\log \tan^2 t\right)$ and $y = a \sin t$

On differentiating both equations w.r.t. t, we get

$$\frac{dx}{dt} = a\left(-\sin t + \frac{1}{\tan \frac{t}{2}} \sec^2 \frac{t}{2} \times \frac{1}{2}\right)$$

$$\Rightarrow \quad \frac{dx}{dt} = a\left(-\sin t + \frac{1}{2 \sin \frac{t}{2} \cos \frac{t}{2}}\right)$$

$$\Rightarrow \quad \frac{dx}{dt} = a\left(-\sin t + \frac{1}{\sin t}\right) = \frac{a \cos^2 t}{\sin t} \text{ and } \frac{dy}{dt} = a \cos t$$

So, $\frac{dy}{dx} = \frac{dy}{dt} / \frac{dx}{dt} = \frac{a \cos t}{\frac{a \cos^2 t}{\sin t}} = \tan t$

$$\Rightarrow \left(\frac{dy}{dx}\right)_{t = \frac{\pi}{4}} = \tan \frac{\pi}{4} = 1$$

Exercise for Session 5

1. If $x = 2\cos \theta - \cos 2\theta$ and $y = 2 \sin \theta - \sin 2\theta$, prove that $\frac{dy}{dx} = \tan\left(\frac{3\theta}{2}\right)$.
2. If $x = e^{\cos 2t}$ and $y = e^{\sin 2t}$, then prove that $\frac{dy}{dx} = \frac{-y \log x}{x \log y}$.
3. If $x = \cos t$ and $y = \sin t$, then prove that $\frac{dy}{dx} = \frac{1}{\sqrt{3}}$, at $t = \frac{2\pi}{3}$.
4. If $x = a\left(t + \frac{1}{t}\right)$ and $y = a\left(t - \frac{1}{t}\right)$, then prove that $\frac{dy}{dx} = \frac{x}{y}$.
5. If $x = \sin^{-1}\left(\frac{2t}{1+t^2}\right)$ and $y = \tan^{-1}\left(\frac{2t}{1-t^2}\right)$, then prove that $\frac{dy}{dx} = 1$.
6. If $x = a \sec^3 \theta$ and $y = a \tan^3 \theta$, then find $\frac{dy}{dx}$ at $\theta = \frac{\pi}{3}$.
7. Let $y = x^3 - 8x + 7$ and $x = f(t)$. If $\frac{dy}{dt} = 2$ and $x = 3$ at $t = 0$, then find the value of $\frac{dx}{dt}$ at $t = 0$.

Session 6

Logarithmic Differentiation, Differentiation of Infinite Series

Logarithmic Differentiation

So far, we have discussed derivatives of the functions of the form $(f(x))^n$, $n^{f(x)}$ and n^n, where $f(x)$ is a function of x and n is a constant. In this section, we will mainly be discussing derivatives of the functions of the form $(f(x))^{g(x)}$, where $f(x)$ and $g(x)$ are functions of x or $f(x)s(x)h(x)\ldots$ or $\dfrac{f_1(x)f_2(x)\ldots}{g_1(x)g_2(x)\ldots}$

To find the derivatives of these types of functions, we proceed as follows

Let $\boldsymbol{y = (f(x))^{g(x)}}$

Taking logarithm on both sides, we have

$$\log y = g(x)\log\{f(x)\}$$

Differentiating w.r.t. x, we get

$$\frac{1}{y}\cdot\frac{dy}{dx} = g(x)\cdot\frac{1}{f(x)}\cdot\frac{d\,f(x)}{dx} + \log\{f(x)\}\cdot\frac{d\,g(x)}{dx}$$

$$\therefore\quad \frac{dy}{dx} = y\left[\frac{g(x)}{f(x)}\cdot\frac{d\,f(x)}{dx} + \log\{f(x)\}\cdot\frac{d\,g(x)}{dx}\right]$$

or $$\boldsymbol{\frac{dy}{dx} = (f(x))^{g(x)}\left\{\frac{g(x)}{f(x)}\cdot\frac{d\,f(x)}{dx} + \log\{f(x)\}\cdot\frac{d\,g(x)}{dx}\right\}}$$

Logarithmic Differentiation

(For Quickly Solving Objective MCQs)

If $y = \{f(x)\}^{\phi(x)}$, then

$$\boldsymbol{\frac{dy}{dx}} = \textbf{Differentiation of } y \textbf{ taking } f(x) \textbf{ as constant} + \textbf{Differentiation of } y \textbf{ taking } \phi(x) \textbf{ as constant.}$$

or when we have to differentiate the function of the form $y = (\text{Variable})^{\text{variable}}$, take log on both sides and then differentiate.

Example 45 *If* $y = x^{\sin x}$, *then find* $\dfrac{dy}{dx}$.

Sol. $y = x^{\sin x}$, taking log on both sides, we get

$$\log y = \sin x \log x$$

On differentiating both sides, we get

$$\frac{1}{y}\frac{dy}{dx} = \sin x\cdot\left(\frac{1}{x}\right) + \log x\cdot(\cos x)$$

$$\Rightarrow\quad \frac{dy}{dx} = y\left[\frac{\sin x}{x} + (\cos x)\log x\right]$$

$$\therefore\quad \frac{dy}{dx} = x^{\sin x}\left[\frac{\sin x}{x} + (\cos x)\log x\right]$$

Aliter

Here, $y = x^{\sin x}$ could also be differentiated by using definition;

$$\frac{d}{dx}(\text{variable})^{\text{variable}} = \frac{d}{dx}(\text{variable})^{\text{constant}} + \frac{d}{dx}(\text{constant})^{\text{variable}}$$

i.e. $$\frac{dy}{dx} = \underset{\text{variable}\quad\text{constant}}{\frac{d}{dx}(x)^{\sin x}} + \underset{\text{constant}\qquad\text{variable}}{\frac{d}{dx}(x)^{\sin x}}$$

$$= \sin x\,(x)^{\sin x - 1} + (x)^{\sin x}\cdot(\log x)\cdot\cos x$$

$$= (\sin x)\frac{(x)^{\sin x}}{x} + (x)^{\sin x}\cdot\log x\cdot\cos x$$

$$= x^{\sin x}\left\{\frac{\sin x}{x} + \cos x\cdot\log x\right\}$$

Example 46 *If* $x^y\cdot y^x = 1$, *then find* $\dfrac{dy}{dx}$.

Sol. Taking log on both the sides, $y\log x + x\log y = \log 1$

Differentiating both the sides, we get

$$y\cdot\frac{d}{dx}(\log x) + \left\{\frac{d}{dx}y\right\}\cdot\log x + \left\{\frac{d}{dx}x\right\}\cdot\log y + x\left\{\frac{d}{dx}\log y\right\} = 0$$

$$\Rightarrow\quad y\cdot\frac{1}{x} + \log x\cdot\frac{dy}{dx} + 1\cdot\log y + x\cdot\frac{1}{y}\cdot\frac{dy}{dx} = 0$$

$$\Rightarrow\quad \left[\log x + \frac{x}{y}\right]\frac{dy}{dx} = -\left[\frac{y}{x} + \log y\right]$$

$$\Rightarrow\quad \frac{dy}{dx} = -\frac{(y + x\log y)}{(x + y\log x)}\cdot\frac{y}{x}$$

Example 47 If $y^{\cot x} + (\tan^{-1} x)^y = 1$, then find $\frac{dy}{dx}$.

Sol. Let $u = y^{\cot x}$ and $v = (\tan^{-1} x)^y$, we get

$$u + v = 1 \quad \text{...(i)}$$

Taking log on both sides for u and v, we get

$$\log u = \cot x \log y \text{ and } \log v = y \log (\tan^{-1} x)$$

On differentiating both sides, we get

$$\frac{1}{u} \cdot \frac{du}{dx} = \cot x \cdot \frac{1}{y}\frac{dy}{dx} + \log y \cdot (-\text{cosec}^2 x)$$

$$\Rightarrow \quad \frac{du}{dx} = y^{\cot x}\left[\frac{\cot x}{y} \cdot \frac{dy}{dx} - (\text{cosec}^2 x) \log y\right] \quad \text{...(ii)}$$

Again, differentiating $\log v = y \log (\tan^{-1} x)$, we get

$$\frac{1}{v} \cdot \frac{dv}{dx} = y \cdot \frac{1}{\tan^{-1} x} \cdot \frac{1}{1 + x^2} + \log (\tan^{-1} x) \cdot \frac{dy}{dx}$$

$$\Rightarrow \quad \frac{dv}{dx} = (\tan^{-1} x)^y \left[\frac{y}{(1 + x^2) \tan^{-1} x} + \log (\tan^{-1} x) \cdot \frac{dy}{dx}\right] \quad \text{...(iii)}$$

From Eq. (i), we get $\frac{du}{dx} + \frac{dv}{dx} = 0$

$$\Rightarrow y^{\cot x}\left\{\frac{\cot x}{y} \cdot \frac{dy}{dx} - (\text{cosec}^2 x) \log y\right\} + (\tan^{-1} x)^y \left[\frac{y}{(1 + x^2) \tan^{-1} x} + \log (\tan^{-1} x) \cdot \frac{dy}{dx}\right] = 0$$

$$\Rightarrow \quad \left\{\frac{y^{\cot x} \cdot \cot x}{y} + (\tan^{-1} x)^y \cdot \log (\tan^{-1} x)\right\}\frac{dy}{dx} = \left\{y^{\cot x} \cdot (\text{cosec}^2 x) \log y - \frac{(\tan^{-1} x)^y \cdot y}{(1 + x^2) \tan^{-1} x}\right\}$$

Hence, $\frac{dy}{dx} = \frac{(y^{\cot x} \cdot \text{cosec}^2 x \cdot \log y) - \left\{\frac{(\tan^{-1} x)^{y-1} \cdot y}{1 + x^2}\right\}}{(y^{\cot x - 1} \cdot \cot x) + \{(\tan^{-1} x)^y \cdot \log (\tan^{-1} x)\}}$

Derivative of the Product of Finite Number of Functions

Example 48 If $f(x) = (x + 1)(x + 2)(x + 3) \ldots (x + n)$, then find $f'(0)$.

Sol. Here $f(x) = (x + 1)(x + 2)(x + 3) \ldots (x + n)$

$$\log f(x) = \log \{(x + 1)(x + 2) \ldots (x + n)\}$$

Differentiating both sides w.r.t. x, we get

$$\frac{1}{f(x)} f'(x) = \frac{1}{x + 1} + \frac{1}{x + 2} + \frac{1}{x + 3} + \ldots + \frac{1}{x + n}$$

$$\therefore \quad f'(0) = f(0)\left\{1 + \frac{1}{2} + \frac{1}{3} + \ldots + \frac{1}{n}\right\}$$

$$= (1 \cdot 2 \cdot 3 \cdot \ldots \cdot n)\left\{1 + \frac{1}{2} + \frac{1}{3} + \ldots + \frac{1}{n}\right\}$$

$$= (n)!\left\{1 + \frac{1}{2} + \frac{1}{3} + \ldots + \frac{1}{n}\right\}$$

Example 49 If $f(x) = \prod_{n=1}^{100} (x - n)^{n(101-n)}$, then find $\frac{f(101)}{f'(101)}$.

Sol. $f(x) = \prod_{n=1}^{100} (x - n)^{n(101-n)}$

$$\Rightarrow \quad \log f(x) = \left\{n(101 - n) \log\left\{\prod_{n=1}^{100} (x - n)\right\}\right\}$$

{Here, Π changes to Σ when taken log}

$$\Rightarrow \quad \log f(x) = \sum_{n=1}^{100} n(101 - n) \log (x - n)$$

Differentiating both sides, we get

$$\frac{f'(x)}{f(x)} = \sum_{n=1}^{100} n(101 - n) \cdot \frac{1}{x - n}$$

$$\therefore \quad \frac{f'(101)}{f(101)} = \sum_{n=1}^{100} \frac{n(101 - n)}{(101 - n)} = \sum_{n=1}^{100} n = 5050$$

$$\Rightarrow \quad \frac{f(101)}{f'(101)} = \frac{1}{5050}$$

Differentiation of Infinite Series

When the value of y is given as an infinite series, then we use the fact that, if one term is deleted from an infinite series, it remains unaffected, to replace all terms except first term by y. Thus, we convert it into a finite series or function.

Example 50 If $y = \sqrt{\log x + \sqrt{\log x + \sqrt{\log x + \ldots \infty}}}$ then find $\frac{dy}{dx}$.

Sol. We have, $y = \sqrt{\log x + \sqrt{\log x + \sqrt{\log x + \ldots \infty}}}$

Then $\quad y = \sqrt{\log x + y}$

$$\Rightarrow \quad y^2 = \log x + y$$

Differentiating both sides, we get

$$2y \cdot \frac{dy}{dx} = \frac{1}{x} + \frac{dy}{dx}$$

$$\Rightarrow \quad \frac{dy}{dx}(2y - 1) = \frac{1}{x}$$

$$\Rightarrow \quad \frac{dy}{dx} = \frac{1}{x(2y - 1)}$$

Exercise for Session 6

■ **Directions** (Q. Nos. 1 to 10) *Differentiate the following functions w.r.t. x.*

1. x^x **2.** $x^{\sqrt{x}}$ **3.** x^{x^x}

4. $(x^x)^x$ **5.** $(x^x)\sqrt{x}$ **6.** $(\cos x)^x$

7. $(\sin x)^{\cos x}$ **8.** $(\sin x)^{\cos^{-1} x}$ **9.** $\cos(x^x)$

10. $\log(x^x + \operatorname{cosec}^2 x)$

11. If $y = (\sin x)^{\tan x} + (\cos x)^{\sec x}$, then find $\frac{dy}{dx}$.

12. If $x^y = e^{x-y}$, then prove that $\frac{dy}{dx} = \frac{\log x}{(1+\log x)^2}$

13. If $x^y + y^x = 2$, then find $\frac{dy}{dx}$.

14. If $(\cos x)^y = (\sin y)^x$, then find $\frac{dy}{dx}$.

15. If $x \sin(a+y) + \sin a \cdot \cos(a+y) = 0$. Prove that $\frac{dy}{dx} = \frac{\sin^2(a+y)}{\sin a}$.

16. If $y = \sqrt{\cos x + \sqrt{\cos x + \sqrt{\cos x + \ldots \infty}}}$, then prove that $\frac{dy}{dx} = \frac{\sin x}{1-2y}$.

17. If $y = (\tan x)^{(\tan x)^{(\tan x)^{\cdots \infty}}}$, then prove that $\frac{dy}{dx} = 2$ at $x = \frac{\pi}{4}$.

18. If $y = e^{x^{e^x}} + x^{e^{e^x}} + e^{x^{x^e}}$, then prove that

$$\frac{dy}{dx} = e^{x^{e^x}} \cdot x^{e^x} \cdot \left\{\frac{e^x}{x} + e^x \cdot \log x\right\} + x^{e^{e^x}} \cdot e^{e^x} \cdot \left\{\frac{1}{x} + e^x \cdot \log x\right\} + e^{x^{x^e}} \cdot x^{x^e} \cdot x^{e-1}\{1 + e \log x\}.$$

19. If $y = \tan^{-1}\left(\frac{a_1 x - \alpha}{a_1 \alpha + x}\right) + \tan^{-1}\left(\frac{a_2 - a_1}{1 + a_1 a_2}\right) + \tan^{-1}\left(\frac{a_3 - a_2}{1 + a_2 a_3}\right) + \ldots + \tan^{-1}\left(\frac{a_n - a_{n-1}}{1 + a_n a_{n-1}}\right) - \tan^{-1}(a_n)$, then find $\frac{dy}{dx}$.

Session 7

Differentiation of a Function w.r.t. Another Function

Differentiation of a Function w.r.t. Another Function

Suppose it is required to differentiate a function $f(x)$ with respect to another function $g(x)$. Let $y = f(x)$ and $z = g(x)$. Here, both functions are different but both are in same variable x.

Then, to find the derivative of $f(x)$ with respect to $g(x)$ or derivative of $g(x)$ with respect to $f(x)$, i.e. to find $\frac{dy}{dz}$ or $\frac{dz}{dy}$. We firstly differentiate both functions $f(x)$ and $g(x)$ with respect to x separately and then put these values in the following formulae:

$$\frac{dy}{dz} = \frac{dy/dx}{dz/dx} \quad \text{or} \quad \frac{dz}{dy} = \frac{dz/dx}{dy/dx}$$

Example 51 ***Differentiate*** $\sin^{-1}\left(\frac{2x}{1+x^2}\right)$ ***w.r.t.*** $\tan^{-1} x$, $-1 < x < 1$.

Sol. Let $u = \sin^{-1}\left(\frac{2x}{1+x^2}\right)$ and $v = \tan^{-1} x$

Putting $x = \tan\theta \Rightarrow \theta = \tan^{-1} x$

$$\Rightarrow \quad u = \sin^{-1}\left(\frac{2\tan\theta}{1+\tan^2\theta}\right)$$

$$\Rightarrow \quad u = \sin^{-1}(\sin 2\theta) \qquad \left[\because \sin 2\theta = \frac{2\tan\theta}{1+\tan^2\theta}\right]$$

$$\Rightarrow \quad u = 2\theta \Rightarrow u = 2\tan^{-1} x$$

$$\Rightarrow \quad \frac{du}{dx} = \frac{2}{1+x^2} \qquad \text{...(i)}$$

Again, $v = \tan^{-1} x \Rightarrow \frac{dv}{dx} = \frac{1}{1+x^2}$ ...(ii)

Now, $$\frac{du}{dv} = \frac{du/dx}{dv/dx} = \frac{\frac{2}{1+x^2}}{\frac{1}{1+x^2}} = 2$$

Example 52 ***If*** $x \in \left(\frac{1}{\sqrt{2}}, 1\right)$. ***Differentiate*** $\tan^{-1}\left(\frac{\sqrt{1-x^2}}{x}\right)$ ***w.r.t.*** $\cos^{-1}(2x\sqrt{1-x^2})$.

Sol. Let $u = \tan^{-1}\left(\frac{\sqrt{1-x^2}}{x}\right)$

and $v = \cos^{-1}(2x\sqrt{1-x^2})$

Putting $x = \sin\theta$, then $x \in \left(\frac{1}{\sqrt{2}}, 1\right)$

$$\Rightarrow \quad \frac{1}{\sqrt{2}} < \sin\theta < 1 \Rightarrow \frac{\pi}{4} < \theta < \frac{\pi}{2}$$

Now, $u = \tan^{-1}\left(\frac{\sqrt{1-x^2}}{x}\right) \Rightarrow u = \tan^{-1}\left(\frac{\sqrt{1-\sin^2\theta}}{\sin\theta}\right)$

$$\Rightarrow \quad u = \tan^{-1}\left(\frac{\cos\theta}{\sin\theta}\right) \Rightarrow u = \tan^{-1}(\cot\theta)$$

$$\Rightarrow \quad u = \tan^{-1}\left\{\tan\left(\frac{\pi}{2} - \theta\right)\right\}$$

$$\left[\because \frac{\pi}{4} < \theta < \frac{\pi}{2} \Rightarrow 0 < \frac{\pi}{2} - \theta < \frac{\pi}{4}\right]$$

$$\Rightarrow \quad u = \frac{\pi}{2} - \theta \Rightarrow u = \frac{\pi}{2} - \sin^{-1} x$$

$$\Rightarrow \quad \frac{du}{dx} = -\frac{1}{\sqrt{1-x^2}} \qquad \text{...(i)}$$

Again, $v = \cos^{-1}(2x\sqrt{1-x^2})$

$$\Rightarrow \quad v = \frac{\pi}{2} - \sin^{-1}(2x\sqrt{1-x^2})$$

$$\Rightarrow \quad v = \frac{\pi}{2} - \sin^{-1}(\sin 2\theta), \text{ where } x = \sin\theta$$

$$\Rightarrow \quad v = \frac{\pi}{2} - \sin^{-1}(\sin(\pi - 2\theta)) \Rightarrow v = \frac{\pi}{2} - (\pi - 2\theta)$$

$$\left[\because \frac{\pi}{4} < \theta < \frac{\pi}{2} \Rightarrow 0 < \pi - 2\theta > \frac{\pi}{2}\right]$$

$$\Rightarrow \quad v = -\frac{\pi}{2} + 2\theta \Rightarrow v = -\frac{\pi}{2} + 2\sin^{-1} x$$

$$\Rightarrow \quad \frac{dv}{dx} = \frac{2}{\sqrt{1-x^2}} \qquad \text{...(ii)}$$

$$\therefore \quad \frac{du}{dv} = \frac{\frac{du}{dx}}{\frac{dv}{dx}} = \frac{-\frac{1}{\sqrt{1-x^2}}}{\frac{2}{\sqrt{1-x^2}}} = -\frac{1}{2}$$

Example 53 *Find the derivative of* $\sec^{-1}\left(\frac{1}{2x^2-1}\right)$ *w.r.t.* $\sqrt{1-x^2}$ *at* $x=\frac{1}{2}$.

Sol. Let $u=\sec^{-1}\left(\frac{1}{2x^2-1}\right)$ and $v=\sqrt{1-x^2}$

Put $x=\cos\theta$

$\therefore$ $u=\sec^{-1}(\sec 2\theta)=2\theta$

and $v=\sqrt{1-\cos^2\theta}=\sin\theta$

$\Rightarrow$ $\frac{du}{d\theta}=2$

and $\frac{dv}{d\theta}=\cos\theta$

$\Rightarrow$ $\frac{du}{dv}=\frac{du/d\theta}{dv/d\theta}=\frac{2}{\cos\theta}=\frac{2}{x}$

Now, $\left(\frac{du}{dv}\right)_{\text{at } x=\frac{1}{2}}=\frac{2}{\frac{1}{2}}=4$

Example 54 If $y=f(x^3)$, $z=g(x^5)$, $f'(x)=\tan x$ and $g'(x)=\sec x$, then find the value of $\lim_{x\to 0}\frac{dy/dz}{x}$.

Sol. Here, $y=f(x^3)\Rightarrow \frac{dy}{dx}=f'(x^3)\cdot 3x^2$

$\frac{dy}{dx}=3x^2\tan x^3$ $[\because f'(x)=\tan x]$

and $z=g(x^5)\Rightarrow \frac{dz}{dx}=g'(x^5)\cdot 5x^4$

$\frac{dz}{dx}=5x^4\cdot\sec x^5$ $[\because g'(x)=\sec x]$

Now, $\frac{dy}{dz}=\frac{3x^2\tan x^3}{5x^4\sec x^5}=\frac{3}{5x^2}\times\frac{\tan x^3}{\sec x^5}$

$\therefore$ $\lim_{x\to 0}\frac{\frac{dy}{dz}}{x}=\lim_{x\to 0}\frac{3\tan x^3}{5x^3\sec x^5}=\frac{3}{5}$

Example 55 Find the derivative of $f(\tan x)$ w.r.t. $g(\sec x)$ at $x=\frac{\pi}{4}$, where $f'(1)=2$ and $g'(\sqrt{2})=4$.

Sol. Let $u=f(\tan x)$ and $v=g(\sec x)$

$\Rightarrow$ $\frac{du}{dx}=f'(\tan x)\cdot\sec^2 x$

and $\frac{dv}{dx}=g'(\sec x)\cdot\sec x\cdot\tan x$

$\Rightarrow$ $\frac{du}{dv}=\frac{du/dx}{dv/dx}=\frac{f'(\tan x)\sec^2 x}{g'(\sec x)\sec x\tan x}$

$\Rightarrow$ $\left(\frac{du}{dv}\right)_{x=\frac{\pi}{4}}=\frac{f'\left(\tan\frac{\pi}{4}\right)}{g'\left(\sec\frac{\pi}{4}\right)\sin\frac{\pi}{4}}=\frac{f'(1)\sqrt{2}}{g'(\sqrt{2})}=\frac{2\sqrt{2}}{4}=\frac{1}{\sqrt{2}}$

Exercise for Session 7

1. Find the derivative of $\tan^{-1}\frac{2x}{1-x^2}$ w.r.t. $\sin^{-1}\frac{2x}{1+x^2}$, if

   (i) $x\in(-1,1)$ (ii) $x\in(1,\infty)$

   (iii) $x\in(-\infty,-1)$

2. Differentiate $x^{\sin^{-1}x}$ w.r.t. $\sin^{-1}x$.

3. Differentiate $\sin^{-1}(2ax\sqrt{1-a^2x^2})$ w.r.t. $\sqrt{1-a^2x^2}$.

4. Differentiate $\log\sin x$ w.r.t. $\sqrt{\cos x}$

5. Differentiate $\tan^{-1}\left\{\frac{\sqrt{1+x^2}-\sqrt{1-x^2}}{\sqrt{1+x^2}+\sqrt{1-x^2}}\right\}$ w.r.t. $\cos^{-1}x^2$.

6. Differentiate x^x w.r.t. $x\log x$.

7. Differentiate $\sin^{-1}(4x\sqrt{1-4x^2})$ w.r.t. $\sqrt{1-4x^2}$, if

   (i) $x\in\left(-\frac{1}{2\sqrt{2}},\frac{1}{2\sqrt{2}}\right)$ (ii) $x\in\left(\frac{1}{2\sqrt{2}},\frac{1}{2}\right)$

   (iii) $x\in\left(-\frac{1}{2},-\frac{1}{2\sqrt{2}}\right)$

Session 8

Higher Derivatives of a Function

Higher Derivatives of a Function

If $y = f(x)$, then the derivative of $\frac{dy}{dx}$ w.r.t. x is called the second derivative of y w.r.t. x and it is denoted by $\frac{d^2y}{dx^2}$.

Also, $\frac{d^2y}{dx^2} = \frac{d}{dx}\left(\frac{dy}{dx}\right)$; $\frac{d^3y}{dx^3} = \frac{d}{dx}\left(\frac{d^2y}{dx^2}\right)$ and so on.

The nth order derivative of y w.r.t. x is denoted by $\frac{d^ny}{dx^n}$. If $y = f(x)$, then other notations for $\frac{dy}{dx}, \frac{d^2y}{dx^2}, \frac{d^3y}{dx^3}, \ldots, \frac{d^ny}{dx^n}$ are $y_1, y_2, y_3, \ldots, y_n$ or $y', y'', y''', \ldots, y^n$ or $f'(x), f''(x), f'''(x), \ldots, f^n(x)$.

Remark

If y is a function of x, given parametrically by $x = \phi(t)$ $y = \psi(t)$, then

$$\frac{d^2y}{dx^2} = \frac{d}{dx}\left(\frac{dy}{dx}\right) = \frac{d}{dx}\left(\frac{\psi'(t)}{\phi'(t)}\right) = \frac{d}{dt}\cdot\left(\frac{\psi'(t)}{\phi'(t)}\right) \times \frac{dt}{dx}$$

Example 56 If $y = x^3 \log_e x$, then find y'' and y'''.

Sol. Here, $y = x^3 \log_e x \Rightarrow y' = x^3 \cdot \frac{1}{x} + 3x^2 \cdot \log_e x$

$$y' = x^2 + 3x^2 \cdot \log_e x$$

Again differentiating both sides, we get

$$y'' = 2x + 6x \cdot \log_e x + 3x^2 \cdot \frac{1}{x}$$

$$y'' = 5x + 6x \cdot \log_e x$$

Differentiating again,

$$y''' = 5 + 6 \cdot \log x + 6x \cdot \frac{1}{x}$$

$$y''' = 11 + 6 \log x$$

Example 57 If $y = \sin(\sin x)$, then prove that $y'' + (\tan x)\, y' + y \cos^2 x = 0$.

Sol. Here, $y = \sin(\sin x)$ ...(i)

$\Rightarrow$ $y' = \cos(\sin x) \cdot \cos x$

$\Rightarrow$ $(\sec x)\, y' = \cos(\sin x)$ ...(ii)

Again differentiating w.r.t. x, we get

$(\sec x) y'' + (\sec x \tan x) y' = -\sin(\sin x) \cdot \cos x$

$\Rightarrow$ $y'' + (\tan x) y' = -\sin(\sin x) \cdot \cos^2 x$

Using Eq. (i), we get $y = \sin(\sin x)$

$\Rightarrow$ $y'' + (\tan x) y' + (\cos^2 x) y = 0$

Example 58 If $(a + bx)e^{y/x} = x$, show that $x^3 y'' = (xy' - y)^2$.

Sol. Here, $(a + bx)e^{y/x} = x \Rightarrow e^{y/x} = \frac{x}{a + bx}$

Taking logarithm on both sides, we have

$$\frac{y}{x} = \log\left(\frac{x}{a + bx}\right) \quad \text{...(i)}$$

$\Rightarrow$ $\frac{y}{x} = \log x - \log(a + bx)$

Differentiating both sides, we get

$$\frac{xy' - y \cdot 1}{x^2} = \frac{1}{x} - \frac{b}{a + bx}$$

$\Rightarrow$ $xy' - y = \frac{ax}{(a + bx)} = ae^{y/x}$ [from Eq. (i)]

Again taking logarithm on both sides, we get

$$\log(xy' - y) = \log a + \frac{y}{x} \cdot \log e$$

Again differentiating both sides w.r.t. x, we get

$$\frac{xy'' + y' - y'}{xy' - y} = 0 + \frac{(xy' - y \cdot 1)}{x^2}$$

$\Rightarrow$ $x^3 y'' = (xy' - y)^2$.

Example 59 ***If*** $x = a(t + \sin t)$ ***and*** $y = a(1 - \cos t)$, ***then find*** $\frac{d^2y}{dx^2}$.

Sol. Here, $x = a(t + \sin t)$ and $y = a(1 - \cos t)$

Differentiating both sides w.r.t. t, we get

$$\frac{dx}{dt} = a(1 + \cos t) \quad \text{and} \quad \frac{dy}{dt} = a(\sin t)$$

$$\therefore \quad \frac{dy}{dx} = \frac{a \sin t}{a(1 + \cos t)} = \frac{2 \sin \frac{t}{2} \cdot \cos \frac{t}{2}}{2 \cos^2 \frac{t}{2}} = \tan\left(\frac{t}{2}\right)$$

Again, differentiating both sides, we get

$$\frac{d^2y}{dx^2} = \sec^2\left(\frac{t}{2}\right)\cdot\frac{1}{2}\cdot\frac{dt}{dx} = \frac{1}{2}\sec^2\left(\frac{t}{2}\right)\cdot\frac{1}{a(1+\cos t)}$$

$$= \frac{1}{2a}\cdot\frac{\sec^2\left(\frac{t}{2}\right)}{2\left(\cos^2\frac{t}{2}\right)}$$

Hence, $\frac{d^2y}{dx^2} = \frac{1}{4a}\cdot\sec^4\left(\frac{t}{2}\right)$

Example 60 Show that the function $y = f(x)$ defined by the parametric equations $x = e^t \cdot \sin t$, $y = e^t \cdot \cos t$, satisfies the relation $y''(x+y)^2 = 2(xy' - y)$.

Sol. Here, $x = e^t \cdot \sin t$

On differentiating w.r.t. t, we get

$$\frac{dx}{dt} = e^t \cdot \cos t + e^t \cdot \sin t = e^t(\sin t + \cos t)$$

and $y = e^t \cdot \cos t$

On differentiating w.r.t. t, we get

$$\frac{dy}{dt} = e^t \cdot(-\sin t) + e^t \cdot(\cos t) = e^t(\cos t - \sin t)$$

So, $$\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{e^t(\cos t - \sin t)}{e^t(\cos t + \sin t)} = \frac{y-x}{y+x}$$

or $$\frac{dy}{dx} = \frac{y-x}{y+x} \quad \text{...(i)}$$

On differentiating both sides w.r.t. x, we get

$$\frac{d^2y}{dx^2} = \frac{(y+x)\cdot\left\{\frac{dy}{dx}-1\right\} - (y-x)\left\{\frac{dy}{dx}+1\right\}}{(y+x)^2}$$

or $$y'' = \frac{(y+x)\cdot(y'-1) - (y-x)(y'+1)}{(y+x)^2}$$

Therefore, $(x+y)^2 \cdot y'' = 2(xy' - y)$

Exercise for Session 8

1. If $y = x^x$, then prove that $\frac{d^2y}{dx^2} - \frac{1}{y}\left(\frac{dy}{dx}\right)^2 - \frac{y}{x} = 0$.
2. If $y = A\cos(\log x) + B\sin(\log x)$, then prove that $x^2\frac{d^2y}{dx^2} + x\frac{dy}{dx} + y = 0$.
3. If $y = x\log\left(\frac{x}{a+bx}\right)$, then prove that $x^3\frac{d^2y}{dx^2} = \left(x\frac{dy}{dx} - y\right)^2$.
4. If $y = \log(x + \sqrt{x^2+a^2})$, then prove that $(x^2+a^2)\frac{d^2y}{dx^2} + x\frac{dy}{dx} = 0$.
5. If $y = (x + \sqrt{x^2+1})^m$, then prove that $(x^2+1)y_2 + xy_1 - m^2y = 0$.
6. If $x = at^2$, $y = 2at$, then find $\frac{d^2y}{dx^2}$.
7. If $x = a\cos^3\theta$, $y = a\sin^3\theta$, then find $\frac{d^2y}{dx^2}$.
8. If $x = \tan\left(\frac{1}{a}\log y\right)$, then show that $(1+x^2)\frac{d^2y}{dx^2} = (a-2x)\frac{dy}{dx}$.
9. If $x = a\cos\theta + b\sin\theta$ and $y = a\sin\theta - b\cos\theta$, then prove that $y^2\frac{d^2y}{dx^2} - x\frac{dy}{dx} + y = 0$.
10. If $y = \frac{ax+b}{cx+d}$, then prove that $2y_1y_3 = 3(y_2)^2$.
11. If $x = f(t)$ and $y = \phi(t)$, prove that $\frac{d^2y}{dx^2} = \frac{f_1\phi_2 - f_2\phi_1}{f_1^3}$, where suffixes denote differentiation w.r.t. 't'.
12. If $x = \sin t$, $y = \sin Kt$, then show that $(1-x^2)y_2 - xy_1 + K^2y = 0$.
13. If $\frac{x+b}{2} = a\tan^{-1}(a\log_e y), a > 0$, then prove that $yy'' - yy'\log y = (y')^2$.
14. Let $f(x)$ be a polynomial function of degree 2 and $f(x) > 0$ for all $x \in R$. If $g(x) = f(x) + f'(x) + f''(x)$, then for any x show that $g(x) > 0$.

Session 9

Differentiation of a Function Given in the Form of a Determinant

Differentiation of a Function Given in the Form of a Determinant

To find the derivative of a determinant, we differentiate the row (or columns) keeping other rows (or columns) unchanged, i.e.

$$\text{If } y=\begin{vmatrix} u(x) & v(x) & w(x) \\ p(x) & q(x) & r(x) \\ \lambda(x) & \mu(x) & \gamma(x) \end{vmatrix}, \text{ then}$$

$$\frac{dy}{dx}=\begin{vmatrix} u'(x) & v'(x) & w'(x) \\ p(x) & q(x) & r(x) \\ \lambda(x) & \mu(x) & \gamma(x) \end{vmatrix}+\begin{vmatrix} u(x) & v(x) & w(x) \\ p'(x) & q'(x) & r'(x) \\ \lambda(x) & \mu(x) & \gamma(x) \end{vmatrix}+\begin{vmatrix} u(x) & v(x) & w(x) \\ p(x) & q(x) & r(x) \\ \lambda'(x) & \mu'(x) & \gamma'(x) \end{vmatrix}$$

The differentiation can also be done column-wise.

Example 61 *If* $f(x)=\begin{vmatrix} x & x^2 & x^3 \\ 1 & 2x & 3x^2 \\ 0 & 2 & 6x \end{vmatrix}$, *then find* $f'(x)$.

Sol. Here, $f(x)=\begin{vmatrix} x & x^2 & x^3 \\ 1 & 2x & 3x^2 \\ 0 & 2 & 6x \end{vmatrix}$

On differentiating, we get

$$f'(x)=\begin{vmatrix} \frac{d}{dx}(x) & \frac{d}{dx}(x^2) & \frac{d}{dx}(x^3) \\ 1 & 2x & 3x^2 \\ 0 & 2 & 6x \end{vmatrix}+\begin{vmatrix} x & x^2 & x^3 \\ \frac{d}{dx}(1) & \frac{d}{dx}(2x) & \frac{d}{dx}(3x^2) \\ 0 & 2 & 6x \end{vmatrix}+\begin{vmatrix} x & x^2 & x^3 \\ 1 & 2x & 3x^2 \\ \frac{d}{dx}(0) & \frac{d}{dx}(2) & \frac{d}{dx}(6x) \end{vmatrix}$$

$$\text{or } f'(x)=\begin{vmatrix} 1 & 2x & 3x^2 \\ 1 & 2x & 3x^2 \\ 0 & 2 & 6x \end{vmatrix}+\begin{vmatrix} x & x^2 & x^3 \\ 0 & 2 & 6x \\ 0 & 2 & 6x \end{vmatrix}+\begin{vmatrix} x & x^2 & x^3 \\ 1 & 2x & 3x^2 \\ 0 & 0 & 6 \end{vmatrix}$$

As we know, if any two rows or columns are equal, then value of the determinant is zero.

$$\therefore \quad f'(x)=0+0+\begin{vmatrix} x & x^2 & x^3 \\ 1 & 2x & 3x^2 \\ 0 & 0 & 6 \end{vmatrix}=6(2x^2-x^2)$$

Therefore, $f'(x)=6x^2$

Example 62 *If* $f(x)=\begin{vmatrix} x+a^2 & ab & ac \\ ab & x+b^2 & bc \\ ac & bc & x+c^2 \end{vmatrix}$, *then find* $f'(x)$.

Sol. We have, $f(x)=\begin{vmatrix} x+a^2 & ab & ac \\ ab & x+b^2 & bc \\ ac & bc & x+c^2 \end{vmatrix}$

$$\therefore \quad f'(x)=\begin{vmatrix} 1 & 0 & 0 \\ ab & x+b^2 & bc \\ ac & bc & x+c^2 \end{vmatrix}+\begin{vmatrix} x+a^2 & ab & ac \\ 0 & 1 & 0 \\ ac & bc & x+c^2 \end{vmatrix}+\begin{vmatrix} x+a^2 & ab & ac \\ ab & x+b^2 & bc \\ 0 & 0 & 1 \end{vmatrix}$$

$$=\{(x+b^2)(x+c^2)-b^2c^2\}+\{(x+a^2)(x+c^2)-a^2c^2\}+\{(x+a^2)(x+b^2)-a^2b^2\}$$

$$=3x^2+2x(a^2+b^2+c^2)$$

Example 63 Let $f(x)=\begin{vmatrix} x^3 & \sin x & \cos x \\ 6 & -1 & 0 \\ p & p^2 & p^3 \end{vmatrix}$, where p is constant. Then, find $\frac{d^3}{dx^3}[f(x)]$ at $x=0$. ***[IIT JEE 1997]***

Sol. Given, $f(x)=\begin{vmatrix} x^3 & \sin x & \cos x \\ 6 & -1 & 0 \\ p & p^2 & p^3 \end{vmatrix}$

On differentiating, we get

$$\frac{d}{dx}[f(x)]=\begin{vmatrix} \frac{d}{dx}(x^3) & \frac{d}{dx}(\sin x) & \frac{d}{dx}(\cos x) \\ 6 & (-1) & 0 \\ p & p^2 & p^3 \end{vmatrix} + \begin{vmatrix} x^3 & \sin x & \cos x \\ 0 & 0 & 0 \\ p & p^2 & p^3 \end{vmatrix} + \begin{vmatrix} x^3 & \sin x & \cos x \\ 6 & -1 & 0 \\ 0 & 0 & 0 \end{vmatrix}$$

So, $\frac{d}{dx}[f(x)]=\begin{vmatrix} 3x^2 & \cos x & -\sin x \\ 6 & -1 & 0 \\ p & p^2 & p^3 \end{vmatrix}$

Again differentiating, we get

$$\frac{d^2}{dx^2}[f(x)]=\begin{vmatrix} 6x & -\sin x & -\cos x \\ 6 & -1 & 0 \\ p & p^2 & p^3 \end{vmatrix} + \text{Remaining two determinants as zero.}$$

Again differentiating, we get

$$\frac{d^3}{dx^3}[f(x)]=\begin{vmatrix} 6 & -\cos x & \sin x \\ 6 & -1 & 0 \\ p & p^2 & p^3 \end{vmatrix} + \text{Remaining two determinants as zero}$$

At $x=0$, $\frac{d^3}{dx^3}[f(x)]=\begin{vmatrix} 6 & -1 & 0 \\ 6 & -1 & 0 \\ p & p^2 & p^3 \end{vmatrix}=0$

$\therefore \quad \left(\frac{d^3}{dx^3}[f(x)]\right)_{\text{at } x=0} = 0$ (i.e. independent of p)

Example 64 *If* $y=\cos ax$, *prove that* $\begin{vmatrix} y & y_1 & y_2 \\ y_3 & y_4 & y_5 \\ y_6 & y_7 & y_8 \end{vmatrix}=0$, *where* $y_r=\frac{d^r}{dx^r}y$.

Sol. Given, $y=\cos(ax)$

Then, $y_1=-a\sin(ax)=a\cos\left(\frac{\pi}{2}+ax\right)$

$y_2=-a^2\cos(ax)=a^2\cos\left(\frac{2\pi}{2}+ax\right)$

$y_3=+a^3\sin(ax)=a^3\cos\left(\frac{3\pi}{2}+ax\right)$

.....

.....

$$y_n=a^n\cos\left(\frac{n\pi}{2}+ax\right)$$

$\therefore$ The determinant $\Delta(x)=\begin{vmatrix} y & y_1 & y_2 \\ y_3 & y_4 & y_5 \\ y_6 & y_7 & y_8 \end{vmatrix}$

$$\Delta(x)=\begin{vmatrix} \cos ax & a\cos\left(\frac{\pi}{2}+ax\right) & a^2\cos\left(\frac{2\pi}{2}+ax\right) \\ a^3\cos\left(\frac{3\pi}{2}+ax\right) & a^4\cos\left(\frac{4\pi}{2}+ax\right) & a^5\cos\left(\frac{5\pi}{2}+ax\right) \\ a^6\cos\left(\frac{6\pi}{2}+ax\right) & a^7\cos\left(\frac{7\pi}{2}+ax\right) & a^8\cos\left(\frac{8\pi}{2}+ax\right) \end{vmatrix}$$

$$\Delta(x)=a^3\times a^6\begin{vmatrix} \cos(ax) & -a\sin(ax) & -a^2\cos(ax) \\ \sin(ax) & a\cos(ax) & -a^2\sin(ax) \\ -\cos(ax) & a\sin(ax) & a^2\cos(ax) \end{vmatrix}$$

$$\Delta(x)=a^9\times(0)\{R_1\to -R_3\}$$

Hence, $\Delta(x)=0$

Example 65 If $f(x)=\begin{vmatrix} (1+x)^a & (1+2x)^b & 1 \\ 1 & (1+x)^a & (1+2x)^b \\ (1+2x)^b & 1 & (1+x)^a \end{vmatrix}$,

then find

(i) constant term (ii) coefficient of x.

Sol. Here, $f(x)=\begin{vmatrix} (1+x)^a & (1+2x)^b & 1 \\ 1 & (1+x)^a & (1+2x)^b \\ (1+2x)^b & 1 & (1+x)^a \end{vmatrix}$

$$=A+Bx+Cx^2+\ldots \qquad \ldots(i)$$

Putting $x=0$, we get

$$f(0)=\begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{vmatrix}=A+B(0)+C(0)^2+\ldots$$

$\Rightarrow \quad A=0$

Again, differentiating Eq. (i) w.r.t. x, we get

$$f'(x)=\begin{vmatrix} a(1+x)^{a-1} & 2b(1+2x)^{b-1} & 0 \\ 1 & (1+x)^a & (1+2x)^b \\ (1+2x)^b & 1 & (1+x)^a \end{vmatrix} + \begin{vmatrix} (1+x)^a & (1+2x)^b & 1 \\ 0 & a(1+x)^{a-1} & 2b(1+2x)^{b-1} \\ (1+2x)^b & 1 & (1+x)^a \end{vmatrix} + \begin{vmatrix} (1+x)^a & (1+2x)^b & 1 \\ 1 & (1+x)^a & (1+2x)^b \\ 2b(1+2x)^{b-1} & 0 & a(1+x)^{a-1} \end{vmatrix} = B+2Cx+\ldots$$

$$f'(0)=\begin{vmatrix} a & 2b & 0 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{vmatrix}+\begin{vmatrix} 1 & 1 & 1 \\ 0 & a & 2b \\ 1 & 1 & 1 \end{vmatrix}+\begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 2b & 0 & a \end{vmatrix}=B$$

$\Rightarrow \quad B=0$ ...(ii)

$\therefore$ Coefficient of constant term = coefficient of $x=0$.

Example 66 If $a_i, b_i \in N$ for $i=1,2,3$, then coefficient of x in the determinant;

$$\begin{vmatrix} (1+x)^{a_1b_1} & (1+x)^{a_1b_2} & (1+x)^{a_1b_3} \\ (1+x)^{a_2b_1} & (1+x)^{a_2b_2} & (1+x)^{a_2b_3} \\ (1+x)^{a_3b_1} & (1+x)^{a_3b_2} & (1+x)^{a_3b_3} \end{vmatrix}$$

Sol. Here,

$$\begin{vmatrix} (1+x)^{a_1b_1} & (1+x)^{a_1b_2} & (1+x)^{a_1b_3} \\ (1+x)^{a_2b_1} & (1+x)^{a_2b_2} & (1+x)^{a_2b_3} \\ (1+x)^{a_3b_1} & (1+x)^{a_3b_2} & (1+x)^{a_3b_3} \end{vmatrix}=A+Bx+Cx^2+\ldots$$

Differentiating both the sides w.r.t. x, we get

$$\begin{vmatrix} a_1b_1(1+x)^{a_1b_1-1} & (1+x)^{a_1b_2} & (1+x)^{a_1b_3} \\ a_2b_1(1+x)^{a_2b_1-1} & (1+x)^{a_2b_2} & (1+x)^{a_2b_3} \\ a_3b_1(1+x)^{a_3b_1-1} & (1+x)^{a_3b_2} & (1+x)^{a_3b_3} \end{vmatrix}$$

$$+\begin{vmatrix} (1+x)^{a_1b_1} & a_1b_2(1+x)^{a_1b_2-1} & (1+x)^{a_1b_3} \\ (1+x)^{a_2b_1} & a_2b_2(1+x)^{a_2b_2-1} & (1+x)^{a_2b_3} \\ (1+x)^{a_3b_1} & a_3b_2(1+x)^{a_3b_2-1} & (1+x)^{a_3b_3} \end{vmatrix}$$

$$+\begin{vmatrix} (1+x)^{a_1b_1} & (1+x)^{a_1b_2} & a_1b_3(1+x)^{a_1b_3-1} \\ (1+x)^{a_2b_1} & (1+x)^{a_2b_2} & a_2b_3(1+x)^{a_2b_3-1} \\ (1+x)^{a_3b_1} & (1+x)^{a_3b_2} & a_3b_3(1+x)^{a_3b_3-1} \end{vmatrix}$$

$$=B+2Cx+\ldots$$

Putting $x=0$,

$$B=\begin{vmatrix} a_1b_1 & 1 & 1 \\ a_2b_1 & 1 & 1 \\ a_3b_1 & 1 & 1 \end{vmatrix}+\begin{vmatrix} 1 & a_1b_2 & 1 \\ 1 & a_2b_2 & 1 \\ 1 & a_3b_2 & 1 \end{vmatrix}+\begin{vmatrix} 1 & 1 & a_1b_3 \\ 1 & 1 & a_2b_3 \\ 1 & 1 & a_3b_3 \end{vmatrix}$$

$\Rightarrow \quad B=0$

Exercise for Session 9

1. If $f(x)$, $g(x)$ and $h(x)$ are three polynomials of degree 2, then prove that $\phi(x)=\begin{vmatrix} f(x) & g(x) & h(x) \\ f'(x) & g'(x) & h'(x) \\ f''(x) & g''(x) & h''(x) \end{vmatrix}$ is a constant polynomial.

2. If f, g and h are differentiable functions of x and $\Delta=\begin{vmatrix} f & g & h \\ (xf)' & (xg)' & (xh)' \\ (x^2f)'' & (x^2g)'' & (x^2h)'' \end{vmatrix}$.

Prove that $\Delta'=\begin{vmatrix} f & g & h \\ f' & g' & h' \\ (x^3f'')' & (x^3g'')' & (x^3h'')' \end{vmatrix}$.

3. Find $\frac{dy}{dx}$ at $x=-1$, when $(\sin y)^{\sin\frac{\pi x}{2}}+\frac{\sqrt{3}}{2}\sec^{-1}(2x)+2^x\tan\{\log_e(x+2)\}=0$.

Session 10

Derivative of an Inverse Function

Derivative of an Inverse Function

Theorem If the inverse functions f and g are defined by $y = f(x)$ and $x = g(y)$ and if $f'(x)$ exists and $f'(x) \neq 0$, then $g'(y) = \dfrac{1}{f'(x)}$. This result can also be written as, if $\dfrac{dy}{dx}$ exists and $\dfrac{dy}{dx} \neq 0$, then

$$\frac{dx}{dy} = \frac{1}{\dfrac{dy}{dx}} \quad \text{or} \quad \frac{dy}{dx}\cdot\frac{dx}{dy} = 1 \quad \text{or} \quad \frac{dy}{dx} = \frac{1}{\dfrac{dx}{dy}} \qquad \left[\because \frac{dx}{dy} \neq 0\right]$$

Example 67 If $y = f(x) = x^3 + x^5$ and g is the inverse of f, then find $g'(2)$ (means dx/dy when $y = 2$).

Sol. Here, $y = x^3 + x^5$

On differentiation, we get

$$\frac{dy}{dx} = 3x^2 + 5x^4 \Rightarrow g'(y) = \frac{dx}{dy} = \frac{1}{3x^2 + 5x^4}$$

when $y = 2$, then $2 = x^3 + x^5 \Rightarrow x = 1$

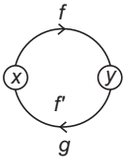
$$\therefore \quad g'(2) = \left.\frac{dx}{dy}\right]_{\substack{x=1\\y=2}} = \frac{1}{3+5} = \frac{1}{8}$$

Aliter $y = f(x),\ x = g(y)$

$$(gof)(x) = x$$

$$g'[f(x)]\, f'(x) = 1$$

when $f(x) = 2$, then $x = 1$



$$g'(2)\cdot f'(1) = 1 \qquad [\text{but } f'(1) = 8]$$

$$\therefore \quad g'(2) = 1/8$$

Example 68 Let $f(x) = \exp(x^3 + x^2 + x)$ for any real number x and let g be the inverse function for f. The value of $g'(e^3)$ is

(a) $\dfrac{1}{6e^3}$ (b) $\dfrac{1}{6}$ (c) $\dfrac{1}{34e^{39}}$ (d) 6

Sol. Let $y = e^{x^3 + x^2 + x}$,

On differentiating, $\dfrac{dy}{dx} = e^{x^3 + x^2 + x}\cdot(3x^2 + 2x + 1)$

$$\Rightarrow \quad g'(y) = \frac{dx}{dy} = \frac{1}{e^{x^3 + x^2 + x}\cdot[3x^2 + 2x + 1]}$$

$$y = e^3$$

$$\Rightarrow \quad e^3 = e^{x^3 + x^2 + x}$$

$$\Rightarrow \quad x^3 + x^2 + x - 3 = 0$$

$$\Rightarrow \quad (x-1)(x^2 + 2x + 3) = 0$$

$$\Rightarrow \quad x = 1 \qquad [\because x^2 + 2x + 3 > 0]$$

$$\therefore \quad g'(e^3) = \frac{1}{6e^3}$$

Hence, (*a*) is the correct option.

Exercise for Session 10

1. The function $f(x) = e^x + x$, being differentiable and one to one, has a differentiable increase $f^{-1}(x)$. Find $\dfrac{d}{dx}(f^{-1}(x))$ at point $f(\log 2)$.
2. Let $g(x)$ be the inverse of an invertible function $f(x)$ which is differentiable for all real x, then find $g''(f(x))$.
3. Let $g(x)$ be the inverse of an invertible function $f(x)$ which is differentiable at $x = c$, then $g'(f(c))$ equals

   (a) $f'(c)$ (b) $\dfrac{1}{f'(c)}$ (c) $f(c)$ (d) None of these

4. If $f(x) = x + \tan x$ and f is inverse of g, then $g'(x)$ equals

   (a) $\dfrac{1}{1+[g(x)-x]^2}$ (b) $\dfrac{1}{2-[g(x)-x]^2}$ (c) $\dfrac{1}{2+[g(x)-x]^2}$ (d) None of these

JEE Type Solved Examples :
Single Option Correct Type Questions

● **Ex. 1** *Let f be a twice differentiable function such that $f''(x) = -f(x)$ and $f'(x) = g(x)$. If $h(x) = \{f(x)\}^2 + \{g(x)\}^2$, where $h(5) = 11$. Find $h(10)$.*

(a) 0 (b) 9
(c) 11 (d) None of these

Sol. (*c*) Given, $h(x) = \{f(x)\}^2 + \{g(x)\}^2$

On differentiating both the sides w.r.t. x, we get

$h'(x) = 2f(x) \cdot f'(x) + 2g(x) \cdot g'(x)$ ...(i)

Now, $f'(x) = g(x)$.

Then, $f''(x) = g'(x)$

$\Rightarrow$ $-f(x) = g'(x)$ ...(ii)

$[\because f''(x) = -f(x),$ given$]$

From Eqs. (i) and (ii), we get

$h'(x) = 2f(x) \cdot g(x) + 2g(x) \cdot \{-f(x)\}$

[using $f'(x) = g(x)$ and $g'(x) = -f(x)$]

$\therefore$ $h'(x) = 0$

So, $h(x)$ must be constant. $\left[\because \frac{d}{dx}(\text{constant}) = 0\right]$

But $h(5) = 11$

$h(x) = 11$

So, $h(10) = 11$

● **Ex. 2** *Let $f(x)$ be a real valued differentiable function not identically zero such that $f(x + y^{2n+1}) = f(x) + \{f(y)\}^{2n+1}, n \in N$ and x, y are any real numbers and $f'(0) \geq 0$. Find the values of $f(5)$ and $f'(10)$.*

(a) 3, 2 (b) 0, 1
(c) 1, 5 (d) 5, 1

Sol. (*d*) Here, $f(x + y^{2n+1}) = f(x) + \{f(y)\}^{2n+1}$ ...(i)

Putting $x = 0$, $y = 0$, we get

$f(0) = f(0) + \{f(0)\}^{2n+1} \Rightarrow f(0) = 0$

$f'(0) \geq 0$ [given]

$\Rightarrow$ $\lim_{x \to 0} \frac{f(x) - f(0)}{x - 0} \geq 0 \Rightarrow \lim_{x \to 0} \frac{f(x)}{x} \geq 0$

Now, if $x > 0 \Rightarrow f(x) \geq 0$ ...(ii)

Putting $x = 0$, $y = 1$ in Eq. (i), we get

$f(1) = f(0) + \{f(1)\}^{2n+1}$ or $f(1)[1 - \{f(1)\}^{2n}] = 0$

$\therefore$ $f(1) = 0$ or 1 [using Eq. (ii)]

Putting $y = 1$ in Eq. (i), for all real x.

$f(x + 1) = f(x) + \{f(1)\}^{2n+1}$ ...(iii)

Now, two cases arise either $f(1) = 0$ or 1

***Case* I** If $f(1) = 0$

$\Rightarrow$ $f(x + 1) = f(x)$ [using Eq. (iii)]

$\Rightarrow$ $f(1) = f(2) = f(3) = ... = 0$

$\therefore$ $f(x)$ is identically zero. (which is not possible)

***Case* II** If $f(1) = 1$

$\Rightarrow$ $f(x + 1) = f(x) + 1$ [using Eq. (iii)]

$\therefore$ $f(2) = f(1) + 1 = 1 + 1 = 2$

$f(3) = f(2) + 1 = 2 + 1 = 3$

$f(4) = f(3) + 1 = 3 + 1 = 4$

$f(5) = f(4) + 1 = 4 + 1 = 5$

Proceeding in same way, we get

$f(x) = x$ and $f'(x) = 1 \Rightarrow f'(10) = 1$

So, $f(5) = 5$ and $f'(10) = 1$

● **Ex. 3** *Let $f\left(\frac{x+y}{2}\right) = \frac{f(x) + f(y)}{2}$ and $f'(0) = a$ and $f(0) = b$. Find $f''(x)$ (where y is independent of x), when $f(x)$ is differentiable.*

(a) 0 (b) 1
(c) a (d) None of these

Sol. (*a*) Here $f\left(\frac{x+y}{2}\right) = \frac{f(x) + f(y)}{2}$, this holds for any real x, y and y is independent of x. i.e. $\frac{dy}{dx} = 0$

On differentiating w.r.t. x, we get

$$f'\left(\frac{x+y}{2}\right) \cdot \frac{1}{2}\left(1 + \frac{dy}{dx}\right) = \frac{1}{2}\left\{f'(x) + f'(y) \cdot \frac{dy}{dx}\right\}$$

$\therefore$ $\frac{1}{2} f'\left(\frac{x+y}{2}\right) = \frac{1}{2} f'(x)$ $\left[\text{as } \frac{dy}{dx} = 0\right]$

$\Rightarrow$ $f'\left(\frac{x+y}{2}\right) = f'(x)$ ...(i)

Taking $x = 0$ and $y = x$ in Eq. (i), we get

$f'\left(\frac{0+x}{2}\right) = f'(0) \Rightarrow f'\left(\frac{x}{2}\right) = a$ $[\because f'(0) = a,$ given$]$

which shows $f\left(\frac{x}{2}\right) = a\left(\frac{x}{2}\right) + c$ [using integration]

$\therefore$ $f(x) = ax + c$

Let $x = 0$

$\Rightarrow$ $f(0) = b = c$

$\therefore$ $f(x) = ax + b$

On differentiating,

$f'(x) = a$ and $f''(x) = 0$

● **Ex. 4** *If* $y=\dfrac{(a-x)\sqrt{a-x}-(b-x)\sqrt{x-b}}{\sqrt{a-x}+\sqrt{x-b}}$, *then find* $\dfrac{dy}{dx}$ *whenever defined.*

(a) $\dfrac{x-(a+b)}{\sqrt{(a-x)(x-b)}}$ (b) $\dfrac{2x+(a+b)}{\sqrt{a-x}(x-b)}$

(c) $\dfrac{2x-(a+b)}{2\sqrt{(a-x)(x-b)}}$ (d) None of these

Sol. (*c*) Here, $y=\dfrac{(a-x)^{3/2}+(x-b)^{3/2}}{(a-x)^{1/2}+(x-b)^{1/2}}$, use

$a^3+b^3=(a+b)(a^2-ab+b^2)$

$$\therefore \quad y=\frac{\left[\begin{array}{l}\{(a-x)^{1/2}+(x-b)^{1/2}\}\{(a-x)\\ \quad -\sqrt{(a-x)(x-b)}+(x-b)\}\end{array}\right]}{\{(a-x)^{1/2}+(x-b)^{1/2}\}}$$

$$\Rightarrow \quad y=(a-b)-\sqrt{(ax+bx-ab-x^2)}$$

$$\therefore \quad \frac{dy}{dx}=-\frac{(a+b-2x)}{2\sqrt{(a-x)(x-b)}}$$

$$\Rightarrow \quad \frac{dy}{dx}=\frac{2x-(a+b)}{2\sqrt{(a-x)(x-b)}}$$

● **Ex. 5** *If* $x^2+y^2=R^2\ (R>0)$, *then* $K=\dfrac{y''}{\sqrt{(1+(y')^2)^3}}$. *Find* K *in terms of* R.

(a) $\dfrac{1}{R}$ (b) $-\dfrac{1}{R}$

(c) R (d) $\dfrac{1}{2R}$

Sol. (*b*) Here, $x^2+y^2=R^2$

On differentiating w.r.t. x, we get

$$2x+2yy'=0 \Rightarrow x+yy'=0$$

$$\Rightarrow \quad y'=-\frac{x}{y} \qquad \ldots(i)$$

Again, differentiating both the sides,

$$1+yy''+(y')^2=0$$

$$\therefore \quad y''=-\frac{(1+(y')^2)}{y} \qquad \ldots(ii)$$

Now, $K=\dfrac{y''}{\sqrt{(1+(y')^2)^3}}=-\dfrac{(1+(y')^2)}{y\cdot(1+(y')^2)^{3/2}}$

$$=-\frac{1}{y\sqrt{1+(y')^2}}=-\frac{1}{y\sqrt{1+\dfrac{x^2}{y^2}}} \qquad \text{[from Eq. (i)]}$$

$$=-\frac{1}{\sqrt{x^2+y^2}}=-\frac{1}{R}$$

$$\therefore \quad K=-\frac{1}{R}$$

● **Ex. 6** *Let* $f(x)=x+\sin x$, *suppose* g *denotes the inverse function of* f. *Then, find the value of* $g'\left(\dfrac{\pi}{4}+\dfrac{1}{\sqrt{2}}\right)$.

(a) $2+\sqrt{2}$ (b) $\sqrt{2}-2$

(c) $2-\sqrt{2}$ (d) $2\sqrt{2}$

Sol. (*c*) Here, $f(x)=x+\sin x$

$$\therefore \quad \frac{dy}{dx}=1+\cos x \Rightarrow g'(y)=\frac{dx}{dy}=\frac{1}{1+\cos x}$$

where, $y=\dfrac{\pi}{4}+\dfrac{1}{\sqrt{2}}=x+\sin x \Rightarrow x=\dfrac{\pi}{4}$

$$\therefore \quad g'\left(\frac{\pi}{4}+\frac{1}{\sqrt{2}}\right)=\frac{1}{1+\dfrac{1}{\sqrt{2}}}=\frac{\sqrt{2}}{\sqrt{2}+1}=2-\sqrt{2}$$

● **Ex. 7** *Let* $e^{f(x)}=\log x$. *If* $g(x)$ *is the inverse of* $f(x)$, *then find* $g'(x)$.

(a) e^{e^x} (b) e^x (c) e^{e^x+x} (d) None of these

Sol. (*c*) Let $f(x)=y \Rightarrow x=f^{-1}(y)=g(y)$

$$\Rightarrow \quad x=e^{e^y} \Rightarrow \frac{dx}{dy}=e^{e^y}\cdot e^y=e^{e^y+y}=g'(y)$$

$$\therefore \quad g'(x)=e^{e^x+x}$$

● **Ex. 8** *If* $f(x)=4x^3-6x^2\cos 2a+3x\cdot\sin 2a\cdot\sin 6a+\sqrt{\log(2a-a^2)}$, *then*

(a) $f'\left(\dfrac{1}{2}\right)<0$ (b) $f'\left(\dfrac{1}{2}\right)\le 0$

(c) $f'\left(\dfrac{1}{2}\right)>0$ (d) None of these

Sol. (*c*) Here, $f(x)=4x^3-6x^2\cos 2a+3x\sin 2a\cdot\sin 6a+\sqrt{\log(2a-a^2)}$ for $f(x)$ to exists.

$$\log(2a-a^2)\ge 0 \Rightarrow (2a-a^2)\ge e^0$$

i.e. $2a-a^2\ge 1$ or $a^2-2a+1\le 0 \Rightarrow (a-1)^2\le 0$

which is only possible, if $(a-1)^2=0$, i.e. $a=1$.

$$\therefore \quad f(x)=4x^3-6x^2\cos 2+3x\sin 2\cdot\sin 6$$

$$\Rightarrow \quad f'(x)=12x^2-12x\cos 2+3\sin 2\sin 6$$

$$\Rightarrow \quad f'\left(\frac{1}{2}\right)=3-6\cos 2+3\sin 2\sin 6$$

$$=3(1+\sin 2\sin 6)-6\cos 2 \Rightarrow f'\left(\frac{1}{2}\right)>0$$

Note

$\cos 2<0$ and $1+\sin 2\sin 6>0$

● **Ex. 9** *Suppose,* $f(x) = e^{ax} + e^{bx}$, *where* $a \neq b$ *and* $f''(x) - 2f'(x) - 15f(x) = 0$ *for all* $x \in R$. *Then, find* ab.

(a) 15 (b) −15 (c) 10 (d) 16

Sol. (*b*) $f(x) = e^{ax} + e^{bx}$

$\Rightarrow$ $f'(x) = ae^{ax} + be^{bx}$, $f''(x) = a^2e^{ax} + b^2e^{bx}$

$\therefore$ $f''(x) - 2f'(x) - 15f(x) = 0$

$\Rightarrow$ $\{a^2e^{ax} + b^2e^{bx}\} - 2\{ae^{ax} + be^{bx}\} - 15\{e^{ax} + e^{bx}\} = 0$, for all x.

$\Rightarrow$ $(a^2 - 2a - 15)e^{ax} + (b^2 - 2b - 15)e^{bx} = 0$, for all x.

$\Rightarrow$ $a^2 - 2a - 15 = 0$ and $b^2 - 2b - 15 = 0$

$\Rightarrow$ $(a - 5)(a + 3) = 0$

and $(b - 5)(b + 3) = 0$

$\Rightarrow$ $a = 5$ or -3

and $b = 5$ or -3

But $a \neq b$, hence, $a = 5, b = -3$

or $a = -3, b = 5 \Rightarrow ab = -15$

JEE Type Solved Examples :
More than One Correct Option Type Questions

● **Ex. 10** *The functions* $u = e^x \cdot \sin x$ *and* $v = e^x \cdot \cos x$ *satisfy the equation*

(a) $v\frac{du}{dx} - u\frac{dv}{dx} = u^2 + v^2$ (b) $v\frac{du}{dx} + u\frac{dv}{dx} = u^2 + v^2$

(c) $\frac{du}{dx} + \frac{dv}{dx} = 2v$ (d) $\frac{du}{dx} + \frac{dv}{dx} = 2u$

Sol. (*a, c*) We have, $u = e^x \sin x$, $v = e^x \cos x$

Differentiating both the equations w.r.t. x, we get

$$\frac{du}{dx} = e^x(\sin x + \cos x) \quad ...(i)$$

and $$\frac{dv}{dx} = e^x(\cos x - \sin x) \quad ...(ii)$$

Now, $\frac{du}{dx} + \frac{dv}{dx} = 2e^x \cos x$ [using Eqs. (i) and (ii)]

$\Rightarrow$ $\frac{du}{dx} + \frac{dv}{dx} = 2v$

Also, $\frac{du}{dx} = u + v$ and $\frac{dv}{dx} = v - u$

$\therefore$ $v\frac{du}{dx} = uv + v^2$ and $u\frac{dv}{dx} = uv - u^2$

$\Rightarrow$ $v\frac{du}{dx} - u\frac{dv}{dx} = u^2 + v^2$

● **Ex. 11** *If* $y + \log(1 + x) = 0$, *then which of the following is true?*

(a) $e^y = xy' + 1$ (b) $y' = -\frac{1}{(x + 1)}$

(c) $y' + e^y = 0$ (d) $y' = e^y$

Sol. (*a, b, c*) We have, $y + \log_e(1 + x) = 0$

$\Rightarrow$ $y = -\log(1 + x) \Rightarrow y = \log(1 + x)^{-1}$

$\Rightarrow$ $e^y = \frac{1}{1 + x}$ ...(i)

$\Rightarrow$ $xe^y + e^y = 1$

On differentiating w.r.t. x, we get

$xe^y y' + e^y + e^y y' = 0$

$xy' + y' + 1 = 0$ [$\because e^y \neq 0$] ...(ii)

$\Rightarrow$ $y' = -\frac{1}{x + 1}$

$\Rightarrow$ $y' = -e^y$ [from Eq. (i)]

$\Rightarrow$ $y' + e^y = 0$

From Eq. (ii), we have

$xy' + 1 = -y' \Rightarrow xy' + 1 = e^y$

● **Ex. 12** *If* $x^p \cdot y^q = (x + y)^{p+q}$, *then* $\frac{dy}{dx}$ *is*

(a) independent of p

(b) independent of q

(c) dependent both p and q

(d) $\frac{y}{x}$

Sol. (*a, b, d*) We have, $x^p \cdot y^q = (x + y)^{p+q}$

On taking log both sides, we get

$p\log x + q\log y = (p + q)\log(x + y)$

On differentiating w.r.t. x, we get

$$\frac{p}{x} + \frac{q}{y}\frac{dy}{dx} = \frac{p + q}{x + y}\left(1 + \frac{dy}{dx}\right)$$

$\Rightarrow$ $\frac{dy}{dx}\left(\frac{q}{y} - \frac{p + q}{x + y}\right) = \frac{p + q}{x + y} - \frac{p}{x}$

$\Rightarrow$ $\frac{dy}{dx} = \frac{y}{x}$

● **Ex. 13** *Two functions* f *and* g *have first and second derivatives at* $x = 0$ *and satisfy the relations* $f(0) = \frac{2}{g(0)}$, $f'(0) = 2g'(0) = 4g(0)$, $g''(0) = 5f''(0) = 6f(0) = 3$ *Then,*

(a) If $h(x)=\dfrac{f(x)}{g(x)}$, then $h'(0)=\dfrac{15}{4}$

(b) If $k(x)=f(x)\cdot g(x)\cdot \sin x$, then $k'(0)=2$

(c) $\lim\limits_{x\to 0}\dfrac{g'(x)}{f'(x)}=\dfrac{1}{2}$

(d) None of the above

Sol. (a, b, c) We have, $f(0)=\dfrac{2}{g(0)}$,

$$f'(0)=2g'(0)=4g(0)$$
$$g''(0)=5f''(0)=6f(0)=3$$

Now, on solving these equations, we get

$$f(0)=\frac{1}{2},\ g(0)=4,\ f'(0)=16,\ g'(0)=8$$
$$f''(0)=\frac{3}{5},\ g''(0)=3$$

(a) We have, $h(x)=\dfrac{f(x)}{g(x)}$,

$$h'(x)=\frac{g(x)f'(x)-g'(x)f'(x)}{[g(x)]^2}$$
$$\therefore\quad h'(0)=\frac{g(0)f'(0)-g'(0)f'(0)}{[g(0)]^2}$$
$$=\frac{4\times 16-8\times\frac{1}{2}}{(4)^2}=\frac{15}{4}$$

(b) $k(x)=f(x)\cdot g(x)\cdot\sin x$

$k'(x)=f(x)g(x)\cos x+f(x)\sin x\cdot g'(x)+g(x)\sin x f'(x)$

$k'(0)=f(0)g(0)\cos 0+f(0)\sin 0\,g'(0)+g(0)\sin 0\,f'(0)$

$$k'(0)=\frac{1}{2}\times 4\times 1+0+0=2$$

(c) $\lim\limits_{x\to 0}\dfrac{g'(x)}{f'(x)}=\dfrac{g'(0)}{f'(0)}=\dfrac{1}{2}$

● ***Ex. 14*** *If $f(x)=|x^2-3|x|+2|$, then which of the following is/are true?*

(a) $f'(x)=2x-3$ for $x\in(0,1)\cup(2,\infty)$

(b) $f'(x)=2x+3$ for $x\in(-\infty,-2)\cup(-1,0)$

(c) $f'(x)=-2x-3$ for $x\in(-2,-1)$

(d) None of the above

Sol. $(a,\ b,\ c)$ We have,

$$f(x)=|x^2-3|x|+2|=\begin{cases}|x^2-3x+2|, & x\ge 0\\ |x^2+3x+2|, & x<0\end{cases}$$

$$\Rightarrow\quad f(x)=\begin{cases}x^2-3x+2, & x^2-3x+2\ge 0,\quad x\ge 0\\ -x^2+3x-2, & x^2-3x+2<0,\quad x\ge 0\\ x^2+3x+2, & x^2+3x+2\ge 0,\quad x<0\\ -x^2-3x-2, & x^2+3x+2<0,\quad x<0\end{cases}$$

$$\Rightarrow\quad f(x)=\begin{cases}x^2-3x+2, & x\in[0,1]\cup(2,\infty)\\ -x^2+3x+2, & x\in(1,2)\\ x^2+3x+2, & x\in(-\infty,-2]\cup[-1,0)\\ -x^2-3x+2, & x\in(-2,-1)\end{cases}$$

$$\Rightarrow\quad f'(x)=\begin{cases}2x-3, & x\in(0,1)\cup(2,\infty)\\ -2x+3, & x\in(1,2)\\ 2x+3, & x\in(-\infty,-2)\cup(-1,0)\\ -2x-3, & x\in(-2,-1)\end{cases}$$

JEE Type Solved Examples :
Statements I and II Type Questions

■ **Directions** (Ex. Nos. 15-17) *This section is based on Statement I and Statement II. Select the correct answer from the codes given below.*

(a) Both Statement I and Statement II are correct and Statement II is the correct explanation of Statement I

(b) Both Statement I and Statement II are correct but Statement II is not the correct explanation of Statement I

(c) Statement I is correct but Statement II is incorrect

(d) Statement II is correct but Statement I is incorrect

● ***Ex. 15*** *Consider* $f(x)=\dfrac{x}{x^2-1}$ *and* $g(x)=f''(x)$

Statement I *Graph of $g(x)$ is concave up for $x>1$.*

Statement II

$$\frac{d^n}{dx^n}f(x)=\frac{(-1)^n n!}{2}\left\{\frac{1}{(x+1)^{n+1}}+\frac{1}{(x-1)^{n+1}}\right\}\ n\in N$$

Sol. (b) We have, $f(x)=\dfrac{x}{x^2-1}\ \Rightarrow\ f(x)=\dfrac{x}{(x+1)(x-1)}$

$$\Rightarrow\quad f(x)=\frac{1}{2}\left[\frac{1}{x+1}+\frac{1}{x-1}\right]$$
$$\Rightarrow\quad f'(x)=\frac{1}{2}\left[-\frac{1}{(x+1)^2}-\frac{1}{(x-1)^2}\right]$$
$$\Rightarrow\quad f''(x)=\frac{(-1)(-2)}{2}\left[\frac{1}{(x+1)^3}+\frac{1}{(x-1)^3}\right]$$
$$\vdots\qquad\qquad\vdots$$
$$\Rightarrow\quad f^n(x)=\frac{(-1)^n n!}{2}\left[\frac{1}{(x+1)^{n+1}}+\frac{1}{(x-1)^{n+1}}\right]$$

Now, $g(x)=f''(x)$

$g'(x)=f'''(x)$

$\Rightarrow\quad g''(x)=f''''(x)$

$$\Rightarrow \quad g''(x) = \frac{(-1)^4 4!}{2}\left[\frac{1}{(x+1)^5} + \frac{1}{(x-1)^5}\right]$$

$$\Rightarrow \quad g''(x) = \frac{4!}{2}\left[\frac{1}{(x+1)^5} + \frac{1}{(x-1)^5}\right]$$

$$\therefore \quad g''(1) > 0$$

$\therefore$ Graph of $g(x)$ is concave up for $x > 1$.

Hence, both statements are correct but Statement II is not the correct explanation of Statement I.

● ***Ex. 16*** **Statement I** *If differentiable function $f(x)$ satisfies the relation $f(x) + f(x-2) = 0, \forall\ x \in R$, and if $\left(\frac{d}{dx} f(x)\right)_{x=a} = 6$, then $\left(\frac{d}{dx} f(x)\right)_{a+4000} = 6$*

Statement II *$f(x)$ is a periodic function with period 4.*

Sol. (a) We have, $f(x) + f(x-2) = 0$ ...(i)

Replace x by $x-2$ in Eq. (i), we have

$$f(x-2) + f(x-4) = 0 \quad \text{...(ii)}$$

From Eqs. (i) and (ii),

$$f(x) - f(x-4) = 0 \quad \text{...(iii)}$$

Replace x by $x+4$ in Eq. (iii), we get

$$f(x+4) - f(x) = 0$$

$$\Rightarrow \quad f(x+4) = f(x)$$

$$\Rightarrow \quad f(x) = f(x+4) = f(x+8) \ldots f(x+4000)$$

$$\Rightarrow \quad f'(x) = f'(x+4000)$$

Hence, both the statements are true and Statement II is the correct explanation of Statement I.

● ***Ex. 17*** **Statement I** *Let $f(x) = x[x]$ and $[\cdot]$ denotes greatest integer function, when x is not an integral, then rule for $f'(x)$ is given by $[x]$.*

Statement II *$f'(x)$ does not exist for any $x \in Z$.*

Sol. (a) $$f(x) = x[x] = \begin{cases} -x, & -1 \le x < 0 \\ 0, & 0 \le x < 1 \\ x, & 1 \le x < 2 \\ 2x, & 2 \le x < 3 \\ \vdots & \vdots \end{cases}$$

$$\Rightarrow \quad f'(x) = \begin{cases} -1, & -1 < x < 0 \\ 0, & 0 < x < 1 \\ 1, & 1 < x < 2 \\ 2, & 2 < x < 3 \\ \vdots & \vdots \end{cases}$$

$$\Rightarrow \quad f'(x) = [x]$$

Hence, both statements are true and Statement II is the correct explanation of Statement I.

JEE Type Solved Examples : Passage Based Questions

Passage I

(Ex. Nos. 18 to 20)

A non-zero polynomial with real coefficients has the property that $f''(x) \cdot f'(x) = f(x)$. Then,

● ***Ex. 18*** *The leading coefficient of $f(x)$, is*

(a) 1/6 (b) 1/9
(c) 1/12 (d) 1/18

● ***Ex. 19*** *The degree of $f(x)$, is*

(a) 2 (b) 3
(c) 4 (d) 5

● ***Ex. 20*** *The value of $f'''(x)$, is*

(a) 1/18 (b) 1/3
(c) 1/9 (d) 1/6

Sol. (Ex. Nos. 18 to 20)

Let degree of $f(x) = n$

$\therefore$ Degree of $f'(x) = n-1$, degree of $f''(x) = n-2$

Since, $f''(x) \cdot f'(x) = f(x)$

$$\Rightarrow \quad (n-1) + (n-2) = n$$

$$\Rightarrow \quad 2n - 3 = n \quad \text{or} \quad n = 3$$

$\therefore$ Degree of $f(x) = 3$

Hence, $f(x) = ax^3 + bx^2 + cx + d$

$$\Rightarrow \quad f'(x) = 3ax^2 + 2bx + c$$

$$\Rightarrow \quad f''(x) = 6ax + 2b$$

$$f'''(x) = 6a$$

As, $f''(x) \cdot f'(x) = f(x)$

$$\Rightarrow \quad (6ax + 2b)(3ax^2 + 2bx + c) = (ax^3 + bx^2 + cx + d)$$

On comparing coefficients of x^3, we get

$$18a^2 = a \ \Rightarrow\ a = 0, \frac{1}{18}$$

$$\therefore \quad a = \frac{1}{18} \qquad [\because a \neq 0]$$

The leading coefficient of $f(x) = \frac{1}{18}$ and $f'''(x) = 6a = \frac{1}{3}$.

18. (d) **19.** (b) **20.** (b)

Passage II

(Ex. Nos. 21 to 22)

The ends A and B of a rod of length $\sqrt{5}$ are sliding along the curve $y = 2x^2$. Let x_A and x_B be the x-coordinate of the ends. Then,

● ***Ex. 21*** *The moment when A is at $(0, 0)$ and B is at $(1, 2)$. The derivative $\frac{dx_B}{dx_A}$, is*

(a) $\frac{1}{9}$ (b) $\frac{1}{7}$

(c) $\frac{1}{5}$ (d) None of these

● ***Ex. 22*** *The moment when A is at $(1, 2)$ and B is at $(0, 0)$. The derivative $\frac{dx_B}{dx_A}$, is*

(a) 16 (b) 8 (c) 9 (d) 2

Sol. (Ex. Nos. 21 to 22)

We have, $y = 2x^2$

$$(AB)^2 = (x_B - x_A)^2 + (2x_B^2 - 2x_A^2)^2 = 5$$

$$\Rightarrow \quad (x_B - x_A)^2 + 4(x_B^2 - x_A^2)^2 = 5$$

Differentiating w.r.t. x_A and denoting $\frac{dx_B}{dx_A} = D$

$$2(x_B - x_A)(D - 1) + 8(x_B^2 - x_A^2) \cdot \{2x_B D - 2x_A\} = 0 \quad \ldots(i)$$

Now, when $A(0, 0)$ and $B(1, 2) \Rightarrow x_A = 0,\ x_B = 1$

Then, Eq. (i) reduces to

$$2(1 - 0)(D - 1) + 8(1 - 0)\{2D - 0\} = 0$$

$$\Rightarrow \quad 2D - 2 + 16D = 0$$

$$\Rightarrow \quad D = \frac{1}{9} \Rightarrow \frac{dx_B}{dx_A} = \frac{1}{9}$$

Again, when $A(1, 2)$ and $B(0, 0) \Rightarrow x_A = 1,\ x_B = 0$

Eq. (i) reduces to

$$2(0 - 1)(D - 1) + 8(0 - 1)\{0 - 2\} = 0$$

$$\Rightarrow \quad -2D + 2 + 16 = 0 \Rightarrow D = 9$$

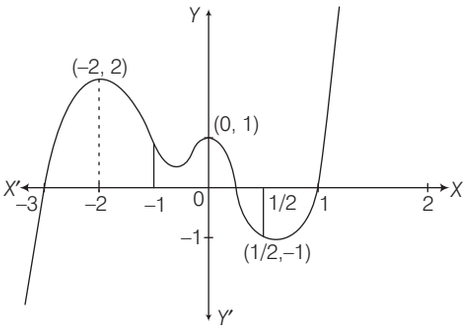
$$\therefore \quad \frac{dx_B}{dx_A} = 9$$

21. (a) **22.** (c)

Passage III

(Ex. Nos. 23 to 24)

The figure of $y = P(x) = ax^5 + bx^4 + cx^3 + dx^2 + ex + f$ is given below



● ***Ex. 23*** *If $P''(x)$ has real roots α, β, γ. Then, $[\alpha] + [\beta] + [\gamma]$ is*

(a) -2 (b) -3

(c) -1 (d) 0

Sol. (*b*) Here, $P'(x) = 0$ at $x = -2, -1, 0, \frac{1}{2}$.

$\Rightarrow$ $P''(x)$ will have real roots belongs to $(-2,-1), (-1,0), \left(0, \frac{1}{2}\right)$.

[$\because$ between any two roots of a function, atleast one root of its derivative exist]

$\therefore \quad [\alpha] + [\beta] + [\gamma] = -3$

● ***Ex. 24*** *The minimum number of real roots of equation $(P''(x))^2 + P'(x) \cdot P'''(x) = 0$*

(a) 5

(b) 7

(c) 6

(d) 4

Sol. (*c*) Let $f(x) = (P''(x))^2 + P'(x) \cdot P'''(x)$

$$\Rightarrow \quad f(x) = \frac{d}{dx}(P'(x) \cdot P''(x))$$

Since, $P'(x)$ has 4 real roots.

So, $P''(x)$ has 3 real roots.

$\Rightarrow f(x)$ has 6 real roots.

JEE Type Solved Examples :
Matching Type Questions

● ***Ex. 25*** *Match the Column I with Column II and mark the correct option from the codes given below.*

	Column I	Column II	
(i)	If $f'(x) = \sqrt{3x^2 + 6}$ and $y = f(x^3)$ then at $x = 1$, $\frac{dy}{dx}$ is	p.	-2
(ii)	If f is a differentiable function such that $f(xy) = f(x) + f(y) : x, y \in R$, then $f(e) + f(1/e)$ is	q.	-1
(iii)	If f is a twice differentiable function such that $f''(x) = -f(x)$ and $f'(x) = g(x)$. If $h(x) = [f(x)]^2 + [g(x)]^2$ and $h(5) = 9$, then $h(10)$ is	r.	0
(iv)	$y = \tan^{-1}(\cot x) + \cot^{-1}(\tan x)$, $\frac{\pi}{2} < x < \pi$, then $\frac{dy}{dx}$ is	s.	9

Codes

	i	ii	iii	iv		i	ii	iii	iv
(a)	s	r	s	p	(b)	p	q	r	s
(c)	q	p	r	r	(d)	s	p	q	q

Sol. (*a*) (i) $\because$ $y = f(x^3)$

$\therefore$ $\frac{dy}{dx} = f'(x^3) \cdot 3x^2$

$\left(\frac{dy}{dx}\right)_{x=1} = f'(1) \cdot 3 = 9$

(ii) $\because$ $f(xy) = f(x) + f(y)$

Put $x = y = 1$,

$f(1) = f(1) + f(1)$

$\therefore$ $f(1) = 0$

Also, $f(1) = f(e) + f(1/e)$

i.e. $x = e, y = \frac{1}{e}$

$\therefore$ $f(e) + f(1/e) = 0$

(iii) $\because$ $f''(x) = -f(x)$ and $g(x) = f'(x)$

$\therefore$ $g'(x) = f''(x) = -f(x)$ ...(i)

Also, $h(x) = [f(x)]^2 + [g(x)]^2$

$\therefore$ $h'(x) = 2f(x)f'(x) + 2g(x)g'(x)$

$= 2f(x)g(x) - 2g(x)f(x) = 0$

$\therefore$ $h(x) = c, \forall\ x \in R$

Here, $h(5) = 9 \implies h(10) = 9$

(iv) $\because$ $y = \tan^{-1}(\cot x) + \cot^{-1}(\tan x), \frac{\pi}{2} < x < \pi$

$\therefore$ $\frac{dy}{dx} = \frac{-\operatorname{cosec}^2 x}{1 + \cot^2 x} + \frac{(-1)\sec^2 x}{1 + \tan^2 x} = -1 - 1 = -2$

Hence, (i) $\to$ s; (ii) $\to$ r; (iii) $\to$ s; (iv) $\to$ p

● ***Ex. 26*** *Match the Column I with Column II and mark the correct option from the codes given below.*

	Column I	Column II	
(i)	If $y = \cos^{-1}(\cos x)$, then y' at $x = 5$ is equal to	p.	-1
(ii)	For the function $f(x) = \log_e \tan\left(\frac{\pi}{4} + \frac{x}{2}\right)$, if $\frac{dy}{dx} = \sec x + p$, then p is equal to	q.	0
(iii)	The derivative of $\tan^{-1}\left(\frac{1+x}{1-x}\right)$ at $x = -1$ is	r.	1/2
(iv)	The derivative of $\frac{\log \lvert x \rvert}{x}$ at $x = -1$ is	s.	1

Codes

	i	ii	iii	iv		i	ii	iii	iv
(a)	p	q	r	s	(b)	q	p	r	s
(c)	s	r	q	p	(d)	r	s	p	q

Sol. (*a*) (i) We have, $y = \cos^{-1}(\cos x)$

$$y = \begin{cases} x, & 0 \le x \le \pi \\ 2\pi - x, & \pi \le x \le 2\pi \end{cases} \implies \frac{dy}{dx} = \begin{cases} 1, & 0 \le x \le \pi \\ -1, & \pi \le x \le 2\pi \end{cases}$$

$\because$ $5 \in [\pi, 2\pi]$ $\therefore$ $\left(\frac{dy}{dx}\right)_{x=5} = -1$

(ii) We have, $f(x) = \log \tan\left(\frac{\pi}{4} + \frac{x}{2}\right)$

$$f'(x) = \frac{1}{\tan\left(\frac{\pi}{4} + \frac{x}{2}\right)} \times \sec^2\left(\frac{\pi}{4} + \frac{x}{2}\right) \times \frac{1}{2}$$

$$f'(x) = \frac{1}{2\sin\left(\frac{\pi}{4} + \frac{x}{2}\right)\cos\left(\frac{\pi}{4} + \frac{x}{2}\right)}$$

$$f'(x) = \frac{1}{\sin\left(\frac{\pi}{2} + x\right)} = \frac{1}{\cos x} = \sec x$$

$\therefore$ $p = 0$

(iii) Let $y = \tan^{-1}\left(\frac{1+x}{1-x}\right) \implies y = \tan^{-1}(1) + \tan^{-1} x$

$\therefore$ $\frac{dy}{dx} = \frac{1}{1 + x^2} \implies \left(\frac{dy}{dx}\right)_{x=-1} = \frac{1}{2}$

(iv) Let $y = \frac{\log |x|}{x} \implies \frac{dy}{dx} = \frac{-\log |x|}{x^2} + \frac{1}{x^2}$

$\left(\frac{dy}{dx}\right)_{x=-1} = \frac{-\log 1}{1} + \frac{1}{1} = 1$

Hence, (i) $\to$ p; (ii) $\to$ q; (iii) $\to$ r; (iv) $\to$ s

JEE Type Solved Examples :
Single Integer Answer Type Questions

● **Ex. 27** *If* $y=\sqrt{(x-\sin x)+\sqrt{(x-\sin x)+\ldots}}$, *then* $\left|\left|\frac{dx}{dy}\right|^2_{x=\frac{\pi}{2}}-2\pi\right|=$ ..... .

Sol. (3) Here, $y=\sqrt{(x-\sin x)+\sqrt{(x-\sin x)+....\infty}}$

So, $y=\sqrt{(x-\sin x)+y}$

$\therefore$ $y^2=x-\sin x+y$

Differentiating, we get

$$2y\frac{dy}{dx}=1-\cos x+\frac{dy}{dx} \qquad ...(i)$$

At $x=\frac{\pi}{2}$, $y^2-y=\frac{\pi}{2}-1 \Rightarrow y^2-y+\frac{1}{4}=\frac{\pi}{2}-\frac{3}{4}$

$\Rightarrow$ $\left(y-\frac{1}{2}\right)^2=\frac{2\pi-3}{4} \Rightarrow (2y-1)=\pm\sqrt{2\pi-3}$

From Eq. (i), we get $(2y-1)\frac{dy}{dx}=1-\cos x$

$\therefore$ $\left|\frac{dy}{dx}\right|_{x=\frac{\pi}{2}}=\frac{1}{\sqrt{2\pi-3}} \Rightarrow \left|\left|\frac{dx}{dy}\right|^2_{x=\frac{\pi}{2}}-2\pi\right|=3$

● **Ex. 28** *If* $f(x)=(x-a)(x-b)$ *for* $a,b\in R$. *Then, the minimum number of roots of equation* $\pi(f'(x))^2\cos(\pi f(x))+\sin(\pi f(x))f''(x)=0$ *in* (α,β), *where* $f(\alpha)=3=f(\beta)$, *is* ..... (*where* $\alpha<a<b<\beta$).

Sol. (4) Let $g(x)=f'(x)\sin(\pi f(x))=2\left[x-\left(\frac{a+b}{2}\right)\right]\sin(\pi\ f(x))$

$g'(x)=\pi(f'(x))^2\cos(\pi\ f(x))+\sin(\pi\ f(x))\ f''(x)=0$

$g(a)=0=g(b)=g\left(\frac{a+b}{2}\right)=g(\alpha)=g(\beta)$

$\therefore$ $g'(x)$ must have atleast one root in the intervals $(\alpha,\ a)$, $\left(a,\frac{a+b}{2}\right),\left(\frac{a+b}{2},\ b\right)$ and (b,β). i.e. minimum 4 roots.

● **Ex. 29** *Let* $f(x)=\int_{-2}^{x}e^{(1+t)^2}\ dt$ *and* $g(x)=f(h(x))$, *where* $h(x)$ *is defined for all* $x\in R$. *If* $g'(2)=e^4$ *and* $h'(2)=1$, *then absolute value of sum of all possible values of* $h(2)$, *is* ..... .

Sol. (2) Here, $f(x)=\int_{-2}^{x}e^{(1+t)^2}dt$

$$g(x)=\int_{-2}^{h(x)}e^{(1+t)^2}\ dt$$

$\Rightarrow$ $g'(x)=h'(x)\cdot e^{(1+h(x))^2}$ [by Leibnitz Rule]

$\Rightarrow$ $g'(2)=h'(2)\cdot e^{(1+h(2))^2}$

$\Rightarrow$ $e^4=1\cdot e^{(1+h(2))^2}$ [given $g'(2)=e^4$ and $h'(2)=1$]

$\Rightarrow$ $(1+h(2))^2=4 \Rightarrow h(2)=-3,1$

$\therefore$ Absolute value of sum of all possible values of $h(2)=|-3+1|=2$.

Subjective Type Questions

● **Ex. 30** *If* $f(x)=\cos\left\{\frac{\pi}{2}[x]-x^3\right\}, 1<x<2$ *and* $[x]$ = *the greatest integer* $\le x$, *then find* $f'\left(\sqrt[3]{\frac{\pi}{2}}\right)$.

Sol. As we know, $1<\sqrt[3]{\frac{\pi}{2}}<2$

$\therefore$ If $x=\sqrt[3]{\frac{\pi}{2}} \Rightarrow [x]=1$, so $f(x)=\cos\left\{\frac{\pi}{2}-x^3\right\}$

$f(x)=\sin x^3$ $\left[\text{at } x=\sqrt[3]{\frac{\pi}{2}}\in(1,2)\right]$

$\Rightarrow$ $f'(x)=\cos x^3\cdot 3x^2$

$\therefore$ $f'\left(\sqrt[3]{\frac{\pi}{2}}\right)=3\left(\frac{\pi}{2}\right)^{2/3}\cdot\cos\frac{\pi}{2}=0 \Rightarrow f'\left(\sqrt[3]{\frac{\pi}{2}}\right)=0$

● **Ex. 31** *If* $u=f(x^3), v=g(x^2)$, $f'(x)=\cos x$ *and* $g'(x)=\sin x$, *then find* $\frac{du}{dv}$.

Sol. Here, $u=f(x^3)$

$\Rightarrow$ $\frac{du}{dx}=f'(x^3)\cdot\frac{d}{dx}(x^3)=\{\cos(x^3)\}\cdot 3x^2=3x^2\cdot\cos x^3$

and $v=g(x^2)$

$\Rightarrow$ $\frac{dv}{dx}=g'(x^2)\cdot\frac{d}{dx}(x^2)=\{\sin x^2\}\cdot(2x)=2x\cdot\sin x^2$

$$\therefore \quad \frac{du}{dv}=\frac{\frac{du}{dx}}{\frac{dv}{dx}}=\frac{3x^2\cdot\cos x^3}{2x\cdot\sin x^2}$$

$$\Rightarrow \quad \frac{du}{dv}=\frac{3}{2}x\cdot\cos x^3\cdot\operatorname{cosec} x^2$$

● **Ex. 32** *Find a, b, c and d, where $f(x)=(ax+b)\cos x+(cx+d)\sin x$ and $f'(x)=x\cos x$ is identity in x.*

Sol. Here, $f'(x)=x\cos x$

$\Rightarrow a\cos x-(ax+b)\sin x+c\sin x+(cx+d)\cos x\equiv x\cos x$

or $(a+cx+d)\cos x+(-ax-b+c)\sin x\equiv x\cos x+0\cdot\sin x$

$\Rightarrow \quad a+d+cx=x$ and $-ax-b+c=0$

which is again identity in x.

$\Rightarrow \quad a+d=0, c=1, -a=0, -b+c=0$

$\Rightarrow \quad a=0, b=1, c=1, d=0$

● **Ex. 33** *If $f(x)=x^3+x^2f'(1)+xf''(2)+f'''(3)$ for all $x\in R$. Then, find $f(x)$ independent of $f'(1)$, $f''(2)$ and $f'''(3)$.*

Sol. Here, $f(x)=x^3+x^2f'(1)+xf''(2)+f'''(3)$

Put $f'(1)=a,\ f''(2)=b,\ f'''(3)=c$ ...(i)

$\therefore \quad f(x)=x^3+ax^2+bx+c$

$\Rightarrow \quad f'(x)=3x^2+2ax+b$ or $f'(1)=3+2a+b$ ...(ii)

$\Rightarrow \quad f''(x)=6x+2a$ or $f''(2)=12+2a$ ...(iii)

$\Rightarrow \quad f'''(x)=6$ or $f'''(3)=6$ ...(iv)

From Eqs. (i) and (iv), $c=6$

From Eqs. (i), (ii) and (iii), we have $a=-5, \quad b=2$

$\therefore \quad f(x)=x^3-5x^2+2x+6$

● **Ex. 34** *Let $f(x)=x^2+xg'(1)+g''(2)$ and $g(x)=f(1)\cdot x^2+xf'(x)+f''(x)$, then find $f(x)$ and $g(x)$.*

Sol. Here, put $g'(1)=a,\ g''(2)=b$ ...(i)

Then, $f(x)=x^2+ax+b, f(1)=1+a+b$

$\Rightarrow \quad f'(x)=2x+a, \quad f''(x)=2$

$\therefore \quad g(x)=(1+a+b)x^2+(2x+a)\cdot x+2$

$=x^2(3+a+b)+ax+2$

$\Rightarrow \quad g'(x)=2x(3+a+b)+a$

Hence, $g'(1)=2(3+a+b)+a$ ...(ii)

$g''(2)=2(3+a+b)$ ...(iii)

From Eqs. (i), (ii) and (iii), we have

$a=2(3+a+b)+a$ and $b=2(3+a+b)$

i.e. $3+a+b=0$ and $b+2a+6=0$

Hence, $b=0$ and $a=-3$

So, $f(x)=x^2-3x$ and $g(x)=-3x+2$

● **Ex. 35** *If $y=\dfrac{\sin x}{1+\dfrac{\cos x}{1+\dfrac{\sin x}{1+\cos x\ \ldots\infty}}}$, prove that $\dfrac{dy}{dx}=\dfrac{(1+y)\cos x+\sin x}{1+2y+\cos x-\sin x}$.*

Sol. Given function is $y=\dfrac{\sin x}{1+\dfrac{\cos x}{1+y}}=\dfrac{(1+y)\sin x}{1+y+\cos x}$

$\Rightarrow y+y^2+y\cos x=(1+y)\sin x$

On differentiating both the sides w.r.t. x, we get

$$\frac{dy}{dx}+2y\frac{dy}{dx}+y(-\sin x)+\cos x\cdot\frac{dy}{dx}$$

$$=(1+y)\cos x+\frac{dy}{dx}\cdot\sin x$$

$$\Rightarrow \frac{dy}{dx}\{1+2y+\cos x-\sin x\}=(1+y)\cos x+y\sin x$$

$$\Rightarrow \quad \frac{dy}{dx}=\frac{(1+y)\cos x+y\sin x}{(1+2y+\cos x-\sin x)}$$

● **Ex. 36** *If $y=\dfrac{x}{x+\dfrac{\sqrt[3]{x}}{x+\dfrac{\sqrt[3]{x}}{x+\sqrt[3]{x}+\ldots.\infty}}}$, then find $\dfrac{dy}{dx}$.*

Sol. $$y=\frac{x}{x+\dfrac{\sqrt[3]{x}}{x+\dfrac{\sqrt[3]{x}}{x+\sqrt[3]{x}+\ldots.\infty}}}$$

$$\Rightarrow \quad y=\frac{x}{x+\dfrac{x}{x+\dfrac{\sqrt[3]{x}}{x+\sqrt[3]{x}+\ldots.\infty}}}\cdot x^{-2/3}$$

$$\Rightarrow \quad y=\frac{x}{x+y\cdot x^{-2/3}}$$

$$\Rightarrow \quad y\{x^{5/3}+y\}=x^{5/3}$$

or $$x^{5/3}y+y^2=x^{5/3}$$

Differentiating both the sides w.r.t. x, we get

$$x^{5/3}\cdot\frac{dy}{dx}+\frac{5}{3}\cdot x^{2/3}\cdot y+2y\frac{dy}{dx}=\frac{5}{3}\cdot x^{2/3}$$

$$\Rightarrow \quad (x^{5/3}+2y)\frac{dy}{dx}=\frac{5}{3}x^{2/3}-\frac{5}{3}x^{2/3}y$$

or $$\frac{dy}{dx}=\frac{\frac{5}{3}x^{2/3}(1-y)}{(x^{5/3}+2y)}$$

● **Ex. 37** *If* $y = \tan^{-1}\dfrac{1}{x^2+x+1} + \tan^{-1}\dfrac{1}{x^2+3x+3} + \tan^{-1}\dfrac{1}{x^2+5x+7}$ *+... to n terms, show that* $\dfrac{dy}{dx} = \dfrac{1}{(x+n)^2+1} - \dfrac{1}{x^2+1}$.

Sol. Given, $y = \tan^{-1}\dfrac{1}{x^2+x+1} + \tan^{-1}\dfrac{1}{x^2+3x+3} + \tan^{-1}\dfrac{1}{x^2+5x+7} + \ldots$ to n terms

$$= \tan^{-1}\left\{\frac{1}{1+x(x+1)}\right\} + \tan^{-1}\left\{\frac{1}{1+(x+1)(x+2)}\right\} + \tan^{-1}\left\{\frac{1}{1+(x+2)(x+3)}\right\} + \ldots + \tan^{-1}\left\{\frac{1}{1+\{x+(n-1)\}\{x+n\}}\right\}$$

$$= \tan^{-1}\left\{\frac{(x+1)-x}{1+(x+1)x}\right\} + \tan^{-1}\left\{\frac{(x+2)-(x+1)}{1+(x+2)(x+1)}\right\} + \tan^{-1}\left\{\frac{(x+3)-(x+2)}{1+(x+3)(x+2)}\right\} + \ldots + \tan^{-1}\left\{\frac{(x+n)-(x+n-1)}{1+(x+n)(x+n-1)}\right\}$$

$\therefore\quad y = \{\tan^{-1}(x+1) - \tan^{-1}(x)\} + \{\tan^{-1}(x+2) - \tan^{-1}(x+1)\} + \{\tan^{-1}(x+3) - \tan^{-1}(x+2)\} + \ldots + \{\tan^{-1}(x+n) - \tan^{-1}(x+n-1)\}$

$$y = \tan^{-1}(x+n) - \tan^{-1}(x)$$

On differentiating both the sides w.r.t. x, we get

$$\frac{dy}{dx} = \frac{1}{1+(x+n)^2} - \frac{1}{1+x^2}$$

● **Ex. 38** *If* $f(\theta) = \cos\theta_1 \cdot \cos\theta_2 \cdot \cos\theta_3 \ldots \cos\theta_n$, *show that* $\{\tan\theta_1 + \tan\theta_2 + \tan\theta_3 + \ldots + \tan\theta_n\} = -\left\{\dfrac{f'(\theta)}{f(\theta)}\right\}$, *where* $\dfrac{d\theta_1}{d\theta} = \dfrac{d\theta_2}{d\theta} = \ldots = \dfrac{d\theta_n}{d\theta} = 1$.

Sol. $f(\theta) = \cos\theta_1 \cdot \cos\theta_2 \cdot \cos\theta_3 \ldots \cos\theta_n$

Taking log on both the sides,

$$\log f(\theta) = \log(\cos\theta_1) + \log(\cos\theta_2) + \ldots + \log(\cos\theta_n)$$

On differentiating both the sides w.r.t. θ, we get

$$\frac{1}{f(\theta)} \cdot f'(\theta) = \frac{1}{\cos\theta_1}\cdot(-\sin\theta_1) + \frac{1}{\cos\theta_2}\cdot(-\sin\theta_2) + \ldots + \frac{1}{\cos\theta_n}\cdot(-\sin\theta_n)$$

Hence, $(\tan\theta_1 + \tan\theta_2 + \ldots + \tan\theta_n) = -\left\{\dfrac{f'(\theta)}{f(\theta)}\right\}$

● **Ex. 39** *Find the sum of the series* $\sin x + 3\sin 3x + 5\sin 5x + \ldots + (2k-1)\sin(2k-1)x$ *(using calculus).*

Sol. Let $S = \cos x + \cos 3x + \cos 5x + \ldots\ldots + \cos(2k-1)x$

Here, the angles are in AP whose first term is x and common difference is $2x$.

$$\therefore\quad S = \frac{\sin\left(\frac{k\cdot 2x}{2}\right)}{\sin\left(\frac{2x}{2}\right)} \cdot \cos\left\{\frac{x}{1} + \frac{(k-1)2x}{2}\right\} = \frac{\sin kx}{\sin x}\cdot\cos kx$$

or $\{\cos x + \cos 3x + \cos 5x + \ldots + \cos(2k-1)x\} = \dfrac{\sin 2kx}{2\sin x}$ ...(i)

On differentiating Eq. (i) w.r.t. x, we get

$$-\{\sin x + 3\sin 3x + 5\sin 5x + \ldots + (2k-1)\sin(2k-1)x\} = \frac{1}{2}\left\{\frac{2k(\cos 2kx)\cdot\sin x - (\sin 2kx)\cdot\cos x}{\sin^2 x}\right\}$$

$$\therefore\quad [\sin x + 3\sin 3x + 5\sin 5x + \ldots + (2k-1)\sin(2k-1)x] = -\frac{1}{2\sin^2 x}\left[k\{\sin(2k+1)x - \sin(2k-1)x\} - \frac{1}{2}\{\sin(2k+1)x + \sin(2k-1)x\}\right]$$

$$= \frac{1}{4\sin^2 x}[(2k+1)\sin(2k-1)x - (2k-1)\sin(2k+1)x]$$

● **Ex. 40** *Find the sum of series* $\sum_{r=1}^{n} r\,x^{r-1}$, *using calculus.*

Sol. Let $S = 1 + x + x^2 + x^3 + x^4 + \ldots + x^n$

which is a geometric progression.

$$\therefore\quad S = 1 + x + x^2 + x^3 + \ldots + x^n = \frac{1(1-x^{n+1})}{1-x}$$

On differentiating both the sides, we get

$$0 + 1 + 2x + 3x^2 + 4x^3 + \ldots + nx^{n-1} = \frac{(1-x)\cdot[-(n+1)x^n] - (1-x^{n+1})\cdot(-1)}{(1-x)^2}$$

$$\therefore\quad \sum_{r=1}^{n} r\,x^{r-1} = \frac{1}{(1-x)^2}\cdot\{1-(n+1)x^n + n\cdot x^{n+1}\}$$

● **Ex. 41** *Use calculus to find the sum of* $\left[\dfrac{1}{x+1} + \dfrac{2}{x^2+1} + \dfrac{4}{x^4+1} + \ldots + \dfrac{2^n}{x^{2^n}+1}\right]$.

Sol. We know that, $(1-x)(1+x) = (1-x^2)$

$$(1-x)(1+x)(1+x^2) = (1-x^4) = (1-x^{2^2})$$

$$(1-x)(1+x)(1+x^2)(1+x^4) = (1-x^8) = (1-x^{2^3})$$

$$(1-x)(1+x)(1+x^2)(1+x^4)\ldots(1+x^{2^n}) = (1-x^{2^{n+1}}) \quad \ldots(i)$$

Taking log on both the sides of Eq. (i), we get

$$\log\{(1-x)(1+x)(1+x^2)(1+x^4)\ldots(1+x^{2^n})\} = \log(1-x^{2^{n+1}})$$

or $\log(1-x)+\log(1+x)+\log(1+x^2)+\log(1+x^4)$

$$+\ldots+\log(1+x^{2^n}) = \log(1-x^{2^{n+1}})$$

On differentiating the above equation, we get

$$\frac{1(-1)}{1-x}+\frac{1\cdot 1}{1+x}+\frac{1\,(2x)}{1+x^2}+\frac{1\cdot(4x^3)}{1+x^4}+\ldots+\frac{1\cdot 2^n\cdot x^{2^n-1}}{1+x^{2^n}}$$

$$=\frac{-1\cdot 2^{n+1}\cdot x^{2^{n+1}-1}}{1-x^{2^{n+1}}}$$

or $$\frac{1}{1+x}+\frac{2x}{1+x^2}+\frac{4x^3}{1+x^4}+\ldots+\frac{2^n\cdot x^{2^n-1}}{1+x^{2^n}}$$

$$=\frac{1}{1-x}-\frac{2^{n+1}\cdot x^{2^{n+1}-1}}{1-x^{2^{n+1}}}$$

Multiplying both the sides by x,

$$\left[\frac{x}{1+x}+\frac{2x^2}{1+x^2}+\frac{4x^4}{1+x^4}+\ldots+\frac{2^n\cdot x^{2^n}}{1+x^{2^n}}\right]$$

$$=\frac{x}{1-x}-\frac{2^{n+1}\cdot x^{2^{n+1}}}{1-x^{2n+1}}$$

or $$\frac{(x+1)-1}{1+x}+\frac{2\,(x^2+1)-2}{1+x^2}+\frac{4\,(x^4+1)-4}{1+x^4}$$

$$+\ldots+\frac{2^n\,(x^{2^n}+1)-2^n}{1+x^{2^n}}=\frac{x}{1-x}-2^{n+1}\cdot\frac{x^{2^{n+1}}}{1-x^{2^{n+1}}}$$

or $$[(1+2+2^2+\ldots+2^n)-P]=\frac{x}{1-x}-\frac{2^{n+1}\cdot x^{2^{n+1}}}{1-x^{2^{n+1}}}$$

where, $P=\dfrac{1}{1+x}+\dfrac{2}{1+x^2}+\dfrac{4}{1+x^4}+\ldots+\dfrac{2^n}{1+x^{2^n}}$

Then, $$P=\frac{2^{n+1}-1}{2-1}-\frac{x}{1-x}+\frac{2^{n+1}\cdot x^{2^{n+1}}}{1-x^{2^{n+1}}}$$

$\Rightarrow$ $$P=2^{n+1}-1-\frac{x}{1-x}+\frac{2^{n+1}\cdot x^{2^{n+1}}}{1-x^{2^{n+1}}}$$

$\Rightarrow$ $$P=2^{n+1}\left[1+\frac{x^{2^{n+1}}}{1-x^{2^{n+1}}}\right]-\left[1+\frac{x}{1-x}\right]$$

$\Rightarrow$ $$P=2^{n+1}\left[\frac{1}{1-x^{2^{n+1}}}\right]-\left[\frac{1}{1-x}\right]$$

Hence, $$\left\{\frac{1}{1+x}+\frac{2}{1+x^2}+\frac{4}{1+x^4}+\ldots+\frac{2^n}{1+x^{2^n}}\right\}$$

$$=\left\{\frac{2^{n+1}}{1-x^{2^{n+1}}}\right\}-\left\{\frac{1}{1-x}\right\}$$

● ***Ex. 42*** *If $f_n(x)=e^{f_{n-1}(x)}$ for all $n\in N$ and $f_0(x)=x$, then find $\dfrac{d}{dx}\{f_n(x)\}$.*

Sol. Here, $$f_n(x)=e^{f_{n-1}(x)} \quad \ldots(i)$$

$\Rightarrow$ $$\frac{d}{dx}\{f_n(x)\}=e^{f_{n-1}(x)}\cdot\frac{d}{dx}\{f_{n-1}(x)\}$$

or $$\frac{d}{dx}\{f_n(x)\}=f_n(x)\frac{d}{dx}\{f_{n-1}(x)\}$$

[using Eq. (i)] ...(ii)

Replacing n by $n-1$ in Eq. (ii), we have

$$\frac{d}{dx}\{f_{n-1}(x)\}=f_{n-1}(x)\cdot\frac{d}{dx}\{f_{n-2}(x)\} \quad \ldots(iii)$$

$\therefore$ From Eqs. (ii) and (iii), we get

$$\frac{d}{dx}\{f_n(x)\}=f_n(x)\cdot f_{n-1}(x)\cdot\frac{d}{dx}\{f_{n-2}(x)\} \quad \ldots(iv)$$

Similarly, $$\frac{d}{dx}\{f_{n-2}(x)\}=f_{n-2}(x)\cdot\frac{d}{dx}\{f_{n-3}(x)\}$$

$$\frac{d}{dx}\{f_1(x)\}=f_1(x)\frac{d}{dx}\{f_0(x)\} \quad \ldots(v)$$

From Eqs. (iv) and (v), we get

$$\frac{d}{dx}\{f_n(x)\}=f_n(x)f_{n-1}(x)\cdot f_{n-2}(x)\ldots f_2(x)\cdot f_1(x)\left\{\frac{d}{dx}f_0(x)\right\}$$

$\Rightarrow$ $$\frac{d}{dx}\{f_n(x)\}=f_n(x)f_{n-1}(x)\cdot f_{n-2}(x)\ldots f_2(x)\cdot f_1(x)\cdot 1$$

$$\left[\because\ f_0(x)=x\ \Rightarrow\frac{d}{dx}\{f_0(x)\}=1\right]$$

● ***Ex. 43*** *If $y^3-y=2x$, then prove that $\dfrac{d^2y}{dx^2}=-\dfrac{24y}{(3y^2-1)^3}$.*

Hence, show that $\left(x^2-\dfrac{1}{27}\right)\dfrac{d^2y}{dx^2}+x\cdot\dfrac{dy}{dx}=\dfrac{1}{9}y$.

Sol. Given, $$y^3-y=2x \quad \ldots(i)$$

On differentiating both the sides w.r.t. x, we get

$$(3y^2-1)\frac{dy}{dx}=2 \quad \text{or} \quad \frac{dy}{dx}=\frac{2}{3y^2-1} \quad \ldots(ii)$$

Again, differentiating w.r.t. x,

$$\frac{d^2y}{dx^2}=\frac{-2(6y)\cdot\frac{dy}{dx}}{(3y^2-1)^2}=\frac{-12y}{(3y^2-1)^2}\cdot\frac{2}{(3y^2-1)} \quad \text{[from Eq. (ii)]}$$

$\therefore$ $$\frac{d^2y}{dx^2}=-\frac{24y}{(3y^2-1)^3} \quad \ldots(iii)$$

Now, LHS $=\left(x^2-\dfrac{1}{27}\right)\dfrac{d^2y}{dx^2}+x\cdot\dfrac{dy}{dx}$

$$=\left(\frac{y^2(y^2-1)^2}{4}-\frac{1}{27}\right)\left(\frac{-24y}{(3y^2-1)^3}\right)+\frac{y\,(y^2-1)}{2}\cdot\frac{2}{(3y^2-1)}$$

[from Eqs. (i), (ii) and (iii)]

$$= \left(\frac{27y^2(y^2-1)^2-4}{108}\right)\frac{-24y}{(3y^2-1)^3} + \frac{y(y^2-1)}{(3y^2-1)}$$

$$= \frac{y}{9}\left[\frac{-54y^2(y^2-1)^2+8}{(3y^2-1)^3} + \frac{9(y^2-1)}{(3y^2-1)}\right]$$

Let $(3y^2-1) = \alpha$

Then, LHS $= \frac{y}{9}\left[\frac{-2(1+\alpha)(\alpha-2)^2+8}{\alpha^3} + \frac{3(\alpha-1)}{\alpha}\right]$

$$= \frac{y}{9}\left[\frac{-2\alpha^3+6\alpha^2+3\alpha^3-6\alpha^2}{\alpha^3}\right]$$

$$= \frac{y}{9} = \text{RHS}$$

Hence, $\left(x^2 - \frac{1}{27}\right)\frac{d^2y}{dx^2} + x\cdot\frac{dy}{dx} = \frac{y}{9}$

● ***Ex. 44*** *If $2x = y^{1/5} + y^{-1/5}$, then express y as an explicit function of x and prove that $(x^2-1)\frac{d^2y}{dx^2} + x\cdot\frac{dy}{dx} = 25y$.*

Sol. We have, $(y^{1/5} + y^{-1/5})^2 = (y^{1/5} - y^{-1/5})^2 + 4$

Then, $(y^{1/5} - y^{-1/5})^2 = 4x^2 - 4$ $[\because\ 2x = y^{1/5} + y^{-1/5}]$

$\therefore$ $y^{1/5} - y^{-1/5} = 2\sqrt{x^2-1}$ ...(i)

and $y^{1/5} + y^{-1/5} = 2x$ [given]...(ii)

Adding Eqs. (i) and (ii), we get

$$2y^{1/5} = 2x + 2\sqrt{x^2-1}$$

$\therefore$ $y^{1/5} = x + \sqrt{x^2-1}$

or $y = (x + \sqrt{x^2-1})^5$ ...(iii)

On differentiating both the sides w.r.t. x, we get

$$\frac{dy}{dx} = 5(x+\sqrt{x^2-1})^4\cdot\left\{1 + \frac{1\cdot 2x}{2\sqrt{x^2-1}}\right\}$$

$\Rightarrow$ $\frac{dy}{dx} = \frac{5(x+\sqrt{x^2-1})^5}{\sqrt{x^2-1}}$

$\Rightarrow$ $\frac{dy}{dx} = \frac{5y}{\sqrt{x^2-1}}$ [using Eq. (iii)]

$\Rightarrow$ $(x^2-1)\left(\frac{dy}{dx}\right)^2 = 25y^2$ ...(iv)

Again, differentiating both the sides w.r.t. x, we get

$$2x\left(\frac{dy}{dx}\right)^2 + (x^2-1)\cdot 2\frac{dy}{dx}\cdot\frac{d^2y}{dx^2} = 50y\cdot\frac{dy}{dx}$$

On dividing by $2\frac{dy}{dx}$ on both the sides,

$$x\cdot\frac{dy}{dx} + (x^2-1)\frac{d^2y}{dx^2} = 25y \qquad \left[\because\ \frac{dy}{dx} \neq 0\right]$$

● ***Ex. 45*** *If $y = 1 + \frac{a_1}{(x-a_1)} + \frac{a_2x}{(x-a_1)(x-a_2)} + \frac{a_3x^2}{(x-a_1)(x-a_2)(x-a_3)} + \ldots$ to $(n+1)$ terms, show that $\frac{dy}{dx} = \frac{y}{x}\left[n - \frac{x}{x-a_1} - \frac{x}{x-a_2} - \frac{x}{x-a_3} - \ldots - \frac{x}{x-a_n}\right]$.*

Sol. Here, $y = 1 + \frac{a_1}{(x-a_1)} + \frac{a_2x}{(x-a_1)(x-a_2)} + \frac{a_3x^2}{(x-a_1)(x-a_2)(x-a_3)} + \ldots$ to $(n+1)$ terms

$\Rightarrow$ $y = \frac{x}{(x-a_1)} + \frac{a_2x}{(x-a_1)(x-a_2)} + \frac{a_3x^2}{(x-a_1)(x-a_2)(x-a_3)} + \ldots$ to (n) terms

[adding first two terms]

$\Rightarrow$ $y = \frac{x^2}{(x-a_1)(x-a_2)} + \frac{a_3x^2}{(x-a_1)(x-a_2)(x-a_3)} + \ldots$ to $(n-1)$ terms

[again adding first two terms]

Proceeding in the same way, we get

$$y = \frac{x^n}{(x-a_1)(x-a_2)(x-a_3)\ldots(x-a_n)} \quad \text{...(i)}$$

Taking logarithm on both the sides of Eq. (i), we have

$$\log y = n\log x - \log(x-a_1) - \log(x-a_2) - \log(x-a_3) - \ldots - \log(x-a_n)$$

On differentiating both the sides w.r.t. x, we get

$$\frac{1}{y}\cdot\frac{dy}{dx} = \frac{n}{x} - \frac{1}{(x-a_1)} - \frac{1}{(x-a_2)} - \ldots - \frac{1}{(x-a_n)}$$

or $\frac{dy}{dx} = \frac{y}{x}\left[n - \frac{x}{(x-a_1)} - \frac{x}{(x-a_2)} - \ldots - \frac{x}{(x-a_n)}\right]$

● ***Ex. 46*** *If for all x, y the function f is defined by $f(x) + f(y) + f(x)\cdot f(y) = 1$ and $f(x) > 0$. Then, show $f'(x) = 0$, when $f(x)$ is differentiable.*

Sol. Here, $f(x) + f(y) + f(x)\cdot f(y) = 1$ ...(i)

Put $x = y = 0$, we get

$$2f(0) + \{f(0)\}^2 = 1$$

$\Rightarrow$ $\{f(0)\}^2 + 2f(0) - 1 = 0$

$$f(0) = \frac{-2 \pm \sqrt{4+4}}{2} = -1 - \sqrt{2} \quad \text{and} \quad -1 + \sqrt{2}$$

As $f(0) > 0 \Rightarrow f(0) = \sqrt{2} - 1$

[neglecting $f(0) = -1 - \sqrt{2}$ as $f(0)$ is positive]

Again, putting $y = x$ in Eq. (i),

$$2f(x) + \{f(x)\}^2 = 1$$

On differentiating w.r.t. x, we have

$$2f'(x) + 2f(x)f'(x) = 0$$

$$2f'(x)\{1 + f(x)\} = 0$$

$$\Rightarrow \quad f'(x) = 0$$

Because $f(x) > 0$

Therefore, $f'(x) = 0$ when $f(x) > 0$

● ***Ex. 47*** *If* $y = f\left(\dfrac{2x-1}{x^2+1}\right)$ *and* $f'(x) = \sin x^2$, *then find* $\dfrac{dy}{dx}$.

Sol. Here, $\dfrac{dy}{dx} = \dfrac{d}{dx} f\left(\dfrac{2x-1}{x^2+1}\right)$

$$= \frac{df\left(\dfrac{2x-1}{x^2+1}\right)}{d\left(\dfrac{2x-1}{x^2+1}\right)} \cdot \frac{d\left(\dfrac{2x-1}{x^2+1}\right)}{dx}$$

$$= f'\left(\frac{2x-1}{x^2+1}\right) \cdot \left\{\frac{(x^2+1)\cdot(2) - (2x-1)\cdot(2x)}{(x^2+1)^2}\right\}$$

$$= \sin\left(\frac{2x-1}{x^2+1}\right)^2 \cdot \frac{2\{x^2+1-2x^2+x\}}{(x^2+1)^2}$$

$$= \sin\left(\frac{2x-1}{x^2+1}\right)^2 \cdot \frac{2(1+x-x^2)}{(x^2+1)^2}$$

$$\Rightarrow \quad \frac{dy}{dx} = \frac{2(1+x-x^2)}{(x^2+1)^2} \cdot \sin\left(\frac{2x-1}{x^2+1}\right)^2$$

● ***Ex 48*** *Let* $f(x)$ *be a polynomial function of second degree. If* $f(1) = f(-1)$ *and* a_1, a_2, a_3 *are in AP, then show that* $f'(a_1), f'(a_2), f'(a_3)$ *are in AP.*

Sol. Let $f(x) = \lambda x^2 + \mu x + \nu$

Then, $f'(x) = 2\lambda x + \mu$

Also, $f(1) = f(-1)$

$\Rightarrow \quad \lambda + \mu + \nu = \lambda - \mu + \nu$

$\Rightarrow \quad \mu = 0$

$\therefore \quad f'(x) = 2\lambda x$

$\Rightarrow \quad f'(a_1) = 2\lambda a_1,\ f'(a_2) = 2\lambda a_2$

and $f'(a_3) = 2\lambda a_3$

As, a_1, a_2, a_3 are in AP. Therefore, $f'(a_1), f'(a_2), f'(a_3)$ are in AP.

● ***Ex. 49*** *If* $5f(x) + 3f\left(\dfrac{1}{x}\right) = x + 2$ *and* $y = x\ f(x)$, *then find* $\dfrac{dy}{dx}$ *at* $x = 1$.

Sol. Here, $5f(x) + 3f\left(\dfrac{1}{x}\right) = x + 2$ ...(i)

Put $x = \dfrac{1}{x}$, we get $5f\left(\dfrac{1}{x}\right) + 3f(x) = \dfrac{1}{x} + 2$ ...(ii)

Solving Eqs. (i) and (ii), we get

$$16f(x) = 5x - \frac{3}{x} + 4 \qquad \text{...(iii)}$$

$$\Rightarrow \quad y = x f(x)$$

$$\Rightarrow \quad y = x \cdot \frac{1}{16}\left\{5x - \frac{3}{x} + 4\right\}$$

$$\Rightarrow \quad y = \frac{1}{16}\{5x^2 - 3 + 4x\}$$

or $\dfrac{dy}{dx} = \dfrac{1}{16}\{10x + 4\}$

Now, $\dfrac{dy}{dx}$ at $x = 1$,

$$\left(\frac{dy}{dx}\right)_{\text{at } x=1} = \frac{10+4}{16} = \frac{14}{16} = \frac{7}{8}$$

$$\therefore \quad \left(\frac{dy}{dx}\right)_{\text{at } x=1} = \frac{7}{8}$$

Differentiation Exercise 1 :
Single Option Correct Type Questions

1. If $y=\dfrac{\sec x-\tan x}{\sec x+\tan x}$, then $\dfrac{dy}{dx}$ equals

(a) $2\sec x(\sec x-\tan x)$ (b) $-2\sec x(\sec x-\tan x)^2$

(c) $2\sec x(\sec x+\tan x)^2$ (d) $-2\sec x(\sec x+\tan x)^2$

2. If $y=\dfrac{1+x^2+x^4}{1+x+x^2}$ and $\dfrac{dy}{dx}=ax+b$, then

(a) $a=2,\ b=1$ (b) $a=-2,\ b=1$

(c) $a=2,\ b=-1$ (d) $a=-2,\ b=-1$

3. Which of the following could be the sketch of graph of $y=\dfrac{d}{dx}(x\log x)$?

(a) 
(b) 
(c) 
(d) 
4. Let $f(x)=x+3\log(x-2)$ and $g(x)=x+5\log(x-1)$, then the set of x satisfying the inequality $f'(x)<g'(x)$ is

(a) $(2,7/2)$ (b) $(1,2)\cup(7/2,\infty)$

(c) $(2,\infty)$ (d) $(7/2,\infty)$

5. If $\cos^{-1}\left(\dfrac{x^2-y^2}{x^2+y^2}\right)=\log a$, then $\dfrac{dy}{dx}$ is

(a) $-\dfrac{x}{y}$ (b) $-\dfrac{y}{x}$ (c) $\dfrac{y}{x}$ (d) $\dfrac{x}{y}$

6. If $f(x)=(|x|)^{|\sin x|}$, then $f'(-\pi/4)$ is equal to

(a) $\left(\dfrac{\pi}{4}\right)^{1/\sqrt{2}}\cdot\left(\dfrac{\sqrt{2}}{2}\log\dfrac{4}{\pi}-\dfrac{2\sqrt{2}}{\pi}\right)$

(b) $\left(\dfrac{\pi}{4}\right)^{1/\sqrt{2}}\cdot\left(\dfrac{\sqrt{2}}{2}\log\dfrac{4}{\pi}+\dfrac{2\sqrt{2}}{\pi}\right)$

(c) $\left(\dfrac{\pi}{4}\right)^{1/\sqrt{2}}\cdot\left(\dfrac{\sqrt{2}}{2}\log\dfrac{\pi}{4}-\dfrac{2\sqrt{2}}{\pi}\right)$

(d) $\left(\dfrac{\pi}{4}\right)^{1/\sqrt{2}}\cdot\left(\dfrac{\sqrt{2}}{2}\log\dfrac{\pi}{4}+\dfrac{2\sqrt{2}}{\pi}\right)$

7. If $y=\cfrac{x}{a+\cfrac{x}{b+\cfrac{x}{a+\cfrac{x}{b+\ldots\infty}}}}$, then $\dfrac{dy}{dx}$ equals

(a) $\dfrac{a}{ab+2ay}$ (b) $\dfrac{b}{ab+2by}$

(c) $\dfrac{a}{ab+2by}$ (d) $\dfrac{b}{ab+2ay}$

8. If $y=x^{x^2}$, then $\dfrac{dy}{dx}$ equals

(a) $2\log x\cdot x^2$

(b) $(2\log x+1)\cdot x^{x^2}$

(c) $(\log x+1)\cdot x^{x^2+1}$

(d) $x^{x^2+1}\cdot(\log(ex^2))$

9. If $x\sqrt{1+y}+y\sqrt{1+x}=0$, then $\dfrac{dy}{dx}$ equals

(a) $\dfrac{1}{(1+x)^2}$ (b) $\dfrac{-1}{(1+x)^2}$

(c) $\dfrac{-1}{(1+x)}+\dfrac{1}{(1+x)^2}$ (d) None of these

10. If $x^2e^y+2xye^x+13=0$, then $\dfrac{dy}{dx}$ equals

(a) $\dfrac{-2xe^{y-x}+2y(x-1)}{x(xe^{y-x}+2)}$ (b) $-\left[\dfrac{2xe^{y-x}+2y(x+1)}{x(xe^{y-x}+2)}\right]$

(c) $\dfrac{2xe^{x-y}+2y(x-1)}{x(xe^{y-x}+2)}$ (d) None of these

11. If $x=e^{y+e^{y+\ldots\infty}}$; $x>0$, then $\dfrac{dy}{dx}$ equals

(a) $\dfrac{x}{1+x}$ (b) $\dfrac{1+x}{x}$

(c) $\dfrac{1-x}{x}$ (d) $\dfrac{1}{x}$

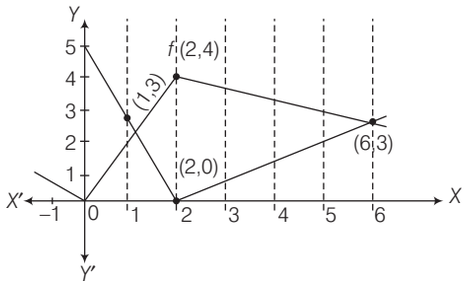
12. Let g be the inverse function of f and $f'(x)=\dfrac{x^{10}}{1+x^2}$.

If $g(2)=a$, then $g'(2)$ is equal to

(a) $\dfrac{5}{2^{10}}$ (b) $\dfrac{1+a^2}{a^{10}}$

(c) $\dfrac{a^{10}}{1+a^2}$ (d) $\dfrac{1+a^{10}}{a^2}$

13. If f and g are the functions whose graphs are as shown, let $u(x) = f(g(x)); w(x) = g(g(x))$



Then, the value of $u'(1) + w'(1)$ is

(a) $-\frac{1}{2}$ (b) $-\frac{3}{2}$ (c) $-\frac{5}{4}$ (d) does not exist

14. If $f'(x) = g(x)$ and $g'(x) = -f(x)$ for all real x and $f(5) = 2 = f'(5)$, then $f^2(10) + g^2(10)$ equals

(a) 2 (b) 4
(c) 8 (d) None of these

15. If $f(x) = x + \frac{x^2}{1!} + \frac{x^3}{2!} + \ldots + \frac{x^n}{(n-1)!}$, then $f(0) + f'(0) + f''(0) + \ldots + f^n(0)$ is equal to

(a) $\frac{n(n+1)}{2}$ (b) $\frac{(n^2+1)}{2}$
(c) $\left(\frac{n(n+1)}{2}\right)^2$ (d) $\frac{n(n+1)(2n+1)}{6}$

16. If $y = (fofof)(x)$ and $f(0) = 0, f'(0) = 2$, then $y'(0)$ is equal to

(a) 6 (b) 7 (c) 8 (d) 9

17. If $y^2 = p(x)$ is a polynomial of degree 3, then $2\frac{d}{dx}\left(y^3 \cdot \frac{d^2y}{dx^2}\right)$ is equal to

(a) $p'''(x) \cdot p'(x)$ (b) $p''(x) \cdot p'''(x)$
(c) $p(x) \cdot p'''(x)$ (d) None of these

18. If $y = f(x)$ and $x = g(y)$ are inverse functions of each other, then

(a) $g''(y) = \frac{1}{f'(x)}$ (b) $g''(y) = -\frac{f''(x)}{(f'(x))^3}$
(c) $g''(y) = -\frac{f'(x)}{(f''(x))^3}$ (d) None of these

19. If y is a function of x, then $\frac{d^2y}{dx^2} + y \cdot \frac{dy}{dx} = 0$. If x is a function of y, then the equation becomes

(a) $\frac{d^2x}{dy^2} - x \cdot \frac{dx}{dy} = 0$ (b) $\frac{d^2x}{dy^2} + y\left(\frac{dx}{dy}\right)^3 = 0$
(c) $\frac{d^2x}{dy^2} - y\left(\frac{dx}{dy}\right)^2 = 0$ (d) $\frac{d^2x}{dy^2} - x\left(\frac{dx}{dy}\right)^2 = 0$

20. Let $g(x) = \log_e f(x)$, where $f(x)$ is twice differentiable positive function on $(0, \infty)$ such that $f(x+1) = x f(x)$, for $N = 1, 2, 3, \ldots$, then

$$g''\left(N + \frac{1}{2}\right) - g''\left(\frac{1}{2}\right) \text{ equals}$$

(a) $-4\left\{1 + \frac{1}{9} + \frac{1}{25} + \ldots + \frac{1}{(2N-1)^2}\right\}$

(b) $4\left\{1 + \frac{1}{9} + \frac{1}{25} + \ldots + \frac{1}{(2N-1)^2}\right\}$

(c) $-4\left\{1 + \frac{1}{9} + \frac{1}{25} + \ldots + \frac{1}{(2N+1)^2}\right\}$

(d) $4\left\{1 + \frac{1}{9} + \frac{1}{25} + \ldots + \frac{1}{(2N+1)^2}\right\}$

21. If the function $f(x) = x^3 + e^{x/2}$ and $g(x) = f^{-1}(x)$, then the value of $g'(1)$ is

(a) 1 (b) 2
(c) 3 (d) e

22. Let $f(\theta) = \sin\left(\tan^{-1}\left(\frac{\sin\theta}{\sqrt{\cos 2\theta}}\right)\right)$, where $-\frac{\pi}{4} < \theta < \frac{\pi}{4}$.

Then, the value of $\frac{d}{d(\tan\theta)} \cdot f(\theta)$, is

(a) 1 (b) 2
(c) 3 (d) 4

23. If $y = \log_{\sin x}(\tan x)$, then $\frac{dy}{dx}$ at $x = \frac{\pi}{4}$ is equal to

(a) $\frac{4}{\log 2}$ (b) $-4\log 2$
(c) $\frac{-4}{\log 2}$ (d) None of these

24. If $y = \sum_{r=1}^{x} \tan^{-1}\left(\frac{1}{1 + r + r^2}\right)$, then $\frac{dy}{dx}$ is equal to

(a) $\frac{1}{1 + x^2}$ (b) $\frac{1}{1 + (1 + x)^2}$
(c) 0 (d) None of these

25. If $y = \sin^{-1}\left(\frac{\sin\alpha \sin x}{1 - \cos\alpha \sin x}\right)$, then $y'(0)$ is equal to

(a) 1 (b) $2\tan\alpha$
(c) $\left(\frac{1}{2}\right)\tan\alpha$ (d) $\sin\alpha$

26. If $f(x) = \cot^{-1}\left(\frac{x^x - x^{-x}}{2}\right)$, then $f'(1)$ equals

(a) -1 (b) 1
(c) $\log_e 2$ (d) $-\log_e 2$

27. The function $f(x) = e^x + x$, being differentiable and one-one, has a differentiable inverse $f^{-1}(x)$. The value of $\frac{d}{dx}(f^{-1})$ at the point $f(\log 2)$ is

(a) $\frac{1}{\ln 2}$ (b) $\frac{1}{3}$

(c) $\frac{1}{4}$ (d) None of these

28. If $f''(x) = -f(x)$, $g(x) = f'(x)$, $F(x) = \left(f\left(\frac{x}{2}\right)\right)^2 + \left(g\left(\frac{x}{2}\right)\right)^2$ and $F(5) = 5$, then $F(10)$ is equal to

(a) 5 (b) 10 (c) 0 (d) 15

29. If $x = \sec\theta - \cos\theta$ and $y = \sec^n\theta - \cos^n\theta$, then $(x^2 + 4)\left(\frac{dy}{dx}\right)^2$ is equal to

(a) $n^2(y^2 - 4)$ (b) $n^2(4 - y^2)$

(c) $n^2(y^2 + 4)$ (d) None of these

30. If $x = f(t)\cos t - f'(t)\sin t$ and $y = f(t)\sin t + f'(t)\cos t$, then $\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2$ is equal to

(a) $f(t) - f''(t)$ (b) $[f(t) - f''(t)]^2$

(c) $[f(t) + f''(t)]^2$ (d) None of these

31. If $y = at^2 + 2bt + c$ and $t = ax^2 + 2bx + c$, then $\frac{d^3y}{dx^3}$ is equal to

(a) $24a^2(at + b)$ (b) $24a(ax + b)^2$

(c) $24a(at + b)^2$ (d) $24a^2(ax + b)$

32. Differential coefficient of $\left(x^{\frac{l+m}{m-n}}\right)^{\frac{1}{n-l}} \cdot \left(x^{\frac{m+n}{n-l}}\right)^{\frac{1}{l-m}} \cdot \left(x^{\frac{n+l}{l-m}}\right)^{\frac{1}{m-n}}$ w.r.t. x, is

(a) 1 (b) 0 (c) -1 (d) x^{lmn}

33. If $y = (A + Bx)e^{mx} + (m-1)^{-2}e^x$, then $\frac{d^2y}{dx^2} - 2m\frac{dy}{dx} + m^2y$ is equal to

(a) e^x (b) e^{mx} (c) e^{-mx} (d) $e^{(1-m)x}$

34. If $f(x) = -\frac{x^3}{3} + x^2\sin 1.5a - x\sin a\cdot\sin 2a - 5\sin^{-1}(a^2 - 8a + 17)$, then

(a) $f(x)$ is not defined at $x = \sin 8$

(b) $f'(\sin 8) > 0$

(c) $f'(x)$ is not defined at $x = \sin 8$

(d) $f'(\sin 8) < 0$

35. If f and g are differentiable functions such that $g'(a) = 2$ and $g(a) = b$ and if fog is an identity function, then $f'(b)$ has the value equal to

(a) 2/3 (b) 1

(c) 0 (d) 1/2

36. The derivative of the function, $f(x) = \cos^{-1}\left\{\frac{1}{\sqrt{13}}(2\cos x - 3\sin x)\right\} + \sin^{-1}\left\{\frac{1}{\sqrt{13}}(2\cos x + 3\sin x)\right\}$ w.r.t. $\sqrt{1+x^2}$ at $x = \frac{3}{4}$ is

(a) $\frac{3}{2}$ (b) $\frac{5}{2}$

(c) $\frac{10}{3}$ (d) 0

37. If $f(x) = \sqrt{x + 2\sqrt{2x-4}} + \sqrt{x - 2\sqrt{2x-4}}$, then the value of $10f'(102^+)$, is

(a) -1 (b) 0

(c) 1 (d) does not exist

38. Let $y = \ln(1 + \cos x)^2$, then the value of $\frac{d^2y}{dx^2} + \frac{2}{e^{y/2}}$ equals

(a) 0 (b) $\frac{2}{1+\cos x}$

(c) $\frac{4}{(1+\cos x)}$ (d) $\frac{-4}{(1+\cos x)^2}$

39. If $f(x) = \frac{a + \sqrt{a^2 - x^2} + x}{\sqrt{a^2 - x^2} + a - x}$, where $a > 0$ and $x < a$, then $f'(0)$ has the value equal to

(a) $\sqrt{a}$ (b) a

(c) $\frac{1}{\sqrt{a}}$ (d) $\frac{1}{a}$

40. Let $u(x)$ and $v(x)$ be differentiable functions such that $\frac{u(x)}{v(x)} = 7$. If $\frac{u'(x)}{v'(x)} = p$ and $\left(\frac{u(x)}{v(x)}\right)' = q$, then $\frac{p+q}{p-q}$ has the value equal to

(a) 1 (b) 0

(c) 7 (d) -7

41. If $f(x) = |\log_e|x||$, then $f'(x)$ equals

(a) $\frac{1}{|x|}$, $x \neq 0$

(b) $\frac{1}{x}$ for $|x| > 1$ and $-\frac{1}{x}$ for $|x| < 1$

(c) $-\frac{1}{x}$ for $|x| > 1$ and $\frac{1}{x}$ for $|x| < 1$

(d) $\frac{1}{x}$ for $x > 0$ and $-\frac{1}{x}$ for $x < 0$

42. If $f(x)$ is given by, $f(x) = (\cos x + i \sin x)$ $(\cos 3x + i \sin 3x) \ldots (\cos (2n-1)\, x + i \sin (2n-1)\, x)$, then $f''(x)$ is equal to

(a) $n^3 f(x)$ (b) $-n^4 f(x)$

(c) $-n^2 f(x)$ (d) $n^4 f(x)$

43. Let $f(x) = x^n$, n being a non-negative integer. The value of n for which the equality $f'(x+y) = f'(x) + f'(y)$ is valid for all $x, y > 0$, is

(a) 0, 1 (b) 1, 2

(c) 2, 4 (d) None of these

44. If $f(x) = \sin\left\{\frac{\pi}{3}[x] - x^2\right\}$ for $2 < x < 3$ and $[x]$ denotes the greatest integer less than or equal to x, then $f'(\sqrt{\pi/3})$ is equal to

(a) $\sqrt{\pi/3}$ (b) $-\sqrt{\pi/3}$

(c) $-\sqrt{\pi}$ (d) None of these

45. The functions $u = e^x \sin x, v = e^x \cos x$ satisfy the equation

(a) $v\frac{du}{dx} - u\frac{dv}{dx} = u^2 + v^2$ (b) $\frac{d^2u}{dx^2} = 2v$

(c) $\frac{d^2v}{dx^2} = -2u$ (d) All of these

46. If $f(x) = \log_x \{\ln(x)\}$, then $f'(x)$ at $x = e$, is

(a) e (b) $-e$

(c) e^2 (d) e^{-1}

47. Let f be a differentiable function satisfying

$$[f(x)]^n = f(nx) \text{ for all } x \in R.$$

Then, $f'(x)f(nx)$ equals

(a) $f(x)$ (b) 0

(c) $f(x)f'(nx)$ (d) None of these

48. If $y = f(x)$ is an odd differentiable function defined on $(-\infty, \infty)$ such that $f'(3) = -2$, then $f'(-3)$ equals

(a) 4 (b) 2

(c) -2 (d) 0

49. If $y = \sqrt{x + \sqrt{y + \sqrt{x + \sqrt{y + \ldots \infty}}}}$, then $\frac{dy}{dx}$ is equal to

(a) $\frac{y+x}{y^2 - 2x}$ (b) $\frac{y^3 - x}{2y^2 - 2xy - 1}$

(c) $\frac{y^3 + x}{2y^2 - x}$ (d) None of these

50. If $f(x) = |\cos x - \sin x|$, then $f'\left(\frac{\pi}{4}\right)$ is equal to

(a) $\sqrt{2}$ (b) $-\sqrt{2}$

(c) 0 (d) None of these

51. Let $f(x) = x^2 + xg'(1) + g''(2)$ and $g(x) = x^2 + xf'(2) + f''(3)$. Then,

(a) $f'(1) = 4 + f'(2)$

(b) $g'(2) = 8 + g'(1)$

(c) $g''(2) + f''(3) = 4$

(d) All of the above

52. If $f(x) = x^n$, then the value of

$$f(1) - \frac{f'(1)}{1!} + \frac{f''(1)}{2!} - \frac{f'''(1)}{3!} + \frac{f''''(1)}{4!} - \ldots + \frac{(-1)^n f^n(1)}{n!} \text{ is}$$

(a) 1 (b) 2^n

(c) 2^{n-1} (d) 0

Differentiation Exercise 2 : More than One Option Correct Type Questions

53. If $y + \log(1+x) = 0$, which of the following is true?

(a) $e^y = xy' - 1$ (b) $y' = -\frac{1}{(x+1)}$

(c) $y' + e^y = 0$ (d) $y' = e^y$

54. If $y = 2^{3^x}$, then y' equals

(a) $3^x \cdot \log 3 \cdot \log 2$

(b) $y \cdot (\log_2 y) \cdot \log 3 \cdot \log 2$

(c) $2^{3^x} \cdot 3^x \cdot \log 6$

(d) $2^{3^x} \cdot 3^x \cdot \log 3 \cdot \log 2$

55. If g is the inverse of f and $f(x) = x^2 + 3x - 3, (x > 0)$, then $g'(1)$ equals

(a) $\frac{1}{2g(1)+3}$ (b) -1 (c) $\frac{1}{5}$ (d) $-\frac{f'(1)}{(f(1))^2}$

56. If $x^3 - 2x^2y^2 + 5x + y - 5 = 0$ and $y(1) = 1$, then

(a) $y'(1) = \frac{4}{3}$ (b) $y''(1) = -\frac{1}{3}$

(c) $y''(1) = -8\frac{22}{27}$ (d) $y'(1) = \frac{2}{3}$

57. Let $y=\sqrt{x+\sqrt{x+\sqrt{x+\ldots\infty}}}$, then dy/dx equals

(a) $\frac{1}{2y-1}$ (b) $\frac{x}{x+2y}$

(c) $\frac{1}{\sqrt{1-4x}}$ (d) $\frac{y}{2x+y}$

58. If $y=x^{(\ln x)^{\ln(\ln x)}}$, then $\frac{dy}{dx}$ is equal to

(a) $\frac{y}{x}(\ln x^{\ln x-1}+2\ln x\ln(\ln x))$

(b) $\frac{y}{x}(\ln x)^{\ln(\ln x)}(2\ln(\ln x)+1)$

(c) $\frac{y}{x\ln x}((\ln x)^2+2\ln x(\ln x))$

(d) $\frac{y}{x}\cdot\frac{\ln y}{\ln x}(2\ln(\ln x)+1)$

59. Which of the following functions are not derivable at $x=0$?

(a) $f(x)=\sin^{-1}2x\sqrt{1-x^2}$ (b) $g(x)=\sin^{-1}\left(\frac{2^{x+1}}{1+4^x}\right)$

(c) $h(x)=\sin^{-1}\left(\frac{1-x^2}{1+x^2}\right)$ (d) $k(x)=\sin^{-1}(\cos x)$

60. Let $f(x)=\frac{\sqrt{x-2\sqrt{x-1}}}{\sqrt{x-1}-1}\cdot x$, then

(a) $f'(10)=1$ (b) $f'(3/2)=-1$

(c) domain of $f(x)$ is $x\geq 1$ (d) None of these

61. If $2^x+2^y=2^{x+y}$, then $\frac{dy}{dx}$ is equal to

(a) $-\frac{2^y}{2^x}$ (b) $\frac{1}{1-2^x}$

(c) $1-2^y$ (d) $\frac{2^x(1-2^y)}{2^y(2^x-1)}$

62. For the function $y=f(x)=(x^2+bx+c)e^x$, which of the following holds?

(a) If $f(x)>0$ for all real $x\not\Rightarrow f'(x)>0$

(b) If $f(x)>0$ for all real $x\Rightarrow f'(x)>0$

(c) If $f'(x)>0$ for all real $x\Rightarrow f(x)>0$

(d) If $f'(x)>0$ for all real $x\not\Rightarrow f(x)>0$

63. If $\sqrt{y+x}+\sqrt{y-x}=c$, where $c\neq 0$, then $\frac{dy}{dx}$ has the value equal to

(a) $\frac{2x}{c^2}$ (b) $\frac{x}{y+\sqrt{y^2-x^2}}$

(c) $\frac{y-\sqrt{y^2-x^2}}{x}$ (d) $\frac{c^2}{2y}$

64. If $y=\tan x\tan 2x\tan 3x$, then $\frac{dy}{dx}$ has the value equal to

(a) $3\sec^2 3x\tan x\tan 2x+\sec^2 x\tan 2x\tan 3x+2\sec^2 2x\tan 3x\tan x$

(b) $2y(\operatorname{cosec}2x+2\operatorname{cosec}4x+3\operatorname{cosec}6x)$

(c) $3\sec^2 3x-2\sec^2 2x-\sec^2 x$

(d) $\sec^2 x+2\sec^2 2x+3\sec^2 3x$

Differentiation Exercise 3 : Statements I and II Type Questions

■ **Directions** (Q. Nos. 65 to 74) *This section is based on Statement* I *and Statement* II. *Select the correct answer from the codes given below.*

(a) Both Statement I and Statement II are correct and Statement II is the correct explanation of Statement I

(b) Both Statement I and Statement II are correct but Statement II is not the correct explanation of Statement I

(c) Statement I is correct but Statement II is incorrect

(d) Statement II is correct but Statement I is incorrect

65. Consider $f(x)=\frac{x}{x^2-1}$

Statement I Graph of $f(x)$ is concave up for $x>1$.

Statement II If $f(x)$ is concave up, then $f''(x)>0$.

66. If $f(x)=\sin^{-1}\left(\frac{2x}{1+x^2}\right)$, then

Statement I The value of $f'(2)=-\frac{2}{5}$.

Statement II $f(x)=\sin^{-1}\left(\frac{2x}{1+x^2}\right)=\frac{-2}{1+x^2}$, for $x>1$.

67. **Statement I** If $f(0)=a$, $f'(0)=b$, $g(0)=0$, $(fog)'(0)=c$, then $g'(0)=\frac{c}{b}$.

Statement II $(f(g(x))'=f'(g(x))\cdot g'(x)$, for all n.

68. Let f and g be real valued functions defined on interval $(-1,1)$ such that $g''(x)$ is continuous, $g(0)=0$, $g'(0)=0$, $g''(0)=0$ and $f(x)=g(x)\sin x$.

Statement I $\lim_{x\to 0}(g(x)\cot x-g(0)\operatorname{cosec}x)=f''(0)$.

Statement II $f'(0)=g'(0)$.

69. **Statement I** If $y = \sin^{-1}(3x - 4x^3)$, then $\frac{dy}{dx} = \frac{3}{\sqrt{1-x^2}}$ only when $\frac{-1}{2} \le x < \frac{1}{2}$.

Statement II $\sin^{-1}(3x - 4x^3)$

$$= \begin{cases} -\pi - 3\sin^{-1} x, & -1 \le x \le -\frac{1}{2} \\ 3\sin^{-1} x, & -\frac{1}{2} \le x \le \frac{1}{2} \\ \pi - 3\sin^{-1} x, & \frac{1}{2} \le x \le 1. \end{cases}$$

70. If $y = \cos^{-1}\left(\frac{1-x^2}{1+x^2}\right)$, then

Statement I $\frac{dy}{dx} = \frac{2}{1+x^2}$ for $x \in R$.

Statement II $\cos^{-1}\left(\frac{1-x^2}{1+x^2}\right) = \begin{cases} 2\tan^{-1} x, & x \ge 0 \\ -2\tan^{-1} x, & x < 0. \end{cases}$

71. If $y = x + [x]$, then

Statement I $\frac{dy}{dx} = 1$ for all $x \in R$.

Statement II $\frac{d([x])}{dx} = \begin{cases} 0, & x \notin \text{Integer} \\ \text{does not exist}, & x \in \text{Integer}. \end{cases}$

72. **Statement I** If $f(x)$ is a continuous function defined from R to Q and $f(5) = 3$, then differential coefficient of $f(x)$ w.r.t. x will be 0.

Statement II Differentiation of constant function is always zero.

73. **Statement I** Derivative of $\sin^{-1}\left(\frac{2x}{1+x^2}\right)$ w.r.t. $\cos^{-1}\left(\frac{1-x^2}{1+x^2}\right)$ is 1 for $0 < x < 1$.

Statement II $\sin^{-1}\left(\frac{2x}{1+x^2}\right) = \cos^{-1}\left(\frac{1-x^2}{1+x^2}\right)$ for $-1 \le x \le 1$.

74. Consider function $f(x)$ satisfies the relation $f(x + y^3) = f(x) + f(y^3), \forall\ x, y \in R$ and differentiable for all x.

Statement I If $f'(2) = a$, then $f'(-2) = a$.

Statement II $f(x)$ is an odd function.

Differentiation Exercise 4 : Passage Based Questions

Passage I (Q. Nos. 75 to 77)

Let $\frac{f(x+y) - f(x)}{2} = \frac{f(y) - 1}{2} + xy$, *for all* $x, y \in R$, $f(x)$ *is differentiable and* $f'(0) = 1$. *Let* $g(x)$ *be a derivable function at* $x = 0$ *and follows the functional rule*

$g\left(\frac{x+y}{k}\right) = \frac{g(x) + g(y)}{k}$; $k \in R$, $k \ne 0, 2$

and $g'(0) - \lambda g'(0) \ne 0$.

75. Domain of $\log(f(x))$, is

(a) R^+ (b) $R - \{0\}$
(c) R (d) R^-

76. Range of $y = \log_{3/4}(f(x))$ is

(a) $(-\infty, 1]$ (b) $[3/4, \infty)$
(c) $(-\infty, \infty)$ (d) R

77. If the graphs of $y = f(x)$ and $y = g(x)$ intersect in coincident points then λ can take values

(a) -3 (b) 1
(c) -1 (d) 4

Passage II (Q. Nos. 78 to 80)

Left hand derivative and right hand derivative of a function $f(x)$ *at a point* $x = a$ *are defined as*

$$f'(a^-) = \lim_{h \to 0^+} \frac{f(a) - f(a-h)}{h} = \lim_{h \to 0^+} \frac{f(a+h) - f(a)}{h}$$

and $$f'(a^+) = \lim_{h \to 0^+} \frac{f(a+h) - f(a)}{h} = \lim_{h \to 0^+} \frac{f(a) - f(a+h)}{h} = \lim_{h \to 0^+} \frac{f(a) - f(x)}{a - x}$$ *respectively.*

Let f *be a twice differentiable function. We also know that derivative of an even function is odd function and derivative of an odd function is even function.*

78. If f is odd, then which of the following is left hand derivative of f at $x = -a$?

(a) $\lim_{h \to 0^-} \frac{f(a-h) - f(a)}{-h}$

(b) $\lim_{h \to 0^-} \frac{f(h-a) - f(a)}{h}$

(c) $\lim_{h \to 0^+} \frac{f(a) + f(a-h)}{-h}$

(d) $\lim_{h \to 0^-} \frac{f(a) - f(a-h)}{-h}$

79. If f is even function, then which of the following is right hand derivative of f' at $x = a$?

(a) $\lim_{h \to 0^-} \frac{f'(a) + f'(-a+h)}{h}$

(b) $\lim_{h \to 0^+} \frac{f'(a) + f'(-a-h)}{h}$

(c) $\lim_{h \to 0^-} \frac{-f'(-a) + f'(-a-h)}{-h}$

(d) $\lim_{h \to 0^+} \frac{f'(a) + f'(-a+h)}{-h}$

80. The statement $\lim_{h \to 0} \frac{f(-x) - f(-x-h)}{h}$ $= \lim_{h \to 0} \frac{f(x) - f(x-h)}{-h}$ implies that for all $x \in R$,

(a) f is odd
(b) f is even
(c) f is neither even nor odd
(d) Nothing can be concluded

Passage III

(Q. Nos. 81 to 82)

If $f(x) = \sin^{-1}(3x - 4x^3)$. *Then answer the following*

81. The value of $f'(0)$ is

(a) -3 (b) 3
(c) $\sqrt{2}$ (d) $-\sqrt{2}$

82. The value of $f'\left(\frac{1}{\sqrt{2}}\right)$ is

(a) -3 (b) 3
(c) $-3\sqrt{2}$ (d) $3\sqrt{2}$

Passage IV (Q. Nos. 83 to 84)

Let the derivative of $f(x)$ *be defined as*

$D^* f(x) = \lim_{h \to 0} \frac{f^2(x+h) - f^2(x)}{h}$, *where* $f^2(x) = \{f(x)\}^2$.

83. If $u = f(x)$, $v = g(x)$, then the value of $D^*(u \cdot v)$ is

(a) $(D^* u)v + (D^* v)\, u$ (b) $u^2(D^* v) + v^2(D^* u)$
(c) $D^* u + D^* v$ (d) $uv\, D^*(u + v)$

84. If $u = f(x)$, $v = g(x)$, then the value of $D^*\left(\frac{u}{v}\right)$ is

(a) $\frac{u^2 (D^* v) - v^2 (D^* u)}{v^4}$ (b) $\frac{u (D^* v) - v (D^* u)}{v^2}$
(c) $\frac{v^2 (D^* u) - u^2 (D^* v)}{v^4}$ (d) $\frac{v (D^* u) - u (D^* v)}{v^2}$

Passage V

(Q. Nos. 85 to 87)

A curve is represented parametrically by the equations $x = e^t \cos t$ *and* $y = e^t \sin t$, *where t is a parameter. Then*,

85. The relation between the parameter 't' and the angle α between the tangent to the given curve and the X-axis is given by, 't' equals

(a) $\frac{\pi}{2} - \alpha$ (b) $\frac{\pi}{4} + \alpha$
(c) $\alpha - \frac{\pi}{4}$ (d) $\frac{\pi}{4} - \alpha$

86. The value of $\frac{d^2 y}{dx^2}$ at the point, where $t = 0$, is

(a) 1 (b) 2
(c) -2 (d) 3

87. If $F(t) = \int (x + y)\, dt$, then the value of $F\left(\frac{\pi}{2}\right) - F(0)$ is

(a) 1 (b) -1
(c) $e^{\pi/2}$ (d) 0

Passage VI

(Q. Nos. 88 to 90)

Equation $x^n - 1 = 0$, $n > 1$, $n \in N$ *has roots* $1, a_1, a_2, \ldots, a_n$.

88. The value of $(1 - a_1)(1 - a_2) \ldots (1 - a_n)$, is

(a) $\frac{n^2}{2}$ (b) n
(c) $(-1)^n n$ (d) None of these

89. The value of $\sum_{r=1}^{n} \frac{1}{2 - a_r}$, is

(a) $\frac{2^{n-1}(n-2) + 1}{2^n - 1}$ (b) $\frac{2^n (n-2) + 1}{2^n - 1}$
(c) $\frac{2^{n-1}(n-1) - 1}{2^n - 1}$ (d) None of these

90. The value of $\sum_{r=1}^{n} \frac{1}{1 - a_r}$, is

(a) $\frac{n}{4}$ (b) $\frac{n(n-1)}{2}$
(c) $\frac{n-1}{2}$ (d) None of these

Differentiation Exercise 5 : Matching Type Questions

91. Match the entries between following two columns.

	Column I		Column II
(A)	$y = f(x)$ be given by $x = t^5 - 5t^3 - 20t + 7$ and $y = 4t^3 - 3t^2 - 18t + 3$, then $-5 \times \frac{dy}{dx}$ at $t = 1$	(p)	0
(B)	$P(x)$ be a polynomial of degree 4 with $P(2) = -1$, $P'(2) = 0$, $P''(2) = 2$, $P'''(2) = -12$ and $P''''(2) = 24$, then $P''(3)$ is equal to	(q)	–2
(C)	$y = \frac{1}{x}$, then $\frac{\frac{dy}{\sqrt{1+y^4}}}{\frac{dx}{\sqrt{1+x^4}}}$	(r)	2
(D)	$f\left(\frac{2x+3y}{5}\right) = \frac{2f(x)+3f(y)}{5}$ and $f'(0) = p$ and $f(0) = q$, then $f''(0)$	(s)	–1

92. Match the following.

	Column I		Column II
(A)	$y = \sin^{-1}\left(\frac{2x}{1+x^2}\right)$, then $\frac{dy}{dx} = -\frac{2}{1+x^2}$	(p)	for $x < 0$
(B)	$y = \cos^{-1}\left(\frac{1}{\sqrt{1+x^2}}\right)$, then $\frac{dy}{dx} = -\frac{1}{1+x^2}$	(q)	for $x > 1$
(C)	$y = \lvert e^{\lvert x \rvert} - e \rvert$, then $\frac{dy}{dx} > 0$	(r)	for $x < -1$
(D)	$u = \log \lvert 2x \rvert$, $v = \lvert \tan^{-1} x \rvert$, then $\frac{du}{dv} > 2$	(s)	for $-1 < x < 0$

Differentiation Exercise 6 : Single Integer Answer Type Questions

93. If $f(x) = x^3 + x^2 f'(1) + xf''(2) + f'''(3)$ for all $x \in R$. Then, $f(1)$ is ..... .

94. Let $f(x) = \sin^{-1}\left(\frac{2x+2}{\sqrt{4x^2+8x+13}}\right)$, then the value of $\frac{d(\tan f(x))}{d(\tan^{-1} x)}$, when $x = \frac{1}{2}$, is ..... .

95. Let $x, x_1, x_2, x_3, x_4, \ldots, x_8$ be 9 real zeroes, of the polynomial $P(x) = x^{10} + ax^2 + bx + c$, where $a, b, c \in R$. If the value of $Q(x_1) = \frac{p}{q}$, where p and q are coprime to each other. If $Q(x) = (x - x_2)(x - x_3)\ldots(x - x_8)$ and $x_1 = \frac{1}{2}$, then the value of $q - p$ is ..... .

96. If $f(x) = \begin{vmatrix} (x-a)^4 & (x-a)^3 & 1 \\ (x-b)^4 & (x-b)^3 & 1 \\ (x-c)^4 & (x-c)^3 & 1 \end{vmatrix}$ and $f'(x) = \lambda \begin{vmatrix} (x-a)^4 & (x-a)^2 & 1 \\ (x-b)^4 & (x-b)^2 & 1 \\ (x-c)^4 & (x-c)^2 & 1 \end{vmatrix}$, then value of λ is .... .

97. Let $P(x)$ be a polynomial of degree 4 such that $P(1) = P(3) = P(5) = P(7) = 0$. If the real number $x \neq 1, 3, 5$ is such that $P(x) = 0$ can be expressed as $x = \frac{p}{q}$, where p and q are relatively prime, then $(p - 8q)$ is ..... .

98. If $x^2 + y^2 = t - \frac{1}{t}$ and $x^4 + y^4 = t^2 + \frac{1}{t^2}$, then $\left(\frac{dy}{dx}\right)_{(1,1)}$ is ..... .

99. If $x^2 + y^2 + z^2 - 2xyz = 1$, then the value of $\frac{dx}{\sqrt{1-x^2}} + \frac{dy}{\sqrt{1-y^2}} + \frac{dz}{\sqrt{1-z^2}}$ is equal to ..... .

100. If y is twice differentiable function of x, then the expression $(1-x^2)\cdot\frac{d^2y}{dx^2} - x\frac{dy}{dx} + y$ by means of the transformation $x = \sin t$ in terms of t is $\frac{d^2y}{dt^2} + \lambda y$.
Thus, λ is ..... .

101. The derivative of $f(x) = \cos^{-1}\left(\frac{1}{\sqrt{3}}(2\cos x - 3\sin x)\right) + \left\{\sin^{-1}\left(\frac{1}{\sqrt{3}}(2\cos x + 3\sin x)\right)\right\}$ w.r.t. $\sqrt{1+x^2}$ at $x = \frac{1}{\sqrt{3}}$ is ..... .

102. Suppose $f(x) = e^{ax} + e^{bx}$, where $a \neq b$ and $f''(x) - 2f'(x) - 15f(x) = 0$ for all x. Then, the value of $|a+b|$ is equal to ..... .

103. Suppose, $A = \frac{dy}{dx}$ of $x^2 + y^2 = 4$ at $(\sqrt{2}, \sqrt{2})$, $B = \frac{dy}{dx}$ of $\sin y + \sin x = \sin x \cdot \sin y$ at (π, π) and $C = \frac{dy}{dx}$ of $2e^{xy} + e^x e^y - e^x - e^y = e^{xy+1}$ at (1, 1), then $(A - B - C)$ has the value equal to ..... .

104. A function is represented parametrically by the equations $x = \frac{1+t}{t^3}$; $y = \frac{3}{2t^2} + \frac{2}{t}$, then $\frac{dy}{dx} - x\cdot\left(\frac{dy}{dx}\right)^3$ has the absolute value equal to ..... .

105. Suppose, the function $f(x) - f(2x)$ has the derivative 5 at $x = 1$ and derivative 7 at $x = 2$. The derivative of the function $f(x) - f(4x)$ at $x = 1$, has the value $10 + \lambda$, then the value of λ is equal to ..... .

106. If $x + y = 3e^2$, then $D(x^y)$ vanishes when x equals to λe^2, then the value of λ is equal to ..... .

107. Let $h(x)$ be differentiable for all x and let $f(x) = (kx + e^x)h(x)$, where k is some constant. If $h(0) = 5$, $h'(0) = -2$ and $f'(0) = 18$, then the value of k is equal to ..... .

Complex Number Exercise 7 :
Questions Asked in Previous 10 Years' Exams

(i) JEE Advanced & IIT-JEE

108. For $x \in R$, $f(x) = |\log 2 - \sin x|$ and $g(x) = f(f(x))$, then **[One Correct Option, 2016 Adv.]**

(a) g is not differentiable at $x = 0$ (b) $g'(0) = \cos(\log 2)$
(c) $g'(0) = -\cos(\log 2)$ (d) g is differentiable at $x = 0$ and $g'(0) = -\sin(\log 2)$

109. Let $f: R \to R$, $g: R \to R$ and $h: R \to R$ be differentiable functions such that $f(x) = x^3 + 3x + 2$, $g(f(x)) = x$ and $h(g(g(x))) = x$ for all $x \in R$. Then, **[More than One Correct Option, 2016 Adv.]**

(a) $g'(2) = \frac{1}{15}$ (b) $h'(1) = 666$ (c) $h(0) = 16$ (d) $h(g(3)) = 36$

(ii) JEE Main & AIEEE

110. If for $x \in \left(0, \frac{1}{4}\right)$, the derivative of $\tan^{-1}\left(\frac{6x\sqrt{x}}{1-9x^3}\right)$ is $\sqrt{x}\cdot g(x)$, then $g(x)$ equals **[2017 JEE Main]**

(a) $\frac{3}{1+9x^3}$ (b) $\frac{9}{1+9x^3}$ (c) $\frac{3x\sqrt{x}}{1-9x^3}$ (d) $\frac{3x}{1-9x^3}$

111. Let $g(x) = \log f(x)$, where $f(x)$ is a twice differentiable positive function on $(0, \infty)$ such that $f(x+1) = x f(x)$. Then, for $N = 1, 2, 3, \ldots$, $g''\left(N + \frac{1}{2}\right) - g''\left(\frac{1}{2}\right)$ is equal to **[2008 AIEEE]**

(a) $-4\left\{1 + \frac{1}{9} + \frac{1}{25} + \ldots + \frac{1}{(2N-1)^2}\right\}$ (b) $4\left\{1 + \frac{1}{9} + \frac{1}{25} + \ldots + \frac{1}{(2N-1)^2}\right\}$
(c) $-4\left\{1 + \frac{1}{9} + \frac{1}{25} + \ldots + \frac{1}{(2N+1)^2}\right\}$ (d) $4\left\{1 + \frac{1}{9} + \frac{1}{25} + \ldots + \frac{1}{(2N+1)^2}\right\}$

112. $\dfrac{d^2x}{dy^2}$ equals **[2007 AIEEE]**

(a) $\left(\dfrac{d^2y}{dx^2}\right)^{-1}$ (b) $-\left(\dfrac{d^2y}{dx^2}\right)^{-1}\left(\dfrac{dy}{dx}\right)^{-3}$

(c) $\left(\dfrac{d^2y}{dx^2}\right)\left(\dfrac{dy}{dx}\right)^{-2}$ (d) $-\left(\dfrac{d^2y}{dx^2}\right)\left(\dfrac{dy}{dx}\right)^{-3}$

113. If $f''(x) = -f(x)$, where $f(x)$ is a continuous double differentiable function and $g(x) = f'(x)$.

If $F(x) = \left\{f\left(\dfrac{x}{2}\right)\right\}^2 + \left\{g\left(\dfrac{x}{2}\right)\right\}^2$ and $F(5) = 5$, then $F(10)$ is **[2006 AIEEE]**

(a) 0 (b) 5 (c) 10 (d) 25

114. If y is a function of x and $\log(x + y) = 2xy$, then the value of $y'(0)$ is **[2004 AIEEE]**

(a) 1
(b) −1
(c) 2
(d) 0

115. If $x^2 + y^2 = 1$, then **[2000 AIEEE]**

(a) $yy'' - 2(y')^2 + 1 = 0$
(b) $yy'' + (y')^2 + 1 = 0$
(c) $yy'' + (y')^2 - 1 = 0$
(d) $yy'' + 2(y')^2 + 1 = 0$

Answers

Exercise for Session 1

1. $a^x \log a + ax^{a-1}$ **2.** $\dfrac{\tan x}{|\tan x|}\sec^2 x$

3. $\dfrac{1}{x \log_e 3} + \dfrac{3}{x} + 2\sec^2 x$

4. $\dfrac{x}{|x|} + na_0x^{n-1} + (n-1)a_1x^{n-2} + (n-2)a_2x^{n-3} + \ldots + a_{n-1}1$

5. 0

6. $e^x x^{n-1}\left\{n \log_a x + \dfrac{1}{\log_e a} + x \log_a x\right\}$

7. $\dfrac{2^x}{\sqrt{x}}\left\{\log 2 \cot x - \operatorname{cosec}^2 x - \dfrac{\cot x}{2x}\right\}$

8. $\dfrac{x^2}{(x \sin x + \cos x)^2}$ **9.** y

10. $x \in (-\infty, -1) \cup (1, \infty)$

Exercise for Session 2

1. $4(x^2 + x + 1)^3 \cdot (2x + 1)$

2. $\dfrac{1}{2\sqrt{x^2 + x + 1}} \cdot (2x + 1)$

3. $3 \sin^2 x \cos x$ **4.** $\dfrac{x}{(a^2 - x^2)^{3/2}}$

5. $e^{x \sin x}(x \cos x + \sin x)$ **6.** $-\dfrac{\sqrt{b^2 - a^2}}{b + a \cos x}$

7. $e^{e^x} \cdot e^x$ **8.** $\dfrac{1}{\sqrt{a^2 + x^2}}$

9. $\dfrac{2ab \cos x}{a^2 - b^2 \sin^2 x}$

10. $\sec x$

11. $\dfrac{(\sin 3x)\left(e^x + \dfrac{1}{x}\right) - 3(e^x + \log x)\cos 3x}{\sin^2 3x}$

12. $\dfrac{m}{\sqrt{1 - x^2}} \cos(m \sin^{-1} x)$

13. $\dfrac{2 \log a \cdot \sin^{-1} x}{\sqrt{1 - x^2}} \cdot a^{(\sin^{-1} x)^2}$

14. $e^{\cos^{-1}\sqrt{1 - x^2}} \cdot \dfrac{1}{\sqrt{1 - x^2}}$ **15.** $\dfrac{\sin^{-1} x}{(1 - x^2)^{3/2}}$

16. $\dfrac{1}{x \log_e 10} - \dfrac{\log_e 10}{x(\log_e x)^2}$

17. $-2x\{5^{3 - x^2} \cdot \log_e 5 + 5(3 - x^2)^4\}$

18. $\dfrac{-2a^2}{x^3}\left\{1 + \dfrac{a^2}{\sqrt{a^4 - x^4}}\right\}$

19. $\dfrac{x}{4\sqrt{4 + \sqrt{4 + \sqrt{4 + x^2}}}\sqrt{4 + \sqrt{4 + x^2}}\sqrt{4 + x^2}}$

Solutions

1. Here, $y = \dfrac{\sec x - \tan x}{\sec x + \tan x} \cdot \dfrac{\sec x - \tan x}{\sec x - \tan x}$

$\therefore \quad y = (\sec x - \tan x)^2$

$\Rightarrow \quad \dfrac{dy}{dx} = 2(\sec x - \tan x)\cdot(\sec x \tan x - \sec^2 x)$

$= -2\sec x(\sec x - \tan x)^2$

2. Here, $y = \dfrac{1 + x^2 + x^4}{1 + x + x^2} = \dfrac{(1 + x^2)^2 - x^2}{(1 + x + x^2)}$

$= \dfrac{(1 + x + x^2)(1 - x + x^2)}{(1 + x + x^2)} = (1 - x + x^2)$

$\therefore \quad \dfrac{dy}{dx} = 2x - 1 = ax + b$

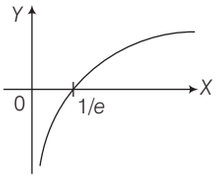
$\Rightarrow \quad a = 2, \; b = -1$

3. $y = \dfrac{d}{dx}(x \log x) = x \cdot \dfrac{1}{x} + \log x \cdot 1$

$\Rightarrow \quad y = 1 + \log_e x$

$\therefore y = 0$, when $\log_e x = -1 \;\Rightarrow\; x = \dfrac{1}{e}$

Thus, $y = 1 + \log_e x$ can be shown as



4. Here, $f'(x) = 1 + \dfrac{3}{x-2} = \dfrac{x+1}{x-2}$ and $g'(x) = 1 + \dfrac{5}{x-1} = \dfrac{x+4}{x-1}$

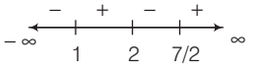
Since, $f'(x) < g'(x)$

$\Rightarrow \quad \dfrac{x+1}{x-2} < \dfrac{x+4}{x-1}$

or $\dfrac{x+1}{x-2} - \dfrac{x+4}{x-1} < 0$

$\Rightarrow \quad \dfrac{(x^2-1)-(x^2+2x-8)}{(x-1)(x-2)} < 0$

$\Rightarrow \quad \dfrac{-2x+7}{(x-1)(x-2)} < 0 \;\Rightarrow\; \dfrac{2x-7}{(x-1)(x-2)} > 0$



$\therefore \quad x \in (1,2) \cup (7/2, \infty)$, since $\log(x-2)$ exists, when $x > 2$.

$\Rightarrow \quad x \in \left(\dfrac{7}{2}, \infty\right)$

5. Here, $\cos^{-1}\left(\dfrac{x^2 - y^2}{x^2 + y^2}\right) = \log a$

$\Rightarrow \quad \cos^{-1}\left(\dfrac{1 - (y/x)^2}{1 + (y/x)}\right) = \log a$

Put $\dfrac{y}{x} = \tan\theta$

$\Rightarrow \quad \cos^{-1}\left(\dfrac{1 - \tan^2\theta}{1 + \tan^2\theta}\right) = \log a$

$\Rightarrow \quad \cos^{-1}(\cos 2\theta) = \log a$

$\Rightarrow \quad 2\theta = \log_e a$

$\Rightarrow \quad 2\tan^{-1}\left(\dfrac{y}{x}\right) = \log a$

$\Rightarrow \quad \dfrac{y}{x} = \tan\left(\dfrac{\log a}{2}\right)$

On differentiating both sides, we get

$$\frac{x\dfrac{dy}{dx} - y \cdot 1}{x^2} = 0$$

$\Rightarrow \quad x\dfrac{dy}{dx} - y = 0$

$\Rightarrow \quad \dfrac{dy}{dx} = \dfrac{y}{x}$

6. Here, $f(x) = (|x|)^{|\sin x|}$ as $x \to \dfrac{-\pi}{4}$

$\Rightarrow \quad f(x) = (-x)^{-\sin x}$

Taking logarithm on both sides, we get

$$\log(f(x)) = (-\sin x)\log(-x)$$

On differentiating both sides, we get

$$\frac{1}{f(x)} \cdot f'(x) = (-\sin x)\frac{1}{x} + \log(-x)\cdot(-\cos x)$$

At $x = -\dfrac{\pi}{4}$,

$$f'\left(-\frac{\pi}{4}\right) = f\left(-\frac{\pi}{4}\right)\left[\frac{-\dfrac{1}{\sqrt{2}}}{\dfrac{\pi}{4}} + \log\left(\frac{\pi}{4}\right)\cdot\left(-\frac{1}{\sqrt{2}}\right)\right]$$

$$= \left(\frac{\pi}{4}\right)^{\frac{1}{\sqrt{2}}}\left[\frac{\sqrt{2}}{2}\log\frac{4}{\pi} - \frac{2\sqrt{2}}{\pi}\right]$$

7. Here, $y = \dfrac{x}{a + \dfrac{x}{b+y}} = \dfrac{x(b+y)}{ab + ay + x}$

$\Rightarrow \quad aby + ay^2 + xy = bx + xy$

$\Rightarrow \quad aby + ay^2 = bx$

On differentiating w.r.t. x, we get

$$ab\frac{dy}{dx} + 2ay\frac{dy}{dx} = b$$

$\therefore \quad \dfrac{dy}{dx} = \dfrac{b}{a(b+2y)}$

8. Taking logarithm on both sides, we get

$$\log y = x^2 \log x$$

On differentiating both sides, we get

$$\frac{1}{y}\cdot\frac{dy}{dx} = x^2\cdot\frac{1}{x} + 2x\cdot(\log x)$$

$$\Rightarrow \quad \frac{dy}{dx} = x^{x^2}\cdot(x + 2x\cdot\log x)$$

$$= x^{x^2+1}\cdot(1+2\log x) = x^{x^2+1}\cdot(\log(e\,x^2))$$

9. Here, $x\sqrt{1+y} = -y\sqrt{1+x}$

On squaring both sides, we get

$$x^2(1+y) = y^2(1+x)$$

$$\Rightarrow \quad x^2 + x^2y = y^2 + y^2x$$

$$\Rightarrow \quad (x-y)(x+y) + xy(x-y) = 0$$

$$\Rightarrow \quad (x-y)(x+y+xy) = 0 \Rightarrow \; x+y+xy = 0$$

$$\Rightarrow \quad y = \frac{-x}{(1+x)}$$

$$\therefore \quad \frac{dy}{dx} = -\left[\frac{(1+x)\cdot 1 - x\cdot 1}{(1+x)^2}\right] \Rightarrow \; \frac{dy}{dx} = \frac{-1}{(1+x)^2}$$

10. Here, $x^2e^y + 2xye^x + 13 = 0$

On differentiating both sides, we get

$$x^2\cdot e^y\cdot\frac{dy}{dx} + 2x\cdot e^y + 2\left[xe^x\cdot\frac{dy}{dx} + ye^x + yx\cdot e^x\right] = 0$$

$$\Rightarrow \quad \frac{dy}{dx}\cdot x(xe^y + 2e^x) + 2(xe^y + ye^x + xye^x) = 0$$

$$\Rightarrow \quad \frac{dy}{dx} = -\frac{2[xe^y + ye^x(x+1)]}{x(xe^y + 2e^x)}$$

or $$\frac{dy}{dx} = -2\left[\frac{(xe^{y-x} + y(x+1))}{x(xe^{y-x} + 2)}\right]$$

11. Here, $x = e^{y+x}$. Taking log on both sides, we get

$$\log x = (y+x)\log e$$

On differentiating w.r.t. x, we get

$$\frac{1}{x} = \frac{dy}{dx} + 1 \Rightarrow \frac{dy}{dx} = \frac{1}{x} - 1 = \frac{1-x}{x}$$

12. $g(f(x)) = x$, as g is the inverse of f.

$$\Rightarrow \quad g'(f(x))\cdot f'(x) = 1$$

$$\Rightarrow \quad g'(f(x)) = \frac{1+x^2}{x^{10}}, \text{ as } g(2) = a$$

Put $x = a$

$$\Rightarrow \quad g'(f(a)) = \frac{1+a^2}{a^{10}} \quad \Rightarrow f(a) = 2$$

$$\therefore \quad g'(2) = \frac{1+a^2}{a^{10}}$$

13. Here, $u'(x) = f'(g(x))\cdot g'(x)$

$$\Rightarrow \quad u'(1) = f'(g(1))\cdot g'(1) = f'(3)\cdot g'(1)$$

$$= \left(-\frac{1}{4}\right)\cdot(-3) = \frac{3}{4}$$

and $w'(x) = g'(g(x))\cdot g'(x)$

$$\Rightarrow \quad w'(1) = g'(g(1))\cdot g'(1) = g'(3)\cdot g'(1)$$

$$= \frac{3}{4}\cdot(-3) = -\frac{9}{4}$$

$$\therefore \quad u'(1) + w'(1) = \frac{3}{4} - \frac{9}{4} = -\frac{6}{4} = -\frac{3}{2}$$

14. Let $h(x) = f^2(x) + g^2(x)$

On differentiating both sides, we get

$$h'(x) = 2f(x)\cdot f'(x) + 2g(x)\cdot g'(x)$$

$$= -2g'(x)\cdot f'(x) + 2f'(x)\cdot g'(x) = 0$$

$\therefore$ $h(x)$ is constant.

Thus, $h(10) = f^2(10) + g^2(10) = h(5)$

$$\therefore \quad f^2(10) + g^2(10) = f^2(5) + g^2(5) = f^2(5) + (f'(5))^2 = 4 + 4 = 8$$

15. Here, $f(0) = 0$

$f'(0) = 1$

$f''(0) = 2$

$f'''(0) = 3$

$\vdots \quad \vdots$

$f^n(0) = n$

$$\therefore \; f(0) + f'(0) + f''(0) + f'''(0) + \ldots + f^n(0) = 1 + 2 + 3 + \ldots + n$$

$$= \frac{n(n+1)}{2}$$

16. Here, $\frac{dy}{dx} = f'(f(f(x)))\cdot f'(f(x))\cdot f'(x)$

$$\therefore \quad y'(0) = f'(f(f(0)))\cdot f'(f(0))\cdot f'(0)$$

$$= f'(f(0))\cdot f'(0)\cdot 2 = f'(0)\cdot f'(0)\cdot 2 = 2\times 2\times 2 = 8$$

17. Here, $y^2 = p(x)$

Differentiating both sides, we get $2y\cdot y' = p(x)$

Again, differentiating both sides, we get

$$2yy'' + 2(y')^2 = p''(x)$$

On multiplying by y^2, we get

$$2y^3\cdot y'' + 2(y\cdot y')^2 = y^2p''(x)$$

$$\because \quad y\cdot y' = \frac{p'(x)}{2} \qquad \left[\because\; y\cdot y' = \frac{p'(x)}{2}\right]$$

$$\Rightarrow \quad 2y^3\cdot y'' + 2\cdot\frac{(p'(x))^2}{4} = y^2p''(x)$$

$$\Rightarrow \quad 2y^3\cdot y'' + \frac{1}{2}\cdot(p'(x))^2 = p''(x)\cdot y^2$$

Again, differentiating both sides, we get

$$2\cdot\frac{d}{dx}\left(y^3\cdot\frac{d^2y}{dx^2}\right) + \frac{1}{2}\cdot 2p'(x)\cdot p''(x) = p'''(x)y^2 + 2y\cdot y'p''(x)$$

$$\Rightarrow 2\cdot\frac{d}{dx}\left(y^3\cdot\frac{d^2y}{dx^2}\right) = p'''(x)\cdot p(x) + 2y\cdot y'\cdot p''(x) - p'(x)\cdot p''(x)$$

$$[\because 2y\cdot y' = p'(x)]$$

$$= p'''(x)\cdot p(x) + p'(x)\cdot p''(x) - p'(x)\cdot p''(x)$$

$$= p'''(x)\cdot p(x)$$

18. As, $\frac{dy}{dx} = f'(x)$ and $\frac{dx}{dy} = g'(y)$

$$\Rightarrow \quad g'(y) = \frac{1}{f'(x)} \qquad \ldots(\text{i})$$

On differentiating w.r.t. y, we get

$$g''(y)=\frac{d}{dy}\left(\frac{1}{f'(x)}\right)=\frac{d}{dx}\left(\frac{1}{f'(x)}\right)\cdot\frac{dx}{dy}$$
$$=-\frac{f''(x)}{(f'(x))^2}\cdot\frac{dx}{dy}$$
$$=-\frac{f''(x)}{(f'(x))^2}\cdot\frac{1}{f'(x)}=-\frac{f''(x)}{(f'(x))^3}$$

$\therefore \quad g''(y)=-\dfrac{f''(x)}{(f'(x))^3}$

19. As discussed in Q.18,

$$\frac{d^2x}{dy^2}=-\frac{d^2y/dx^2}{\left(\frac{dy}{dx}\right)^3}$$

$$\Rightarrow \quad \frac{d^2y}{dx^2}=-\frac{d^2x}{dy^2}\cdot\left(\frac{dy}{dx}\right)^3 \qquad ...(i)$$

Now, $\dfrac{d^2y}{dx^2}+y\cdot\dfrac{dy}{dx}=0$

$$\Rightarrow -\frac{d^2x}{dy^2}\cdot\left(\frac{dy}{dx}\right)^3+y\left(\frac{dy}{dx}\right)=0$$

$$\Rightarrow \quad \frac{d^2x}{dy^2}-y\left(\frac{dx}{dy}\right)^2=0$$

20. $g(x+1)=\log(f(x+1))=\log x+\log(f(x))$

$\Rightarrow \; g(x+1)-g(x)=\log x$

On differentiating both sides, we get

$$g'(x+1)-g'(x)=\frac{1}{x}$$

Again, differentiating both sides, we get

$$g''(x+1)-g''(x)=-\frac{1}{x^2} \qquad ...(i)$$

$\therefore$
$$g''\left(1+\frac{1}{2}\right)-g''\left(\frac{1}{2}\right)=-4$$
$$g''\left(2+\frac{1}{2}\right)-g''\left(1+\frac{1}{2}\right)=-\frac{4}{9}$$
$$g''\left(3+\frac{1}{2}\right)-g''\left(2+\frac{1}{2}\right)=\frac{-4}{25}$$
$$\vdots \qquad \vdots \qquad \vdots$$
$$g''\left(N+\frac{1}{2}\right)-g''\left(N-\frac{1}{2}\right)=-\frac{4}{(2N-1)^2}$$

On adding, we get

$$g''\left(N+\frac{1}{2}\right)-g''\left(\frac{1}{2}\right)=-4\left(1+\frac{1}{9}+\frac{1}{25}+\ldots+\frac{1}{(2N-1)^2}\right)$$

21. Here, $f(x)=x^3+e^{x/2}$ and $g(x)=f^{-1}(x)$

$$\Rightarrow \quad g'(f(x))\cdot f'(x)=1$$

Putting $f(x)=1\Rightarrow x^3+e^{x/2}=1 \;\Rightarrow\; x=0$

$$\therefore \quad g'(1)\cdot f'(0)=1,\; f'(x)=3x^2+\frac{1}{2}e^{x/2}$$

$$\Rightarrow \quad g'(1)\cdot\frac{1}{2}=1 \;\Rightarrow\; g'(1)=2$$

22. Let $f(\theta)=\sin\alpha$, where $\alpha=\tan^{-1}\left(\dfrac{\sin\theta}{\sqrt{\cos 2\theta}}\right)$

$$\Rightarrow \quad \tan\alpha=\frac{\sin\theta}{\sqrt{\cos 2\theta}}$$

$$\therefore \quad \sin\alpha=\frac{\sin\theta}{\cos\theta}=\tan\theta \qquad [\because\ \theta\in(-\pi/4,\pi/4)]$$

$$\Rightarrow \quad f(\theta)=\tan\theta \qquad \therefore \quad \frac{d(f(\theta))}{d(\tan\theta)}=1$$

23. We have, $y=\dfrac{\log\tan x}{\log\sin x}$

$$\Rightarrow \quad \frac{dy}{dx}=\frac{(\log\sin x)\left(\frac{\sec^2 x}{\tan x}\right)-(\log\tan x)(\cot x)}{(\log\sin x)^2}$$

$$\therefore \quad \left[\frac{dy}{dx}\right]_{x=\pi/4}=\frac{-4}{\log 2} \qquad \text{[on simplification]}$$

24. We have, $y=\sum_{r=1}^{x}\tan^{-1}\left(\dfrac{1}{1+r+r^2}\right)=\sum_{r=1}^{x}\tan^{-1}\left[\dfrac{(r+1)-r}{1+(r+1)r}\right]$

$$=\sum_{r=1}^{x}[\tan^{-1}(r+1)-\tan^{-1}r]$$
$$=[\tan^{-1}2-\tan^{-1}1+\tan^{-1}3-\tan^{-1}2+\ldots+\tan^{-1}x$$
$$-\tan^{-1}(x-1)+\tan^{-1}(x+1)-\tan^{-1}x]$$
$$=[\tan^{-1}(x+1)-\tan^{-1}1]$$

$$\therefore \quad \frac{dy}{dx}=\frac{1}{1+(x+1)^2}$$

25. We have, $y=\sin^{-1}\left(\dfrac{\sin\alpha\sin x}{1-\cos\alpha\sin x}\right)$

$$\Rightarrow \quad \frac{dy}{dx}=\frac{1}{\sqrt{1-\frac{\sin^2\alpha\sin^2 x}{(1-\cos\alpha\sin x)^2}}}\cdot\frac{d}{dx}\left(\frac{\sin\alpha\sin x}{1-\cos\alpha\sin x}\right)$$

$$\Rightarrow \quad \frac{dy}{dx}=\frac{(1-\cos\alpha\sin x)}{\sqrt{1+\cos 2\alpha\sin^2 x-2\cos\alpha\sin x}}\cdot\frac{\sin\alpha}{\cos\alpha}$$

$$\Rightarrow \quad \frac{dy}{dx}=-\frac{\frac{d}{dx}\left(-\frac{1}{1-\cos\alpha\sin x}\right)\tan\alpha\,(1-\cos\alpha\sin x)}{\{\sqrt{1+\cos 2\alpha\sin^2 x-2\sin x\cos\alpha}\}}$$

$$\Rightarrow \quad \frac{dy}{dx}=\frac{\left[\frac{-\cos\alpha\cos x}{(1-\cos\alpha\sin x)^2}\right]\sin\alpha\cos x}{(1-\cos\alpha\sin x)\sqrt{[1+\cos 2\alpha\sin^2 x-2\cos\alpha\sin x]}}$$

$$\therefore \quad \left[\frac{dy}{dx}\right]_{x=0}=\sin\alpha \;\Rightarrow\; y'(0)=\sin\alpha$$

26. We have, $f(x)=\cot^{-1}\left(\dfrac{x^x-x^{-x}}{2}\right)$

$$\Rightarrow \quad f'(x)=-\frac{1}{1+\left(\frac{x^x-x^{-x}}{2}\right)^2}\cdot\frac{d}{dx}\left(\frac{x^x-x^{-x}}{2}\right)$$

$$\Rightarrow \quad f'(x)=\frac{-2}{4+(x^x-x^{-x})^2}\cdot\frac{d}{dx}(x^x-x^{-x})$$

$$\Rightarrow \quad f'(x)=\frac{-2}{(x^x+x^{-x})^2}\cdot\frac{d}{dx}(e^{x\log x}-e^{-x\log x})$$

$$\Rightarrow \quad f'(x)=\frac{-2}{(x^x+x^{-x})^2}\left\{e^{x\log x}\cdot\frac{d}{dx}(x\log x)-e^{-x\log x}\cdot\frac{d}{dx}(-x\log x)\right\}$$

$$\Rightarrow \quad f'(x)=\frac{-2}{(x^x+x^{-x})^2}\{x^x(1+\log x)+x^{-x}(1+\log x)\}$$

$$\Rightarrow \quad f'(x)=\frac{-2(1+\log x)}{(x^x+x^{-x})^2}\cdot(x^x+x^{-x})=\frac{-2(1+\log x)}{x^x+x^{-x}}$$

$$\therefore \quad f'(1)=\frac{-2}{(1+1)}=-1$$

27. $f(g(x))=x \Rightarrow f'(g(x))\,g'(x)=1$

$$\Rightarrow (e^{g(x)}+1)\,g'(x)=1$$

$$\Rightarrow (e^{g(f(\log 2))}+1)\,g'(f(\log 2))=1$$

$$\Rightarrow (e^{\log 2}+1)\,g'(f(\log 2))=1$$

$$\Rightarrow g'(f(\log 2))=\frac{1}{3}$$

28. $F'(x)=\left[f\left(\frac{x}{2}\right)\cdot f'\left(\frac{x}{2}\right)+g\left(\frac{x}{2}\right)g'\left(\frac{x}{2}\right)\right]$

Here, $g(x)=f'(x)$ and $g'(x)=f''(x)=-f(x)$

So, $F'(x)=f\left(\frac{x}{2}\right)g\left(\frac{x}{2}\right)-f\left(\frac{x}{2}\right)g\left(\frac{x}{2}\right)=0$

$\therefore$ $F(x)$ is a constant function. Hence, $F(10)=5$

29. We have, $x=\sec\theta-\cos\theta$ and $y=\sec^n\theta-\cos^n\theta$

$$\Rightarrow \quad \frac{dx}{d\theta}=\sec\theta\tan\theta+\sin\theta=\tan\theta(\sec\theta+\cos\theta)$$

and $$\frac{dy}{d\theta}=n[\sec^n\theta\tan\theta+\cos^{n-1}\theta\sin\theta]$$

$$=n\tan\theta(\sec^n\theta+\cos^n\theta)$$

$$\therefore \quad \frac{dy}{dx}=\frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}}=\frac{n\tan\theta(\sec^n\theta+\cos^n\theta)}{\tan\theta(\sec\theta+\cos\theta)}$$

$$\Rightarrow \quad \left(\frac{dy}{dx}\right)^2=n^2\cdot\frac{(\sec^n\theta-\cos^n\theta)^2+4}{(\sec\theta-\cos\theta)^2+4}=\frac{n^2(y^2+4)}{(x^2+4)}$$

$$\Rightarrow \quad (x^2+4)\left(\frac{dy}{dx}\right)^2=n^2(y^2+4)$$

30. We have, $x=f(t)\cos t-f'(t)\sin t$

and $y=f(t)\sin t+f'(t)\cos t$

$$\Rightarrow \quad \frac{dx}{dt}=-f(t)\sin t+f'(t)\cos t-f'(t)\cos t-f''(t)\sin t$$

$$=-[f(t)+f''(t)]\sin t$$

and $$\frac{dy}{dt}=f(t)\cos t+f'(t)\sin t-f'(t)\sin t+f''(t)\cos t$$

$$=[f(t)+f''(t)]\cos t$$

$$\therefore \quad \left(\frac{dx}{dt}\right)^2+\left(\frac{dy}{dt}\right)^2=[f(t)+f''(t)]^2$$

31. Note that in y highest degree of x is 4 and therefore $\frac{d^3y}{dx^3}$ is a linear function of x, which is satisfied only in (d).

32. Exponent of $x=\frac{[l^2-m^2+m^2-n^2+n^2-l^2]}{(l-m)(m-n)(n-l)}$

$$\Rightarrow \quad y=x^0=1 \Rightarrow y=1 \Rightarrow y'=0$$

33. $y=(A+Bx)e^{mx}+(m-1)^{-2}\cdot e^x$

$$\Rightarrow y\cdot e^{-mx}=(A+Bx)+(m-1)^{-2}\cdot e^{(1-m)x}$$

$$\Rightarrow e^{-mx}\cdot y_1-mye^{-mx}=B-(m-1)^{-1}\cdot e^{-(m-1)x}$$

$$\Rightarrow e^{-mx}\cdot y_2-y_1e^{-mx}\cdot m-m[e^{-mx}\cdot y_1-ye^{-mx}\cdot m]=e^{-(m-1)x}$$

$$\Rightarrow e^{-mx}\cdot y_2-2my_1e^{-mx}+m^2y\cdot e^{-mx}=e^{-(m-1)x}$$

$$\therefore \quad y_2-2my_1+m^2y=e^x$$

34. We have, $f(x)=-\frac{x^3}{3}+x^2\sin 6-x\sin 4\cdot\sin 8$

$$-5\sin^{-1}((a-4)^2+1)\,(a=4)$$

$$\Rightarrow f'(x)=-x^2+2x\sin 6-\sin 4\sin 8$$

$$\Rightarrow f'(\sin 8)=-\sin^2 8+2\sin 6\sin 8-\sin 4\sin 8$$

$$=\sin 8\,[-\sin 8+2\sin 6-\sin 4]$$

$$=-\sin 8\,[\sin 8+\sin 4-2\sin 6]$$

$$=-\sin 8\,[2\sin 6\cos 2-2\sin 6]$$

$$=2\sin 8\sin 6\,[1-\cos 2]<0$$

sin 8	
sin 4	sin 6

35. $f(g(x))=x \Rightarrow f'(g(x))\cdot g'(x)=1;\ f'(g(a))\cdot g'(a)=1;\ f'(b)\cdot 2=1$

$$\Rightarrow \quad f'(b)=\frac{1}{2}$$

36. Put $\cos\phi=\frac{2}{\sqrt{13}};\sin\phi=\frac{3}{\sqrt{13}};\tan\phi=\frac{3}{2}$

$$y=\cos^{-1}\{\cos(x+\phi)\}+\sin^{-1}\{\cos(x-\phi)\}$$

$$=\cos^{-1}\{\cos(x+\phi)\}+\frac{\pi}{2}-\cos^{-1}\{\cos(\phi-x)\}$$

$$=x+\phi+\frac{\pi}{2}-\phi+x$$

$$y=2x+\frac{\pi}{2};z=\sqrt{1+x^2}$$

Now, $$\frac{dy}{dz}=\frac{\frac{dy}{dx}}{\frac{dz}{dx}}=\frac{2\sqrt{1+x^2}}{x}$$

$$\therefore \quad \left(\frac{dy}{dz}\right)_{x=\frac{3}{4}}=\frac{10}{3}$$

37. $f(x)=\sqrt{x+2\sqrt{2x-4}}+\sqrt{x-2\sqrt{2x-4}}$

$$\therefore \ f(x)=\sqrt{(\sqrt{x-2}+\sqrt{2})^2}+\sqrt{(\sqrt{x-2}-\sqrt{2})^2}$$

$$=|\sqrt{x-2}+\sqrt{2}|+|\sqrt{x-2}-\sqrt{2}|$$

For $\sqrt{x-2}$ to exist, $x\geq 2$

Also, $\sqrt{x-2}+\sqrt{2}>0$ [true]

But $\sqrt{x-2}-\sqrt{2}\geq 0$ only, if $x\geq 4 < 0$ only, if $x<4$

Now, $f(x)$ becomes

$$f(x)=\begin{cases}\sqrt{x-2}+\sqrt{2}-\sqrt{x-2}+\sqrt{2}, & \text{for } 2\le x<4\\ \sqrt{x-2}+\sqrt{2}+\sqrt{x-2}-\sqrt{2}, & \text{for } x\ge 4\end{cases}$$

$$\therefore\quad f(x)=\begin{cases}2\sqrt{2}, & \text{for } 2\le x<4\\ 2\sqrt{x-2}, & \text{for } 4\le x<\infty\end{cases}$$

$\because$ f is continuous in $[2, 4)\cup[4, \infty)$.

$$\therefore\quad f'(x)=\begin{cases}0, & 2\le x<4\\ \dfrac{1}{\sqrt{x-2}}, & 4\le x<\infty\end{cases}$$

$$\therefore\quad f'(102^+)=\frac{1}{\sqrt{102-2}}=\frac{1}{10}$$

$$\therefore\quad 10f'(102^+)=1$$

38. Here, $y=2\ln(1+\cos x)\Rightarrow y_1=\dfrac{-2\sin x}{1+\cos x}$

$$y_2=-2\left[\frac{(1+\cos x)\cos x-\sin x(-\sin x)}{(1+\cos x)^2}\right]$$

$$=-2\left[\frac{\cos x+1}{(1+\cos x)^2}\right]=\frac{-2}{(1+\cos x)}$$

$$\therefore\ 2e^{-y/2}=2\cdot e^{\frac{-\ln(1+\cos x)^2}{2}}=\frac{2}{(1+\cos x)}$$

$$\therefore\quad y_2+\frac{2}{e^{y/2}}=0$$

39. $y=\dfrac{(a+x)+\sqrt{a-x}\cdot\sqrt{a+x}}{(a-x)+\sqrt{a-x}\cdot\sqrt{a+x}}$

$$y=\frac{\sqrt{(a+x)}\,(\sqrt{a+x}+\sqrt{a-x})}{\sqrt{a-x}\ \ (\sqrt{a+x}+\sqrt{a-x})}=\left(\frac{a+x}{a-x}\right)^{1/2}$$

$$\frac{dy}{dx}=\frac{1}{2}\sqrt{\frac{a-x}{a+x}}\left(\frac{(a-x)+(a+x)}{(a-x)^2}\right)=\frac{1}{2}\frac{\sqrt{a-x}}{\sqrt{a+x}}\times\frac{2a}{(a-x)^2}$$

$$\therefore\quad \left(\frac{dy}{dx}\right)_{x=0}=\frac{1}{a}$$

40. We have, $u(x)=7v(x)$

$$\Rightarrow\quad u'(x)=7v'(x)\ \Rightarrow\ p=7$$

Again, $$\frac{u(x)}{v(x)}=7\ \Rightarrow\left(\frac{u(x)}{v(x)}\right)'=0$$

$$\Rightarrow\quad q=0$$

Now, $$\frac{p+q}{p-q}=\frac{7+0}{7-0}=1$$

41. For $x>1$, we have $f(x)=|\log|x||=\log x$

$$\Rightarrow\quad f'(x)=\frac{1}{x}$$

For $x<-1$, we have

$$f(x)=|\log|x||=\log(-x)$$

$$\Rightarrow\quad f'(x)=\frac{1}{x}$$

For $0<x<1$, we have

$$f(x)=|\log|x||=-\log x$$

$$f'(x)=-\frac{1}{x}$$

For $-1<x<0$, we have

$$f(x)=-\log(-x)$$

$$f'(x)=-\frac{1}{x}$$

Hence, $$f'(x)=\begin{cases}\dfrac{1}{x}, & |x|>1\\ -\dfrac{1}{x}, & |x|<1\end{cases}$$

42. We have, $f(x)=\cos\{x+3x+\ldots+(2n-1)x\}$

$$+i\sin\{x+3x+5x+\ldots+(2n-1)x\}$$

$$\Rightarrow\quad f(x)=\cos n^2x+i\sin n^2x$$

$$\Rightarrow\quad f'(x)=-n^2(\sin n^2x)+n^2(i\cos n^2x)$$

$$\Rightarrow\quad f''(x)=-n^4\cos n^2x-n^4i\sin n^2x$$

$$\Rightarrow\quad f''(x)=-n^4(\cos n^2x+i\sin n^2x)$$

$$\Rightarrow\quad f''(x)=-n^4f(x)$$

43. We have, $f(x)=x^n$

$$\Rightarrow\quad f(x+y)=(x+y)^n\Rightarrow f'(x+y)=n(x+y)^{n-1}$$

Also, $f'(x)=nx^{n-1}$ and $f'(y)=ny^{n-1}$

$$\therefore\quad f'(x+y)=f'(x)+f'(y)$$

$$\Rightarrow\ n(x+y)^{n-1}=n\cdot x^{n-1}+n\cdot y^{n-1}$$

$$\Rightarrow\quad (x+y)^{n-1}=x^{n-1}+y^{n-1}\qquad\ldots(i)$$

For $n-1>1$, we find that LHS of Eq. (i) is greater than the RHS. So, we must have $n-1\le 1$, i.e. $n-1=0$ or $n-1=1$.

Hence, $n=1$ or $n=2$

44. For $2<x<3$, we have $[x]=2$

$$\therefore\quad f(x)=\sin\left(\frac{2\pi}{3}-x^2\right)$$

$$\Rightarrow\quad f'(x)=-2x\cos\left(\frac{2\pi}{3}-x^2\right)$$

$$\Rightarrow\quad f'(\sqrt{\pi/3})=-2\sqrt{\pi/3}\cos\pi/3=-\sqrt{\pi/3}$$

45. We have, $u=e^x\sin x$

$$\Rightarrow\quad \frac{du}{dx}=e^x\sin x+e^x\cos x=u+v$$

and $$v=e^x\cos x$$

$$\Rightarrow\quad \frac{dv}{dx}=e^x\cos x+e^x\sin x=v-u$$

$$\therefore\quad v\frac{du}{dx}-u\frac{dv}{dx}=v(u+v)-u(v-u)=u^2+v^2$$

$$\frac{d^2u}{dx^2}=\frac{du}{dx}+\frac{dv}{dx}=u+v+v-u=2v$$

and $$\frac{d^2v}{dx^2}=\frac{dv}{dx}-\frac{du}{dx}=(v-u)-(v+u)=-2u$$

46. We have, $f(x) = \log_x \{\ln(x)\} = \dfrac{\ln\{\ln(x)\}}{\ln(x)}$

$$\therefore \quad f'(x) = \frac{\ln(x)\cdot\frac{1}{\ln(x)}\cdot\frac{1}{x} - \ln\{\ln(x)\}\frac{1}{x}}{\{\ln(x)\}^2} = \frac{1-\ln\{\ln(x)\}}{x\{\ln(x)\}^2}$$

$$\Rightarrow \quad f'(e) = \frac{1-\ln\{\ln(e)\}}{e\{\ln(e)\}^2} = \frac{1-\ln(1)}{e} = \frac{1}{e} \text{ or } e^{-1}$$

47. We have, $[f(x)]^n = f(nx)$ for all x

$$\Rightarrow \quad n[f(x)]^{n-1}f'(x) = nf'(nx)$$

$$\Rightarrow \quad n[f(x)]^n f'(x) = nf(x)f'(nx)$$

[multiplying both sides by $f(x)$]

$$\Rightarrow \quad nf(nx)f'(x) = nf(x)f'(nx) \qquad [\because [f(x)]^n = f(nx)]$$

$$\Rightarrow \quad f(nx)f'(x) = f(x)f'(nx)$$

48. Since, $f(x)$ is an odd differentiable function defined on R.

Therefore, $f(-x) = -f(x)$ for all $x \in R$

Differentiating both the sides w.r.t. x, we get

$$-f'(-x) = -f'(x) \text{ for all } x \in R$$

$$\Rightarrow \quad f'(-x) - f'(x) = 0 \text{ for all } x \in R$$

$$\Rightarrow \quad f'(-3) = f'(3) = -2$$

Aliter

We know that the derivative of a differentiable odd function is an even function. Therefore, $f'(x)$ is an even function.

Hence, $f'(-3) = f'(3) = -2$

49. We have, $y = \sqrt{x+\sqrt{y+\sqrt{x+\sqrt{y+\ldots\infty}}}}$

$$\Rightarrow \quad y^2 = x + \sqrt{y+\sqrt{x+\sqrt{y+\ldots\infty}}}$$

$$\Rightarrow \quad y^2 = x + \sqrt{y+y} \;\Rightarrow\; (y^2-x)^2 = 2y$$

Differentiating both the sides w.r.t. x, we get

$$2(y^2-x)\left(2y\frac{dy}{dx} - 1\right) = 2\frac{dy}{dx}$$

$$\Rightarrow \quad \frac{dy}{dx} = \frac{y^2-x}{2y^3-2xy-1}$$

50. We have, $f(x) = |\cos x - \sin x|$

$$\Rightarrow \quad f(x) = \begin{cases} \cos x - \sin x, & \text{for } 0 < x \le \dfrac{\pi}{x} \\ \sin x - \cos x, & \text{for } \dfrac{\pi}{4} < x < \dfrac{\pi}{2} \end{cases}$$

Clearly, $\left(\text{LHD at } x = \dfrac{\pi}{4}\right) = \left\{\dfrac{d}{dx}(\cos x - \sin x)\right\}_{\text{at } x=\frac{\pi}{4}}$

$$= (-\sin x - \cos x)_{x=\frac{\pi}{4}} = -\sqrt{2}$$

and $\left(\text{RHD at } x = \dfrac{\pi}{4}\right) = \left\{\dfrac{d}{dx}(\sin x - \cos x)\right\}_{\text{at } x=\frac{\pi}{4}}$

$$= (\cos x + \sin x)_{x=\frac{\pi}{4}} = \sqrt{2}$$

$$\therefore \quad \left(\text{LHD at } x = \frac{\pi}{4}\right) \neq \left(\text{RHD at } x = \frac{\pi}{4}\right)$$

Thus, $f'\left(\dfrac{\pi}{4}\right)$ doesn't exist.

51. We have, $f(x) = x^2 + xg'(1) + g''(2)$

and $g(x) = x^2 + xf'(2) + f''(3)$

$$\Rightarrow \quad f'(x) = 2x + g'(1)$$

and $g'(x) = 2x + f'(2)$ ...(i)

Putting $x = 1$ in Eq (i), we get

$$f'(1) = 2 + g'(1)$$

and $g'(1) = 2 + f'(2)$

$$\Rightarrow \quad f'(1) = 4 + f'(2)$$

Putting $x = 2$ in Eq. (i), we get

$$f'(2) = 4 + g'(1)$$

and $g'(2) = 4 + f'(2)$

$$\Rightarrow \quad g'(2) = 4 + 4 + g'(1) = 8 + g'(1)$$

Differentiating Eq. (i) w.r.t. x, we get

$$f''(x) = 2$$

and $g''(x) = 2$ for all x

$$\Rightarrow \quad f''(3) = 2$$

and $g''(2) = 2$

$$\Rightarrow g''(2) + f''(3) = 2 + 2 = 4$$

52. We have, $f(x) = x^n$

$$f^r(x) = n(n-1)(n-2)\ldots\{n-(r-1)\}x^{n-r}$$

$$\Rightarrow \quad f^r(x) = \frac{n!}{(n-r)!}x^{n-r}$$

$$\Rightarrow \quad f^r(1) = \frac{n!}{(n-r)!}$$

$$\therefore \; f(1) - \frac{f'(1)}{1!} + \frac{f''(1)}{2!} - \frac{f'''(1)}{3!} + \ldots + \frac{(-1)^n f^n(1)}{n!}$$

$$= \sum_{r=0}^{n}(-1)^r \frac{f^r(1)}{r!}, \text{ where } f^0(1) = f(1)$$

$$= \sum_{r=0}^{n}(-1)^r \frac{n!}{(n-r)!\,r!} = \sum_{r=0}^{n}(-1)^r {}^nC_r = 0$$

53. We have, $y + \log(1+x) = 0$

$$\Rightarrow \quad \frac{dy}{dx} + \frac{1}{(1+x)} = 0$$

$$\Rightarrow \quad y' = -\frac{1}{(x+1)} \qquad \ldots(i)$$

Also, $\log(1+x) = -y$

$$\Rightarrow \quad 1 + x = e^{-y} \;\Rightarrow\; 1 = e^{-y}\cdot(-y')$$

$$\Rightarrow \quad e^y = -y'$$

or $y' + e^y = 0$

54. As, $y = 2^{3^x}$

$$\Rightarrow \quad \frac{dy}{dx} = 2^{3^x} \cdot \log 2 \cdot \left(\frac{d}{dx}(3^x)\right)$$

$$= 2^{3^x} \cdot \log 2 \cdot 3^x \cdot \log 3$$

$$= 2^{3^x} \cdot 3^x \cdot \log 2 \cdot \log 3 \quad \ldots(i)$$

Also, $y = 2^{3^x}$ and $\log_2 y = 3^x$

$\therefore$ Eq. (i) becomes,

$$\frac{dy}{dx} = y \cdot (\log_2 y) \cdot \log 3 \cdot \log 2$$

55. Here, $f(x) = x^2 + 3x - 3$

$$g(f(x)) = x$$

$$\Rightarrow \quad g'(f(x)) \cdot f'(x) = 1,\ f'(x) = 2x + 3$$

$$\Rightarrow \quad g'(f(x)) = \frac{1}{2x+3}$$

$$\therefore \quad g'(1) = \frac{1}{2g(1)+3} \quad \ldots(i)$$

and $g^{-1}(x) = f(x)$

When $f(x) = 1$,

then $g^{-1}(x) = 1 \Rightarrow x = g(1)$

Also, $f(x) = 1$

$$\Rightarrow \quad 1 = x^2 + 3x - 3$$

$$\Rightarrow \quad x^2 + 3x - 4 = 0$$

$$\Rightarrow \quad (x+4)(x-1) = 0$$

$$\Rightarrow \quad x = 1 \quad [\text{as } x > 0]$$

$$\therefore \quad g'(1) = \frac{1}{2(1)+3} = \frac{1}{5}$$

56. Here, $x^3 - 2x^2y^2 + 5x + y - 5 = 0$

On differentiating, we get

$3x^2 - 4xy^2 - 4x^2y\,dy/dx + 5 + dy/dx = 0$

$$\Rightarrow \quad y' = \frac{3x^2 - 4xy^2 + 5}{4x^2y - 1}$$

$$\therefore \quad y'(1) = \frac{3-4+5}{4-1} = \frac{4}{3}$$

Also, $y''(x)$

$$= \frac{[(6x - 4y^2 - 8xyy')](4x^2y - 1) - (8xy + 4x^2y')(3x^2 - 4xy^2 + 5)]}{(4x^2y - 1)^2}$$

$$\Rightarrow \quad y''(1) = \frac{\left(6 - 4 - 8 \cdot \frac{4}{3}\right) \cdot (4-1) - \left(8 + 4 \cdot \frac{4}{3}\right) \cdot (3 - 4 + 5)}{(4-1)^2}$$

$$= -8\frac{22}{27}$$

57. Here, $y = \sqrt{x+y}$

$$\Rightarrow \quad y^2 = x + y$$

On differentiating w.r.t. x, we get

$$2y \cdot \frac{dy}{dx} = 1 + \frac{dy}{dx}$$

$$\Rightarrow \quad \frac{dy}{dx} = \frac{1}{2y-1}$$

Also, $y = \frac{x}{y} + 1$

$$\Rightarrow \quad \frac{dy}{dx} = \frac{y \cdot 1 - x \cdot \frac{dy}{dx}}{y^2}$$

$$\Rightarrow \quad (y^2 + x)\frac{dy}{dx} = y$$

$$\Rightarrow \quad \frac{dy}{dx} = \frac{y}{y^2 + x} \quad [\because y^2 = x + y]$$

$$\Rightarrow \quad \frac{dy}{dx} = \frac{y}{(x+y)+x} = \frac{y}{2x+y}$$

58. We have, $y = x^{(\ln x)^{\ln(\ln x)}}$

$$\Rightarrow \quad \ln y = (\ln x)^{\ln(\ln x)} \ln x \quad \ldots(i)$$

$$\Rightarrow \ln(\ln y) = \ln(\ln x) \cdot \ln(\ln x) + \ln(\ln x)$$

$$\Rightarrow \quad \frac{1}{\ln y} \cdot \frac{1}{y} \cdot \frac{dy}{dx} = \frac{2\ln(\ln x)}{\ln x} \cdot \frac{1}{x} + \frac{1}{x \ln x}$$

$$= \frac{2\ln(\ln x) + 1}{x \ln x}$$

$$\therefore \quad \frac{dy}{dx} = \frac{y}{x} \cdot \frac{\ln y}{\ln x}(2\ln(\ln x) + 1)$$

Substituting the value of $\ln y$ from Eq. (i), we get

$$\frac{dy}{dx} = \frac{y}{x}(\ln x)^{\ln(\ln x)}(2\ln(\ln x) + 1)$$

59. (a) We have, $y = \sin^{-1} 2x\sqrt{1-x^2}$

$$\Rightarrow \quad \frac{dy}{dx} = \frac{2 - 4x^2}{\sqrt{1 - 4x^2 + 4x^4}}$$

Clearly, it is not defined at $x = \frac{1}{\sqrt{2}}$.

Not derivable at $x = \frac{1}{\sqrt{2}}$, check with $x = \sin\theta$ or direct differentiation.

(b) $g'(x) = \frac{1}{\sqrt{1 - \left(\frac{2 \cdot 2^x}{1 + 2^{2x}}\right)^2}} \cdot \frac{(1+4^x)(2^{x+1})\ln 2 - 2^{x+1} \cdot 4^x \cdot \ln 4}{(1+4^x)^2}$

$$= \frac{1 + 2^{2x}}{\sqrt{1 + 4^{2x} - 2 \cdot 2^{2x}}} \times \frac{2^{x+1}\ln 2\,(1 - 4^x)}{(1+4^x)^2}$$

$$= \frac{2^{x+1}\ln 2(1 - 4^x)}{\left|1 - 2^{2x}\right|(1 + 4^x)}$$

Clearly, it is not defined, when $1 - 2^x = 0$

i.e. at $x = 0$

$\Rightarrow$ Not derivable at $x = 0$

(c) $h(x) = \sin^{-1}\left(\frac{1-x^2}{1+x^2}\right) = \frac{\pi}{2} - \cos^{-1}\left(\frac{1-x^2}{1+x^2}\right)$

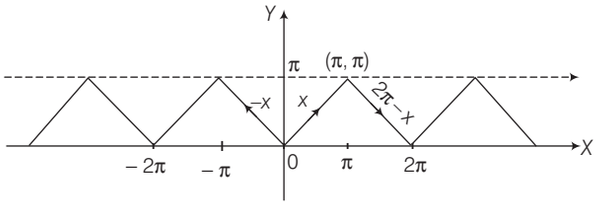
$$= \begin{cases} \frac{\pi}{2} - 2\tan^{-1}x, & x \geq 0 \\ \frac{\pi}{2} + 2\tan^{-1}x, & x < 0 \end{cases}$$

$$\therefore \quad h'(x) = \begin{cases} \frac{-2}{1+x^2}, & x > 0 \\ \text{not derivable}, & x = 0 \\ \frac{2}{1+x^2}, & x < 0 \end{cases}$$

$\therefore$ Not differentiable at $x = 0$.

(d) $k(x) = \sin^{-1}(\cos x) = \frac{\pi}{2} - \cos^{-1}(\cos x)$

and graph for $\cos^{-1}(\cos x)$, is shown as



$\therefore$ $k(x)$ is not differentiable at $x = 0$.

60. $f(x) = \frac{\sqrt{(\sqrt{x-1})^2 + 1 - 2\sqrt{x-1}}}{\sqrt{x-1}-1} \cdot x$

$$= \frac{|\sqrt{x-1}-1|}{\sqrt{x-1}-1} \cdot x = \begin{cases} -x, & \text{if } x \in [1, 2) \\ x, & \text{if } x \in (2, \infty) \end{cases}$$

$$\Rightarrow \quad f'(x) = \begin{cases} -1, & \text{if } x \in [1, 2) \\ 1, & \text{if } x \in (2, \infty) \end{cases}$$

$\therefore$ $f'(10) = 1$ and $f'\left(\frac{3}{2}\right) = -1$

61. $2^x + 2^y = 2^{x+y}$

Differentiating both sides, we get

$$2^x \log 2 + 2^y \log 2 \frac{dy}{dx} = 2^{x+y} \cdot \log 2 \left(1 + \frac{dy}{dx}\right)$$

$$\Rightarrow \quad \log 2 \cdot 2^y (2^x - 1) \frac{dy}{dx} = 2^x (1 - 2^y) \log 2$$

$$\Rightarrow \quad \frac{dy}{dx} = \frac{2^x (1-2^y)}{2^y (2^x - 1)} \qquad \ldots(i)$$

Also, $2^x = 2^y (2^x - 1)$

$$\therefore \quad \frac{dy}{dx} = (1 - 2^y) \qquad \ldots(ii)$$

when $2^y = 2^x (2^y - 1)$ [from Eq. (i)]

$$\Rightarrow \quad \frac{dy}{dx} = \frac{-1}{2^x - 1} = \frac{1}{1 - 2^x} \qquad \ldots(iii)$$

As, $2^x = 2^y (2^x - 1)$ and $2^y = 2^x (2^y - 1)$

$$\therefore \quad -\frac{2^y}{2^x} = \frac{2^x (1-2^y)}{2^y (2^x - 1)}$$

Substituting this in Eq. (i), we get

$$\frac{dy}{dx} = -\frac{2^y}{2^x}$$

62. $f(x) = (x^2 + bx + c)e^x$

$$\therefore \quad f'(x) = \{x^2 + (b+2)x + (b+c)\}e^x$$

$f(x) > 0$ iff $D = b^2 - 4c < 0$

Now, $f'(x) > 0$ iff $D' = (b+2)^2 - 4(b+c)$

$$= D + 4 < 0$$

Thus, for $f'(x) > 0$, $D + 4 < 0$ holds.

$$\Rightarrow \quad D < 0$$

$$\Rightarrow \quad f(x) > 0$$

63. We have, $\sqrt{y+x} + \sqrt{y-x} = c$

On differentiating w.r.t. x, we get

$$\frac{dy}{dx}\left(\frac{1}{\sqrt{y+x}} + \frac{1}{\sqrt{y-x}}\right) = \frac{1}{\sqrt{y-x}} - \frac{1}{\sqrt{y+x}}$$

$$\Rightarrow \quad \frac{dy}{dx} = \frac{\sqrt{y+x} - \sqrt{y-x}}{(\sqrt{y+x} + \sqrt{y-x})}$$

$$\frac{dy}{dx} = \frac{(y+x)-(y-x)}{(\sqrt{y+x} + \sqrt{y-x})^2} = \frac{2x}{c^2}$$

$$\therefore \quad \frac{dy}{dx} = \frac{x}{y + \sqrt{y^2 - x^2}}$$

Now, $\frac{dy}{dx} = \frac{(\sqrt{y+x} - \sqrt{y-x})^2}{(y+x)-(y-x)} = \frac{y - \sqrt{y^2 - x^2}}{x}$

64. $y = \tan x \cdot \tan 2x \cdot \tan 3x$ ...(i)

Differentiating both sides, we get

$$\frac{dy}{dx} = 3\sec^2 3x \cdot \tan x \cdot \tan 2x + \sec^2 x \cdot \tan 2x \cdot \tan 3x + 2\sec^2 2x \cdot \tan x \cdot \tan 3x \qquad \ldots(ii)$$

Taking log on both sides of Eq. (i), we get

$$\log y = \log \tan x + \log \tan 2x + \log \tan 3x$$

Differentiating both sides, we get

$$\frac{1}{y} \cdot \frac{dy}{dx} = 2 \operatorname{cosec} 2x + 4 \operatorname{cosec} 4x + 6 \operatorname{cosec} 6x$$

$$\therefore \quad \frac{dy}{dx} = 2y (\operatorname{cosec} 2x + 2 \operatorname{cosec} 4x + 3 \operatorname{cosec} 6x) \qquad \ldots(iii)$$

$$\tan(3x) = \tan(2x + x) = \frac{\tan 2x + \tan x}{1 - \tan 2x \tan x}$$

$$\Rightarrow \quad \tan 3x \cdot \tan 2x \cdot \tan x = \tan 3x - \tan 2x - \tan x$$

Differentiating both sides, we get

$$\frac{dy}{dx} = 3\sec^2 3x - 2\sec^2 2x - \sec^2 x$$

65. Here, $f(x) = \frac{x}{(x-1)(x+1)} = \frac{1}{2}\left[\frac{(x+1)+(x-1)}{(x-1)(x+1)}\right]$

$$f(x) = \frac{1}{2}\left[\frac{1}{x-1} + \frac{1}{x+1}\right]$$

$$\Rightarrow \quad f'(x) = \frac{1}{2}\left[-\frac{1}{(x-1)^2} - \frac{1}{(x+1)^2}\right]$$

$$f''(x)=\frac{1}{2}\left[\frac{2}{(x-1)^3}+\frac{2}{(x+1)^3}\right]>0, \text{ for all } x>1$$

$\therefore f(x)$ is concave up.

66. Let $x=\tan\theta$, where $-\frac{\pi}{2}<\theta<\frac{\pi}{2}$.

$$\Rightarrow \quad f(x)=\sin^{-1}(\sin 2\theta)$$

$$\therefore f(x)=\begin{cases}\pi-2\theta, & \frac{\pi}{2}<2\theta<\pi\\ 2\theta, & -\frac{\pi}{2}\le 2\theta\le\frac{\pi}{2}\\ -\pi-2\theta, & -\pi<2\theta<-\frac{\pi}{2}\end{cases}=\begin{cases}\pi-2\tan^{-1}x, & x>1\\ 2\tan^{-1}x, & -1\le x\le 1\\ -\pi-2\tan^{-1}x, & x<-1\end{cases}$$

$$\therefore f'(x)=\begin{cases}\frac{-2}{1+x^2}, & x>1\\ \frac{2}{1+x^2}, & -1\le x\le 1\\ \frac{-2}{1+x^2}, & x<-1\end{cases} \Rightarrow f'(2)=\frac{-2}{1+4}=\frac{-2}{5}$$

67. As, $(f(g(x))'=f'(g(x))\cdot g'(x)$

$$(f(g(0)))'=f'(g(0))\cdot g'(0)=c$$

$$\Rightarrow \quad f'(0)\cdot g'(0)=c \Rightarrow g'(0)=\frac{c}{b}$$

68. $\lim\limits_{x\to 0}\dfrac{g(x)\cos x-g(0)}{\sin x}=\lim\limits_{x\to 0}\dfrac{g'(x)\cos x-g(x)\sin x}{\cos x}=0$

Now, $f(x)=g(x)\sin x$

$$f'(x)=g(x)\cos x+g'(x)\sin x$$

$\therefore \quad f'(0)=0$

On differentiating both sides, we get

$$f''(x)=g'(x)\cos x-g(x)\sin x+g''(x)\sin x+g'(x)\cos x$$
$$=g''(x)\sin x+2g'(x)\cos x-g(x)\sin x$$

Also, $f'(0)=g'(0)$

$\therefore$ Both statements are correct but Statement II is not the correct explanation of Statement I.

69. Statement II is correct.

$$\therefore \quad y=\sin^{-1}(3x-4x^3)=3\sin^{-1}x, \text{ when } -\frac{1}{2}\le x\le\frac{1}{2}$$

$$\Rightarrow \frac{dy}{dx}=\frac{3}{\sqrt{1-x^2}} \text{ only when } \frac{-1}{2}\le x\le\frac{1}{2}$$

$\therefore$ Both statements are true and Statement II is the correct explanation of Statement I.

70. Clearly, Statement I is false.

$$\cos^{-1}\left(\frac{1-x^2}{1+x^2}\right)=\begin{cases}2\tan^{-1}x, & x\ge 0\\ -2\tan^{-1}x, & x<0\end{cases}$$

$\therefore$ Statement II is correct but Statement I is incorrect.

71. Clearly, Statement II is true.

$$\therefore \quad \frac{dy}{dx}=\begin{cases}1, & x\notin \text{Integer}\\ \text{does not exist}, & x\in \text{Integer}\end{cases}$$

Thus, Statement I is incorrect but Statement II is correct.

72. We have, $f(x)$ is a continuous function $f: R\to Q$.

$f: R\to 0$, iff $f(x)$ is constant function.

$$f(5)=3$$
$$f(x)=3$$
$$f'(x)=0$$

So, Statements I and II both are correct and Statement II is the correct explanation of Statement I.

73. Let $f(x)=\sin^{-1}\dfrac{2x}{1+x^2}$, $g(x)=\cos^{-1}\left(\dfrac{1-x^2}{1+x^2}\right)$

$$f(x)=\begin{cases}2\tan^{-1}x, & -1\le x\le 1\\ \pi-2\tan^{-1}x, & x>1\\ -\pi-2\tan^{-1}x, & x<-1\end{cases}$$

$$g(x)=\begin{cases}2\tan^{-1}x, & x\ge 0\\ -2\tan^{-1}x, & x<0\end{cases}$$

$$f'(x)=\begin{cases}\frac{2}{1+x^2}, & -1\le x\le 1\\ -\frac{2}{1+x^2}, & x>1\\ -\frac{2}{1+x^2}, & x<-1\end{cases}$$

$$g'(x)=\begin{cases}\frac{2}{1+x^2}, & x\ge 0\\ -\frac{2}{1+x^2}, & x<0\end{cases}$$

$$\frac{f'(x)}{g'(x)}=1,\ 0<x<1$$

$\therefore \quad f'(x)\ne g'(x), -1\le x\le 1$

Statement I is correct and Statement II is incorrect.

74. Given, $f(x+y^3)=f(x)+f(y^3), \forall\ x, y\in R$

Put $x=y=0$, we get

$$f(0+0)=f(0)+f(0) \Rightarrow f(0)=0$$

Now, put $y=-x^{1/3}$, we get

$$f(0)=f(x)+f(-x)$$

$$\Rightarrow \quad f(x)+f(-x)=0$$

$\Rightarrow f(x)$ is an odd function.

$\Rightarrow f'(x)$ is an even function.

$$\Rightarrow \quad f'(2)=f'(-2)=a$$

Sol. (Q. Nos. 75 to 77)

Consider, $f(x+y)-f(x)=f(y)-1+2xy$

$$\Rightarrow \quad f(0+0)-f(0)=f(0)-1+0$$

$$\Rightarrow \quad f(0)=1 \text{ and } f'(0)=1 \qquad \text{[given]}$$

Also, $f'(x)=\lim\limits_{h\to 0}\dfrac{f(x+h)-f(x)}{h}=\lim\limits_{h\to 0}\left[\dfrac{f(h)-1}{h}+\dfrac{2xh}{h}\right]$

$$f'(x)=f'(0)+2x$$

$\therefore \quad f'(x)=2x+1$

Integrating both sides, $f(x)=x^2+x+c$

As, $\quad f(0)=1 \Rightarrow c=1$

$\therefore \quad f(x)=x^2+x+1$

Thus, domain of $\log(f(x)) = \log(x^2 + x + 1)$ is $x \in R$

Range of $x^2 + x + 1 \geq 3/4$

$\therefore$ Range of $\log_{3/4}(x^2 + x + 1) \leq 1$

$\Rightarrow$ Range $\in (-\infty, 1]$

and $\quad g(0) = \dfrac{g(0) + g(0)}{k} \Rightarrow 2g(0) = kg(0)$

$\Rightarrow \quad g(0) = 0 \qquad [\because k \neq 2]$

$$g'(x) = \lim_{h \to 0} \frac{g\left(\frac{x+h}{1}\right) - g(x)}{h} = \lim_{h \to 0} \frac{g(x) + g(h) - g(x)}{h}$$

$$= \lim_{h \to 0} \frac{g(h) - g(0)}{h} = g'(0) = \lambda$$

$\therefore \quad g(x) = \lambda x + c$

As $\quad g(0) = 0 \Rightarrow c = 0$

$\Rightarrow \quad g(x) = \lambda x$

$\Rightarrow \quad \lambda x = x^2 + x + 1 \Rightarrow x^2 + x(1 - \lambda) + 1 = 0$

$\because \quad D = 0$

$\therefore \quad (1 - \lambda)^2 - 4 = 0 \Rightarrow \lambda = 3, -1$

85. $y = e^t \sin t \Rightarrow \dfrac{dy}{dt} = e^t [\cos t + \sin t]$

$x = e^t \cos t \Rightarrow \dfrac{dx}{dt} = e^t [\cos t - \sin t]$

$\therefore \quad \dfrac{dy}{dx} = \dfrac{\cos t + \sin t}{\cos t - \sin t} = \tan \alpha$

$\Rightarrow \quad \tan\left(\dfrac{\pi}{4} + t\right) = \tan \alpha$

$\Rightarrow \quad \left(\dfrac{\pi}{4} + t\right) = \alpha \Rightarrow t = \alpha - \dfrac{\pi}{4}$

86. $\dfrac{d^2y}{dx^2} = \dfrac{\sec^2\left(\dfrac{\pi}{4} + t\right)}{e^t(\cos t - \sin t)}$

$\therefore \quad \left(\dfrac{d^2y}{dx^2}\right)_{t=0} = 2$

87. $F(t) = \int e^t(\cos t + \sin t)\, dt = e^t \sin t + C$

$$F\left(\frac{\pi}{2}\right) - F(0) = (e^{\pi/2} + C) - 0 = e^{\pi/2}$$

Sol. (Q. Nos. 88 to 90)

88. Since, 1, a_1, a_2, ..., a_n are roots of $x^n - 1 = 0$.

$$\therefore \quad x^n - 1 = (x-1)(x-a_1)(x-a_2)\ldots(x-a_n) \qquad \ldots(i)$$

$$\Rightarrow \quad \frac{x^n - 1}{x-1} = (x-a_1)(x-a_2)\ldots(x-a_n)$$

$$\Rightarrow \quad \lim_{x\to 1}\frac{x^n-1}{x-1} = \lim_{x\to 1}[(x-a_1)(x-a_2)\ldots(x-a_n)]$$

$$\Rightarrow \quad (1-a_1)(1-a_2)\ldots(1-a_n) = n$$

89. From Eq. (i), $\log(x^n - 1) = \log(x-1) + \log(x-a_1) + \ldots + \log(x-a_n)$

Differentiating w.r.t. x, we get

$$\frac{nx^{n-1}}{x^n-1} = \frac{1}{x-1} + \frac{1}{x-a_1} + \frac{1}{x-a_2} + \ldots + \frac{1}{x-a_n} \qquad \ldots(ii)$$

Putting $x = 2$ in Eq. (ii), we get

$$\frac{n2^{n-1}}{x^n-1} = 1 + \frac{1}{2-a_1} + \frac{1}{2-a_2} + \ldots + \frac{1}{2-a_n}$$

$$\Rightarrow \quad \frac{1}{2-a_1} + \frac{1}{2-a_2} + \ldots + \frac{1}{2-a_n} = \frac{n2^{n-1}}{2^n-1} - 1$$

$$= \frac{n2^{n-1} - 2^n + 1}{2^n - 1} = \frac{2^{n-1}(n-2)+1}{2^n-1}$$

90. From Eq. (ii), $\frac{nx^{n-1}}{x^n-1} - \frac{1}{x-1} = \frac{1}{x-a_1} + \frac{1}{x-a_2} + \ldots + \frac{1}{x-a_n}$

$$\Rightarrow \quad \frac{nx^{n-1} - 1(1 + x + x^2 + \ldots + x^{n-1})}{x^n - 1}$$

$$= \frac{1}{x-a_1} + \frac{1}{x-a_2} + \ldots + \frac{1}{x-a_n}$$

$$\Rightarrow \quad \lim_{x\to 1}\frac{nx^{n-1} - 1(1 + x + x^2 + \ldots + x^{n-1})}{x^n - 1}$$

$$= \lim_{x\to 1}\left(\frac{1}{x-a_1} + \frac{1}{x-a_2} + \ldots + \frac{1}{x-a_n}\right)$$

$$\Rightarrow \quad \lim_{x\to 1}\frac{n(n-1)x^{n-2} - \{1 + 2x + \ldots + (n-1)x^{n-2}\}}{nx^{n-1}}$$

$$= \frac{1}{1-a_1} + \frac{1}{1-a_2} + \ldots + \frac{1}{1-a_n}$$

[applying L'Hospital's rule on LHS]

$$\Rightarrow \quad \frac{n(n-1) - \{1 + 2 + \ldots + (n-1)\}}{n}$$

$$= \frac{1}{1-a_1} + \frac{1}{1-a_2} + \ldots + \frac{1}{1-a_n}$$

$$\Rightarrow \quad \frac{1}{1-a_1} + \frac{1}{1-a_2} + \ldots + \frac{1}{1-a_n} = \frac{n-1}{2}$$

91. (A) $\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{12t^2 - 6t - 18}{5t^4 - 15t^2 - 20}$

$$\Rightarrow \left[\frac{dy}{dx}\right]_{t=1} = \frac{12 - 6 - 18}{5 - 15 - 20} = \frac{2}{5} \Rightarrow \left[-5\frac{dy}{dx}\right]_{t=1} = -2$$

(B) Let us take

$$P(x) = a(x-2)^4 + b(x-2)^3 + c(x-2)^2 + d(x-2) + e$$

$$-1 = P(2) = e$$

$$0 = P'(2) = d$$

$$2 = P''(2) = 2c$$

$$\Rightarrow \quad c = 1$$

$$-12 = P'''(2) = 6b$$

$$\Rightarrow \quad b = -2$$

$$P^{iv}(2) = 24\, a = 24 \Rightarrow a = 1$$

Thus, $P''(x) = 12(x-2)^2 - 12(x-2) + 2$

$$\Rightarrow \quad P''(3) = 12 - 12(1) + 2 = 2$$

(C) Here, $\sqrt{(1+y^4)} = \sqrt{\left(1 + \frac{1}{x^4}\right)} = \frac{\sqrt{1+x^4}}{x^2} \qquad \left[\because y = \frac{1}{x}\right]$

$$\Rightarrow \quad \frac{\sqrt{1+y^4}}{\sqrt{1+x^4}} = \frac{1}{x^2} \qquad \ldots(i)$$

But $\quad y = \frac{1}{x}$

$$\therefore \quad \frac{dy}{dx} = -\frac{1}{x^2} \qquad \ldots(ii)$$

From Eqs. (i) and (ii), we get

$$\frac{\sqrt{1+y^4}}{\sqrt{1+x^4}} = -\frac{dy}{dx} \quad \Rightarrow \frac{dy}{\sqrt{(1+y^4)}} + \frac{dx}{\sqrt{(1+x^4)}} = 0$$

$$\Rightarrow \quad \frac{\frac{dy}{\sqrt{1+y^4}}}{\frac{dx}{\sqrt{1+x^4}}} = -1$$

(D) Obviously, $f(x)$ is a linear function.

Also, from $f'(0) = p$ and $f(0) = q$,

$$f(x) = px + q \Rightarrow f''(0) = 0$$

92. (A) We know that,

$$2\tan^{-1}x = \begin{cases} \sin^{-1}\left(\frac{2x}{1+x^2}\right), & \text{if } -1 \le x \le 1 \\ \pi - \sin^{-1}\left(\frac{2x}{1+x^2}\right), & \text{if } x > 1 \\ -\pi - \sin^{-1}\left(\frac{2x}{1+x^2}\right), & \text{if } x < -1 \end{cases}$$

$$\Rightarrow \quad \frac{dy}{dx} = -\frac{2}{1+x^2}, \text{ if } x < -1 \text{ or } x > 1$$

(B) $\cos^{-1}\left(\frac{1}{\sqrt{1+x^2}}\right) = \begin{cases} \tan^{-1}x, & x \ge 0 \\ -\tan^{-1}x, & x < 0 \end{cases}$

$$\Rightarrow \quad \frac{dy}{dx} = -\frac{1}{1+x^2}, \text{ if } x < 0$$

(C) $y = |e^{|x|} - e| = \begin{cases} |e^x - e|, & x \geq 0 \\ |e^{-x} - e|, & x < 0 \end{cases}$

$$= \begin{cases} e^x - e, & x \geq 1 \\ e - e^x, & 0 \leq x < 1 \\ e - e^{-x}, & -1 \leq x < 0 \\ e^{-x} - e, & x < -1 \end{cases}$$

$\Rightarrow \quad \frac{dy}{dx} > 0$, if $x > 1$ or $-1 < x < 0$

(D) $\frac{du}{dx} = \frac{1}{x}$ and $\frac{dv}{dx} = \begin{cases} \frac{1}{1+x^2}, & x > 0 \\ -\frac{1}{1+x^2}, & x < 0 \end{cases}$

$\Rightarrow \quad \frac{du}{dv} = \begin{cases} \frac{1+x^2}{x}, & x > 0 \\ -\frac{1+x^2}{x}, & x < 0 \end{cases}$

Now, we know that $\frac{1+x^2}{x} = x + \frac{1}{x} > 2$, if $x > 1$ and < -2, if $x < -1 \Rightarrow \frac{du}{dv} > 2$, if $x < -1$ or $x > 1$

93. Here, $f(x) = x^3 + x^2 f'(1) + xf''(2) + f'''(3)$

Put $f'(1) = a, f''(2) = b, f'''(3) = c$

$\Rightarrow \quad f(x) = x^3 + ax^2 + bx + c$

$f'(x) = 3x^2 + 2ax + b$

$\Rightarrow \quad f'(1) = 3 + 2a + b$ or $a = 3 + 2a + b$

$\Rightarrow \quad a + b = -3$ ...(i)

$f'' = 6x + 2a \Rightarrow f''(2) = 12 + 2a$

$\therefore \quad b = 12 + 2a \Rightarrow 2a - b = -12$ ...(ii)

$f'''(x) = 6 \Rightarrow c = 6$ ...(iii)

From Eqs. (i) and (ii), we get

$a = -5, \ b = 2$

$\therefore \quad f(1) = 1 + a + b + c$

$= 1 - 5 + 2 + 6 = 4$

94. Let $y = \tan\left(\sin^{-1}\left(\frac{2x+2}{\sqrt{4x^2+8x+13}}\right)\right)$ and $z = \tan^{-1} x$.

$\Rightarrow \quad y = \tan\left(\sin^{-1}\left(\frac{2x+2}{\sqrt{(2x+2)^2+9}}\right)\right)$

$= \tan\left(\tan^{-1}\left(\frac{2x+3}{3}\right)\right) = \frac{2x+3}{3}$

$\Rightarrow \quad \frac{dy}{dx} = \frac{2}{3}$ and $\frac{dz}{dx} = \frac{1}{1+x^2}$

$\therefore \quad \frac{dy}{dx} = \frac{\frac{dy}{dx}}{\frac{dz}{dx}} = \frac{2}{3}(1 + x^2)$

$\Rightarrow \quad \left(\frac{dy}{dz}\right)_{x=\frac{1}{\sqrt{2}}} = \frac{2}{3}\left(1 + \frac{1}{2}\right) = \frac{2}{3} \times \frac{3}{2} = 1$

95. $P(x) = (x - x_1)^3 (x - x_2)(x - x_3) \ldots (x - x_8)$

$\Rightarrow \quad P(x) = (x - x_1)^3 \cdot Q(x)$

$\therefore \quad Q(x) = \frac{P(x)}{(x - x_1)^3}$

As, $Q(x)$ is polynomial.

$\therefore \quad Q(x)$ must be continuous at $x = x_1$.

$\therefore \quad Q(x_1) = \lim_{x \to x_1} Q(x)$

$= \lim_{x \to x_1} \frac{x^{10} + ax^2 + bx + c}{(x - x_1)^3}$

By L' Hospital's rule, we have

$Q(x_1) = \frac{10 \times 9 \times 8 \times x_1^7}{3 \times 2 \times 1}$

$\therefore \quad Q\left(\frac{1}{2}\right) = \frac{10 \times 9 \times 8 \times \left(\frac{1}{2}\right)^7}{3 \times 2 \times 1} = \frac{15}{16} = \frac{p}{q}$

$\Rightarrow \quad q - p = 1$

96. Here, $f'(x) = \begin{vmatrix} 4(x-a)^3 & (x-a)^3 & 1 \\ 4(x-b)^3 & (x-b)^3 & 1 \\ 4(x-c)^3 & (x-c)^3 & 1 \end{vmatrix}$

$$+ \begin{vmatrix} (x-a)^4 & 3(x-a)^2 & 1 \\ (x-b)^4 & 3(x-b)^2 & 1 \\ (x-c)^4 & 3(x-c)^2 & 1 \end{vmatrix} + \begin{vmatrix} (x-a)^4 & (x-a)^3 & 0 \\ (x-b)^4 & (x-b)^3 & 0 \\ (x-c)^4 & (x-c)^3 & 0 \end{vmatrix}$$

$$= 0 + 3\begin{vmatrix} (x-a)^4 & (x-a)^2 & 1 \\ (x-b)^4 & (x-b)^2 & 1 \\ (x-c)^4 & (x-c)^2 & 1 \end{vmatrix} + 0$$

$\Rightarrow \quad \lambda = 3$

97. Let $P(x) = a(x-1)(x-3)(x-5)(x-\lambda)$

$\Rightarrow \log P(x) = \log a + \log(x-1) + \log(x-3) + \log(x-5) + \log(x-7)$

Differentiating both sides, we get

$\frac{1}{P(x)} \cdot P'(x) = \frac{1}{x-1} + \frac{1}{x-3} + \frac{1}{x-5} + \frac{1}{x-\lambda}$

As, $P'(7) = 0$ [$\because P(x) = 0 \Rightarrow P'(x) = 0 \Rightarrow P'(7) = 0$]

$\Rightarrow \quad 0 = \frac{1}{6} + \frac{1}{4} + \frac{1}{2} + \frac{1}{7-\lambda}$

$\Rightarrow \quad \lambda = \frac{89}{11} = \frac{p}{q}$

$\therefore \quad p - 8q = 1$

98. We have, $x^2 + y^2 = t - \frac{1}{t}$

$\Rightarrow \quad (x^2 + y^2)^2 = \left(t - \frac{1}{t}\right)^2 = t^2 + \frac{1}{t^2} - 2$

$\Rightarrow \quad x^4 + y^4 + 2x^2y^2 = x^4 + y^4 - 2$

$\Rightarrow \quad 2x^2y^2 = -2$

$\Rightarrow \quad y^2 = -x^{-2}$

Differentiating w.r.t. x, we get

$$2y \cdot \frac{dy}{dx} = +2x^{-3}$$

$$\therefore \quad \frac{dy}{dx} = +\frac{1}{x^3 y}$$

$$\Rightarrow \quad \left(\frac{dy}{dx}\right)_{(1,1)} = 1$$

99. We have, $x^2 + y^2 + z^2 - 2xyz = 1$ ...(i)

$$\Rightarrow \quad d(x^2 + y^2 + z^2 - 2xyz) = 0$$

$$\Rightarrow \quad 2x\,dx + 2y\,dy + 2z\,dz - 2(xy\,dz + yz\,dx + zx\,dy) = 0$$

$$\Rightarrow \quad (x - yz)\,dx + (y - zx)\,dy + (z - xy)\,dz = 0$$

$$\Rightarrow \quad \frac{dx}{(y - zx)(z - xy)} + \frac{dy}{(x - yz)(z - xy)} + \frac{dz}{(x - yz)(y - zx)} = 0$$

Now, $(y - zx)^2 (z - xy)^2 = (y^2 - 2xyz + z^2x^2)(z^2 - 2xyz + x^2y^2)$

$= (1 - x^2 - z^2 + z^2x^2)(1 - x^2 - y^2 + x^2y^2)$ [using Eq. (i)]

$= (1 - x^2)(1 - z^2)(1 - x^2)(1 - y^2)$

$= (1 - x^2)^2 (1 - y^2)(1 - z^2)$

$\therefore (y - zx)(z - xy) = (1 - x^2) \cdot \sqrt{(1 - y^2)(1 - z^2)}$

Similarly, $(x - yz)(z - xy) = (1 - y^2) \cdot \sqrt{(1 - x^2)(1 - z^2)}$

and $(x - yz)(y - zx) = (1 - z^2) \cdot \sqrt{(1 - x^2((1 - y^2)}$

Substituting these values in Eq. (i), we get

$$\frac{dx}{\sqrt{1 - x^2}} + \frac{dy}{\sqrt{1 - y^2}} + \frac{dz}{\sqrt{1 - z^2}} = 0$$

100. We have, $x = \sin t$ or $t = \sin^{-1} x$

Now, $$\frac{dy}{dx} = \frac{dy}{dt} \cdot \frac{dt}{dx} = \frac{dy}{dt} \cdot \frac{1}{\sqrt{1 - x^2}}$$

$$\Rightarrow \quad \sqrt{1 - x^2}\,\frac{dy}{dx} = \frac{dy}{dt}$$

Differentiating w.r.t. x, we get

$$\sqrt{1 - x^2} \cdot \frac{d^2y}{dx^2} + \frac{1(-2x)}{2\sqrt{1 - x^2}} \cdot \frac{dy}{dx} = \frac{d}{dx}\left(\frac{dy}{dt}\right)$$

$$\Rightarrow \quad \sqrt{1 - x^2} \cdot \frac{d^2y}{dx^2} - \frac{x}{\sqrt{1 - x^2}}\frac{dy}{dx} = \frac{d^2y}{dt^2} \cdot \frac{dt}{dx}$$

$$\Rightarrow \quad (1 - x^2)\frac{d^2y}{dx^2} - x\frac{dy}{dx} = \sqrt{1 - x^2} \cdot \frac{d^2y}{dt^2} \cdot \frac{1}{\sqrt{1` - x^2}}$$

$$\therefore \quad (1 - x^2)\frac{d^2y}{dx^2} - x\frac{dy}{dx} = \frac{d^2y}{dt^2}$$

Adding y on both sides, we get

$$(1 - x^{2)}\frac{d^2y}{dx^2} - x\frac{dx}{dy} + y = \frac{d^2y}{dx^2} + y$$

$$\therefore \quad \lambda = 1$$

101. Put $\cos\phi = \frac{2}{\sqrt{13}}$

and $\sin\phi = \frac{3}{\sqrt{13}}$

$$\Rightarrow \quad y = \cos^{-1}\{\cos(x + \phi)\} + \sin^{-1}\{\cos(x - \phi)\}$$

$$= x + \phi + \frac{\pi}{2} - \phi + x$$

$$y = 2x + \frac{\pi}{2}$$

and $z = \sqrt{1 + x^2}$

$$\therefore \quad \frac{dy}{dz} = \frac{2\sqrt{1 + x^2}}{x} = \left(\frac{2\sqrt{1 + x^2}}{x}\right)_{x = \frac{1}{\sqrt{3}}} = \frac{2\sqrt{1 + \frac{1}{3}}}{\frac{1}{\sqrt{3}}} = 4$$

102. Here, $f''(x) - 2f'(x) - 15f(x) = 0$

$$\Rightarrow \quad (a^2 - 2a - 15)\,e^{ax} + (b^2 - 2b - 15)\,e^{bx} = 0$$

$$\Rightarrow \quad a^2 - 2a - 15 = 0 \quad \text{and} \quad b^2 - 2b - 15 = 0$$

$$\Rightarrow \quad a = (5 \text{ or } -3) \text{ and } (b = 5 \text{ or } -3)$$

Since, $a \neq b$

$$\therefore \quad a + b = 2 \text{ or } -2$$

$$\Rightarrow \quad |a + b| = 2$$

103. $A : 2x + 2yy' = 0 \Rightarrow y' = -\frac{x}{y}$

$$\therefore \quad y'(\sqrt{2}) = -1$$

$B : \cos y \cdot y' + \cos x = \sin x \cdot \cos y \cdot y' + \sin y \cdot \cos x$

when $x = y = \pi$

$$\Rightarrow \quad -y' - 1 = 0 + 0$$

$$\Rightarrow \quad y'(\pi) = -1$$

$C : 2e^{xy}(xy' + y) + e^x e^y y' + e^y e^x - e^x - e^y y'$

$$= e \cdot e^{xy}(xy' + y)$$

At $x = 1, y = 1$

$2e(y' + 1) + e^2 y' + e^2 - e - ey' = e^2(y' + 1)$

$$\Rightarrow \quad ey' + e = 0 \Rightarrow y' = -1$$

Hence, $A - B - C = 1$

104. $\frac{dx}{dt} = -\frac{3}{t^4} - \frac{2}{t^3} = -\left(\frac{3 + 2t}{t^4}\right)$

$$\frac{dy}{dt} = -\left(\frac{3}{t^3} + \frac{2}{t^2}\right) = -\left(\frac{3 + 2t}{t^3}\right)$$

$$\therefore \quad \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = t$$

$$= t - \left(\frac{1 + t}{t^3}\right) \cdot t^3 = -1$$

Now, $\frac{du}{dx} - x \cdot \left(\frac{dy}{dx}\right)^3$

105. We have, $y = f(x) - f(2x)$

$\Rightarrow \quad y' = f'(x) - 2f'(2x)$

$y'(1) = f'(1) - 2f'(2) = 5 \quad ...(i)$

and $\quad y'(2) = f'(2) - 2f'(4) = 7 \quad ...(ii)$

Now, let $\quad y = f(x) - f(4x)$

$\Rightarrow \quad y' = f'(x) - 4f'(4x)$

$\Rightarrow \quad y'(1) = f'(1) - 4f'(4) \quad ...(iii)$

Substituting the value of $f'(2) = 7 + 2f'(4)$ in Eq. (i),

$f'(1) - 2[7 + 2f'(4)] = 5$

$\Rightarrow \quad f'(1) - 4f'(4) = 19$

Hence, $\quad 19 = 10 + \lambda$

$\Rightarrow \quad \lambda = 9$

106. $y = 3e^2 - x$

Let $\quad x^y = x^{3e^2 - x}$

$\Rightarrow \quad f(x) = x^{3e^2 - x}$

$\Rightarrow \quad \ln(f(x)) = (3e^2 - x)\ln x$

$\Rightarrow \quad \frac{1}{f(x)} \cdot f'(x) = \frac{3e^2 - x}{x} - \ln x$

$\therefore \quad f'(x) = 0$

$\Rightarrow \quad 3e^2 - x = x \ln x$

$\Rightarrow \quad 3e^2 = x(1 + \ln x)$

$\Rightarrow \quad x = e^2 \quad$ [by verification]

Hence, $\quad \lambda = 1$

107. $f'(x) = (kx + e^x)h'(x) + h(x)(k + e^x)$

$\therefore \quad f'(0) = h'(0) + h(0)(k + 1)$

$\Rightarrow \quad 18 = -2 + 5(k + 1)$

$\Rightarrow \quad k = 3$

108. We have, $f(x) = |\log 2 - \sin x|$

and $\quad g(x) = f(f(x)),\ x \in R$

Note that, for $x \to 0$, $\log 2 > \sin x$

$\therefore \quad f(x) = \log 2 - \sin x$

$\Rightarrow \quad g(x) = \log 2 - \sin(f(x))$

$= \log 2 - \sin(\log 2 - \sin x)$

Clearly, $g(x)$ is differentiable at $x = 0$ as $\sin x$ is differentiable.

Now, $\quad g'(x) = -\cos(\log 2 - \sin x)(-\cos x)$

$= \cos x \cdot \cos(\log 2 - \sin x)$

$\therefore \quad g'(0) = 1 \cdot \cos(\log 2)$

109. As, $g(f(x)) = x$

Thus, $g(x)$ is inverse of $f(x)$.

$\Rightarrow \quad g(f(x)) = x$

$\Rightarrow \quad g'(f(x)) \cdot f'(x) = 1$

$\therefore \quad g'(f(x)) = \frac{1}{f'(x)} \quad$ [where, $f'(x) = 3x^2 + 3$] $...(i)$

When $f(x) = 2$, then

$x^3 + 3x + 2 = 2$

$\Rightarrow \quad x = 0$

i.e. when $x = 0$, then $f(x) = 2$

$\therefore \quad g'(f(x)) = \frac{1}{3x^2 + 3}$ at $(0, 2)$

$\Rightarrow \quad g'(2) = \frac{1}{3}$

$\therefore$ Option (a) is incorrect.

Now, $\quad h(g(g(x))) = x$

$\Rightarrow \quad h(g(g(f(x)))) = f(x)$

$\Rightarrow \quad h(g(x)) = f(x) \quad ...(ii)$

As $\quad g(f(x)) = x$

$\therefore \quad h(g(3)) = f(3)$

$= 3^3 + 3(3) + 2 = 38$

$\therefore$ Option (d) is incorrect.

From Eq. (ii),

$h(g(x)) = f(x)$

$\Rightarrow \quad h(g(f(x))) = f(f(x))$

$\Rightarrow \quad h(x) = f(f(x)) \quad ...(iii)$

[using $g(f(x)) = x$]

$\Rightarrow \quad h'(x) = f'(f(x)) \cdot f'(x) \quad ...(iv)$

Putting $x = 1$, we get

$h'(1) = f'(f(1)) \cdot f'(1)$

$= (3 \times 36 + 3) \times (6) = 111 \times 6 = 666$

$\therefore$ Option (b) is correct.

Putting $x = 0$ in Eq. (iii), we get

$h(0) = f(f(0))$

$= f(2) = 8 + 6 + 2 = 16$

$\therefore$ Option (c) is correct.

110. Let $y = \tan^{-1}\left(\frac{6x\sqrt{x}}{1 - 9x^3}\right)$, where $x \in \left(0, \frac{1}{4}\right)$

$= \tan^{-1}\left(\frac{2 \cdot (3x^{3/2})}{1 - (3x^{3/2})^2}\right) = 2\tan^{-1}(3x^{3/2})$

As $3x^{3/2} \in \left(0, \frac{3}{8}\right)$

$\therefore \quad \frac{dy}{dx} = 2 \times \frac{1}{1 + 9x^3} \times 3 \times \frac{3}{2} \times x^{1/2}$

$= \frac{9}{1 + 9x^3}\sqrt{x}$

$\therefore \quad g(x) = \frac{9}{1 + 9x^3}$

111. Since, $f(x) = e^{g(x)}$

$\Rightarrow e^{g(x+1)} = f(x+1) = xf(x) = xe^{g(x)}$

and $\quad g(x+1) = \log x + g(x)$

i.e. $\quad g(x+1) - g(x) = \log x \quad ...(i)$

Replacing x by $x-\frac{1}{2}$, we get

$$g\left(x+\frac{1}{2}\right)-g\left(x-\frac{1}{2}\right)=\log\left(x-\frac{1}{2}\right)$$

$$=\log(2x-1)-\log 2$$

$$\therefore \quad g''\left(x+\frac{1}{2}\right)-g''\left(x-\frac{1}{2}\right)=\frac{-4}{(2x-1)^2} \qquad ...(ii)$$

On substituting $x = 1,2,3,...,N$ in Eq. (ii) and adding, we get

$$g''\left(N+\frac{1}{2}\right)-g''\left(\frac{1}{2}\right)=-4\left\{1+\frac{1}{9}+\frac{1}{25}+...+\frac{1}{(2N-1)^2}\right\}.$$

112. Since, $\frac{dx}{dy}=\frac{1}{dy/dx}=\left(\frac{dy}{dx}\right)^{-1}$

$$\Rightarrow \quad \frac{d}{dy}\left(\frac{dx}{dy}\right)=\frac{d}{dx}\left(\frac{dy}{dx}\right)^{-1}\frac{dx}{dy}$$

$$\Rightarrow \quad \frac{d^2x}{dy^2}=-\left(\frac{d^2y}{dx^2}\right)\left(\frac{dy}{dx}\right)^{-2}\left(\frac{dx}{dy}\right)$$

$$=-\left(\frac{d^2y}{dx^2}\right)\left(\frac{dy}{dx}\right)^{-3}$$

113. Since, $f''(x)=-f(x)$

$$\Rightarrow \quad \frac{d}{dx}\{f'(x)\}=-f(x)$$

$$\Rightarrow \quad g'(x)=-f(x) \qquad [\because g(x)=f'(x), \text{ given}] \ ...(i)$$

Also, $F(x)=\left\{f\left(\frac{x}{2}\right)\right\}^2+\left\{g\left(\frac{x}{2}\right)\right\}^2$

$$\Rightarrow \quad F'(x)=2\left(f\left(\frac{x}{2}\right)\right)\cdot f'\left(\frac{x}{2}\right)\cdot\frac{1}{2}$$

$$+2\left(g\left(\frac{x}{2}\right)\right)\cdot g'\left(\frac{x}{2}\right)\cdot\frac{1}{2}=0 \text{ [from Eq.(i)]}$$

$\therefore$ $F(x)$ is constant $\Rightarrow F(10)=F(5)=5$

114. Given that, $\log(x+y)=2xy$ ...(i)

$\therefore$ At $x = 0$

$\Rightarrow \log(y)=0$

$\Rightarrow \quad y=1$

$\therefore$ To find $\frac{dy}{dx}$ at $(0, 1)$

On differentiating Eq. (i) w.r.t. x, we get

$$\frac{1}{x+y}\left(1+\frac{dy}{dx}\right)=2x\frac{dy}{dx}+2y\cdot 1$$

$$\Rightarrow \quad \frac{dy}{dx}=\frac{2y(x+y)-1}{1-2(x+y)x}$$

$$\Rightarrow \quad \left(\frac{dy}{dx}\right)_{(0,1)}=1$$

115. Given, $x^2+y^2=1$

On differentiating w.r.t. x, we get

$$2x+2yy'=0$$

$$\Rightarrow \quad x+yy'=0$$

Again, differentiating w.r.t. x, we get

$$1+y'y'+yy''=0$$

$$\therefore \quad 1+(y')^2+yy''=0$$

Session 1

Function

Function

Let A and B be two non-empty sets and f be a relation which associates each element of set A with unique element of set B, f is called a function from A to B.

Or

If for each element in a set A there is assigned a unique element of set B, we call such an assignment a function $f : A \to B$. "f is a function from A to B".

If $a \in A$, the element in B which is assigned to 'a' is called the image of 'a' and denoted by $f(a)$.

Here, set A is called the domain of f and B is called the codomain of f. The set of elements of B, which are the images of the elements of set A is called the range of f.

e.g. Let $A = \{a, b, c, d\}$, $B = \{1, 2, 3, 4, 5\}$. Here, $f(a) = 2$, $f(b) = 3$, $f(c) = 5$, $f(d) = 1$ given by

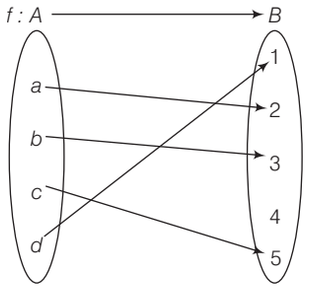

Figure 3.1

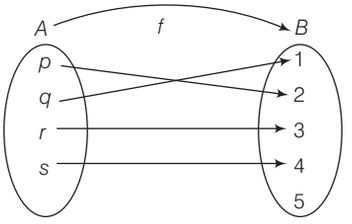
i.e. $A \to$ Domain of $f = \{a, b, c, d\}$

$B \to$ Codomain of $f = \{1, 2, 3, 4, 5\}$

Range of $f = \{1, 2, 3, 5\}$

An element of A (i.e. Domain) cannot associate with more than one element in B.

Example 1 In the given figure, find the domain, codomain and range.



Sol. From the given figure, we conclude that

$A \to$ Domain of $f = \{p, q, r, s\}$

$B \to$ Codomain of $f = \{1, 2, 3, 4, 5\}$

Range of $f = \{1, 2, 3, 4\}$

Remark

We should always remember that "the range is a subset of codomain".

Number of Functions (or Mapping) from *A* to *B*

Let $A = \{x_1, x_2, x_3, \ldots, x_m\}$ [i.e. m elements]

and $B = \{y_1, y_2, y_3, \ldots, y_n\}$ [i.e. n elements]

Then, each element x_i's $(i = 1, 2, \ldots, m)$ of domain corresponds n images.

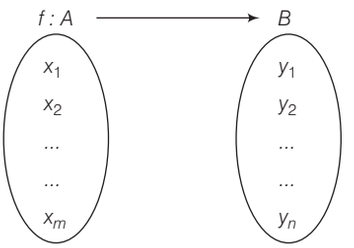


Figure 3.2

i.e. x_1 can take n images.

x_2 can take n images.

.....

.....

x_m can take n images.

Thus, **total number of functions from *A* to *B***

$$= n \times n \times \ldots m \text{ times} = n^m$$

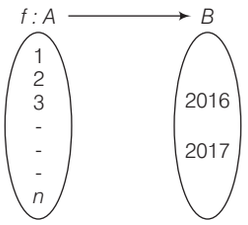
i.e. (Number of elements in codomain) $^{\text{number of elements in domain}}$.

Example 2 ***The number of functions*** $f : \{1, 2, 3, \ldots, n\} \to \{2016, 2017\}$, ***where*** $n \in N$, ***which satisfy the condition*** $f(1) + f(2) + \ldots + f(n)$ ***is an odd number are***

(a) 2^n (b) $n \cdot 2^{n-1}$

(c) 2^{n-1} (d) $n!$

Sol.



We can send 1, 2, 3, ..., $(n-1)$ any where in 2^{n-1} ways, the value $f(n)$ can uniquely determined according to sum of $f(1)+f(2)+...+f(n-1)$ is even or odd.

i.e. if $\{f(1)+f(2)+...+f(n-1)\} \in$ even, $f(n)=2017$

and if $\{f(1)+f(2)+...+f(n-1)\} \in$ odd, $f(n)=2016$

$\therefore$ Number of functions $= 2^{n-1}$

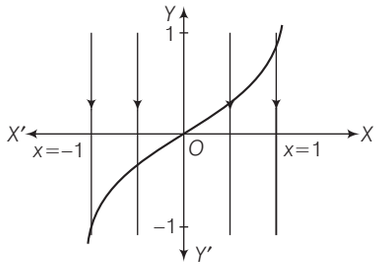
Graphical Representation of Functions

The graph of $y=f(x)$, where f is a function, consists of points whose coordinates (x, y) satisfy $y=f(x)$. Also, it is such that lines drawn parallel to the Y-axis **do not intersect the curve at more than one point**.

Vertical line test for f to be a function If graph of a function is cut a line parallel to Y-axis at more than one point, then it does not form a function.

Example 3 Find whether $f(x)=x^3$ forms a mapping or not.

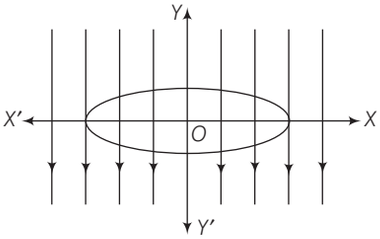
Sol. We have, $y=f(x)=x^3, \forall\, x \in R$.



Here, all the straight lines drawn parallel to Y-axis cut $y=x^3$ only at one point. Thus, $y=f(x)$ forms a mapping.

Example 4 ***Find whether*** $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1,\ a>b$, ***forms a mapping or not.***

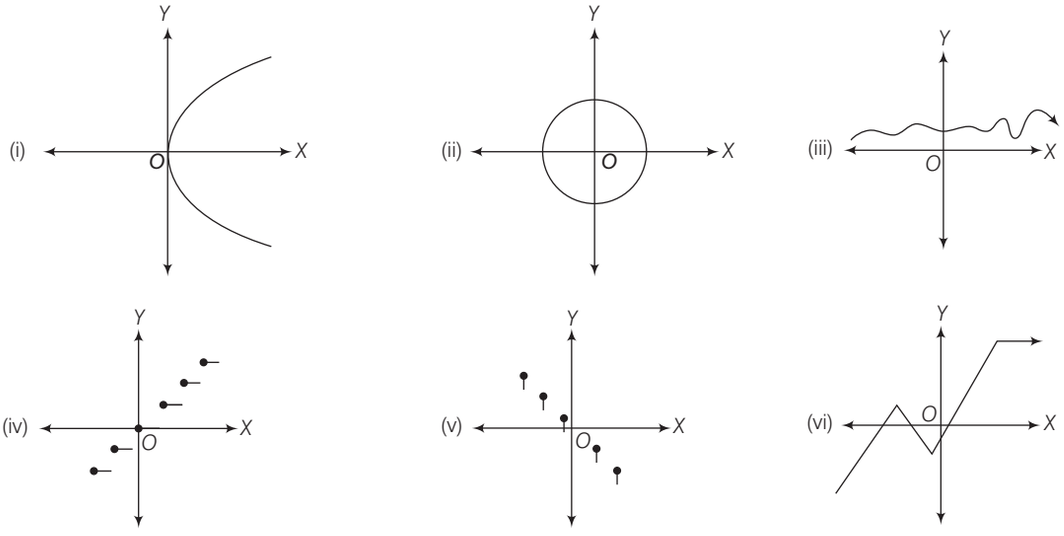
Sol. We have, $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, i.e. $y=\pm\frac{b}{a}\sqrt{a^2-x^2}$, which represents a horizontal ellipse.



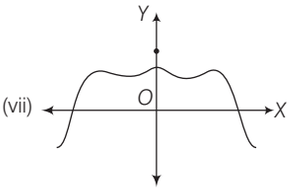
Here, straight lines drawn parallel to Y-axis meet the curve at more than one points. Thus, $f(x)=\pm\frac{b}{a}\sqrt{a^2-x^2}$ does not form a mapping.

Exercise for Session 1

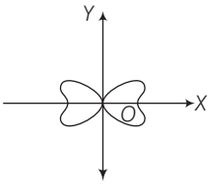
1. Which of the following graphs are graphs of a function?



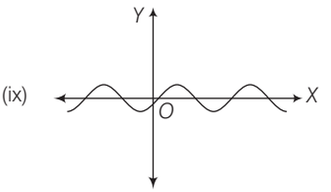
(vii)



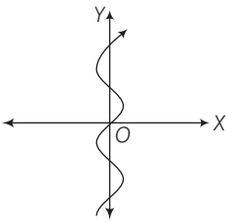
(viii)



(ix)



(x)



2. For which of the following, y can be a function of x, $(x \in R, y \in R)$?

(i) $(x-h)^2 + (y-k)^2 = r^2$ (ii) $y^2 = 4ax$

(iii) $x^4 = y^2$ (iv) $x^6 = y^3$

(v) $3y = (\log x)^2$

3. Let $g(x)$ be a function defined on $[-1, 1]$. If the area of equilateral triangle with two of its vertices at $(0, 0)$ and $(x, g(x))$, is $\frac{\sqrt{3}}{4}$ sq unit, the function $g(x)$ may be

(a) $g(x) = \pm\sqrt{1-x^2}$ (b) $g(x) = \sqrt{1-x^2}$

(c) $g(x) = -\sqrt{1-x^2}$ (d) $g(x) = \sqrt{1+x^2}$

4. Represent diagramatically all possible functions from $\{\alpha, \beta\}$ to $\{1, 2\}$.

5. The number of functions from $f : \{a_1, a_2, \ldots, a_{10}\} \to \{b_1, b_2, \ldots, b_5\}$ is

(a) 10^5 (b) 5^{10}

(c) $\frac{10!}{5!}$ (d) $5!$

Session 2

Domain, Algebraic Functions

Domain

The domain of $y = f(x)$ is the set of all real x for which $f(x)$ is defined (real).

Rules for Finding Domain

(i) If domain of $y = f(x)$ and $y = g(x)$ are D_1 and D_2 respectively, then the domain of $f(x) \pm g(x)$ or $f(x) \cdot g(x)$ is $D_1 \cap D_2$.

(ii) Domain of $\dfrac{f(x)}{g(x)}$ is $D_1 \cap D_2 - \{x : g(x) = 0\}$.

Example 5 Find the domain of the following functions.

(i) $y = \sqrt{5x-3}$ (ii) $y = \sqrt[3]{5x-3}$

(iii) $y = \dfrac{1}{(x-1)(x-2)}$ (iv) $y = \dfrac{1}{\sqrt[3]{(x-1)}}$

Sol. (i) Here, $y = \sqrt{5x-3}$ is defined, if

$$5x - 3 \geq 0$$

$$\Rightarrow \quad x \geq \frac{3}{5} \quad \Rightarrow \quad x \in \left[\frac{3}{5}, \infty\right).$$

Thus, domain is $\left[\dfrac{3}{5}, \infty\right)$.

(ii) Here, $y = \sqrt[3]{5x-3}$ is defined, if

$$5x - 3 \in R \Rightarrow x \in R$$

Thus, domain is R.

(iii) Here, $y = \dfrac{1}{(x-1)(x-2)}$ is defined, if

$$(x-1)(x-2) \neq 0$$

i.e. if $x \neq 1, 2$

Thus, domain is $R - \{1, 2\}$.

(iv) Here, $y = \dfrac{1}{\sqrt[3]{x-1}}$ is defined, if

$$x - 1 \neq 0 \Rightarrow x \neq 1$$

Thus, domain is $R - \{1\}$.

Example 6 Find the domain of $f(x) = \sqrt{\dfrac{1-5^x}{7^{-x}-7}}$.

Sol. For $f(x)$ to be defined, $\dfrac{1-5^x}{7^{-x}-7} \geq 0$ and $7^{-x} - 7 \neq 0$

$$\Rightarrow \quad \frac{5^x - 1}{7^{-x} - 7} \leq 0 \text{ and } 7^{-x} - 7 \neq 0$$

Now, $5^x - 1 = 0 \Rightarrow x = 0$ and $7^{-x} - 7 = 0 \Rightarrow x = -1$

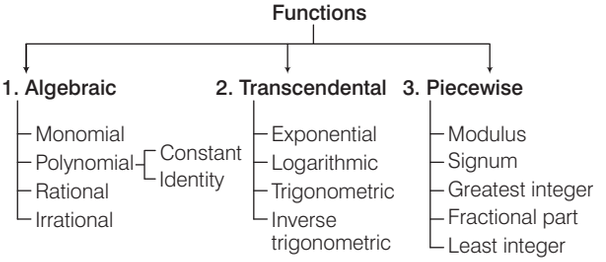
The sign of $\dfrac{5^x - 1}{7^{-x} - 7}$

Hence, from the sign scheme $x \in (-\infty, -1) \cup [0, \infty)$.

$\therefore$ Domain of $f(x)$ is $(-\infty, -1) \cup [0, \infty)$.

Classification of Functions

Functions are classified by the type of mathematical equation which represent their relationship.



Algebraic Functions

A function f is called an algebraic function, if it can be constructed using algebraic operations such as addition, subtraction, multiplication, division and taking roots, starting with polynomials.

e.g. $f(x) = \sqrt{1+x}$,

$$g(x) = \frac{x^3 - 16x}{x + \sqrt{x}} + (x-2)\sqrt[3]{x-1}$$

Different types of algebraic functions are described below

(i) Monomial Function

A function of the form $y = ax^n$, where a is constant and n is a non-negative integer, called monomial function.

e.g. $y = x^2, y = 2x, y = -x, \ldots\ldots$.

(ii) Polynomial Function

A function $y = f(x) = a_0 x^n + a_1 x^{n-1} + \ldots + a_n$, where $a_0, a_1, a_2, \ldots, a_n$ are real constants and n is a non-negative integer, then $f(x)$ is called a polynomial function. If $a_0 \neq 0$, then n is the degree of polynomial function. e.g.

Expression	Degree
$f(x) = x^{1920} + 5x^{1919} + 6x$	polynomial of degree 1920
$g(x) = x^2 + 3x + 3$	polynomial of degree 2
$h(x) = 7 = 7x^0$	polynomial of degree 0

A polynomial of degree one with no constant term is called an **odd linear function**, i.e. $f(x) = ax, a \neq 0$

In case $f(x) = 0$, it is constant function for which degree is not defined. A polynomial of odd degree has its range $(-\infty, \infty)$ but a polynomial of even degree has a range which is always subset of R.

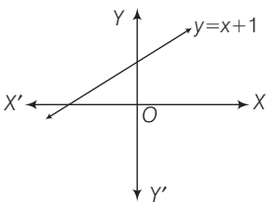
Note: All polynomial functions are algebraic functions but not the converse.

Example 7 Draw the graph of polynomial functions and find their domain and range.

(i) $y = x + 1$ (ii) $y = x^2$

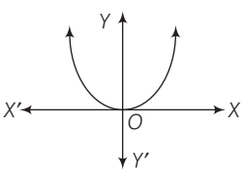
(iii) $y = x^3 + 1$ (iv) $y = x(x-1)(x-2)$

Sol. (i) Graph of $y = (x + 1)$ is shown as



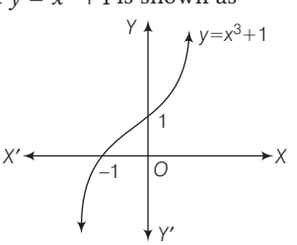
From graph domain is $x \in R$ and range is $y \in R$.

(ii) Graph of $y = x^2$ is shown as



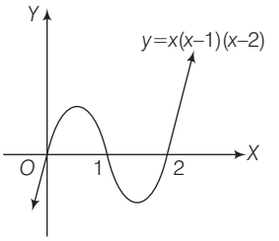
From graph domain is $x \in R$ and range is $y \in [0, \infty)$.

(iii) Graph of $y = x^3 + 1$ is shown as



∴ Domain; $x \in R$ and Range; $y \in R$.

(iv) Graph of $y = x(x-1)(x-2)$ is shown as



∴ Domain; $x \in R$ and Range; $y \in R$.

Constant Function

If the range of a function f consists of only one number, then f is called a constant function. The graph of a constant function is as shown below.

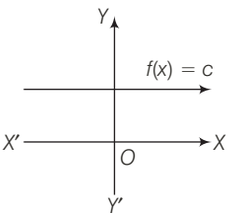


Figure 3.3

Thus, domain is R and range is $\{c\}$.

Identity Function

The function $y = f(x) = x$ for all $x \in R$ is called an identity function on R.

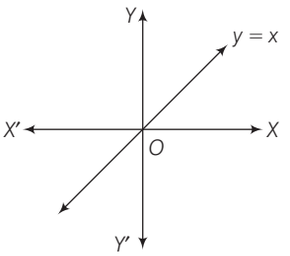

Figure 3.4

Here, domain of identity function is the set of real number. (As here for all values of x, $f(x)$ exists.)

Thus, domain is R and range is R.

(iii) Rational Function

It is defined as the ratio of two polynomials.

Let $P(x) = a_0 x^n + a_1 x^{n-1} + \ldots + a_n$

and $Q(x) = b_0 x^m + b_1 x^{m-1} + \ldots + b_m$.

Then, $f(x) = \dfrac{P(x)}{Q(x)}$ is a rational function provided $Q(x) \neq 0$.

Here, we can say that domain of $f(x)$ is all real numbers except the numbers where denominator is zero
[i.e. Domain $(f) = R - \{x : Q(x) = 0\}$].

e.g. $f(x) = \dfrac{x^2 - 3x + 5}{(x-1)(x-2)}$; Domain is $R - \{1, 2\}$

e.g. $f(x) = \dfrac{1}{2 - \cos 3x}$; As $2 - \cos 3x \neq 0$. $[\because -1 \leq \cos 3x \leq 1]$

$\therefore$ Domain of $f(x)$ is R.

(iv) Irrational Function

An algebraic function having **non-integral** rational exponent is called irrational function.

e.g. $f(x) = x^{1/2}$,

e.g. $f(x) = \dfrac{x^2 + \sqrt{x}}{\sqrt{1 + 3x^2}}$, etc.

An Important Result

There are two polynomial functions, satisfying the relation;

$f(x) \cdot f\left(\frac{1}{x}\right) = f(x) + f\left(\frac{1}{x}\right)$.

They are
(i) $f(x) = 1 + x^n$ and (ii) $f(x) = 1 - x^n$,
where n is a positive integer.
For proof, refer Example 38 in Jee Type Solved Examples.

Exercise for Session 2

■ **Directions** (Q. Nos. 1 to 6) *Find the domain of the following.*

1. $f(x) = \sqrt{x^2 - 5x + 6}$
2. $f(x) = \sqrt{\dfrac{2x + 1}{x^3 - 3x^2 + 2x}}$
3. $f(x) = \sqrt{1 - \sqrt{1 - \sqrt{1 - x^2}}}$
4. $f(x) = \sqrt{x^{12} - x^9 + x^4 - x + 1}$
5. $f(x) = {}^{16-x}C_{2x-1} + {}^{20-3x}P_{4x-5}$
6. $f(x) = \sqrt{{}^{x^2+4x}C_{2x^2+3}}$

Session 3

Transcendental Functions

Transcendental Functions

The functions which are not algebraic are called transcendental functions. Exponential, logarithmic, trigonometric and inverse trigonometric functions are transcendental functions.

(i) Exponential Functions

The function $f(x) = a^x, a > 0, a \neq 1, a \in$ constant is said to be an exponential function.

If $0 < a < 1$ If $a > 1$

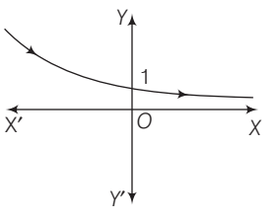

Figure 3.5

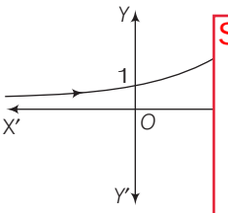

Figure 3.6

In the given graphs, none of them intersect the X-axis. Thus, we can say that they exist for all $x \in R$ and their corresponding values of y are greater than zero.

Thus, domain is R and range is $]\,0, \infty[$.

(ii) Logarithmic Functions

The function $f(x) = \log_a x;\ (x, a > 0)$ and $a \neq 1$ is a logarithmic function. Thus, domain of a logarithmic function is the set of all positive numbers and their range is the set R of real numbers.

If $0 < a < 1$ If $a > 1$

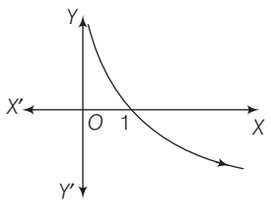

Figure 3.7

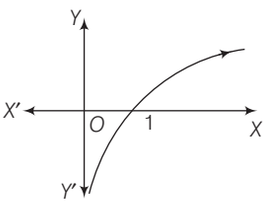

Figure 3.8

Properties of Logarithmic Functions

1. $\log_e(ab) = \log_e a + \log_e b \quad [a, b > 0]$

2. $\log_e\left(\frac{a}{b}\right) = \log_e a - \log_e b \quad [a, b > 0]$

3. $\log_e a^m = m \log_e a \quad [a > 0, m \in R]$

4. $\log_a a = 1 \quad [a > 0, a \neq 1]$

5. $\log_{b^m} a = \frac{1}{m} \log_b a \quad [a, b > 0, b \neq 1 \text{ and } m \in R - \{0\}]$

6. $\log_b a = \frac{1}{\log_a b} \quad [a, b > 0 \text{ and } a, b \neq 1$

$\log_b a = \frac{\log_m a}{\log_m b} \quad [a, b, m > 0 \text{ and } b, m \neq 1]$

$^{\text{og}_a m} = m \quad [a, m > 0 \text{ and } a \neq 1]$

$^{\text{og}_c b} = b^{\log_c a} \quad [a, b, c > 0 \text{ and } c \neq 1]$

$\log_m x > \log_m y \Rightarrow \begin{cases} x > y, & \text{if } m > 1 \\ x < y, & \text{if } 0 < m < 1 \end{cases}$

$[m, x, y > 0, m \neq 1]$

11. $\log_m a = b \Rightarrow a = m^b$

$[m, a > 0, m \neq 1,\ b \in R]$

12. $\log_m a > b \Rightarrow \begin{cases} a > m^b, & \text{if} \quad m > 1 \\ a < m^b, & \text{if} \quad 0 < m < 1 \end{cases}$

13. $\log_m a < b \Rightarrow \begin{cases} a < m^b, & \text{if} \quad m > 1 \\ a > m^b, & \text{if} \quad 0 < m < 1 \end{cases}$

Example 8 Find the domain of a single-valued function $y = f(x)$ given by the equation $10^x + 10^y = 10$.

Sol. Given, $10^x + 10^y = 10$

$\Rightarrow \quad 10^y = 10 - 10^x$

$\Rightarrow \quad y = \log_{10}(10 - 10^x) \quad [\text{as } a^m = b \Rightarrow m = \log_a b]$

Now, $10^1 - 10^x > 0$

$\Rightarrow \quad 10^1 > 10^x \quad \Rightarrow \ 1 > x$

Therefore, domain of the single-valued function

$y = f(x)$ is $x < 1$ or $x \in (-\infty, 1)$

Example 9 Find the domain of

$$f(x)=\frac{1}{\sqrt{\log_{1/2}(x^2-7x+13)}}.$$

Sol. $f(x)=\frac{1}{\sqrt{\log_{1/2}(x^2-7x+13)}}$ exists, if

$$\log_{1/2}(x^2-7x+13)>0$$

$\Rightarrow$ $(x^2-7x+13)<1$ ...(i)

and $x^2-7x+13>0$ ...(ii)

Considering Eq. (ii), $x^2-7x+13>0$, we get

$$\left(x^2-7x+\frac{49}{4}\right)+13-\frac{49}{4}>0$$

$\Rightarrow$ $\left(x-\frac{7}{2}\right)^2+\frac{3}{4}>0$

which is true for all $x\in R$. [As $\left(x-\frac{7}{2}\right)^2\geq 0$ for all x.] ...(iii)

Now, considering Eq. (i), we get

$$x^2-7x+12<0$$

$\Rightarrow$ $(x-3)(x-4)<0$

$\Rightarrow$ $3<x<4$ ...(iv)

Combining Eqs. (iii) and (iv), we get

Domain of $f(x)$ is $]3, 4[$.

Example 10 ***Find the domain of function***

$$f(x)=\frac{1}{\log_{10}(1-x)}+\sqrt{(x+2)}.$$

Sol. $f(x)=\frac{1}{\log_{10}(1-x)}+\sqrt{x+2}$

(As we know, $\log_a x$ is defined when $x, a>0$ and $a\neq 1$, also $\log_a 1=0$)

Thus, $\log_{10}(1-x)$ exists when

$1-x>0$ ...(i)

Also, $\frac{1}{\log_{10}(1-x)}$ exists when

$1-x>0$ and $1-x\neq 1$ ...(ii)

$\Rightarrow$ $x<1$ and $x\neq 0$ ...(iii)

Now, we have $\sqrt{x+2}$, which exists when $x+2\geq 0$

or $x\geq -2$ ...(iv)

Thus, $f(x)=\frac{1}{\log_{10}(1-x)}+\sqrt{x+2}$ exists when Eqs. (iii) and (iv) both hold true.

$\Rightarrow$ $-2\leq x<1$ and $x\neq 0$

$\Rightarrow$ $x\in[-2,0)\cup(0,1)$

Thus, domain of $f(x)$ is $[-2,0)\cup(0,1)$.

Example 11 Find the domain of $f(x)=\log_{10}(1+x^3)$.

Sol. $f(x)=\log_{10}(1+x^3)$ exists,

if $1+x^3>0$

$\Rightarrow$ $(1+x)(1-x+x^2)>0$

[where $(1-x+x^2)$ is always positive as $D<0$ and $a>0$]

So, $1+x>0$ or $x>-1$ or $x\in\,]-1,\infty[$

Thus, domain of above function $f(x)$ is $]-1,\infty[$.

Example 12 Find the domain of $f(x)=\log_{10}\log_{10}(1+x^3)$.

Sol. $f(x)=\log_{10}\log_{10}(1+x^3)$ exists,

if $\log_{10}(1+x^3)>0$ and $1+x^3>0$

$\Rightarrow$ $1+x^3>10^0$ and $1+x^3>0$

$\Rightarrow$ $1+x^3>1$ and $1+x^3>0$

$\Rightarrow$ $1+x^3>1\Rightarrow x^3>0$

$\Rightarrow$ $x\in(0,\infty)$

Thus, domain of above function $f(x)$ is $(0,\infty)$.

Example 13 ***Find the domain of*** $f(x)=\log_{10}\{\log_{10}\log_{10}\log_{10}x\}$.

Sol. $f(x)$ exists, if $\{\log_{10}\log_{10}\log_{10}x\}>0$ and $x>0$

$\Rightarrow$ $\log_{10}\log_{10}x>10^0$ and $x>0$

$\Rightarrow$ $\log_{10}\log_{10}x>1$ and $x>0$

$\Rightarrow$ $\log_{10}x>10^1$ and $x>0$

$\Rightarrow$ $x>10^{10}$ and $x>0$

Thus, $f(x)$ exists, if $x\in(10^{10},\infty)$.

Hence, domain of above function $f(x)$ is $(10^{10},\infty)$.

Example 14 ***Find the domain for***

$$f(x)=\sqrt{\log_{0.4}\left(\frac{x-1}{x+5}\right)}.$$

Sol. $f(x)=\sqrt{\log_{0.4}\left(\frac{x-1}{x+5}\right)}$ exists, if

$$\log_{0.4}\left(\frac{x-1}{x+5}\right)\geq 0 \quad \text{and} \quad \left(\frac{x-1}{x+5}\right)>0$$

$\Rightarrow$ $\frac{x-1}{x+5}\leq(0.4)^0$ and $\frac{x-1}{x+5}>0$

$\Rightarrow$ $\frac{x-1}{x+5}\leq 1$ and $\frac{x-1}{x+5}>0$

$\Rightarrow$ $\frac{x-1}{x+5}-1\leq 0$ and $\frac{x-1}{x+5}>0$

$\Rightarrow$ $\frac{-6}{x+5}\leq 0$ and $\frac{x-1}{x+5}>0$

$\Rightarrow \quad x+5>0 \quad$ and $\quad \dfrac{x-1}{x+5}>0$

$\Rightarrow \quad x>-5 \quad$ and $\quad x-1>0 \quad$ [as $x+5>0$]

$\Rightarrow \quad x>-5 \quad$ and $\quad x>1$

Thus, domain $f(x)$ is $(1, \infty)$.

Example 15 Find the domain of

$$f(x)=\log_{100x}\left(\frac{2\log_{10} x+1}{-x}\right)$$

Sol. $f(x)$ exists, if $\quad 100x>0 \quad$ ...(i)

$$100x \neq 1 \quad \text{...(ii)}$$

$$\frac{2\log_{10} x+1}{-x}>0 \quad \text{...(iii)}$$

$$2\log_{10} x+1<0 \quad [\text{as } x>0 \text{ from Eq. (i)}]$$

$$\log_{10} x<-\frac{1}{2}$$

$$x<(10)^{-1/2} \quad \text{...(iv)}$$

Now, from Eqs. (i), (ii) and (iv), we get

$$x \in (0,10^{-2}) \cup (10^{-2},10^{-1/2}).$$

Thus, domain of $f(x)$ is $(0, 10^{-2}) \cup (10^{-2}, 10^{-½})$.

Example 16 ***Find the domain of definition of***

$$f(x)=\frac{\log_2(x+3)}{x^2+3x+2}.$$

[IIT JEE 2001]

Sol. Here, $f(x)=\dfrac{\log_2(x+3)}{x^2+3x+2}=\dfrac{\log_2(x+3)}{(x+1)(x+2)}$ exists, if

Numerator $\quad x+3>0 \Rightarrow x>-3 \quad$ ...(i)

and denominator $\quad (x+1)(x+2)\neq 0$

$\Rightarrow \quad x\neq -1,-2 \quad$ ...(ii)

Thus, from Eqs. (i) and (ii), we get domain of $f(x)$ is $(-3, \infty) - \{-1,-2\}$.

(iii) Trigonometric Functions

Sine Function $f(x) = \sin x$

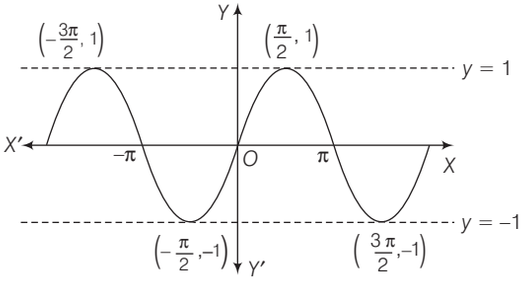

Figure 3.9

Here, domain is R and range is $[-1, 1]$.

Cosine Function $f(x) = \cos x$

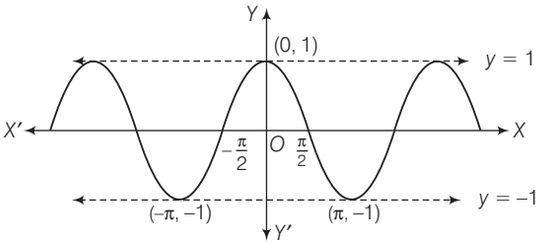

Figure 3.10

Here, domain is R and range is $[-1, 1]$.

Tangent Function $f(x) = \tan x$

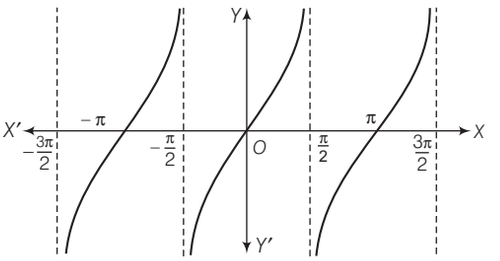

Figure 3.11

Here, domain is $R-\left\{\dfrac{(2n+1)\pi}{2}, n\in Z\right\}$ and range is R.

Cosecant Function $f(x) = \operatorname{cosec} x$

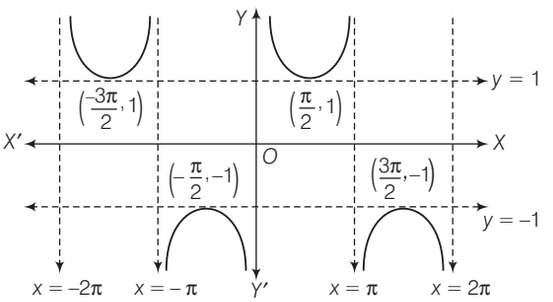

Figure 3.12

Here, domain is $R - \{n\pi, n \in Z\}$ and range is $R - (-1, 1)$.

Secant Function $f(x) = \sec x$

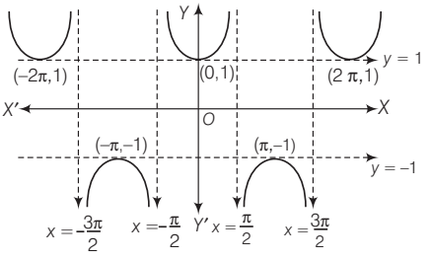

Figure 3.13

Here, domain is $R-\{(2n+1)\dfrac{\pi}{2}, n\in Z\}$ and range is $R-(-1, 1)$.

Cotangent Function $f(x) = \cot x$

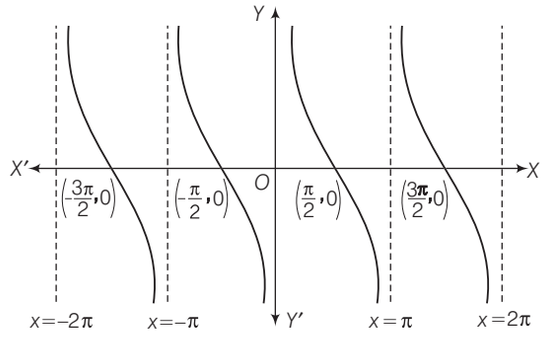

Figure 3.14

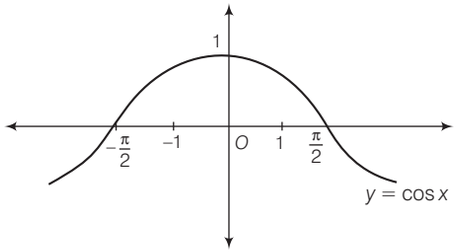
Here, domain is $R - \{n\pi, n \in Z\}$ and range is R.

Example 17 Find domain for $f(x) = \sqrt{\cos(\sin x)}$.

Sol. $f(x) = \sqrt{\cos(\sin x)}$ is defined, if

$$\cos(\sin x) \geq 0 \qquad \ldots(i)$$

As, we know $-1 \leq \sin x \leq 1$ for all x



$\therefore$ $\cos(\sin x) \geq 0$, for all x (using graph of $y = \cos x$)

i.e. $x \in R$

Thus, domain $f(x)$ is R.

Example 18 The function $f(x)$ is defined in $[0, 1]$. Find the domain of $f(\tan x)$.

Sol. Here, $f(x)$ is defined in $[0, 1]$.

$\Rightarrow x \in [0, 1]$, i.e. we can substitute only those values of x, which lie in $[0, 1]$.

For $f(\tan x)$ to be defined, we must have

$$0 \leq \tan x \leq 1 \qquad [\text{as } x \text{ is replaced by } \tan x]$$

i.e. $$n\pi \leq x \leq n\pi + \frac{\pi}{4} \qquad [\text{in general}]$$

or $$0 \leq x \leq \frac{\pi}{4} \qquad [\text{in particular}]$$

Thus, domain for $f(\tan x)$ is $\left[n\pi, n\pi + \frac{\pi}{4}\right]$.

Inverse Trigonometric Functions

We know that trigonometric functions are many-one in their actual domain. Hence, for inverse functions to get defined, the actual domain of trigonometric functions must be restricted to make the function one-one.

$y = \sin^{-1} x$

Since, $y = \sin x$ is not one-one. Therefore, it is not invertible. Let us consider the function $y = \sin x, x \in \left[\frac{-\pi}{2}, \frac{\pi}{2}\right]$ and $y \in [-1, 1]$ whose graph is the portion of the $\sin x$ curve in the interval $\left[\frac{-\pi}{2}, \frac{\pi}{2}\right]$, which is strictly increasing. Hence, one-one and its inverse is $y = \sin^{-1} x$.

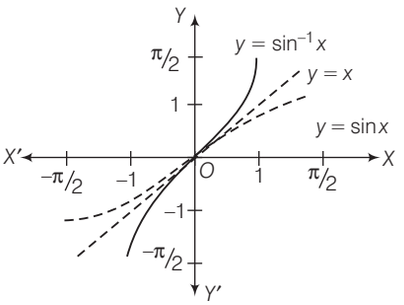


Figure 3.15

Here, domain is $[-1, 1]$; range is $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$.

$y = \cos^{-1} x$

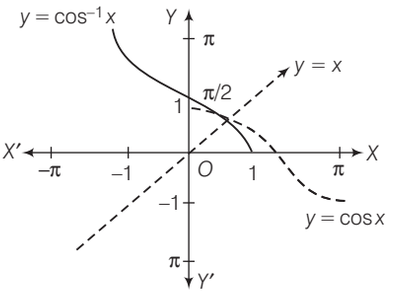

Figure 3.16

Here, domain is $[-1, 1]$; range is $[0, \pi]$.

$y = \tan^{-1} x$

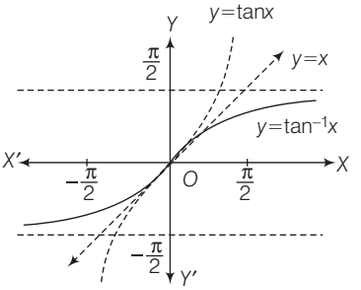

Figure 3.17

Here, domain is R; range is $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$.

$y = \cot^{-1} x$

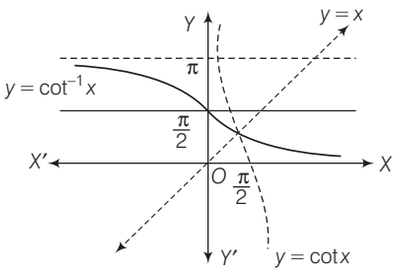

Figure 3.18

Here, domain is R ; range is $(0, \pi)$.

$y = \sec^{-1} x$

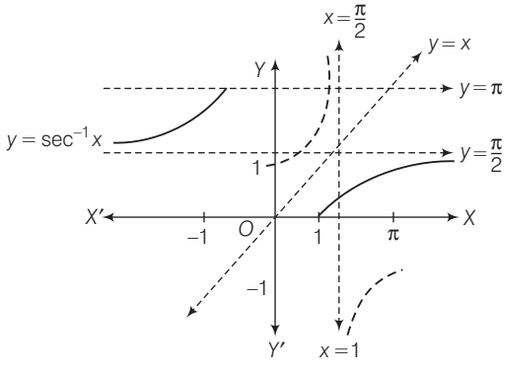

Figure 3.19

Here, domain is $R - (-1, 1)$; range is $[0, \pi] - \{\pi/2\}$.

$y = \text{cosec}^{-1} x$

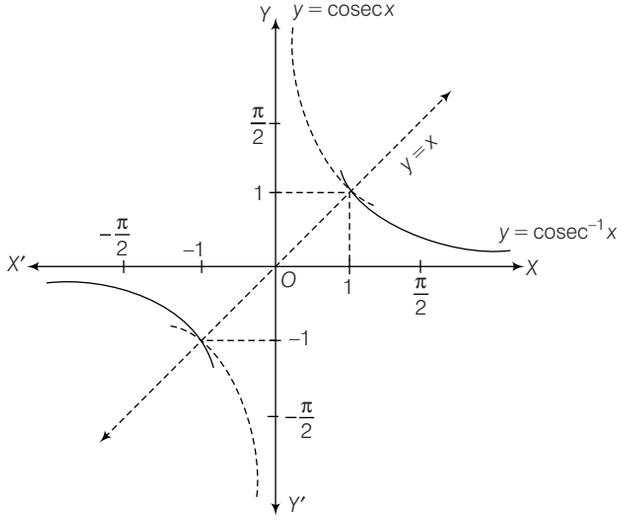

Figure 3.20

Here, domain is $R - (-1, 1)$; range is $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right] - \{0\}$.

Example 19 Find the domain for $f(x) = \sin^{-1}\left(\frac{x^2}{2}\right)$.

Sol. $f(x) = \sin^{-1}\left(\frac{x^2}{2}\right)$ is defined, if

$$-1 \le \frac{x^2}{2} \le 1 \text{ or } -2 \le x^2 \le 2$$

$\Rightarrow \quad 0 \le x^2 \le 2$ [as x^2 cannot be negative]

$\Rightarrow \quad -\sqrt{2} \le x \le \sqrt{2}$

Therefore, domain of $f(x)$ is $[-\sqrt{2}, \sqrt{2}]$.

Example 20 Find the domain for

$$y = \sin^{-1}\left(\log_2\left(\frac{x^2}{2}\right)\right).$$

Sol. For y to be defined, $\frac{x^2}{2} > 0$ ...(i)

and $\quad -1 \le \log_2\left(\frac{x^2}{2}\right) \le 1$ ...(ii)

From Eq. (i), we have $x \in R - \{0\}$ ...(iii)

From Eq. (ii), we have

$$2^{-1} \le \frac{x^2}{2} \le 2^1 \Rightarrow 1 \le x^2 \le 4$$

$\Rightarrow \quad -2 \le x \le -1$ or $1 \le x \le 2$ ...(iv)

Thus, from Eqs. (iii) and (iv), we get

$$x \in [-2, -1] \cup [1, 2]$$

Example 21 Find the domain for $f(x) = \sin^{-1}\left(\frac{1+x^2}{2x}\right)$.

Sol. $f(x) = \sin^{-1}\left(\frac{1+x^2}{2x}\right)$ is defined, if

$$-1 \le \frac{1+x^2}{2x} \le 1 \text{ or } \left|\frac{1+x^2}{2x}\right| \le 1$$

$\Rightarrow \quad |1+x^2| \le |2x|$

$\Rightarrow \quad 1+x^2 \le |2x|$ [as $1+x^2 > 0$]

$\Rightarrow \quad x^2 - 2|x| + 1 \le 0$

$\Rightarrow \quad |x|^2 - 2|x| + 1 \le 0$ [as $x^2 = |x|^2$]

$\Rightarrow \quad (|x|-1)^2 \le 0$

But $(|x|-1)^2$ is either always positive or zero.

Thus, $\quad (|x|-1)^2 = 0$

$\Rightarrow \quad |x| = 1 \Rightarrow x = \pm 1$

Thus, domain for $f(x)$ is $\{-1, 1\}$.

Example 22 Find the domain for $y = \sqrt{\sin^{-1}(\log_2 x)}$.

Sol. y is defined, if $x > 0$, ...(i)

$$-1 \le \log_2 x \le 1$$

$$\Rightarrow \quad 2^{-1} \le x \le 2$$

$$\Rightarrow \quad \frac{1}{2} \le x \le 2 \qquad \text{...(ii)}$$

and $\sin^{-1}(\log_2 x) \ge 0$ ...(iii)

$$\Rightarrow \quad \log_2 x \ge 0$$

$$\Rightarrow \quad x \ge 2^0$$

$$\Rightarrow \quad x \ge 1 \qquad \text{...(iv)}$$

From Eqs. (i), (ii) and (iv), we get

$$1 \le x \le 2$$

Hence, domain is $1 \le x \le 2$ or $x \in [1, 2]$.

Example 23 Find the domain of the function,

$$f(x) = \log\left\{\log_{|\sin x|}(x^2 - 8x + 23) - \frac{3}{\log_2|\sin x|}\right\}.$$

Sol. Here, $f(x)$ is defined, if

$$\log_{|\sin x|}(x^2 - 8x + 23) - \frac{3}{\log_2|\sin x|} > 0$$

$$\Rightarrow \quad \log_{|\sin x|}(x^2 - 8x + 23) - 3\log_{|\sin x|} 2 > 0$$

$$\Rightarrow \quad \log_{|\sin x|}\left(\frac{x^2 - 8x + 23}{8}\right) > 0$$

$$\Rightarrow \quad \frac{x^2 - 8x + 23}{8} < |\sin x|^0$$

and $|\sin x| \ne 0, 1$

$$\Rightarrow \quad x^2 - 8x + 23 < 8 \text{ and } |\sin x| \ne 0, 1$$

$$\Rightarrow \quad x^2 - 8x + 15 < 0 \text{ and } \sin x \ne 0, \pm 1$$

$$\Rightarrow \quad (x - 3)(x - 5) < 0 \text{ and } x \ne n\pi, (2n + 1)\frac{\pi}{2}$$

$$\Rightarrow \quad x \in (3, 5) \text{ and } x \ne \pi, \frac{3\pi}{2} \quad \text{[using number line rule]}$$

$$\Rightarrow \quad x \in (3, \pi) \cup \left(\pi, \frac{3\pi}{2}\right) \cup \left(\frac{3\pi}{2}, 5\right)$$

Thus, domain of $f(x)$ is $(3, \pi) \cup \left(\pi, \frac{3\pi}{2}\right) \cup \left(\frac{3\pi}{2}, 5\right)$.

Exercise for Session 3

■ **Directions** (Q. Nos. 1 to 10) *Find the domain of the following.*

1. $f(x) = \log_{10}(\sqrt{x - 4} + \sqrt{6 - x})$
2. $f(x) = \sqrt{\log_{1/2}\left(\frac{5x - x^2}{4}\right)}$
3. $f(x) = \sqrt{\log_{0.3}\left(\frac{3x - x^2}{x - 1}\right)}$
4. $f(x) = \sqrt{\frac{\log_{0.3}(x - 1)}{x^2 - 2x - 8}}$
5. $f(x) = \log_{10}(1 - \log_{10}(x^2 - 5x + 16))$
6. $f(x) = \sin|x| + \sin^{-1}(\tan x) + \sin(\sin^{-1} x)$
7. $f(x) = \sqrt{e^{\cos^{-1}(\log_4 x^2)}}$
8. $f(x) = \sin^{-1}\left(\frac{3 - 2x}{5}\right) + \sqrt{3 - x}$
9. $f(x) = \frac{\log_{2x} 3}{\cos^{-1}(2x - 1)}$
10. $f(x) = \log_{10} \log_2 \log_{2/\pi}(\tan^{-1} x)^{-1}$

Session 4

Piecewise Functions

Piecewise Functions

(i) Absolute Value Function (or Modulus Function)

The modulus function is defined as

$$y = |x| = \begin{cases} x, & x \geq 0 \\ -x, & x < 0 \end{cases}.$$

It is the numerical value of x.

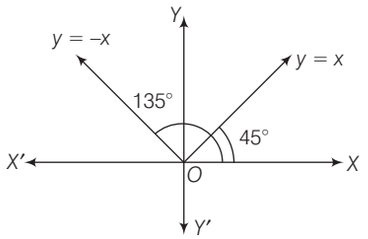

Figure 3.21

Geometrical Interpretation of Modulus of a Function

Geometrically, $|x|$ represents the distance of the point $P(x, 0)$ or $Q(-x, 0)$ from origin.

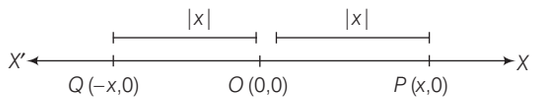

Figure 3.22

i.e. $$d(O, P) = \sqrt{(x-0)^2 + (0-0)^2} = \sqrt{x^2} = |x|$$

$$d(O, Q) = \sqrt{(-x-0)^2 + (0-0)^2} = \sqrt{x^2} = |x|$$

Properties of Modulus

(i) $|x|^2 = x^2$ (ii) $\sqrt{x^2} = |x|$

(iii) $||x|| = |-x| = |x|$ (iv) $|x| = \max\{-x, x\}$

(v) $-|x| = \min\{-x, x\}$ (vi) $\max(a, b) = \dfrac{a+b}{2} + \left|\dfrac{a-b}{2}\right|$

(vii) $\min(a, b) = \dfrac{a+b}{2} - \left|\dfrac{a-b}{2}\right|$

(viii) $|x + y| \leq |x| + |y|$

(ix) $|x + y| = |x| + |y|$, iff $xy \geq 0$

(x) $|x - y| = |x| + |y|$, iff $xy \leq 0$

(xi) $|x| \leq a$, (a is +ve) $\Rightarrow -a \leq x \leq a$ or $x \in [-a, a]$

(xii) $|x| \geq a$, (a is +ve) $\Rightarrow x \leq -a$ or $x \geq a$
or $x \in (-\infty, -a] \cup [a, \infty)$

(xiii) $|x| \leq a$, (a is −ve) $\Rightarrow$ No solution or $x \in \phi$

(xiv) $|x| \geq a$, (a is −ve) $\Rightarrow x \in$ Real number or $x \in (-\infty, \infty)$

(xv) $a \leq |x| \leq b$, where a and b are +ve.

$\Rightarrow -b \leq x \leq -a$ or $a \leq x \leq b$ or $x \in [-b, -a] \cup [a, b]$

Example 24 Solve for x.

(i) $(|x| - 1)(|x| - 2) \leq 0$ (ii) $\dfrac{|x| - 1}{|x| - 2} \geq 0$

(iii) $|x - 3| + |4 - x| = 1$ (iv) $|x| + |x + 4| = 4$

Sol. (i) $(|x| - 1)(|x| - 2) \leq 0$

Using number line rule for $|x|$, we get

$\Rightarrow \quad 1 \leq |x| \leq 2$

i.e. $x \in [-2, -1] \cup [1, 2]$

(ii) $\dfrac{|x| - 1}{|x| - 2} \geq 0$. Using number line rule for $|x|$, we get

$\Rightarrow \quad |x| \leq 1$ or $|x| > 2$

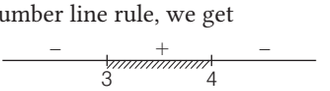
i.e. $x \in [-1, 1] \cup (-\infty, -2) \cup (2, \infty)$

(iii) $|x - 3| + |4 - x| = 1$

As we know, $|x| + |y| = |x + y|$, iff $xy \geq 0$

$\therefore \quad (x - 3)(4 - x) \geq 0$ or $-(x - 3)(x - 4) \geq 0$

Using number line rule, we get



$\Rightarrow \quad x \in [3, 4]$

(iv) $|x| + |x + 4| = 4$

As we know, $|x| + |y| = |x - y|$, iff $xy \leq 0$

$\therefore \quad x(x + 4) \leq 0$

Using number line rule, we get

$\Rightarrow \quad x \in [-4, 0]$

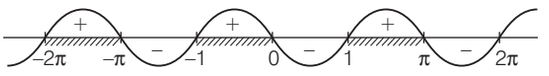
Example 25 ***Solve*** $|x^2-1+\sin x|=|x^2-1|+|\sin x|$, ***where*** $x\in[-2\pi,2\pi]$.

Sol. Let $f(x)=x^2-1$ and $g(x)=\sin x$

We know, $|f(x)+g(x)|=|f(x)|+|g(x)|$ iff $f(x)\cdot g(x)\geq 0$.

$\therefore$ $(x^2-1)\cdot\sin x\geq 0$ on $[-2\pi,2\pi]$.

Using number line rule, we get



$\Rightarrow$ $x\in[-2\pi,-\pi]\cup[-1,0]\cup[1,\pi]$

Example 26 Solve $\left|\frac{x}{|x-1|}\right|+|x|=\frac{x^2}{|x-1|}$.

Sol. Let $f(x)=\frac{x}{x-1}$ and $g(x)=x$

Then, $f(x)+g(x)=\frac{x}{x-1}+x=\frac{x^2}{x-1}$

We know, $|f(x)|+|g(x)|=|f(x)+g(x)|$,

iff $f(x)\cdot g(x)\geq 0$

$\therefore$ $\frac{x}{x-1}\cdot x\geq 0 \Rightarrow \frac{x^2}{x-1}\geq 0$

$\Rightarrow$ $x\in\{0\}\cup(1,\infty)$

Example 27 Find domain for $y=\frac{1}{\sqrt{|x|-x}}$.

Sol. y is defined, if $(|x|-x)>0 \Rightarrow |x|>x$, which is true for negative x only.

Hence, domain $\in(-\infty,0)$.

Example 28 ***Find domain for***

$$y=\cos^{-1}\left(\frac{1-2|x|}{3}\right)+\log_{|x-1|}x.$$

Sol. Here, $\cos^{-1}\left(\frac{1-2|x|}{3}\right)$ exists, if $-1\leq\frac{1-2|x|}{3}\leq 1$

$\Rightarrow$ $-3\leq 1-2|x|\leq 3 \Rightarrow -4\leq -2|x|\leq 2$

$\Rightarrow$ $2\geq|x|\geq -1 \Rightarrow -2\leq x\leq 2$ ...(i)

Also, $\log_{|x-1|}x$ exists, if

$x>0$, $|x-1|>0$ and $|x-1|\neq 1$

$x>0$, $x\in R-\{1\}$ and $x\neq 0,\ 2$ ...(ii)

Hence, from Eqs. (i) and (ii), we get

$x\in(0,1)\cup(1,2)$

Example 29 ***Domain of the function*** $f(x)=\frac{1}{\sqrt{4x-|x^2-10x+9|}}$ ***is***

(a) $(7-\sqrt{40},7+\sqrt{40})$ (b) $(0,7+\sqrt{40})$

(c) $(7-\sqrt{40},\infty)$ (d) None of these

Sol. Here, $f(x)=\frac{1}{\sqrt{4x-|x^2-10x+9|}}$ would exists, if

$4x-|x^2-10x+9|>0$

i.e. $|x^2-10x+9|<4x$,

where

$$|x^2-10x+9|=\begin{cases}x^2-10x+9, & x\leq 1 \text{ or } x\geq 9\\ -(x^2-10x+9), & 1<x<9\end{cases}$$

$\Rightarrow$ Two cases

Case **I** When $x\leq 1$ or $x\geq 9$

$\therefore$ $x^2-10x+9<4x$

$\Rightarrow$ $x^2-14x+9<0 \Rightarrow (x-7)^2<40$

$\Rightarrow$ $x\in(7-\sqrt{40},7+\sqrt{40})$ [but $x\leq 1$ or $x\geq 9$]

$\Rightarrow$ $x\in(7-\sqrt{40},1]\cup[9,7+\sqrt{40})$ ...(i)

Case **II** When $1<x<9$

$-x^2+10x-9<4x \Rightarrow x^2-6x+9>0$

$\Rightarrow$ $(x-3)^2>0$, which is always true except at $x=3$

$\therefore$ $x\in(1,9)-\{3\}$ ...(ii)

From Eqs. (i) and (ii), domain of $f(x)$ is

$(7-\sqrt{40},7+\sqrt{40})-\{3\}$

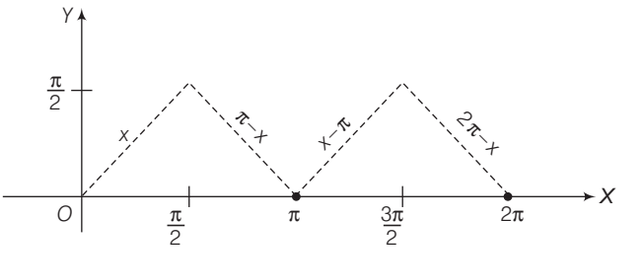
Hence, (d) is the correct answer.

Example 30 ***The domain of the function*** $f(x)=\sqrt{|\sin^{-1}(\sin x)|-\cos^{-1}(\cos x)}$ ***in*** $[0,2\pi]$ ***is***

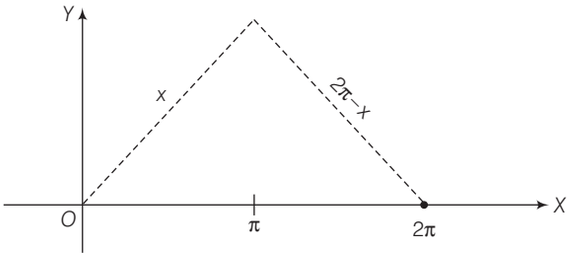
(a) $\left[0,\frac{\pi}{2}\right]\cup\left[\frac{3\pi}{2},2\pi\right]$ (b) $[\pi,2\pi]$

(c) $[0,\pi]-\left\{\frac{\pi}{2}\right\}$ (d) $[0,2\pi]-\left\{\frac{\pi}{2},\frac{3\pi}{2}\right\}$

Sol. As, $|\sin^{-1}(\sin x)|$ could be sketched, as

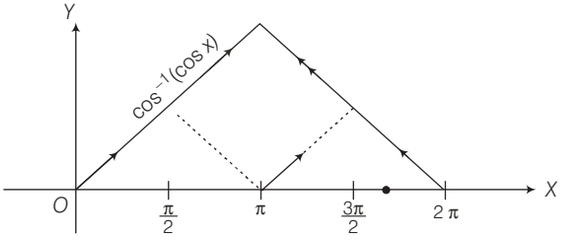


and $\cos^{-1}(\cos x)$ could be sketched as



$\therefore |\sin^{-1}(\sin x)| > \cos^{-1}(\cos x)$ is not possible.

Only equality holds as



Thus, $|\sin^{-1}(\sin x)| = \cos^{-1}(\cos x)$

When $x \in \left[0, \frac{\pi}{2}\right] \cup \left[\frac{3\pi}{2}, 2\pi\right]$

So, domain for $f(x)$ is $\left[0, \frac{\pi}{2}\right] \cup \left[\frac{3\pi}{2}, 2\pi\right]$.

Hence, (a) is the correct answer.

(ii) Signum Function

Signum function is denoted by sgn (x) and it is defined by

$$y = \text{sgn}(x) = \begin{cases} \frac{|x|}{x} \text{ or } \frac{x}{|x|}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases} = \begin{cases} 1, & \text{if } x > 0 \\ -1, & \text{if } x < 0 \\ 0, & \text{if } x = 0 \end{cases}$$

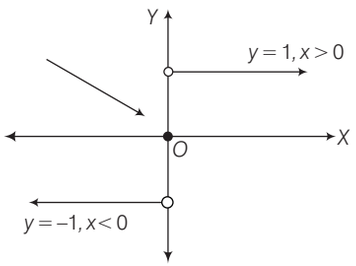


Figure 3.23

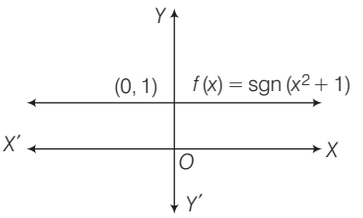
Example 31 Sketch the graph of

(i) $f(x) = \text{sgn}(x^2 + 1)$. (ii) $f(x) = \text{sgn}(\log_e x)$.

(iii) $f(x) = \text{sgn}(\sin x)$. (iv) $f(x) = \text{sgn}(\cos x)$.

Sol. (i) $f(x) = \text{sgn}(x^2 + 1) = \begin{cases} -1, & \text{if } x^2 + 1 < 0 \\ 0, & \text{if } x^2 + 1 = 0 \\ 1, & \text{if } x^2 + 1 > 0 \end{cases}$

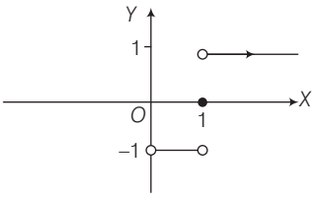


$f(x) = 1, x \in R$

(ii) $f(x) = \text{sgn}(\log_e x)$

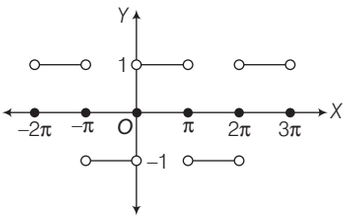
$$= \begin{cases} 1, & \log_e x > 0 \\ -1, & \log_e x < 0 \\ 0, & \log_e x = 0 \end{cases} \quad \therefore f(x) = \begin{cases} 1, & x > 1 \\ -1, & 0 < x < 1 \\ 0, & x = 1 \end{cases}$$

Graph for, $f(x) = \text{sgn}(\log_e x)$ is



(iii) $f(x) = \text{sgn}(\sin x)$

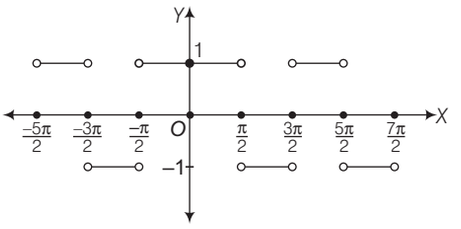
$$f(x) = \begin{cases} 1, & \sin x > 0 \\ -1, & \sin x < 0 \\ 0, & \sin x = 0 \end{cases} = \begin{cases} 1, & 2n\pi < x < (2n+1)\pi \\ -1, & (2n+1)\pi < x < (2n+2)\pi \\ 0, & x = n\pi \end{cases}$$



(iv) $f(x) = \text{sgn}(\cos x)$

$$f(x) = \begin{cases} 1, & \cos x > 0 \\ -1, & \cos x < 0 \\ 0, & \cos x = 0 \end{cases}$$

$$= \begin{cases} 1, & 2n\pi - \pi/2 < x < 2n\pi + \pi/2 \\ -1, & 2n\pi + \pi/2 < x < 2n\pi + 3\pi/2 \\ 0, & x = (2n+1)\pi/2 \end{cases}$$



(iii) Greatest Integer Function or Step Function

$[x]$ indicates the integral part of x, which is nearest and smaller to x. It is also known as floor of x.

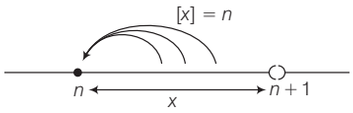


Figure 3.24

Thus, $[2.3202]=2, [0.23]=0, [5]=5,$
$[-8.0725]=-9, [-0.6]=-1$

In general, $n \le x < n+1 \quad [n \in \text{Integer}]$

$\Rightarrow \quad [x]=n$

Here, $f(x)=[x]$ could be expressed graphically as

x	$[x]$
$0 \le x < 1$	0
$1 \le x < 2$	1
$2 \le x < 3$	2
$-1 \le x < 0$	−1
$-2 \le x < -1$	−2

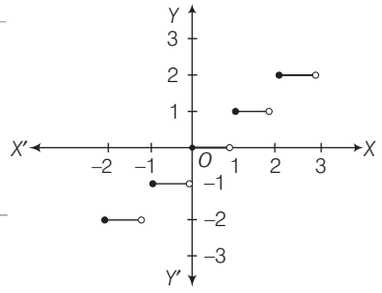

Figure 3.25

(•) darkened circle represents value is taken, (◦) represents value is neglected.

Properties of the Greatest Integer Functions

(i) $[x] \le x < [x]+1$

(ii) $x-1<[x]<x$

(iii) $I \le x < I+1 \Rightarrow [x]=I$, where $I \in$ Integer

(iv) $[[x]]=[x]$

(v) $[x]+[-x]=\begin{cases} 0, & \text{if } x \in \text{Integer} \\ -1, & \text{if } x \notin \text{Integer} \end{cases}$

i.e. $[-x]=\begin{cases} -x, & \text{if } x \in \text{Integer} \\ -1-[x], & \text{if } x \notin \text{Integer} \end{cases}$

(vi) $[x]-[-x]=\begin{cases} 2x, & \text{if } x \in \text{Integer} \\ 2[x]+1, & \text{if } x \notin \text{Integer} \end{cases}$

(vii) $[x \pm n]=[x] \pm n, n \in$ Integer

(viii) $[x] \ge n \Leftrightarrow x \ge n, n \in$ Integer

(ix) $[x] > n \Leftrightarrow x \ge n+1, n \in$ Integer

(x) $[x] \le n \Leftrightarrow x < n+1, n \in$ Integer

(xi) $[x] < n \Leftrightarrow x < n, n \in$ Integer

(xii) $[x]=\left[\frac{x}{2}\right]+\left[\frac{x+1}{2}\right]$

(xiii) $\left[\frac{n+1}{2}\right]+\left[\frac{n+2}{4}\right]+\left[\frac{n+4}{8}\right]+\ldots = n,$
$n \in$ Natural number

(xiv) $[x]+[y] \le [x+y] \le [x]+[y]+1$

(xv) $[x]+\left[x+\frac{1}{n}\right]+\left[x+\frac{2}{n}\right]+$
$\ldots+\left[x+\frac{n-1}{n}\right]=[nx], n \in N$

Example 32 Find domain for, $f(x)=\cos^{-1}[x]$.

Sol. As, $y=\cos^{-1}x$ exists, when $-1 \le x \le 1$.

$\therefore\ f(x)=\cos^{-1}[x]$ exists, when $-1 \le [x] \le 1 \Rightarrow -1 \le x < 2$

or $\quad x \in [-1, 2)$

Example 33 ***Find the value of***

$$\left[\frac{3}{4}\right]+\left[\frac{3}{4}+\frac{1}{100}\right]+\left[\frac{3}{4}+\frac{2}{100}\right]+\ldots+\left[\frac{3}{4}+\frac{99}{100}\right].$$

Sol. $\left[\frac{3}{4}\right]+\left[\frac{3}{4}+\frac{1}{100}\right]+\ldots+\left[\frac{3}{4}+\frac{24}{100}\right]+\left[\frac{3}{4}+\frac{25}{100}\right]$
$+\ldots+\left[\frac{3}{4}+\frac{99}{100}\right]$

$\Rightarrow \underbrace{[0.75]+\ldots+[0.99]}_{\substack{25 \text{ terms are each} \\ \text{equal to zero}}} + \underbrace{[1.0]+\ldots+[1.74]}_{\substack{75 \text{ terms are each} \\ \text{equal to 1}}} \Rightarrow 75$

Aliter Apply property (xv)

Here, $x=\frac{3}{4}$ and $n=100$

$\therefore \left[\frac{3}{4}\right]+\left[\frac{3}{4}+\frac{1}{100}\right]+\ldots+\left[\frac{3}{4}+\frac{99}{100}\right]=\left[\frac{3}{4}\times 100\right]=75$

Example 34 ***Given*** $y=2[x]+3$ ***and*** $y=3[x-2]+5$, ***find the value of*** $[x+y]$.

Sol. We have, $\quad 2[x]+3=3[x-2]+5$

$\Rightarrow \quad 2[x]+3=3[x]-6+5$

$\Rightarrow \quad [x]=4 \Rightarrow 4 \le x < 5$

or $\quad x=4+f \quad [f \to \text{fraction}]$

and $\quad y=2[x]+3=11$

Hence, $\quad [x+y]=[4+f+11]=[15+f]=15$

Example 35 ***Find domain for*** $f(x)=[\sin x]\cos\left(\frac{\pi}{[x-1]}\right)$.

Sol. $[\sin x]$ is always defined. $\cos\left(\frac{\pi}{[x-1]}\right)$ is also defined except when $[x-1]=0 \Rightarrow 0\le x-1<1$

$\Rightarrow \quad 1\le x<2$

Hence, domain of $f(x)$ is $R-[1,2)$.

Example 36 ***The domain of the function*** $f(x)=\frac{\log_4(5-[x-1]-[x]^2)}{x^2+x-2}$ ***is***

(where $[x]$ ***denotes greatest integer function)***

Sol. For domain of $f(x)$,

$$5-[x-1]-[x]^2>0$$

and $\quad x^2+x-2\ne 0$

$\Rightarrow \quad (x+2)(x-1)\ne 0$

$\Rightarrow \quad x\ne 1,-2$

Now, $\quad 5-[x]+1-[x]^2>0$

$\Rightarrow \quad [x]^2+[x]-6<0$

$\Rightarrow \quad ([x]+3)([x]-2)<0$

$\Rightarrow \quad -3<[x]<2$

$\Rightarrow \quad -2\le x<2$

$\because \quad x\ne 1,-2$

$\therefore$ Domain $\in(-2,1)\cup(1,2)$

Example 37 Let $[\sqrt{n^2+1}]=[\sqrt{n^2+\lambda}]$, where $n,\lambda\in N$. Show that λ can have $2n$ different values.

Sol. We have, $n^2+1=(n+1)^2-2n<(n+1)^2; n\in N$

i.e. $\quad \sqrt{n^2+1}<n+1$

$\Rightarrow \quad n<\sqrt{n^2+1}<n+1$

$\Rightarrow \quad [\sqrt{n^2+1}]=n$

$\therefore \quad [\sqrt{n^2+\lambda}]=n$

$\Rightarrow \quad n<\sqrt{n^2+\lambda}<n+1$

or $\quad n^2<(n^2+\lambda)<(n+1)^2$

$\Rightarrow \quad 0<\lambda<2n+1$

Thus, λ can take $2n$ different values.

Example 38 $f(x)=\frac{1}{\sqrt{[x]-x}}$, where $[\cdot]$ denotes the greatest integer function less than or equals to x. Then, find the domain of $f(x)$.

Sol. $f(x)=\frac{1}{\sqrt{[x]-x}}$ exists, if

$$[x]-x>0$$

i.e. $\quad [x]>x$

But from definition of greatest integral function, we know

$$[x]\le x \qquad [\text{as } x=[x]+\{x\}]$$

Thus, it is not possible that $[x]>x$.

Hence, $\quad$ domain $f(x)=\phi$

Example 39 ***If domain for*** $y=f(x)$ ***is*** $[-3,2]$ ***, find the domain of*** $g(x)=f\{|[x]|\}$.

Sol. Here, $f(x)$ is defined in $[-3,2]$.

$\Rightarrow \quad x\in[-3,2]$.

(i.e. we can substitute only those values of x, which lie between $[-3,2]$).

For $g(x)=f\{|[x]|\}$ to be defined, we must have

$-3\le|[x]|\le 2$

$\Rightarrow \quad 0\le|[x]|\le 2 \qquad [\text{as } |x|\ge 0 \text{ for all } x]$

$\Rightarrow \quad -2\le[x]\le 2 \qquad [\text{as } |x|\le a\Rightarrow -a\le x\le a]$

$\Rightarrow \quad -2\le x<3$

[by definition of greatest integral function]

Hence, domain of $g(x)$ is $[-2,3[$ or $[-2,3)$.

Example 40 Find the domain of function $f(x)=\frac{1}{[|x-1|]+[|7-x|]-6}$, where $[\cdot]$ denotes the greatest integer function.

Sol. $f(x)$ is defined when

$$[|x-1|]+[|7-x|]-6\ne 0$$

$$\Rightarrow \begin{cases}[1-x]+[7-x]\ne 6, & \text{when } x\le 1 \quad ...(i)\\ [x-1]+[7-x]\ne 6, & \text{when } 1\le x\le 7 \quad ...(ii)\\ [x-1]+[x-7]\ne 6, & \text{when } x\ge 7 \quad ...(iii)\end{cases}$$

$$[1-x]+[7-x]\ne 6$$

$1+[-x]+7+[-x]\ne 6 \Rightarrow 2[-x]\ne -2$

$\Rightarrow \quad [-x]\ne -1$

$\Rightarrow \quad x\notin(0,1] \qquad ...(a)$

From Eq. (ii), we have

$$[x-1]+[7-x]\ne 6$$

$\Rightarrow \quad [x]-1+7+[-x]\ne 6$

$\Rightarrow \quad [x]+[-x]\ne 0$

$\Rightarrow \quad x\notin$ Integer

$\Rightarrow \quad x\notin\{1,2,3,4,5,6,7\} \qquad ...(b)$

From Eq. (iii), we have

$$[x-1]+[x-7]\ne 6$$

$\Rightarrow \quad [x]-1+[x]-7\ne 6$

$\Rightarrow \quad 2[x]\ne 14 \Rightarrow [x]\ne 7$

$\Rightarrow \quad x\notin[7,8) \qquad ...(c)$

Hence, froms (a), (b) and (c), we get

Domain $f(x)$ is $R-\{(0,1)\cup\{1,2,3,4,5,6,7\}\cup(7,8)\}$.

Example 41 If the function $f(x)=[3.5+b\sin x]$ (where $[\cdot]$ denotes the greatest integer function) is an even function, the complete set of values of b is

(a) $(-0.5, 0.5)$ (b) $[-0.5, 0.5]$

(c) $(0, 1)$ (d) $[-1, 1]$

Sol. We have $f(x)=[3.5+b\sin x]$ For $f(x)$ to be an even funcion.

$$3<3.5+b\sin x<4,\ \forall x\in R$$

$$\Rightarrow\quad -0.5<b<0.5\ \Rightarrow\ b\in(-0.5,0.5)$$

Hence, (a) is the correct answer.

Example 42 The domain of the function

$$f(x)=\log_3\ \log_{1/3}(x^2+10x+25)+\frac{1}{[x]+5}$$

(where $[\cdot]$ denotes the greatest integer function) is

(a) $(-4,-3)$ (b) $(-6,-5)$

(c) $(-6,-4)$ (d) None of these

Sol. Here, $\log_3\log_{1/3}(x^2+10x+25)$ is defined, when

I. $x^2+10x+25>0$, i.e. $(x+5)^2>0\Rightarrow x\neq -5$ ...(i)

II. $\log_{1/3}(x^2+10x+25)>0$

$$\Rightarrow\quad x^2+10x+25<1$$

$$\text{or}\quad x^2+10x+24<0$$

$$\text{or}\quad (x+6)(x+4)<0$$

$$\Rightarrow\quad x\in(-6,-4)\quad ...(ii)$$

From Eqs. (i) and (ii), we get

$$x\in(-6,-5)\cup(-5,-4)\quad ...(iii)$$

III. $[x]+5\neq 0$

$$\Rightarrow\quad [x]\neq -5$$

$$\Rightarrow\quad x\notin[-5,-4)\quad ...(iv)$$

From Eqs. (iii) and (iv), we get

Domain of $f(x)$ is $(-6,-5)$.

Hence, (b) is the correct answer.

Example 43 Let $[x]$ be the greatest integer less than or equal to x.

Then, the equation $\sin x=[1+\sin x]+[1-\cos x]$ has

(a) one solution in $\left[-\frac{\pi}{2},\frac{\pi}{2}\right]$ (b) one solution in $\left[\frac{\pi}{2},\pi\right]$

(c) one solution in R (d) no solution in R

Sol. Given that, $[1+\sin x]+[1-\cos x]=\sin x$

$$\Rightarrow\quad 1+[\sin x]+1+[-\cos x]=\sin x$$

$$\Rightarrow\quad 2+[\sin x]+[-\cos x]=\sin x$$

$$\Rightarrow\quad 2+[-\cos x]=\{\sin x\}$$

Here, LHS is 1, 2 or 3, but RHS $\in[0,1)$

$\therefore$ No solution. Hence, (d) is the correct answer.

(iv) Fractional Part Function

$y=\{x\}$, $\{x\}$ indicates fractional part of x.

Let $x=I+f$, where $I=[x]$

and $f=\{x\}$

Then, $y=\{x\}$

$$=x-[x]$$

Here, $y=\{x\}$ could be expressed graphically, as

x	$\{x\}$
$0\le x<1$	x
$1\le x<2$	$x-1$
$2\le x<3$	$x-2$
$-1\le x<0$	$x+1$
$-2\le x<-1$	$x+2$

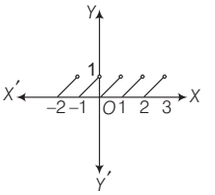

Figure 3.26

Properties of Fractional Part of x

(i) $\{x\}=x$, if $0\le x<1$.

(ii) $\{x\}=0$, if $x\in$ integer.

(iii) $\{-x\}=1-\{x\}$, if $x\notin$ integer.

(iv) $\{x\pm\text{integer}\}=\{x\}$.

Example 44 ***If*** $\{x\}$ ***and*** $[x]$ ***represent fractional and integral parts of*** x ***respectively, then find the value of*** $[x]+\sum_{r=1}^{2000}\frac{\{x+r\}}{2000}$.

Sol. Clearly, $[x]+\sum_{r=1}^{2000}\frac{\{x+r\}}{2000}=[x]+\sum_{r=1}^{2000}\frac{\{x\}}{2000}$

[$\because$ we know that $\{x+r\}=\{x\}$, if $r\in$ Integer]

$$=[x]+\left[\frac{\{x\}}{2000}+\frac{\{x\}}{2000}+\ldots+\text{upto 2000 times}\right]$$

$$=[x]+\frac{2000\{x\}}{2000}$$

$$=[x]+\{x\}$$

$$=x$$

Thus, $[x]+\sum_{r=1}^{2000}\frac{\{x+r\}}{2000}=x$

Example 45 Solve $4\{x\} = x + [x]$.

Sol. We know, $x = [x] + \{x\}$

$\therefore \quad 4\{x\} = [x] + \{x\} + [x] \Rightarrow \{x\} = \dfrac{2[x]}{3}$ ...(i)

But $0 \le \{x\} < 1$

So, $0 \le \dfrac{2[x]}{3} < 1$

$\Rightarrow \quad 0 \le [x] < \dfrac{3}{2}$, therefore $[x] = 0$ or 1

If $[x] = 1$, then $\{x\} = \dfrac{2}{3}$ [from Eq. (i)]

Thus, $x = \dfrac{5}{3}$

If $[x] = 0, \{x\} = 0$ so, $x = 0$

Thus, solutions of $4\{x\} = x + [x]$ are $x \in \left\{0, \dfrac{5}{3}\right\}$.

Example 46 Prove that $[x] + [y] \le [x + y]$, where $x = [x] + \{x\}$ and $y = [y] + \{y\}$, $[\cdot]$ represents greatest integer function and $\{\cdot\}$ represents fractional part function.

Sol. Here, $x + y = [x] + [y] + \{x\} + \{y\}$

$\therefore \quad [x + y] = [[x] + [y] + \{x\} + \{y\}]$

$= [x] + [y] + [\{x\} + \{y\}]$

[using $[x + I] = [x] + I, I \in$ Integer]

$\Rightarrow \quad [x + y] \ge [x] + [y]$

Remark

This could be generalised for n terms as

$[x_1] + [x_2] + \ldots + [x_n] \le [x_1 + x_2 + \ldots + x_n]$.

Example 47 ***Find the number of solutions of*** $|[x] - 2x| = 4$, ***where*** $[x]$ ***is the greatest integer*** $\le x$.

Sol. Let $x = I + f$, $I \in$ integer, $f \in$ fractional part

[i.e. $0 \le f < 1$]

Then, $|[x] - 2x| = 4$

$\Rightarrow \quad |[I + f] - 2(I + f)| = 4$

$\Rightarrow \quad |I - 2I - 2f| = 4 \Rightarrow |I + 2f| = 4$,

which is possible, only if $\left(f = \dfrac{1}{2} \text{ or } 0\right)$

If $f = \dfrac{1}{2}$,

$|I + 1| = 4 \Rightarrow I + 1 = \pm 4$

So, $I = 3, -5$ and $f = \dfrac{1}{2}$

If $f = 0, |I| = 4$

So, $I = \pm 4$ and $f = 0$

Thus, number of solutions are $x = \left\{\pm 4, \dfrac{7}{2}, -\dfrac{9}{2}\right\}$,

i.e. 4 solutions.

(v) Least Integer Function

$y = (x) = [x], [x]$ or (x) indicates the integral part of x which is the nearest and greater to x.

It is known as **ceiling of x**.

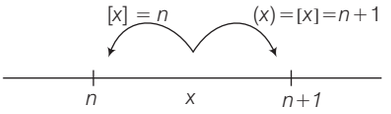

Figure 3.27

Thus, $[2.3203] = 3, \quad (0.23) = 1, (-8.0725) = -8, (-0.6) = 0$

In general, $n < x \le n + 1 \quad (n \in$ Integer)

$\Rightarrow \quad (x) = n + 1 = [x]$

Here, $f(x) = (x) = [x]$ can be expressed graphically as

x	$[x] = (x)$
$-1 < x \le 0$	0
$0 < x \le 1$	1
$1 < x \le 2$	2
$2 < x \le 3$	3
$-2 < x \le -1$	-1

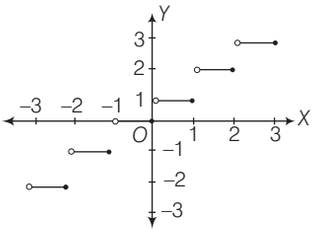

Figure 3.28

(•) represents value is taken.
(∘) represents value is neglected.

Properties of Least Integer Function

(i) $(x) = x = [x]$ holds, if x is Integer.

(ii) $(x + I) = [x + I] = (x) + I, I \in$ Integer.

(iii) Greatest integer function $[x]$ converts $x = I + f$ into I, while (x) converts to $I + 1$.

(iv) $x = (x) + \{x\} - 1$,

(v) $(-x) = \begin{cases} -(x), & \text{if } x \in I \\ -(x) + 1, & \text{if } x \notin I \end{cases}$

(vi) $(x) - (-x) = \begin{cases} 2(x), & \text{if } x \in I \\ 2(x) - 1, & \text{if } x \notin I \end{cases}$

(vii) $(x) \ge n \Leftrightarrow x > n - 1, n \in I$

(viii) $(x) > n \Leftrightarrow x > n, n \in I$

(ix) $(x) \le n \Leftrightarrow x \le n, n \in I$

(x) $(x) < n \Leftrightarrow x < n - 1, n \in I$

(xi) $\left(\dfrac{(x)}{n}\right) = \left(\dfrac{x}{n}\right), n \in N$

(xii) $\left(\dfrac{n+1}{2}\right) + \left(\dfrac{n+2}{4}\right) + \left(\dfrac{n+4}{8}\right) + \ldots = 2(n-1), n \in N$

(xiii) $(x) = \begin{cases} [x], & x \in I \\ [x] + 1, & x \notin I \end{cases}$

(xiv) $(x) + \left(x + \dfrac{1}{n}\right) + \left(x + \dfrac{2}{n}\right) + \ldots + \left(x + \dfrac{n-1}{n}\right) = (nx) + n - 1, n \in N$

Example 48 ***Find the solution set of*** $(x)^2 + (x+1)^2 = 25$, ***where*** (x) ***is the least integer greater than equals to*** x.

Sol. Let $x = I + f$, where I (integer) and f (fractional part) such that $0 < f < 1$.

Then, $(I+f)^2 + (I+f+1)^2 = 25$

$\Rightarrow \quad \{I+1\}^2 + \{I+2\}^2 = 25$

$\Rightarrow \quad I^2 + 2I + 1 + I^2 + 4I + 4 = 25$

$\Rightarrow \quad 2I^2 + 6I + 5 - 25 = 0$

$\Rightarrow \quad 2I^2 + 6I - 20 = 0$

So, $I = 2, -5$

Thus, $x = 2 + f, -5 + f$

where $0 < f < 1$

$\Rightarrow \quad 2 < 2 + f < 3, -5 < -5 + f < -4$ ...(i)

Again, let $x = I$

Then, $x^2 + (x+1)^2 = 25$

$\Rightarrow \quad x = 3, -4$ ...(ii)

From Eqs. (i) and (ii), we get $x \in (-5, -4] \cup (2, 3]$

Example 49 ***If*** $[x]$ = ***the greatest integer less than or equal to*** x ***and*** (x) = ***the least integer greater than or equal to*** x ***and*** $[x]^2 + (x)^2 > 25$, ***then*** x ***belongs to ..... .***

Sol. Let $x = I + f$, where $I \in$ integer, $f \in$ fractional part such that $0 \le f < 1$.

$\therefore \quad [x]^2 + (x)^2 > 25$

$\Rightarrow \quad [I+f]^2 + (I+f)^2 > 25$

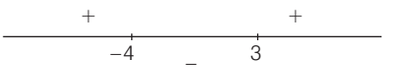
$\Rightarrow \quad I^2 + \{I+1\}^2 > 25$

$\Rightarrow \quad I^2 + I^2 + 2I + 1 > 25$

$\Rightarrow \quad 2I^2 + 2I - 24 > 0$

$\Rightarrow \quad I^2 + I - 12 > 0$

$\Rightarrow \quad (I+4)(I-3) > 0$



$\therefore \quad I < -4$

or $I > 3$

Here, $x = I + f$

So, $x < -4 + f$

or $x > 3 + f$ ...(i)

Now, let $x = I$, then $x^2 + x^2 > 25$

$\Rightarrow \quad x^2 > 12.5$

$\Rightarrow \quad x \le -4$ or $x \ge 4$

Form Eqs. (i) and (ii), we get $x \in (-\infty, -4] \cup [4, \infty)$

Exercise for Session 4

- **Directions** (Q. Nos. 1 to 18) *Find the domain of the following.*

1. $f(x) = \sqrt{x^2 - |x| - 2}$
2. $f(x) = \sqrt{2 - |x|} + \sqrt{1 + |x|}$
3. $f(x) = \log_e |\log_e x|$
4. $f(x) = \sin^{-1}\left(\dfrac{2 - 3[x]}{4}\right)$, which $[\cdot]$ denotes the greatest integer function.
5. $f(x) = \log(x - [x])$, where $[\cdot]$ denotes the greatest integer function.
6. $f(x) = \dfrac{1}{\sqrt{[x]^2 - [x] - 6}}$, where $[\cdot]$ denotes the greatest integer function.
7. $f(x) = \text{cosec}^{-1}[1 + \sin^2 x]$, where $[\cdot]$ denotes the greatest integer function.

8. $f(x) = \cos^{-1}\sqrt{\log_{[x]}\frac{|x|}{x}}$, where $[\cdot]$ denotes the greatest integer function.

9. $f(x) = \sqrt{\frac{x-1}{x-2\{x\}}}$, where $\{\cdot\}$ denotes the fractional part function.

10. $f(x) = \sin^{-1}\left(\frac{[x]}{\{x\}}\right)$, where $[\cdot]$ and $\{\cdot\}$ denotes the greatest integer and fractional part function.

11. $f(x) = \sin^{-1}[2x^2 - 3]$, where $[\cdot]$ denotes the greatest integer function.

12. $f(x) = \sin^{-1}\left[\log_2\left(\frac{x^2}{2}\right)\right]$, where $[\cdot]$ denotes the greatest integer function.

13. $f(x) = \sqrt{2\{x\}^2 - 3\{x\} + 1}$, $x \in [-1, 1]$, where $\{\cdot\}$ denotes the fractional part function.

14. $f(x) = \frac{1}{[|x-2|] + [|x-10|] - 8}$, where $[\cdot]$ denotes the greatest integer function.

15. If a function is defined, as $g(x) = |\sin x| + \sin x$, $\phi(x) = \sin x + \cos x, 0 \le x \le \pi$, then find the domain for $f(x) = \sqrt{\log_{\phi(x)} g(x)}$.

16. Solve the equations, $y = \frac{1}{3}[\sin x + [\sin x + [\sin x]]]$ and $[y + [y]] = 2\cos x$, where $[\cdot]$ denotes the greatest integer function.

17. If $[x] = \left[\frac{x}{2}\right] + \left[\frac{x+1}{2}\right]$, where $[\cdot]$ denotes the greatest integer function and n be positive integer, then show that $\left[\frac{n+1}{2}\right] + \left[\frac{n+2}{4}\right] + \left[\frac{n+4}{8}\right] + \left[\frac{n+8}{16}\right] + \ldots = n$.

18. Find the integral solutions to the equation $[x][y] = x + y$. Show that all the non-integral solutions lie on exactly two lines. Determine these lines.

Session 5

Range

Range

The range of a function is the set of all possible values that can be produced by that function.

e.g. Let $f(x) = x^2$

No matter what value we substitute for x, $f(x)$ will always be positive. Therefore, we would say that the range of this function is the set of all positive real numbers.

Rules for Finding the Range

First of all find the domain of given function $y = f(x)$

(i) If domain contains finite number of points, range is the set of corresponding $f(x)$ values.

(ii) If domain is R or R – {some finite points},
express x in terms of y. From this, find y for x to be defined.
(i.e. Find the values of y for which x exists.)

(iii) If domain is a finite interval, then find the least and the greatest values for range, using monotonicity.
e.g. If $f(x)$ is defined on $[a, b]$, then
Step 1 Put, $f'(x) = 0 \Rightarrow x = \alpha_1, \alpha_2, \ldots, \alpha_n \in (a, b)$
Step 2 Find, $\{f(a), f(\alpha_1), f(\alpha_2), \ldots, f(\alpha_n), f(b)\}$
The greatest and least values gives the range of $f(x)$.

Example 50 ***Find the range for*** $y = \dfrac{x - [x]}{1 - [x] + x}$.

Sol. Here, $y = \dfrac{x - [x]}{1 + x - [x]} = \dfrac{\{x\}}{1 + \{x\}}$

Thus, domain is R.

Now, from $y = \dfrac{\{x\}}{1 + \{x\}}$,

we have, $y + y\{x\} = \{x\} \Rightarrow \{x\} = \dfrac{y}{1 - y}$

Here, $0 \le \{x\} < 1$, so $0 \le \dfrac{y}{1 - y} < 1 \Rightarrow 0 \le y < \dfrac{1}{2}$

Hence, range $= \left[0, \dfrac{1}{2}\right)$.

Example 51 ***Find the range for*** $f(x) = \dfrac{e^x}{1 + [x]}$ ***when*** $x \ge 0$.

Sol. Here, $f(x)$ is defined for all $x \ge 0$. Also, $f(x)$ is an increasing function in $[0, \infty)$.

Thus, range $= [f(0), f(\infty))$

Hence, range $= [1, \infty)$

Example 52 ***Find the domain and range of the function*** $y = \log_e (3x^2 - 4x + 5)$.

Sol. y is defined, if $3x^2 - 4x + 5 > 0$

Where $D = 16 - 4(3)(5) = -44 < 0$

and coefficient of $x^2 = 3 > 0$

Hence, $(3x^2 - 4x + 5) > 0, \ \forall x \in R$

Thus, domain $\in R$

Now, from $y = \log_e (3x^2 - 4x + 5)$,

we have, $3x^2 - 4x + 5 = e^y$ or $3x^2 - 4x + (5 - e^y) = 0$

Since, x is real, therefore discriminant ≥ 0.

i.e. $(-4)^2 - 4(3)(5 - e^y) \ge 0 \Rightarrow 12e^y \ge 44$

So, $e^y \ge \dfrac{11}{3}$. Thus, $y \ge \log\left(\dfrac{11}{3}\right)$

Hence, range is $\left[\log\left(\dfrac{11}{3}\right), \infty\right)$.

Aliter Since, log is an increasing function and $3x^2 - 4x + 5$ is minimum at $x = \dfrac{2}{3}$, i.e. $\log_e(3x^2 - 4x + 5)$ is minimum at $x = \dfrac{2}{3}$ and minimum value of $y = \log_e \dfrac{11}{3}$, i.e. $\left(\log_e \dfrac{11}{3} \le y < \infty\right)$.

Thus, range is $\left[\log_e\left(\dfrac{11}{3}\right), \infty\right)$.

Example 53 Find the range of $y = \sqrt{x - 1} + \sqrt{5 - x}$.

Sol. Here, domain $x \ge 1$ and $x \le 5$, i.e. $x \in [1, 5]$.

Now, check monotonicity, $\dfrac{dy}{dx} = \dfrac{1}{2\sqrt{x - 1}} - \dfrac{1}{2\sqrt{5 - x}}$

When $\dfrac{dy}{dx} = 0$, we get $x = 3$

Thus, $y_{\min}$ at $x = 1$ or $x = 5$

$y_{\min}$ at $x = 1$ is 2;

$y_{\min}$ at $x = 5$ is 2.

Thus, minimum value of $y = 2$.

Also, $y_{\max}$ at $x = 3$ is $2\sqrt{2}$.

Hence, range $= [2, 2\sqrt{2}]$

Remarks

(i) When y is minimum at two or more points, the smallest value amongst them is taken.

(ii) When y is maximum at two or more points, the largest value amongst them is taken.

Example 54 *Find the range of* $\log_3\{\log_{1/2}(x^2+4x+4)\}$.

Sol. Firstly, finding domain

$\log_3\{\log_{1/2}(x^2+4x+4)\}$ exists, if

$\log_{1/2}(x^2+4x+4) > 0$

$\Rightarrow \quad x^2+4x+4 < \left(\frac{1}{2}\right)^0$

[using $\log_a x > b \Rightarrow x < a^b$, if $0 < a < 1$]

$\Rightarrow \quad x^2+4x+4 < 1$

$\Rightarrow \quad x^2+4x+3 < 0$

$\Rightarrow \quad (x+1)(x+3) < 0 \quad \Rightarrow -3 < x < -1$ ...(i)

and $x^2+4x+4 > 0 \quad \Rightarrow (x+2)^2 > 0$,

which is always true except for $x = -2$. ...(ii)

From Eqs. (i) and (ii), we have

$x \in (-3,-2) \cup (-2,-1)$

Thus, domain is $(-3,-2) \cup (-2,-1)$

Now, we find out the range.

Since, $0 < \log_{1/2}(x^2+4x+4) < \infty, \forall\ x \in$ domain y

$\Rightarrow -\infty < \log_3\{\log_{1/2}(x^2+4x+4)\} < \infty$

Thus, range (y) is R.

Example 55 *Range of the function* $f(x) = (\cos^{-1}|1-x^2|)$ *is*

(a) $\left[0, \frac{\pi}{2}\right]$ (b) $\left[0, \frac{\pi}{3}\right]$ (c) $(0, \pi)$ (d) $\left(\frac{\pi}{2}, \pi\right)$

Sol. Here, $f(x) = \cos^{-1}|1-x^2|$ would exists, only when $|1-x^2| \le 1$

$\Rightarrow \quad -1 \le 1-x^2 \le 1 \quad \Rightarrow \quad 2 \ge x^2 \ge 0$

or $x \in [-\sqrt{2}, \sqrt{2}]$

$\because \quad 0 \le |1-x^2| \le 1, \ \forall\ x \in [-\sqrt{2}, \sqrt{2}]$

$\therefore \quad 0 \le \cos^{-1}|1-x^2| \le \frac{\pi}{2}$

Hence, (a) is the correct answer.

Example 56 If x, y and z are real such that $x+y+z=4$, $x^2+y^2+z^2=6$, x belongs to

(a) $(-1, 1)$ (b) $[0, 2]$

(c) $[2, 3]$ (d) $\left[\frac{2}{3}, 2\right]$

Sol. Eliminating z,

$x^2+y^2+(4-(x+y))^2 = 6$

$\Rightarrow \quad y^2+(x-4)y+x^2-4x+5 = 0$

$\Rightarrow \quad D \ge 0$

$\Rightarrow \quad (x-4)^2-4(x^2-4x+5) \ge 0$

$\Rightarrow \quad 3x^2-8x+4 \le 0$

$\Rightarrow \quad (x-2)(3x-2) \le 0$

$\therefore \quad x \in [2/3, 2]$

Hence, (d) is the correct answer.

Example 57 The range of the function $f(x) = \frac{1}{|\sin x|} + \frac{1}{|\cos x|}$ is

(a) $[2\sqrt{2}, \infty)$ (b) $(\sqrt{2}, 2\sqrt{2})$ (c) $(0, 2\sqrt{2})$ (d) $(2\sqrt{2}, 4)$

Sol. $f(x) = \frac{1}{|\sin x|} + \frac{1}{|\cos x|}$

Using AM $\ge$ GM, we get

$$\frac{\frac{1}{|\sin x|} + \frac{1}{|\cos x|}}{2} \ge \left(\frac{1}{|\sin x||\cos x|}\right)^{1/2}$$

$\Rightarrow \quad \frac{1}{|\sin x|} + \frac{1}{|\cos x|} \ge 2\,(2\,|\operatorname{cosec} 2x|)^{1/2}$

[where, $|\operatorname{cosec} 2x| \ge 1$]

$\Rightarrow \quad \frac{1}{|\sin x|} + \frac{1}{|\cos x|} \ge 2\sqrt{2}$

$\therefore$ Range of $f(x)$ is $[2\sqrt{2}, \infty)$.

Hence, (a) is the correct answer.

Example 58 If $z = x+iy$ and $x^2+y^2=16$, then the range of $||x|-|y||$ is

(a) $[0, 4]$ (b) $[0, 2]$

(c) $[2, 4]$ (d) None of these

Sol. Let $x = 4\cos\theta, y = 4\sin\theta$, then

$$|4|\cos\theta| - 4|\sin\theta|| = 4||\cos\theta| - |\sin\theta||$$
$$= 4\sqrt{1 - 2|\cos\theta||\sin\theta|}$$
$$= 4\sqrt{1 - |\sin 2\theta|}$$

$\therefore$ Range is $[0, 4]$. Hence, (a) is the correct answer.

Example 59 The range of $f(x) = \frac{1}{\pi}(\sin^{-1}x + \tan^{-1}x) + \frac{x+1}{x^2+2x+5}$ is

(a) $\left[-\frac{3}{4}, \frac{1}{5}\right]$ (b) $\left[-\frac{5}{4}, \frac{3}{4}\right]$

(c) $\left[-\frac{3}{4}, \frac{5}{4}\right]$ (d) $\left[-\frac{3}{4}, 1\right]$

Sol. Here, $f(x) = \frac{1}{\pi}(\sin^{-1}x + \tan^{-1}x) + \frac{1}{(x+1) + \frac{4}{(x+1)}}$

$= g(x) + h(x)$,

where domain of $g(x)$ is $[-1, 1]$

$\therefore$ Maximum value of $g(x) = g(1) = \frac{3}{4}$

and minimum value of $g(x) = g(-1) = -\frac{3}{4}$

Also, maximum value of $h(x)$ occurs, when $(x+1) + \frac{4}{(x+1)}$ is minimum at $x = 1$.

$\Rightarrow$ Range of $f(x)$ is $\left[-\frac{3}{4}, 1\right]$.

Hence, (d) is the correct answer.

Example 60 The range of the function $f(x) = \sin^2 x - 5\sin x - 6$ is

(a) $[-10, 0]$ (b) $[-1, 1]$ (c) $[0, \pi]$ (d) $\left[-\frac{49}{4}, 0\right]$

Sol. Here, $f(x) = \sin^2 x - 5\sin x - 6$

$$= \left(\sin^2 x - 5\sin x + \frac{25}{4}\right) - 6 - \frac{25}{4}$$
$$= \left(\sin x - \frac{5}{2}\right)^2 - \frac{49}{4} \quad \ldots(i)$$

where $\frac{9}{4} \le \left(\sin x - \frac{5}{2}\right)^2 \le \frac{49}{4}$ ...(ii)

From Eqs. (i) and (ii), we get $-10 \le f(x) \le 0$

$\Rightarrow$ Range of $f(x)$ is $[-10, 0]$.

Hence, (a) is the correct answer.

Example 61 If $f(x) = [x^2] - [x]^2$, where $[\cdot]$ denotes the greatest integer function and $x \in [0, n], n \in N$, then the number of elements in the range of $f(x)$ is

(a) $(2n+1)$ (b) $4n-3$ (c) $3n-3$ (d) $2n-1$

Sol. When $x = n-1$, $f(x) = (n-1)^2 - (n-1)^2 = 0$

When $n - 1 < x < n$,

$[x] = n - 1$

and $(n-1)^2 \le [x^2] \le n^2 - 1$

$\therefore$ $0 \le [x^2] - [x]^2 \le n^2 - 1 - (n-1)^2$

$\Rightarrow$ $0 \le f(x) \le 2n - 2$, but $f(x)$ has to be an integer.

The set of values of $f(x)$ is $\{0, 1, 2, \ldots, 2n-2\}$.

Hence, (d) is the correct answer.

Example 62 ***Range of the function*** $f(x) = \sqrt{|\sin^{-1}|\sin x| - \cos^{-1}|\cos x|}$, ***is***

(a) $\{0\}$ (b) $\left[0, \sqrt{\frac{\pi}{2}}\right]$ (c) $[0, \sqrt{\pi}]$ (d) None of these

Sol. We know that, $|\sin^{-1}|\sin x|| = \cos^{-1}|\cos x|$,

$\forall\ x \in$ domain

$\therefore f(x) = \sqrt{|\sin^{-1}|\sin x| - \cos^{-1}|\cos x|} = 0, \forall\ x \in$ domain

$\therefore$ Range of $f(x)$ is $\{0\}$.

Hence, (a) is the correct answer.

Example 63 The number of values of y in $[-2\pi, 2\pi]$ satisfying the equation $|\sin 2x| + |\cos 2x| = |\sin y|$ is

(a) 3 (b) 4 (c) 5 (d) 6

Sol. Here, $1 \le |\sin 2x| + |\cos 2x| \le \sqrt{2}$ and $|\sin y| \le 1$.

So, solution is possible only when $|\sin y| = 1$.

$\Rightarrow$ $\sin y = \pm 1 \quad \Rightarrow \quad y = \pm\frac{\pi}{2}, \pm\frac{3\pi}{2}$

$\therefore$ Number of values of y is 4.

Hence, (b) is the correct answer.

Example 64 Let $f(x) = \cot^{-1}(x^2 - 4x + 5)$, then range of $f(x)$ is equal to

(a) $\left(0, \frac{\pi}{2}\right)$ (b) $\left(0, \frac{\pi}{4}\right]$

(c) $\left[0, \frac{\pi}{4}\right)$ (d) None of these

Sol. Here, $x^2 - 4x + 5 \Rightarrow (x-2)^2 + 1 \ge 1$

$\therefore$ $1 \le x^2 - 4x + 5 < \infty$

$\Rightarrow$ $0 < \cot^{-1}(x^2 - 4x + 5) \le \frac{\pi}{4}$

[using, $x_1 < x_2 \Rightarrow \cot^{-1}x_1 > \cot^{-1}x_2$, since $\cot^{-1}x$ is decreasing]

$\Rightarrow$ Range of $f(x)$ is $\left(0, \frac{\pi}{4}\right]$.

Hence, (b) is the correct answer.

To Find Range for Rational Expressions

Let $f(x)=\dfrac{ax^2+bx+c}{px^2+qx+r}$

***Step* 1** Write the given function as a equation

$$y=\frac{ax^2+bx+c}{px^2+qx+r}$$

***Step* 2** Rewrite the above equation for x in standard form

$$x^2(py-a)+x(qy-b)+ry-c=0$$

***Step* 3** Find the discriminant to the above equation

$$D=(qy-b)^2-4(py-a)(ry-c)$$

$$D=q^2y^2-2qyb+b^2-4\ [pry^2-(pc+ar)y+ac]$$

$$D=y^2(q^2-4pr)+(4pc+4ar-2bq)y+b^2-4ac$$

***Step* 4** Find $y_1, y_2=\dfrac{-B\pm\sqrt{B^2-4AC}}{2A}$

where, $A=q^2-4pr,\ B=4pc+4ar-2bq, C=b^2-4ac.$

***Step* 5** Let $y_1<y_2$, then range of $f(x)$ is $[y_1, y_2]$ if $A<0$ and $A>0$, then range of $f(x)$ is $R-(y_1, y_2)$.

Example 65 *Find the range of* $f(x)=\dfrac{x^2+14x+9}{x^2+2x+3}$, *where* $x\in R$.

Sol. Here, $A=4-12=-8,\ B=12+36-56=-8,\ C=160$

Now, $\dfrac{-B\pm\sqrt{B^2-4AC}}{2A}=\dfrac{-1\pm\sqrt{1+80}}{-2}=-5, 4$ and here $A<0$

$\therefore$ Range is $[-5, 4]$

Example 66 *For what real values of a does the range of* $f(x)=\dfrac{x+1}{a+x^2}$ *contains the interval* $[0,1]$ *?*

Sol. Let $y=\dfrac{x+1}{a+x^2}$

$\Rightarrow\quad y(a+x^2)=x+1$

$\Rightarrow yx^2-x+(ay-1)=0$ has real roots for every $y\in[0,1]$.

$\therefore\quad 1-4y(ay-1)\geq 0$

$\Rightarrow\quad 1-4ay^2+4y\geq 0$ holds for $0\leq y\leq 1$ ...(i)

***Case* I** If $y=0$

Here, $y=0$ is assumed at $x=-1$ for any $a\neq -1$.

For $a=-1, y=\dfrac{x+1}{x^2-1}$ is undefined for $x=-1$.

***Case* II** If $0<y\leq 1$. Put $z=\dfrac{1}{y}$

$\Rightarrow\quad 1\leq z<\infty$

Now, from Eq. (i), we get

$z^2+4z-4a\geq 0$ holds for $1\leq z<\infty$

$\Rightarrow\quad (z+2)^2-4-4a\geq 0$ holds for $1\leq z<\infty$

Consider, $(z+2)^2-4-4a\geq 0$

$\Rightarrow\quad (z+2)^2\geq 4+4a$

$\Rightarrow\quad z+2\geq\sqrt{4+4a};\ 4+4a\geq 0$

$a\geq -1$ ...(ii)

but $z\geq 1$

$\therefore\quad 9\geq 4+4a$

$\Rightarrow\quad 5\geq 4a\quad [\text{as } (u+2)^2\geq 9 \text{ for } u=1]$

$\Rightarrow\quad a\leq\dfrac{5}{4}, a\neq -1$ ...(iii)

$\therefore$ From Eqs. (i), (ii) and (iii), we get $a\in\left(-1,\dfrac{5}{4}\right]$.

Example 67 Find the range of the function $f(x)=\dfrac{\sin^2 x+\sin x-1}{\sin^2 x-\sin x+2}$.

Sol. Let $y=\dfrac{\sin^2 x+\sin x-1}{\sin^2 x-\sin x+2}$

Let $t=\sin x\ \Rightarrow\ -1\leq t\leq 1$ and $y=\dfrac{t^2+t-1}{t^2-t+2}$

$\Rightarrow\quad (y-1)t^2-(y+1)t+(2y+1)=0$ ...(i)

Since t is real, $\dfrac{3-2\sqrt{11}}{7}\leq y\leq\dfrac{3+2\sqrt{11}}{7}$

***Case* I** If both roots of Eq. (i) are greater than 1, i.e. $t_1>1$ and $t_2>1$.

$\Rightarrow\quad t_1+t_2>2$

and $(t_1-1)(t_2-1)>0$

$\Rightarrow\quad \dfrac{y+1}{y-1}>2$

and $\dfrac{2y+1}{y-1}-\dfrac{y+1}{y-1}+1>0$

$\Rightarrow\quad 1<y<3$

and $y>1$ or $y<\dfrac{1}{2}$

$\therefore\quad y\in(1,3)$ ...(ii)

***Case* II** If $t_1<-1$ and $t_2<-1$

$\Rightarrow\quad t_1+t_2<-2$ and $(t_1+1)(t_2+1)>0$

$\Rightarrow\quad \dfrac{y+1}{y-1}+2<0$ and $\dfrac{2y+1}{y-1}+\dfrac{y+1}{y-1}+1>0$

$\Rightarrow \quad \frac{1}{3} < y < 1 \text{ and } y > 1 \text{ or } y < -\frac{1}{4}$

$\Rightarrow \quad y \in \phi \qquad \ldots(iii)$

***Case* III** If $t_1 < -1$ and $t_2 > -1, t_1 < 1$ and $t_2 > 1$

$\Rightarrow \quad (t_1 + 1)(t_2 + 1) < 0 \text{ and } (t_1 - 1)(t_2 - 1) < 0$

$\Rightarrow \quad \frac{2y+1}{y-1} + \frac{y+1}{y-1} + 1 < 0 \text{ and } \frac{2y+1}{y-1} - \frac{y+1}{y-1} + 1 < 0$

$\Rightarrow \quad -\frac{1}{4} < y < 1 \text{ and } \frac{1}{2} < y < 1 \Rightarrow \frac{1}{2} < y < 1$

$\therefore \quad R_f = \left[\frac{3 - 2\sqrt{11}}{7}, \frac{1}{2}\right] \cup \{1\}$

Exercise for Session 5

■ **Directions** (Q. Nos. 1 to 25) *Find the range of the following.*

1. $f(x) = \sqrt{9 - x^2}$

2. $f(x) = \frac{x}{1 + x^2}$

3. $f(x) = \sin x + \cos x + 3$

4. $f(x) = |x - 1| + |x - 2|, \ -1 \le x \le 3$

5. $f(x) = \log_3 (5 + 4x - x^2)$

6. $f(x) = \frac{x^2 - 2}{x^2 - 3}$

7. $f(x) = \frac{x^2 + 2x + 3}{x}$

8. $f(x) = |x - 1| + |x - 2| + |x - 3|$

9. $f(x) = \log_{[x-1]} \sin x$, where $[\cdot]$ denotes the greatest integer function.

10. $f(x) = \cos^{-1} \sqrt{\log_{[x]} \frac{|x|}{x}}$, where $[\cdot]$ denotes the greatest integer function.

11. $f(x) = \sqrt{[\sin 2x] - [\cos 2x]}$, where $[\cdot]$ denotes the greatest integer function.

12. $f(x) = \sin^{-1}\left[x^2 + \frac{1}{2}\right] + \cos^{-1}\left[x^2 - \frac{1}{2}\right]$, where $[\cdot]$ denotes the greatest integer function.

13. $f(x) = \sin^{-1}(\sqrt{x^2 + x + 1})$

14. $f(x) = \cos^{-1}\left(\frac{x^2}{\sqrt{1 + x^2}}\right)$

15. $f(x) = \sqrt{\log(\cos(\sin x))}$

16. $f(x) = \frac{x - 1}{x^2 - 2x + 3}$

17. $f(x) = \frac{\sin x}{\sqrt{1 + \tan^2 x}} - \frac{\cos x}{\sqrt{1 + \cot^2 x}}$

18. $f(x) = \frac{\tan(\pi [x^2 - x])}{1 + \sin(\cos x)}$

19. $f(x) = \frac{e^x}{[x + 1]}, x \ge 0$

20. $f(x) = [|\sin x| + |\cos x|]$, where $[\cdot]$ denotes the greatest integer function.

21. $f(x) = \sqrt{-x^2 + 4x - 3} + \sqrt{\sin \frac{\pi}{2}\left(\sin \frac{\pi}{2}(x - 1)\right)}$

22. Find the image of the following sets under the mapping $f(x) = x^4 - 8x^3 + 22x^2 - 24x + 10$ (i) $(-\infty, 1)$ (ii) $[1, 2]$.

23. Find the domain and range of $f(x) = \log\left[\cos |x| + \frac{1}{2}\right]$, where $[\cdot]$ denotes the greatest integer function.

24. Find the domain and range of $f(x) = \sin^{-1}(\log [x]) + \log(\sin^{-1} [x])$, where $[\cdot]$ denotes the greatest integer function.

25. Find the domain and range of $f(x) = [\log(\sin^{-1} \sqrt{x^2 + 3x + 2})]$, where $[\cdot]$ denotes the greatest integer function.

Session 6

Odd and Even Functions

Odd and Even Functions

Odd Functions

A function $f(x)$ is said to be an odd function, if $f(-x) = -f(x)$ for all x. Graph of an odd function is **symmetrical in opposite quadrants**, i.e. the curve in first quadrant is identical to the curve in the third quadrant and the curve in second quadrant is identical to the curve in fourth quadrant. Some graphs which are symmetrical in opposite quadrants (or about origin) are

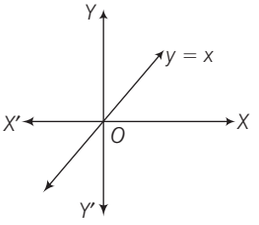


Figure 3.29

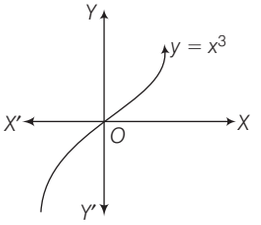

Figure 3.30

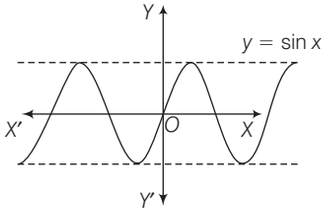

Figure 3.31

Even Functions

A function $f(x)$ is said to be an even, if $f(-x) = f(x)$ for all x. The graph is always **symmetrical about Y-axis**, i.e. the graph on left hand side of Y-axis is the mirror image of the curve on its right hand side.

Some graphs which are symmetrical about ***Y*-axis** are

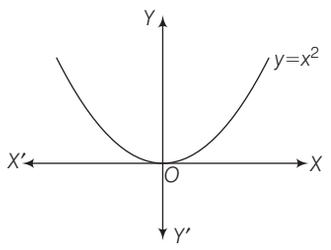

Figure 3.32

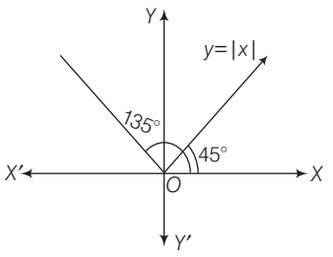

Figure 3.33

Properties of Odd and Even Functions

(i) Product of two odd functions or two even functions is an even function.

(ii) Product of odd and even function is an odd function.

(iii) Every function $y = f(x)$ can be expressed as the sum of an even and odd function.

(iv) The derivative of an odd function is an even function and derivative of an even function is an odd function.

(v) A function which is even or odd, when squared becomes an even function.

(vi) The only function which is both even and odd is $f(x) = 0$, i.e. zero function.

Example 68 If f is an even function, then find the real values of x satisfying the equation

$$f(x) = f\left(\frac{x+1}{x+2}\right).$$ ***[IIT JEE 1996, 2001]***

Sol. Since, $f(x)$ is even, so $f(-x) = f(x)$

Thus, $$x = \frac{x+1}{x+2}$$

or $$-x = \frac{x+1}{x+2}$$

$\Rightarrow$ $$x^2 + 2x = x + 1$$

or $$-x^2 - 2x = x + 1$$

$\Rightarrow$ $$x^2 + x - 1 = 0$$

or $$-x^2 - 3x - 1 = 0$$

$\Rightarrow$ $$x = \frac{-1 \pm \sqrt{5}}{2}$$

or $$x = \frac{-3 \pm \sqrt{5}}{2}$$

Thus, $x \in \left\{\frac{-1+\sqrt{5}}{2}, \frac{-1-\sqrt{5}}{2}, \frac{-3+\sqrt{5}}{2}, \frac{-3-\sqrt{5}}{2}\right\}$

Example 69 Find out whether the given function is even, odd or neither even nor odd,

where $f(x) = \begin{cases} x|x| & , \quad x \le -1 \\ [1+x] + [1-x] & , \quad -1 < x < 1 \\ -x|x| & , \quad x \ge 1 \end{cases}$

where $|\,|$ and $[\,]$ represent the modulus and greatest integer functions.

Sol. The given function can be written as

$$f(x)=\begin{cases}-x^2 & , \quad x\le -1\\ 2+[x]+[-x] & , \quad -1<x<1\\ -x^2 & , \quad x\ge 1\end{cases}$$

[using definition of modulus function and the properties of greatest integer functions]

$$\Rightarrow \quad f(x)=\begin{cases}-x^2 & , \quad x\le -1\\ 2-1+0 & , \quad -1<x<0\\ 2 & , \quad x=0\\ 2+0-1 & , \quad 0<x<1\\ -x^2 & , \quad x\ge 1\end{cases}$$

$$f(x)=\begin{cases}-x^2 & , \quad x\le -1\\ 1 & , \quad -1<x<0\\ 2 & , \quad x=0\\ 1 & , \quad 0<x<1\\ -x^2 & , \quad x\ge 1\end{cases}$$

which is clearly even as

if $f(-x)=f(x)$.

Thus, $f(x)$ is even.

Example 70 Find whether the given function is even or odd function, where $f(x)=\dfrac{x(\sin x+\tan x)}{\left[\dfrac{x+\pi}{\pi}\right]-\dfrac{1}{2}}$, when $x\neq n\pi$, where $[\cdot]$ denotes the greatest integer function.

Sol. $f(x)=\dfrac{x(\sin x+\tan x)}{\left[\dfrac{x+\pi}{\pi}\right]-\dfrac{1}{2}}=\dfrac{x(\sin x+\tan x)}{\left[\dfrac{x}{\pi}\right]+1-\dfrac{1}{2}}$

$$f(x)=\frac{x(\sin x+\tan x)}{\left[\dfrac{x}{\pi}\right]+0.5}$$

Now, $f(-x)=\dfrac{-x(\sin(-x)+\tan(-x))}{\left[-\dfrac{x}{\pi}\right]+0.5}$

$$\Rightarrow \quad f(-x)=\begin{cases}\dfrac{x(\sin x+\tan x)}{-1-\left[\dfrac{x}{\pi}\right]+0.5} & , \quad x\neq n\pi\\ 0 & , \quad x=n\pi\end{cases}$$

So, $f(-x)=-\dfrac{x(\sin x+\tan x)}{\left[\dfrac{x}{\pi}\right]+0.5}$ or $[\because x\neq n\pi]$

$\therefore f(-x)=-f(x)$. Hence, $f(x)$ is an odd function (if $x\neq n\pi$).

Exercise for Session 6

1. Determine whether the following functions are even or odd.

(i) $f(x)=\log(x+\sqrt{1+x^2})$ (ii) $f(x)=x\left(\dfrac{a^x+1}{a^x-1}\right)$

(iii) $f(x)=\sin x+\cos x$ (iv) $f(x)=x^2-|x|$

(v) $f(x)=\log\left(\dfrac{1-x}{1+x}\right)$ (vi) $f(x)=\{(\text{sgn } x)^{sgn\,x}\}^n$; n is an odd integer.

(vii) $f(x)=\text{sgn}(x)+x^2$ (viii) $f(x+y)+f(x-y)=2f(x)\cdot f(y)$; where $f(0)\neq 0$ and $x,y\in R$.

2. Determine whether function; $f(x)=(-1)^{[x]}$ is even, odd or neither of two (where $[\cdot]$ denotes the greatest integer function).

3. A function defined for all real numbers is defined for $x\ge 0$ as follows $f(x)=\begin{cases}x|x|, & 0\le x<1\\ 2x & , \quad x\ge 1\end{cases}$.

How is f defined for $x\le 0$, if (i) f is even? (ii) f is odd?

4. Show that the function $f(x)=\dfrac{2x(\sin x+\tan x)}{2\left[\dfrac{x+21\pi}{\pi}\right]-41}$ is symmetric about origin.

5. If $f:[-20,20]\to R$ defined by $f(x)=\left[\dfrac{x^2}{a}\right]\sin x+\cos x$ is an even function, find the set of values of 'a' (where $[\cdot]$ denotes the greatest integer function).

Session 7

Periodic Functions

Periodic Functions

Definition A function $f(x)$ is said to be periodic function, if there exists a positive real number, T such that $f(x+T)=f(x)$, $\forall\ x \in \text{Dom}\,(f)$. Then, $f(x)$ is periodic with period T, where T is least positive value.

Graphically If the graph repeats at fixed interval, the function is said to be periodic and its period is the width of that interval.

Example 71 Prove that $\sin x$ is periodic and find its period.

Sol. Let $f(x)=\sin x$ and $T>0$, then $f(x)$ is periodic, if $f(x+T)=f(x)$.

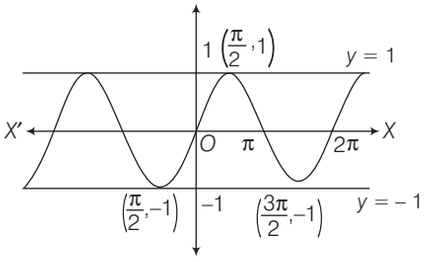
$\Rightarrow \quad \sin(x+T)=\sin(x), \forall\ x \in R$

$\Rightarrow \quad T = 2\pi, 4\pi, 6\pi, \ldots.$

But period of $f(x)$ is smallest positive real number.

Thus, period of $f(x)$ is 2π.

Aliter $f(x)=\sin x$ could be expressed graphically as shown in figure.



Here, graph repeats at an interval of 2π.

Thus, $f(x)$ is periodic with period 2π.

Example 72 Prove that $f(x)=x-[x]$ is periodic function. Also, find its period.

Sol. Let $T>0$.

Then, $\quad f(x+T)=f(x), \forall\ x \in R$

$\Rightarrow \quad (x+T)-[x+T]=x-[x], \forall\ x \in R$

$\Rightarrow \quad [x+T]-[x]=T, \forall\ x \in R$

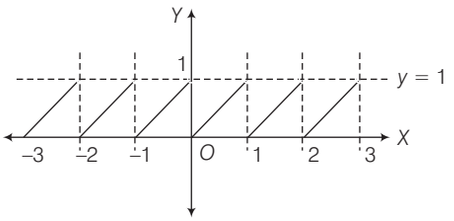
$\Rightarrow \quad T = 1, 2, 3, 4, \ldots$

[since, subtraction of two integers]

The smallest value of T satisfying $f(x+T)=f(x)$ is 1.

Thus, it is periodic with period 1.

Graphically $f(x)=x-[x]=\{x\}$



Clearly, from the given graph, the function repeats itself at an interval of 1 unit. Thus, period of $f(x)=1$.

Remark

For those functions whose periods are not deducted by graphs, they can be judged by inspection method.

Example 73 Let $f(x)$ be periodic and k be a positive real number such that $f(x+k)+f(x)=0$ for all $x \in R$. Prove that $f(x)$ is a periodic with period $2k$.

Sol. We have,

$f(x+k)+f(x)=0, \forall\ x \in R$

$\Rightarrow \quad f(x+k)=-f(x), \forall\ x \in R$, put $x=x+k$

$\Rightarrow \quad f(x+2k)=-f(x+k), \forall\ x \in R$

[as $f(x+k)=-f(x)$]

$\Rightarrow \quad f(x+2k)=f(x), \forall\ x \in R$

which clearly shows that $f(x)$ is periodic with period $2k$.

Some Standard Results on Periodic Functions

Functions	Periods
(i) $\sin^n x, \cos^n x$	π, if n is even.
$\sec^n x, \text{cosec}^n x$	2π, if n is odd or fraction.
(ii) $\tan^n x, \cot^n x$	π, n is even or odd.
(iii) $\lvert\sin x\rvert, \lvert\cos x\rvert, \lvert\tan x\rvert$ $\lvert\cot x\rvert, \lvert\sec x\rvert, \lvert\text{cosec } x\rvert$	π
(iv) $x-[x]$	1
(v) Algebraic functions e.g. $\sqrt{x}, x^2, x^3+5$, ... etc.	Period doesn't exist.
(vi) $f(x)$ = constant	Periodic with no fundamental period.

Example 74 Find periods for

(i) $\cos^4 x$. (ii) $\sin^3 x$. (iii) $\cos\sqrt{x}$. (iv) $\sqrt{\cos x}$.

Sol. (i) $\cos^4 x$ has a period π as n is even.

(ii) $\sin^3 x$ has a period 2π as n is odd.

(iii) $\cos\sqrt{x}$ is not periodic, as for no value of T,

$$f(x+T)=f(x) \Rightarrow \cos\sqrt{x+T}=\cos(\sqrt{x})$$

Thus, there exists no value of T for which $f(x+T)=f(x)$.

Hence, $\cos\sqrt{x}$ is not periodic.

(iv) $f(x)=\sqrt{\cos x}$ has the period 2π as n is in fraction.

Aliter $f(x+T)=f(x) \Rightarrow \sqrt{\cos(x+T)}=\sqrt{\cos(x)}$

$\Rightarrow \quad T=2\pi, 4\pi, \ldots$

But T is the least positive value, hence $f(x)$ is periodic with period 2π.

Properties of Periodic Functions

(i) If $f(x)$ is periodic with period T, then

(a) $c \cdot f(x)$ is periodic with period T

(b) $f(x+c)$ is periodic with period T

(c) $f(x) \pm c$ is periodic with period T, where c is any constant.

We know, $\sin x$ has period 2π.

Then, $f(x)=5(\sin x)+4$ is also periodic with period 2π.

i.e. "If constant is added, subtracted, multiplied or divided in a periodic function, its period remains the same."

(ii) If $f(x)$ is periodic with period T, then $kf(cx+d)$ has period $\frac{T}{|c|}$,

i.e. period is only affected by coefficient of x,

where, $k, c, d \in$ constant.

We know, $f(x)=\left\{7\sin\left(2x+\frac{\pi}{9}\right)\right\}-12$ has the period $\frac{2\pi}{|2|}=\pi$; as $\sin x$ is periodic with period 2π.

(iii) If $f_1(x)$, $f_2(x)$ are periodic functions with periods T_1, T_2 respectively, then $h(x)=f_1(x)+f_2(x)$ has period

$$=\begin{cases}\text{LCM of } \{T_1, T_2\}, \text{ if } h(x) \text{ is not an even function.}\\ \qquad\qquad OR\\ \frac{1}{2}\text{ LCM of } \{T_1, T_2\}, \text{ if } f_1(x) \text{ and } f_2(x) \text{ are complementary}\\ \text{pair-wise comparable functions.}\end{cases}$$

While taking LCM we should always remember

(a) LCM of $\left(\frac{a}{b}, \frac{c}{d}, \frac{e}{f}\right)=\frac{\text{LCM of } (a,c,e)}{\text{HCF of } (b,d,f)}$

e.g. LCM of $=\frac{\text{LCM of } (2\pi, \pi, \pi)}{\text{HCF of } (3, 6, 12)}=\frac{2\pi}{3}$

$\therefore$ LCM of $\left(\frac{2\pi}{3}, \frac{\pi}{6}, \frac{\pi}{12}\right)=\frac{2\pi}{3}$

(b) LCM of rational with rational is possible.

LCM of irrational with irrational is possible.

But LCM of rational and irrational is not possible.

e.g. LCM of $(2\pi, 1, 6\pi)$ is not possible, as $2\pi, 6\pi \in$ irrational and $1 \in$ rational.

Periodicity of Constant Function

The LCM rule is not applicable, if function reduces to constant.

e.g. $\quad f(x)=\sin^2 x+\cos^2 x.$

Since, period of $\sin^2 x$ and $\cos^2 x$ are π.

$\therefore$ Period of $f(x)=\frac{1}{2}\text{LCM}\{\pi, \pi\}=\frac{\pi}{2}$, which is not correct.

Whereas, $\sin^2 x+\cos^2 x=1$ is a constant function and period is undetermined.

Example 75 Find the period, if $f(x)=\sin x+\{x\}$, where $\{x\}$ is fractional part of x .

Sol. Here, $\sin x$ is periodic with period 2π and $\{x\}$ is periodic with period 1. Thus, LCM of 2π and $1 \Rightarrow$ Does not exist.

Hence, $f(x)$ is not periodic.

Example 76 Find period of $f(x)=\tan 3x+\sin\left(\frac{x}{3}\right)$.

Sol. Period for $\tan 3x$ is $\left|\frac{\pi}{3}\right|$.

Period for $\sin\frac{x}{3}$ is $\left|2\pi\times\frac{3}{1}\right|=|6\pi|$

Thus, LCM of $\frac{\pi}{3}$

and $\quad \frac{6\pi}{1} \Rightarrow \frac{6\pi}{1}$

Hence, $f(x)$ is periodic with period 6π.

Example 77 Find the period of

$$f(x)=\sin x+\tan\frac{x}{2}+\sin\frac{x}{2^2}+\tan\frac{x}{2^3}+\ldots+\sin\frac{x}{2^{n-1}}+\tan\frac{x}{2^n}.$$

Sol. We have, Period of $\left(\sin x+\tan\frac{x}{2}\right)$ is 2π,

$\left(\sin\frac{x}{2^2}+\tan\frac{x}{2^3}\right)$ is $2^3\pi$,

.....

.....

$\left(\sin\frac{x}{2^{n-1}}+\tan\frac{x}{2^n}\right)$ is $2^n\pi$.

Thus, LCM of $\{2\pi, 2^3\pi, \ldots, 2^n\pi\}=2^n\pi$.

Hence, the period of $f(x)$ is $2^n\pi$.

Example 78 Find the period of $f(x) = |\sin x| + |\cos x|$.

Sol. $|\sin x|$ has period π and $|\cos x|$ has period π.

Here, $f(x)$ is an even function and $\sin x$, $\cos x$ are complementary.

Thus, period of $f(x) = \frac{1}{2}\{\text{LCM of } \pi \text{ and } \pi\} = \frac{\pi}{2}$

Thus, period for $f(x)$ is $\frac{\pi}{2}$.

Example 79 ***Find the period of*** $f(x) = \sin^4 x + \cos^4 x$.

Sol. $\sin^4 x$ and $\cos^4 x$ both has a period π. [as n is even]

But $f(x)$ is an even function and $\sin x$ and $\cos x$ are complementary.

Hence, $f(x)$ has period $= \frac{1}{2}\{\text{LCM of } \pi, \pi\} = \frac{\pi}{2}$

Thus, period of $f(x)$ is $\frac{\pi}{2}$.

Example 80 Find the period of $f(x) = \cos(\cos x) + \cos(\sin x)$.

Sol. Here, $\cos(\cos x)$ has period π; as it is even, also $\cos(\sin x)$ has period π; as it is even.

Thus, period of $f(x) = \frac{1}{2}\{\text{LCM of } \pi \text{ and } \pi\}$

Hence, period of $f(x) = \frac{\pi}{2}$

Example 81 Find the period of $f(x) = \cos^{-1}(\cos x)$.

Sol. Here, $f(x) = \cos^{-1}(\cos x)$; $f(x + T) = f(x)$

$\Rightarrow \cos^{-1}\{\cos(x + T)\} = \cos^{-1}\{\cos(x)\}$

$\Rightarrow T = 2\pi, 4\pi, 6\pi, \ldots$

But, T is the least positive value. Hence, $T = 2\pi$ or period is 2π.

Aliter $f(x) = \cos^{-1}(\cos x)$ has period 2π, since $\cos x$ has period 2π.

(i.e. In composition of function (fog) or (gof) are periodic, if $g(x)$ and $f(x)$ are periodic, respectively.)

Example 82 The period of $f(x) = \cos(|\sin x| - |\cos x|)$ is

(a) π (b) 2π

(c) $\frac{\pi}{2}$ (d) None of these

Sol. As, $\cos\theta$ is even and $|\sin x| - |\cos x|$ has the period π.

$\therefore$ $\cos(|\sin x| - |\cos x|)$ has period $\frac{\pi}{2}$.

(i.e. Half the period of $g(x)$, if $f(x)$ is even in fog).

Hence, (c) is the correct answer.

Example 83 Period of the function $f(x) = \sin(\sin(\pi x)) + e^{\{3x\}}$, where $\{.\}$ denotes the fractional part of x is

(a) 1 (b) 2

(c) 3 (d) None of these

Sol. As, $\sin(\pi x)$ has period $= \left|\frac{2\pi}{\pi}\right| = 2$

$\therefore$ $\sin(\sin(\pi x))$ has period 2

and $e^{\{3x\}}$ has period $\frac{1}{3}$.

$\therefore$ Period of $f(x) = \sin(\sin(\pi x)) + e^{\{3x\}}$ is LCM of $\left\{2, \frac{1}{3}\right\} = 2$

Hence, (b) is the correct answer.

Example 84 $\sin ax + \cos ax$ and $|\cos x| + |\sin x|$ are periodic functions of same fundamental period, if 'a' equals

(a) 0 (b) 1 (c) 2 (d) 4

Sol. Fundamental period of $|\sin x| + |\cos x|$ is $\frac{\pi}{2}$.

Fundamental period of $(\sin ax + \cos ax)$ is $\frac{2\pi}{a}$.

$\therefore$ $a = 4$

Hence, (d) is the correct answer.

Example 85 ***Let*** $f(x) = \sin x + \cos(\sqrt{4 - a^2})\,x$. ***Then, the integral values of 'a' for which*** $f(x)$ ***is a periodic function, are given by***

(a) $\{2, -2\}$ (b) $(-2, 2]$

(c) $[-2, 2]$ (d) None of these

Sol. $f(x)$ will be periodic, if $\sqrt{4 - a^2}$ is a rational which is only possible when $(4 - a^2)$ is a perfect square.

$\Rightarrow$ $a = 0, 2, -2$ or $a \in \{-2, 0, 2\}$

Hence, (d) is the correct answer.

Example 86 ***Let*** $f(x) = \begin{cases} -1 + \sin K_1\pi x, & x \text{ is rational.} \\ 1 + \cos K_2\pi x, & x \text{ is irrational.} \end{cases}$

If $f(x)$ ***is a periodic function, then***

(a) either $K_1, K_2 \in$ rational or $K_1, K_2 \in$ irrational

(b) $K_1, K_2 \in$ rational only

(c) $K_1, K_2 \in$ irrational only

(d) $K_1, K_2 \in$ irrational such that $\frac{K_1}{K_2}$ is rational

Sol. Range of $-1 + \sin K_1\pi x$ is $[-2, 0]$ and range of $1 + \cos K_2\pi x$ is $[0, 2]$.

$\Rightarrow$ If $g(x) = -1 + \sin K_1\pi x$

$\Rightarrow g(x+T_1) = -1 + \sin K_1\pi x$, where T_1 is a period of $1 + \sin K_1 \pi x$

$\Rightarrow T_1$ is rational

$\Rightarrow$ Period of $f(x)$ is rational.

$\Rightarrow K_1$ and K_2 are rational.

Hence, (b) is the correct answer.

Example 87 If $f(x) = \tan^2 \dfrac{\pi x}{n^2 - 5n + 8} + \cot(n+m)\pi x;\ (n \in N, m \in Q)$ is a periodic function with 2 as its fundamental period, then m can't belong to

(a) $(-\infty, -2) \cup (-1, \infty)$ (b) $(-\infty, -3) \cup (-2, \infty)$

(c) $(-2, -1) \cup (-3, -2)$ (d) $\left(-3, -\dfrac{5}{2}\right) \cup \left(-\dfrac{5}{2}, -2\right)$

Sol. Period is LCM of $n^2 - 5n + 8$ and $\dfrac{1}{n+m}$.

$\Rightarrow \quad n^2 - 5n + 8 = 1 \quad \text{or} \quad n^2 - 5n + 8 = 2$

$\Rightarrow \quad n^2 - 5n + 7 = 0 \quad \text{or} \quad n^2 - 5n + 6 = 0$

Since, $n \in N \therefore n = 2, 3$

and $\left(\dfrac{1}{n+m}\right) K_1 = 2,\ (K_1 \in I) \Rightarrow \dfrac{1}{n+m} \nmid 1$

$\therefore \quad \dfrac{1}{2+m} \nmid 1 \quad \text{or} \quad \dfrac{1}{3+m} \nmid 1$

$\Rightarrow \quad m \notin (-2, -1) \cup (-3, -2)$

Hence, (c) is the correct answer.

Example 88 Let $f(x)$ be a periodic function with period 3 and $f\left(-\dfrac{2}{3}\right) = 7$ and $g(x) = \int_0^x f(t+n)\,dt$, where $n = 3K, K \in N$. Then, $g'\left(\dfrac{7}{3}\right)$ is equal to

(a) $-\dfrac{2}{3}$ (b) 7

(c) -7 (d) $\dfrac{7}{3}$

Sol. $g'(x) = f(x+n) = f(x + (n-3) + 3)$

$= f(x + n - 3)$

.....

.....

$= f(x+3) = f(x)$

$\Rightarrow \quad g'(x) = f(x)$

$\Rightarrow g'\left(\dfrac{7}{3}\right) = f\left(\dfrac{7}{3}\right) = f\left(-\dfrac{2}{3} + 3\right) = f\left(-\dfrac{2}{3}\right) = 7$

Hence, (b) is the correct answer.

Exercise for Session 7

1. Find the periods of following functions.

(i) $f(x) = [\sin 3x] + |\cos 6x|$

(ii) $f(x) = \dfrac{1}{2}\left\{\dfrac{|\sin x|}{\cos x} + \dfrac{|\cos x|}{\sin x}\right\}$

(iii) $f(x) = e^{\cos^4 \pi x + x - [x] + \cos^2 \pi x}$

(iv) $f(x) = 3\sin\dfrac{\pi x}{3} + 4\cos\dfrac{\pi x}{4}$

(v) $f(x) = \cos 3x + \sin\sqrt{3}\pi x$

(vi) $f(x) = \sin\dfrac{\pi x}{n!} - \cos\dfrac{\pi x}{(n+1)!}$

(vii) $f(x) = x - [x - b]$

(viii) $f(x) = e^{\ln(\sin x)} + \tan^3 x - \operatorname{cosec}(3x - 5)$

2. Find the period of the real-valued function satisfying $f(x) + f(x+4) = f(x+2) + f(x+6)$.

3. Check whether the function defined by $f(x+\lambda) = 1 + \sqrt{2f(x) - f^2(x)},\ \forall\ x \in R$ is periodic. If yes, find its period.

4. Let $f(x+p) = 1 + \{2 - 3f(x) + 3(f(x))^2 - (f(x))^3\}^{1/3},\ \forall\ x \in R$, where $p > 0$, prove that $f(x)$ is periodic.

5. Let $f(x)$ be a function such that ; $f(x-1) + f(x+1) = \sqrt{3}\,f(x),\ \forall\ x \in R$. If $f(5) = 100$, find $\sum_{r=0}^{99} f(5 + 12r)$.

Session 8

Mapping of Functions

Mapping of Functions

As discussed earlier, a function exists only if, "to every element in domain there exists unique image in the codomain".

i.e. To every element of A there exists one and only one element of B.

This is written as $f: A \to B$ and is read as f maps from A to B and this correspondence is denoted by $y = f(x)$.

From definition, it follows that there may exist some elements in B, which may not have any corresponding element in set A.

But there should not be any x left (element of A) for which there is no element in set B.

There are four types of mappings defined as

1. One-one Mapping or Injective or Monomorphic

A function $f: A \to B$ is said to be one-one mapping or injective, if different elements of A have different images in B.

Thus, no two elements of set A can have the same f image.

Verbal Description Let us consider set $A = \{1, 3, 5\}$ and $B = \{3, 7, 11, 15\}$, where $f: A \to B$ and $f(x) = 2x + 1$, then here every element in domain possess distinct images in codomain.

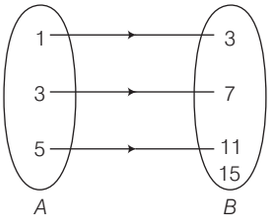


Figure 3.34

Thus, $f(x)$ is one-one or injective.

From above definition, following mappings are not one-one.

(i) $f: A \to B$ (ii) $f: A \to B$

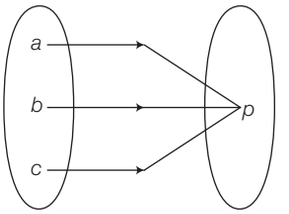

Figure 3.35

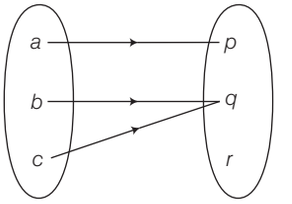

Figure 3.36

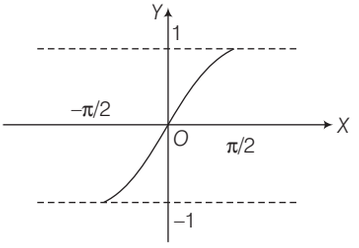
Method to Check One-one Mapping

***Method* 1. Theoretically** If $f(x) = f(y) \Rightarrow x = y$, then $f(x)$ is one-one.

***Method* 2. Graphically** A function is one-one iff no line parallel to X-axis meets the graph of function at more than one point.

Example 89 Let $f: [-\pi/2, \pi/2] \to [-1, 1]$ where $f(x) = \sin x$. Find whether $f(x)$ is one-one or not.

Sol. Here, $f: [-\pi/2, \pi/2] \to [-1, 1]$ indicates that domain $\in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ and codomain $\in [-1, 1]$.



Thus, the graph of $f(x) = \sin x$ should be plotted in $[-\pi/2, \pi/2]$.

Which is clearly not intersected at more than one point by any straight line parallel to X-axis.

Thus, $f(x)$ is one-one.

***Method* 3. By Calculus** For checking whether $f(x)$ is one-one, find whether function is only increasing or only decreasing in its domain. If yes, then one-one.

i.e. if $f'(x) \geq 0, \forall\ x \in$ domain

or if $f'(x) \leq 0, \forall\ x \in$ domain, then one-one.

Remark

Students are advised to use the graphical or calculus method for finding one-one.

Number of One-one Mapping

If A and B are finite sets having m and n elements, then number of one-one function from A to B.

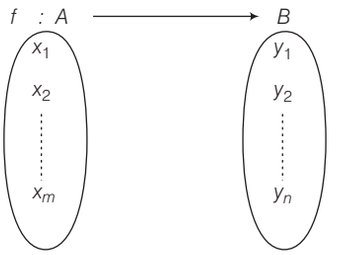


Figure 3.37

Here, x_1 can take n images,

x_2 can take $(n-1)$ images,

x_3 can take $(n-2)$ images,

.....

.....

x_m can take $(n-m+1)$ images.

Thus, number of mapping $\Rightarrow n(n-1)(n-2)\ldots(n-m+1)$

$$\Rightarrow \quad \begin{cases} {}^{n}P_{m}, & \text{if } n \geq m \\ 0, & \text{if } n < m \end{cases}$$

Example 90 $f(x) = x^3 + 3x^2 + 4x + b \sin x + c \cos x$, $\forall\, x \in R$ is a one-one function, the value of $b^2 + c^2$ is

(a) ≥ 1 (b) ≥ 2 (c) ≤ 1 (d) None of these

Sol. Here, $f(x) = x^3 + 3x^2 + 4x + b \sin x + c \cos x$

$$\Rightarrow \quad f'(x) = 3x^2 + 6x + 4 + b \cos x - c \sin x$$

Now, for $f(x)$ to be one-one, the only possibility is

$$f'(x) \geq 0, \ \forall\, x \in R$$

$$\Rightarrow \quad 3x^2 + 6x + 4 + b \cos x - c \sin x \geq 0, \forall\, x \in R$$

$$\Rightarrow \quad 3x^2 + 6x + 4 \geq c \sin x - b \cos x, \ \forall\, x \in R$$

$$\Rightarrow \quad 3x^2 + 6x + 4 \geq \sqrt{b^2 + c^2}, \ \forall\, x \in R$$

$$\Rightarrow \quad \sqrt{b^2 + c^2} \leq 3(x^2 + 2x + 1) + 1, \forall\, x \in R$$

$$\Rightarrow \quad \sqrt{b^2 + c^2} \leq 3(x+1)^2 + 1, \forall\, x \in R$$

$$\Rightarrow \quad \sqrt{b^2 + c^2} \leq 1, \forall\, x \in R \Rightarrow b^2 + c^2 \leq 1, \forall\, x \in R$$

Hence, (c) is the correct answer.

2. Many-one Mapping

A mapping $f : A \to B$ is said to be many-one function, if two or more elements of set A have the same image in B.

In other words; $f : A \to B$ is a many-one function, if it is not one-one function.

Verbal Description Let $f : A \to B$ and $g : X \to Y$ be two functions represented by

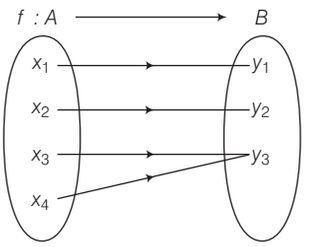

Figure 3.38

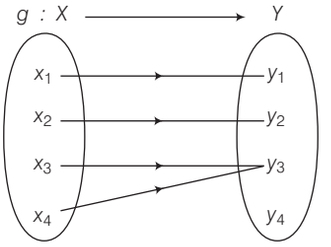

Figure 3.39

Clearly, f and g both are many-one as there are two elements x_3, x_4 which correspond to the same image.

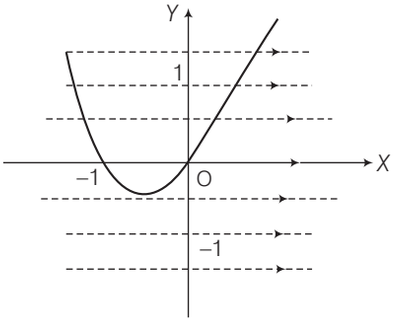
i.e. $f(x_3) = f(x_4) = y_3$. Thus, many-one.

Method to Check Many-one

They are same as for one-one because, if mapping is not one-one it is many-one.

Example 91 Show $f : R \to R$ defined by $f(x) = x^2 + x$ for all $x \in R$ is many-one.

Sol. By graph



$f(x) = x^2 + x$ can be represented graphically, as shown in figure,

where the straight line parallel to X-axis meets the curve at two points (i.e. more than one point).

Thus, it is not one-one it is many-one.

Aliter By calculus,

$$f(x) = x^2 + x$$

$$\Rightarrow \quad f'(x) = 2x + 1$$

where $f'(x) > 0$

if $x > -\frac{1}{2}$

and $f'(x) < 0$

if $x < -\frac{1}{2}$

which shows $f(x)$ is neither increasing nor decreasing i.e. not monotonic. Hence, many-one.

3. Onto Mapping or Surjective

A function $f: A \to B$ is an onto function, if such that each element of B is the f image of atleast one element in A. It is expressed as $f: A \to B$.

Here, range of f = codomain.

i.e. $f(A) = B$

Method to show onto or surjective

Find the range of $y = f(x)$ and show range of $f(x)$ = codomain of $f(x)$.

Remark

If range = codomain, then $f(x)$ is onto. Any polynomial of odd degree has range all real numbers and is onto for $f: R \to R$.

Example 92 Show $f: R \to R$ defined by $f(x) = (x-1)(x-2)(x-3)$ is surjective but not injective

Sol. We have,

$$f(x) = (x-1)(x-2)(x-3)$$
$$f(1) = f(2) = f(3) = 0$$

Hence, it is not injective, it is many-one function.

Now, $f(x)$ is a polynomial of degree 3, i.e. odd.

Hence, $f(x)$ is surjective.

Number of Onto Functions

If A and B are two sets having m and n elements respectively, such that $1 \le n \le m$, then number of onto functions from A to B is

Coefficient of x^m in $m!(e^x - 1)^n$

$\Rightarrow$ Coefficient of x^m in

$$m!\{{}^nC_0 e^{nx} - {}^nC_1 e^{(n-1)x} + \ldots + (-1)^r {}^nC_r e^{rx} + \ldots + (-1)^n {}^nC_n\}$$

$$= \sum_{r=1}^{n} (-1)^{n-r} {}^nC_r \, r^m$$

Or

Consider the set of all possible functions from A to B,

i.e. $\{f: A \to B\}$.

Now, let us define a subset Q such that

$$A_i = \{f \in Q \mid i \notin \text{Range of } f\}, i \in n$$

i.e. $\bigcup_{i=1}^{n} A_i = \{f \text{ is injective}\}$

To find number of onto functions

= Total number of functions

− Number of injective functions

$= n^m - \{\text{Number of injective functions}\}$

$$= n^m - \left| \bigcup_{i=1}^{n} A_i \right|, \quad \ldots(i)$$

where $\bigcup_{i=1}^{n} A_i = \sum_{i=1}^{n} |A_i| - \sum_{i,j} A_i \cap A_j + \ldots$

$$= n \cdot (n-1)^m - {}^nC_2 (n-2)^m + \ldots + (-1)^{n-1} \cdot {}^nC_{n-1} (1)^m \quad \ldots(ii)$$

$\therefore$ Number of onto functions

$$= n^m - \{n \cdot (n-1)^m - {}^nC_2 (n-2)^m + \ldots + (-1)^{n-1} \cdot {}^nC_{n-1} (1)^m\}$$

$$= \sum_{r=1}^{n} (-1)^{n-r} \, {}^nC_r \cdot r^m$$

Example 93 ***If*** $f: R \to \left[\frac{\pi}{6}, \frac{\pi}{2}\right)$, $f(x) = \sin^{-1}\left(\frac{x^2 - a}{x^2 + 1}\right)$ ***is an onto function, the set of values of 'a' is***

(a) $\left\{-\frac{1}{2}\right\}$ (b) $\left[-\frac{1}{2}, -1\right)$

(c) $(-1, \infty)$ (d) None of these

Sol. Here, $f(x)$ is onto.

$$\therefore \quad \frac{\pi}{6} \le \sin^{-1}\left(\frac{x^2 - a}{x^2 + 1}\right) < \frac{\pi}{2} \Rightarrow \frac{1}{2} \le \frac{x^2 - a}{x^2 + 1} < 1$$

$$\Rightarrow \frac{1}{2} \le 1 - \frac{(a+1)}{x^2 + 1} < 1, \forall \; x \in R \Rightarrow a + 1 > 0 \Rightarrow a \in (-1, \infty)$$

Hence, (c) is the correct answer.

4. Into Mapping

A function $f: A \to B$ is an into function, if there exists an element in B having no pre-image in A.

In other words, $f: A \to B$ is into function, if it is not onto function (mapping).

Example 94 ***Show*** $f: R \to R$ ***defined by*** $f(x) = x^2 + 4x + 5$ ***is into.***

Sol. We have, $f(x) = x^2 + 4x + 5$

$$f(x) = (x+2)^2 + 1$$

Since, the codomain of f is R but the range of f is $[1, \infty)$.

Hence, f is into.

One-one Onto Mapping or Bijective

A function is one-one onto or bijective, if it is both one-one and onto. A function is bijective if and only if every possible image is mapped to by exactly one argument.

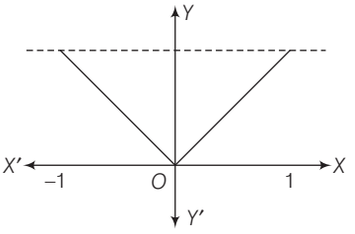
The function $f: A \to B$ is bijective iff for all $y \in B$, there is a unique $x \in A$ such that $f(x) = y$.

Example 95 Let $A=\{x:-1\le x\le 1\}=B$ and a mapping $f:A\to B$. For each of the following functions from A to B, find whether it is surjective or bijective.

(i) $f(x)=|x|$ (ii) $f(x)=x|x|$ (iii) $f(x)=x^3$

(iv) $f(x)=[x]$ (v) $f(x)=\sin\frac{\pi x}{2}$

Sol. (i) $f(x)=|x|$



Which shows many-one, as the straight line is parallel to X-axis cuts at two points. Here, range for $f(x)\in[0,1]$. Which is clearly a subset of codomain.

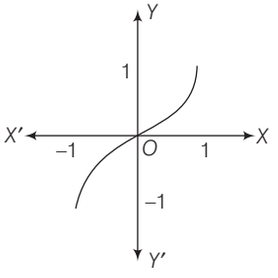
i.e. $[0,1]\subseteq[-1,1]$

Thus, into. Hence, function is many-one-into.

$\therefore$ Neither injective nor surjective.

(ii) $f(x)=x|x|$

The graph shows that $f(x)$ is one-one, as the straight line parallel to X-axis cuts only at one point.



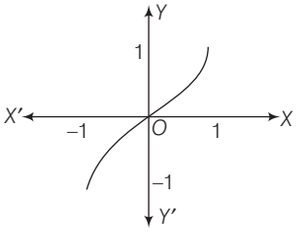
Here, range $f(x)\in[-1, 1]$

Thus, range = codomain

Hence, onto. Therefore, $f(x)$ is one-one onto or (bijective).

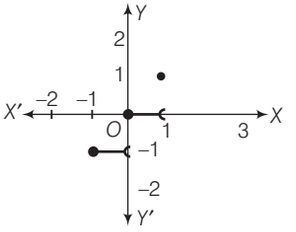
(iii) $f(x)=x^3$

Graph shows $f(x)$ is one-one onto (i.e. bijective). (as explained above)



(iv) $f(x)=[x]$

Graph shows that $f(x)$ is many-one, as the straight line parallel to X-axis meets at more than one points.



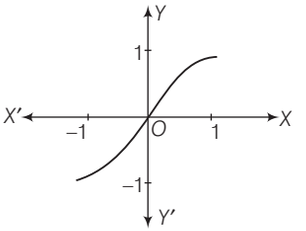
Here, range $f(x)\in\{-1, 0, 1\}$

which shows into as range $\subseteq$ codomain.

Hence, many-one-into.

(v) $f(x)=\sin\frac{\pi x}{2}$

Graph shows $f(x)$ is one-one and onto as range = codomain.



Therefore, $f(x)$ is bijective.

Example 96 The function $f:R\to R$ defined as $f(x)=\log_e(\sqrt{\sqrt{x^2+1}+x}+\sqrt{\sqrt{x^2+1}-x})$ is

(a) one-one and onto both

(b) one-one but not onto

(c) onto but not one-one

(d) Neither one-one nor onto

Sol. (d) Here, $f(x)=\frac{2}{2}\log\left(\sqrt{\sqrt{x^2+1}+x}+\sqrt{\sqrt{x^2+1}-x}\right)$

$$=\frac{1}{2}\log\left(\sqrt{\sqrt{x^2+1}+x}+\sqrt{\sqrt{x^2+1}-x}\right)^2$$

$$=\frac{1}{2}\log\left[\sqrt{x^2+1}+x+\sqrt{x^2+1}-x+2\sqrt{(\sqrt{x^2+1})^2-x^2}\right]$$

$$=\frac{1}{2}\log\left[2\sqrt{x^2+1}+2\sqrt{x^2+1-x^2}\right]$$

$$=\frac{1}{2}\log[2\sqrt{x^2+1}+2]$$

Now, $f(-x)=f(x)$

$\therefore$ $f(x)$ is even function.

Hence, neither one-one nor onto.

Quick Review

Let $X = \{x_1, x_2, x_3, \ldots, x_n\}$ [i.e. n elements]

and $Y = \{y_1, y_2, y_3, \ldots, y_r\}$ [i.e. r elements]

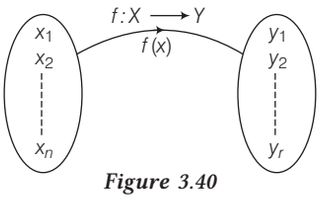


Figure 3.40

(a) Total number of functions $= r^n$
$=$ (Number of elements in codomain)$^{\text{number of elements in domain}}$

(b) Total number of one to one functions $= \begin{cases} {}^rC_n \cdot n!, & r \geq n \\ 0, & r < n \end{cases}$

(c) Total number of many-one functions $= \begin{cases} r^n - {}^rC_n \cdot n!, & r \geq n \\ r^n, & r < n \end{cases}$

(d) Total number of constant functions $= r$

(e) Total number of onto functions

$$= \begin{cases} {}^rC_1(r-1)^n + {}^rC_2(r-2)^n - {}^rC_3(r-3)^n + \ldots, & r < n \\ r!, & r = n \\ 0, & r > n \end{cases}$$

(f) Total number of into functions

$$= \begin{cases} {}^rC_1(r-1)^n - {}^rC_2(r-2)^n + {}^rC_3(r-3)^n - \ldots, & r \leq n \\ r^n, & r > n \end{cases}$$

Example 97 If $X = \{1, 2, 3, 4, 5\}$ and $Y = \{a, b, c, d, e, f\}$ and $f : X \to Y$, find the total number of

(i) functions (ii) one to one functions
(iii) many-one functions (iv) constant functions
(v) onto functions (vi) into functions

Sol. (i) Total number of functions $= 6^5 = 7776$

(ii) Total number of one to one functions
$= {}^6C_5 \cdot 5! = 6! = 720$

(iii) Total number of many-one functions $= 6^5 - 6! = 7056$

(iv) Total number of constant functions $= 6$

(v) Total number of onto functions $= 0$ (as $r > n$)

(vi) Total number of into functions $= 6^5 = 7776$

Example 98 Find the number of surjections from A to B, where $A = \{1, 2, 3, 4\}$, $B = \{a, b\}$. ***[IIT JEE 2000]***

Sol. Number of surjections from A to $B = \sum_{r=1}^{2} (-1)^{2-r} {}^2C_r (r)^4$

$$= (-1)^{2-1} {}^2C_1 (1)^4 + (-1)^{2-2} {}^2C_2 (2)^4 = -2 + 16 = 14$$

Therefore, number of onto mappings from A to $B = 14$.

Aliter Total number of mapping from A to B is 2^4 of which two functions $f(x) = a$ for all $x \in A$ and $g(x) = b$ for all $x \in A$ are not surjective.

Thus, total number of surjections from

$$A \text{ to } B = 2^4 - 2 = 14.$$

Exercise for Session 8

1. There are exactly two distinct linear functions, which map $[-1, 1]$ onto $[0, 3]$. Find the point of intersection of the two functions.

2. Let f be one-one function with domain $\{x, y, z\}$ and range $\{1, 2, 3\}$. It is given that exactly one of the following statement is true and remaining two are false.
$f(x) = 1, f(y) \neq 1, f(z) \neq 2$. Determine $f^{-1}(1)$.

3. Let $A = R - \{3\}$, $B = R - \{1\}$ and $f : A \to B$ defined by $f(x) = \dfrac{x-2}{x-3}$. Is 'f' bijective? Give reasons.

4. Let $f : R \to R$ defined by $f(x) = \dfrac{x^2}{1+x^2}$. Prove that f is neither injective nor surjective.

5. If the function $f : R \to A$, given by $f(x) = \dfrac{x^2}{x^2+1}$ is surjection, find A.

6. If the function $f : R \to A$, given by $f(x) = \dfrac{e^x - e^{-|x|}}{e^x + e^{|x|}}$ is surjection, find A.

7. Let $f(x) = ax^3 + bx^2 + cx + d \sin x$. Find the condition that $f(x)$ is always one-one function.

8. Let $f : X \to Y$ be a function defined by $f(x) = a \sin\left(x + \dfrac{\pi}{4}\right) + b \cos x + c$. If f is both one-one and onto, find the sets X and Y.

Session 9

Identical (or Equal) Functions

Identical (or Equal) Functions

Two functions f and g are said to be identical (or equal) functions, if

(i) the domain of f = the domain of g,

(ii) the range of f = the range of g, and

(iii) $f(x) = g(x), \forall\ x \in$ domain.

Examples of Equal or Identical Functions

(i) $f(x) = \ln x^2, g(x) = 2 \ln x$ (NI)

$f(x) = \text{cosec } x, g(x) = \dfrac{1}{\sin x}$ (I)

(ii) $f(x) = \cot(\cot^{-1} x), g(x) = x$ (I)

$f(x) = \tan x, g(x) = \dfrac{1}{\cot x}$ (NI)

(iii) $f(x) = \sin^{-1}(3x - 4x^3), g(x) = 3 \sin^{-1} x$ (NI)

(iv) $f(x) = \text{sgn}(x^2 + 1), g(x) = \sin^2 x + \cos^2 x$ (I)

(v) $f(x) = \tan^2 x \cdot \sin^2 x, g(x) = \tan^2 x - \sin^2 x$ (I)

(vi) $f(x) = \sec^2 x - \tan^2 x, g(x) = 1$ (NI)

(vii) $f(x) = \log_x e, g(x) = \dfrac{1}{\log_e x}$ (I)

(viii) $f(x) = \tan(\cot^{-1} x), g(x) = \cot(\tan^{-1} x)$ (I)

(ix) $f(x) = \sqrt{x^2 - 1}, g(x) = \sqrt{x - 1} \cdot \sqrt{x + 1}$ (NI)

(x) $f(x) = \tan x \cdot \cot x, g(x) = \sin x \cdot \text{cosec } x$ (NI)

(xi) $f(x) = e^{\ln e^x}, g(x) = e^x$ (I)

(xii) $f(x) = \sqrt{\dfrac{1 - \cos 2x}{2}}, g(x) = \sin x$ (NI)

(xiii) $f(x) = \sqrt{x^2}, \ g(x) = (\sqrt{x})^2$ (NI)

(xiv) $f(x) = \log(x + 2) + \log(x - 3)$,
$g(x) = \log(x^2 - x - 6)$ (NI)

(xv) $f(x) = x \mid x \mid, g(x) = x^2 \text{ sgn } x$ (I)

(xvi) $f(x) = \lim\limits_{n \to \infty} \dfrac{x^{2n} - 1}{x^{2n} + 1}, g(x) = \text{sgn}(\mid x \mid - 1)$ (I)

(xvii) $f(x) = \sin(\sin^{-1} x), g(x) = \cos(\cos^{-1} x)$ (I)

(xviii) $f(x) = \dfrac{1}{1 + \dfrac{1}{x}}, g(x) = \dfrac{x}{1 + x}$ (NI)

(xix) $f(x) = e^{\ln \sec^{-1} x}, g(x) = \sec^{-1} x$ (NI)

Identical, if $x \in (-\infty, -1] \cup [1, \infty)$

(xx) $F(x) = (fog)(x), G(x) = (gof)(x)$, where $f(x) = e^x$, $g(x) = \ln x$ (NI)

Example 99 ***If*** $f(x) = \log_{x^2} 25$ ***and*** $g(x) = \log_x 5$***, then*** $f(x) = g(x)$ ***holds, now find the interval for*** x**.**

Sol. Domain of $f \in R - \{\pm 1, 0\}$

Domain of $g \in (0, \infty) - \{1\}$

For $f(x) = g(x)$,

domain of f = domain of g.

i.e., $f(x) = g(x)$, if $x \in (0, \infty) - \{1\}$

Example 100 Let $A = \{1, 2\}$, $B = \{3, 6\}$ and $f : A \to B$ given by $f(x) = x^2 + 2$ and $g : A \to B$ given by $g(x) = 3x$. Find whether they equal or not.

Sol. $f(1) = 3, f(2) = 6$

$g(1) = 3, g(2) = 6$

which shows $f(x)$ and $g(x)$ have same domains and range, thus $f = g$.

Example 101 Which pair of functions is identical?

(a) $\sin^{-1}(\sin x)$ and $\sin(\sin^{-1} x)$

(b) $\log_e e^x$, $e^{\log_e x}$

(c) $\log_e x^2, 2 \log_e x$

(d) None of the above

Sol. Here, (a) $\sin^{-1}(\sin x)$ is defined for $x \in \left[-\dfrac{\pi}{2}, \dfrac{\pi}{2}\right]$,

while $\sin(\sin^{-1} x)$ is defined only for $x \in [-1, 1]$.

(b) $\log_e e^x$ is defined for all x,

while $e^{\log_e x}$ is defined for $x > 0$.

(c) $\log_e x^2$ is defined for all $x \in R - \{0\}$, while $2 \log_e x$ is defined for $x > 0$.

$\therefore$ None is identical.

Hence, (d) is the correct answer.

Exercise for Session 9

- **Directions** (Q. Nos. 1 to 10) *Which of the following are identical (or equal) functions?*

1. $f(x) = \ln e^{x^2}, g(x) = e^{\ln x}$
2. $f(x) = \sec x, g(x) = \dfrac{1}{\cos x}$
3. $f(x) = \sec^{-1} x + \operatorname{cosec}^{-1} x,\ g(x) = \dfrac{\pi}{2}$
4. $f(x) = \cot^2 x \cdot \cos^2 x,\ g(x) = \cot^2 x - \cos^2 x$
5. $f(x) = \operatorname{sgn}(\cot^{-1} x), g(x) = \operatorname{sgn}(x^2 - 4x + 5)$
6. $f(x) = \log_e x,\ g(x) = \dfrac{1}{\log_x e}$
7. $f(x) = \sqrt{1 - x^2}, g(x) = \sqrt{1 - x} \cdot \sqrt{1 + x}$
8. $f(x) = \dfrac{1}{|x|}, g(x) = \sqrt{x^{-2}}$
9. $f(x) = [\{x\}], g(x) = \{[x]\}$ [Note that $f(x)$ and $g(x)$ are constant functions]
10. $f(x) = e^{\ln \cot^{-1} x}, g(x) = \cot^{-1} x$

Session 10

Composite Functions

Composite Functions

Let us consider two functions, $f : X \to Y_1$ and $g : Y_1 \to Y$.
We define function $h : X \to Y$, such that,
$h(x) = g(f(x)) = (gof)(x)$.

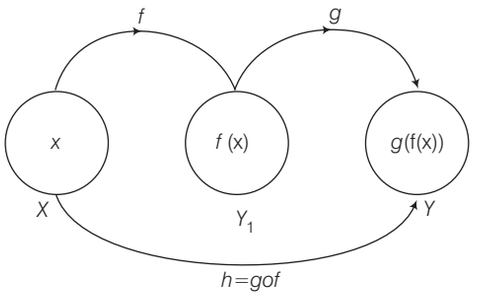

Figure 3.41

To obtain $h(x)$, we first take f-image of an element $x \in X$ so that $f(x) \in Y_1$, which is the domain of $g(x)$. Then, we take g-image of $f(x)$, i.e. $g(f(x))$ which would be an element of Y.

The diagram below shows the steps to be taken

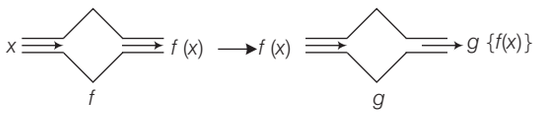

Figure 3.42

The function h defined in the diagram is called composition of f and g, and is denoted by (gof). Clearly,
domain $(gof) = \{X : x \in \text{domain}(f), f(x) \in \text{domain}(g)\}$.
Similarly, we can write, $(fog)(x) = f\{g(x)\}$
and domain $(fog) = \{x : x \in \text{domain}(g), g(x) \in \text{domain } f\}$
In general, $fog \neq gof$.

Properties of Composite Functions

(i) It should be noted that *gof* exists, iff the range of $f \subseteq$ domain of g. Similarly, *fog* exists; iff the range of $g \subseteq$ domain of f.

(ii) Composite of functions is not commutative, i.e. $gof \neq fog$.

(iii) Composite of functions is associative, i.e. if f, g and h are three functions such that $fo(foh)$ and $(fog)oh$ are defined, then $fo(goh) = (fog)oh$.
e.g. Associativity $f : (N) \to I_0 \qquad f(x) = 2x$

$q : I_0 \to Q \qquad g(x) = \frac{1}{x}$

$h : Q \to R \qquad h(x) = e^{1/x}$

$(hog)\,of = ho\,(gof) = e^{2x}$

(iv) The composite of two bijections is a bijection, i.e. if f and g are two bijections such that *gof* is defined, then *gof* is also a bijection.

Proof $f : A \to B$ and $g : B \to C$ be two bijections. Then, *gof* exists such that $gof : A \to C$.

We have to prove that *gof* is one-one and onto.

One-One Let $a_1, a_2 \in A$ such that $(gof)(a_1) = (gof)(a_2)$, then

$(gof)(a_1) = (gof)(a_2) \Rightarrow g[f(a_1)] = g[f(a_2)]$

$\Rightarrow f(a_1) = f(a_2)$ [$\because g$ is one-one]

$\Rightarrow a_1 = a_2$ [$\because f$ is one-one]

$\therefore$ *gof* is also one-one function.

Onto Let $c \in C$, then $c \in C$

$\Rightarrow \exists\, b \in B$ such that $g(b) = c$ [$\because g$ is onto]

and $b \in B \Rightarrow \exists\, a \in A$ such that $f(a) = b$ [$\because f$ is onto]

Therefore, we see that

$c \in C \Rightarrow \exists\, a \in A$ such that $(gof)(a) = g[f(a)] = g(g) = c$

i.e. Every element of C is the *gof* image of some element of A. As such *gof* is an onto function. Hence, *gof* being one-one and onto is a bijection.

(v) f is even, g is even $\Rightarrow$ *fog* is even function.

(vi) f is odd, g is odd $\Rightarrow$ *fog* is odd function.

(vii) f is even, g is odd $\Rightarrow$ *fog* is even function.

(viii) f is odd, g is even $\Rightarrow$ *fog* is even function.

Example 102 Let $f : A \to B$ and $g : B \to C$ be functions and $gof : A \to C$. Which of the following statements is true?

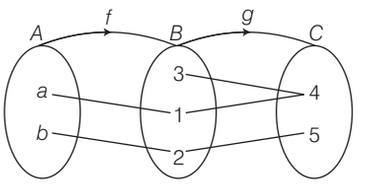
(a) If *gof* is one-one, then f and g both are one-one

(b) If *gof* is one-one, then f is one-one

(c) If *gof* is a bijection, then f is one-one and g is onto

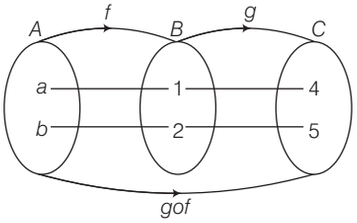
(d) If f and g are both one-one, then *gof* is one-one

Sol. (a) As shown *gof* is one-one, but g is many-one.



$\Rightarrow$ (a) is not correct.

(b) If gof is one-one, then f is also one-one,
if f is many-one, then gof cannot be one-one.



$\Rightarrow$ (c) and (d) are obviously true.
Hence, (b), (c) and (d) are correct answers.

Example 103 If $f:R\to R, f(x)=x^2$ and $g:R\to R$; $g(x)=2x+1$. Find fog and gof, also show $fog\neq gof$.

Sol. $\because$ $(gof)(x)=g\{f(x)\}=g\{x^2\}$

$$(gof)(x)=2x^2+1 \text{ and}$$

$$(fog)(x)=f\{g(x)\}=f(2x+1)$$

$$(fog)(x)=(2x+1)^2$$

where $(2x^2+1)\neq(2x+1)^2$. Therefore, $(gof)\neq(fog)$.

Example 104 Let $g(x)=1+x-[x]$

and $$f(x)=\begin{cases}-1, & x<0\\ 0, & x=0.\\ 1, & x>0\end{cases}$$

Then, for all x, find $f(g(x))$. ***[IIT JEE 2001]***

Sol. Here, $g(x)=1+x-[x]$

$\Rightarrow$ $g(x)=1+\{x\}$ [as $x-[x]=\{x\}$]

i.e. $g(x)\geq 1$.

So, $f(g(x))=1$. Since, $f(x)=1$ for all $x>0$.

Thus, $f(g(x))=1$, for all $x\in R$.

Example 105 Let $f(x)=\begin{cases}1+x, & 0\leq x\leq 2\\ 3-x, & 2<x\leq 3\end{cases}$,

find $(fof)(x)$.

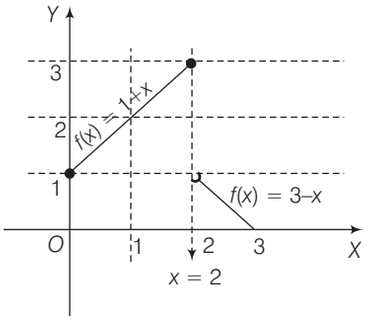
Sol. Clearly, $fof(x)=f\{f(x)\}=\begin{cases}f(1+x), & 0\leq x\leq 2\\ f(3-x), & 2<x\leq 3\end{cases}$

$$=\begin{cases}f(1+x), & 0\leq x\leq 1\\ f(1+x), & 1\leq x\leq 2\\ f(3-x), & 2<x\leq 3\end{cases}$$

$$=\begin{cases}1+(1+x), & 0\leq x\leq 1\\ 3-(1+x), & 1<x\leq 2\\ 1+(3-x), & 2<x\leq 3\end{cases}$$

$$=\begin{cases}2+x, & 0\leq x\leq 1\\ 2-x, & 1<x\leq 2\\ 4-x, & 2<x\leq 3\end{cases}$$

Aliter $f(x)$ can be expressed graphically as shown in figure below;



when

$0\leq f(x)<1; 2<x\leq 3$ where $f(x)=3-x$.

$1\leq f(x)\leq 2; 0\leq x\leq 1$ where $f(x)=1+x$.

$2<f(x)\leq 3; 1\leq x\leq 2$ where $f(x)=1+x$.

Thus, $(fof)(x)=\begin{cases}1+f(x), & 0\leq f(x)\leq 2\\ 3-f(x), & 2<f(x)\leq 3\end{cases}$

$$(fof)(x)=\begin{cases}1+f(x), & 0\leq f(x)<1\\ 1+f(x), & 1\leq f(x)\leq 2\\ 3-f(x), & 2<f(x)\leq 3\end{cases}$$

$$(fof)(x)=\begin{cases}1+(3-x), & 2<x\leq 3\\ 1+(1+x), & 0\leq x\leq 1\\ 3-(1+x), & 1<x\leq 2\end{cases}$$

$$(fof)(x)=\begin{cases}4-x, & 2<x\leq 3\\ 2+x, & 0\leq x\leq 1\\ 2-x, & 1<x\leq 2\end{cases}$$

$$(fof)(x)=\begin{cases}2+x, & 0\leq x\leq 1\\ 2-x, & 1<x\leq 2\\ 4-x, & 2<x\leq 3\end{cases}$$

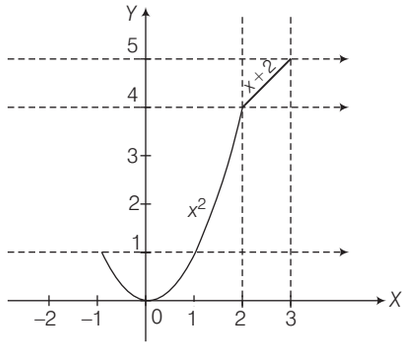
Example 106 Let $f(x)=\begin{cases}x+1, & x\leq 1\\ 2x+1, & 1<x\leq 2\end{cases}$

and $g(x)=\begin{cases}x^2, & -1\leq x<2\\ x+2, & 2\leq x\leq 3\end{cases}$.

Find (fog).

Sol. $f(g(x))=\begin{cases}g(x)+1, & g(x)\leq 1\\ 2g(x)+1, & 1<g(x)\leq 2\end{cases}$

Here, $g(x)$ becomes the variable that means we should draw the graph. It is clear that $g(x) \le 1;\ \forall\ x \in [-1, 1]$



and $1 < g(x) \le 2;\ \forall\ x \in (1, \sqrt{2}]$.

$$\therefore \quad f(g(x)) = \begin{cases} x^2 + 1, & -1 \le x < 1 \\ 2x^2 + 1, & 1 < x \le \sqrt{2} \end{cases}$$

Example 107 If $f(x) = 2x + |x|$, $g(x) = \frac{1}{3}(2x - |x|)$ and $h(x) = f(g(x))$, domain of $\underbrace{\sin^{-1}(h(h(h(h \ldots h(x) \ldots))))}_{n \text{ times}}$ is

(a) $[-1, 1]$ (b) $\left[-1, -\frac{1}{2}\right] \cup \left[\frac{1}{2}, 1\right]$

(c) $\left[-1, -\frac{1}{2}\right]$ (d) $\left[\frac{1}{2}, 1\right]$

Sol. Since, $f(x) = \begin{cases} 2x + x, & x \ge 0 \\ 2x - x, & x < 0 \end{cases} = \begin{cases} 3x, & x \ge 0 \\ x, & x < 0 \end{cases}$

and $g(x) = \frac{1}{3}\begin{cases} 2x - x, & x \ge 0 \\ 2x + x, & x < 0 \end{cases} = \begin{cases} \frac{x}{3}, & x \ge 0 \\ x, & x < 0 \end{cases}$

$$\therefore \quad f(g(x)) = \begin{cases} 3\left(\frac{x}{3}\right), & x \ge 0 \\ x, & x < 0 \end{cases}$$

$\Rightarrow \quad f(g(x)) = x, \forall\ x \in R$

$\therefore \quad h(x) = x$

$\Rightarrow \sin^{-1}(h(h(h \ldots h(x) \ldots))) = \sin^{-1} x$

$\therefore$ Domain of $\sin^{-1}(h(h(h(h \ldots h(x) \ldots))))$ is $[-1, 1]$.

Hence, (a) is the correct answer.

Example 108 ***A function*** $f : R \to R$ ***satisfies***

$$\sin x \cos y\,(f(2x + 2y) - f(2x - 2y)) = \cos x \sin y\,(f(2x + 2y) + f(2x - 2y)).$$

If $f'(0) = \frac{1}{2}$, ***then***

(a) $f''(x) = f(x) = 0$ (b) $4f''(x) + f(x) = 0$

(c) $f''(x) + f(x) = 0$ (d) $4f''(x) - f(x) = 0$

Sol. We have, $\frac{f(2x + 2y)}{f(2x - 2y)} = \frac{\sin(x + y)}{\sin(x - y)}$

$$\Rightarrow \quad \frac{f(\alpha)}{\sin\frac{\alpha}{2}} = \frac{f(\beta)}{\sin\frac{\beta}{2}} = K$$

$$\Rightarrow \quad f(x) = K \sin\frac{x}{2}$$

$$\Rightarrow \quad f'(x) = \frac{K}{2}\cos\frac{x}{2}$$

and $f''(x) = \frac{-K}{4}\sin\frac{x}{2}$

$\Rightarrow \quad 4f''(x) + f(x) = 0$

Hence, (b) is the correct answer.

Exercise for Session 10

1. Consider the real-valued function satisfying $2f(\sin x) + f(\cos x) = x$. Find the domain and range of $f(x)$.
2. If $f(x)$ is defined in $[-3, 2]$, find the domain of definition of $f([|x|])$ and $f([2x + 3])$.
3. $f(x) = \begin{cases} x - 1, & -1 \le x \le 0 \\ x^2, & 0 < x \le 1 \end{cases}$ and $g(x) = \sin x$. Find $h(x) = f(|g(x)|) + |f(g(x))|$.
4. Let $f(x)$ be defined on $[-2, 2]$ and is given by $f(x) = \begin{cases} -1, & -2 \le x \le 0 \\ x - 1, & 0 \le x \le 2 \end{cases}$ and $g(x) = f(|x|) + |f(x)|$, find $g(x)$.
5. Let two functions are defined as $g(x) = \begin{cases} x^2, & -1 \le x < 2 \\ x + 2, & 2 \le x \le 3 \end{cases}$ and $f(x) = \begin{cases} x + 1, & x \le 1 \\ 2x + 1, & 1 < x \le 2 \end{cases}$, find gof.

Session 11

Inverse of a Function

Inverse of a Function

Let $f: A \to B$ be a one-one and onto function, then there exists a unique function, $g: B \to A$ such that $f(x) = y \Leftrightarrow g(y) = x, \ \forall \ x \in A$ and $y \in B$.

Then, g is said to be inverse of f.

Thus, $g = f^{-1}: B \to A = \{(f(x), x) | (x, f(x)) \in f\}$

Let us consider a one-one function with domain A and range B.

Where, $A = \{1, 2, 3, 4\}$ and $B = \{2, 4, 6, 8\}$ and $f: A \to B$ is given by $f(x) = 2x$, then write f and f^{-1} as a set of ordered pairs.

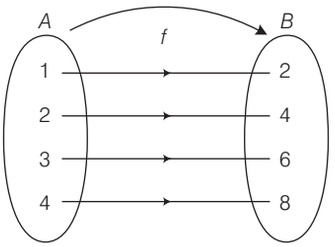


Figure 3.43

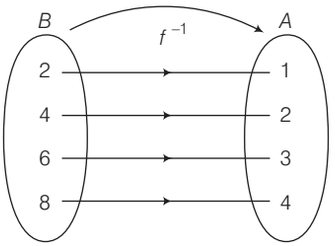

Figure 3.44

Here, member $y \in B$ arises from one and only one member $x \in A$.

So, $f = \{(1, 2)(2, 4)(3, 6)(4, 8)\}$

and $f^{-1} = \{(2, 1)(4, 2)(6, 3)(8, 4)\}$

In above function,

Domain of $f = \{1, 2, 3, 4\} =$ Range of f^{-1}.

Range of $f = \{2, 4, 6, 8\} =$ Domain of f^{-1}.

which represents for a function to have its inverse, it must be **one-one onto** or **bijective**.

Example 109 If $f(x) = 3x - 5$, find $f^{-1}(x)$.

Sol. Here, $f(x) = 3x - 5$

which is clearly bijective as it is linear in x.

Now, let $f(x) = y \Rightarrow y = 3x - 5$

$\Rightarrow \quad x = \dfrac{y+5}{3}$

$\Rightarrow \quad f^{-1}(y) = \dfrac{y+5}{3}$ [as $f(x) = y \Rightarrow x = f^{-1}(y)$]

Therefore, $f^{-1}(x) = \dfrac{x+5}{3}$

Example 110 If $f: [1, \infty) \to [2, \infty)$ is given by $f(x) = x + \dfrac{1}{x}$, find $f^{-1}(x)$, (assume bijection). ***[IIT JEE 2001, 2002]***

Sol. Let $y = f(x)$

$\therefore \quad y = \dfrac{x^2+1}{x} \quad \Rightarrow \quad x^2 - xy + 1 = 0$

$\Rightarrow \quad x = \dfrac{y \pm \sqrt{y^2-4}}{2}$

$\Rightarrow \quad f^{-1}(y) = \dfrac{y \pm \sqrt{y^2-4}}{2}$ [as $f(x) = y \Rightarrow x = f^{-1}(y)$]

$\Rightarrow \quad f^{-1}(x) = \dfrac{x \pm \sqrt{x^2-4}}{2}$

Since, range of inverse function is $[1, \infty)$, therefore neglecting the negative sign, we have

$$f^{-1}(x) = \frac{x + \sqrt{x^2-4}}{2}$$

Example 111 ***Let $f(x) = x^3 + 3$ be bijective, then find its inverse.***

Sol. Let $y = x^3 + 3$ [i.e. $y = f(x)$]

$\Rightarrow \quad x^3 = y - 3$

$\Rightarrow \quad x = (y-3)^{1/3}$

$\Rightarrow \quad f^{-1}(y) = (y-3)^{1/3}$ [$y = f(x) \Rightarrow f^{-1}(y) = x$]

$\Rightarrow \quad f^{-1}(x) = (x-3)^{1/3}$

Thus, $f^{-1}(x) = (x-3)^{1/3}$

when $f(x) = x^3 + 3$ is bijective.

Example 112 Find the inverse of the function, (assuming onto).

$$y = \log_a (x + \sqrt{x^2 + 1}),\ (a > 1).$$

Sol. We have, $y = \log_a(x + \sqrt{x^2 + 1})$

Since, $\sqrt{x^2 + 1} > |x|$

$\therefore$ It is defined for all x.

Now, $y = \log_a(x + \sqrt{x^2 + 1})$,

which is strictly increasing when $a > 1$.

Thus, one-one. Also, given that $f(x)$ is onto.

[where $y = f(x)$]

Hence, the given function is invertible.

Now, $y = \log_a (x + \sqrt{x^2 + 1})$

$\Rightarrow$ $a^y = x + \sqrt{x^2 + 1}$ and $a^{-y} = \sqrt{x^2 + 1} - x$

$\Rightarrow$ $x = \frac{1}{2}(a^y - a^{-y})$

Hence, the inverse in the form $y = f^{-1}(x)$ is,

$$y = \frac{1}{2}(a^x - a^{-x})$$

Graphical Representation of Invertible Functions

Let (h, k) be a point on the graph of the function f. Then, (k, h) is the corresponding point on the graph of inverse of f, i.e. g.

The line segment joining the points (h,k) and (k,h) is bisected at right angle by the line $y = x$.

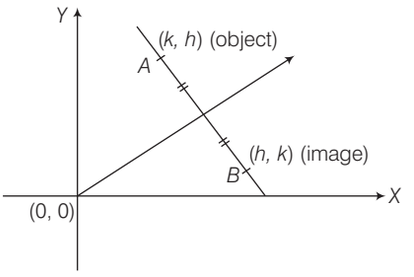

Figure 3.45

So, that the two points play object-image role in the line $y = x$ as plane mirror.

It follows that the graph of $y = f(x)$ and its inverse written in form $y = g(x)$ are symmetrical about the line $y = x$.

The graphs $y = f(x)$ and $y = f^{-1}(x)$, if they intersect then they meet on the line $y = x$ only. Hence, the solutions of $f(x) = f^{-1}(x)$ are also the solutions of $f(x) = x$.

Example 113 Let $f: R \to R$ be defined by $f(x) = \frac{e^x - e^{-x}}{2}$. Is $f(x)$ invertible? If so, find its inverse.

Sol. Let us check for invertibility of $f(x)$.

(a) **One-one** Here, $f'(x) = \frac{e^x + e^{-x}}{2}$

$\Rightarrow$ $f'(x) = \frac{e^{2x} + 1}{2e^x}$, which is strictly increasing as $e^{2x} > 0$ for all x. Thus, it is one-one.

(b) **Onto** Let $y = f(x)$

$\Rightarrow$ $y = \frac{e^x - e^{-x}}{2}$, where y is strictly monotonic.

Hence, range of $f(x) = (f(-\infty), f(\infty))$

$\Rightarrow$ Range of $f(x) = (-\infty, \infty)$

So, range of $f(x) =$ codomain

Hence, $f(x)$ is one-one and onto.

(c) **To find f^{-1}** $y = \frac{e^{2x} - 1}{2e^x}$

$\Rightarrow$ $e^{2x} - 2e^x y - 1 = 0 \Rightarrow e^x = \frac{2y \pm \sqrt{4y^2 + 4}}{2}$

$\Rightarrow$ $x = \log (y \pm \sqrt{y^2 + 1})$

$\Rightarrow$ $f^{-1}(y) = \log (y \pm \sqrt{y^2 + 1})$

[as $f(x) = y \Rightarrow x = f^{-1}(y)$]

Since, $e^{f^{-1}(x)}$ is always positive.

So, neglecting the negative sign.

Hence, $f^{-1}(x) = \log (x + \sqrt{x^2 + 1})$

Example 114 Let $f: [1/2, \infty) \to [3/4, \infty)$, where $f(x) = x^2 - x + 1$. Find the inverse of $f(x)$. Hence, solve the equation $x^2 - x + 1 = \frac{1}{2} + \sqrt{x - \frac{3}{4}}$.

Sol. (a) $f(x) = x^2 - x + 1$

$\Rightarrow f(x) = \left(x - \frac{1}{2}\right)^2 + \frac{3}{4}$, which is clearly one-one and onto in given domain and codomain.

Thus, its inverse can be obtained.

Let $y = \left(x - \frac{1}{2}\right)^2 + \frac{3}{4}$

$\Rightarrow$ $x - \frac{1}{2} = \pm\sqrt{y - \frac{3}{4}}$ $\Rightarrow$ $x = \frac{1}{2} \pm \sqrt{y - \frac{3}{4}}$

$\Rightarrow$ $f^{-1}(y) = \frac{1}{2} + \sqrt{y - \frac{3}{4}}$ $[f(x) = y \Rightarrow x = f^{-1}(y)]$

[neglecting – ve sign as x is always +ve]

$$\Rightarrow \quad f^{-1}(x) = \frac{1}{2} + \sqrt{x - \frac{3}{4}}$$

(b) To solve $x^2 - x + 1 = \frac{1}{2} + \sqrt{x - \frac{3}{4}}$, since solution of $f(x) = f^{-1}(x)$ are solutions of $f(x) = x$.

i.e. $\quad f(x) = x \Rightarrow x^2 - x + 1 = x$

$\Rightarrow \quad x^2 - 2x + 1 = 0 \Rightarrow (x-1)^2 = 0$

$\therefore\ x = 1$ is the required solution.

Properties of Inverse Functions

(i) *The inverse of a bijection is unique.*

Proof Let $f : A \to B$ be a bijection. If possible let $g : B \to A$ and $h : B \to A$ be two inverse functions of f. Also, let $a_1, a_2 \in A$ and $b \in B$ such that $g(b) = a_1$ and $h(b) = a_2$, then $g(b) = a_1 \Rightarrow f(a_1) = b$

$$h(b) = a_2 \Rightarrow f(a_2) = b$$

But, since f is one-one, so $f(a_1) = f(a_2) \Rightarrow a_1 = a_2$

$$\Rightarrow \quad g(b) = h(b), \forall\ b \in B$$

(ii) *If $f : A \to B$ is a bijection and $g : B \to A$ is the inverse of f, then $fog = I_B$ and $gof = I_A$, where I_A and I_B are identity functions on the sets A and B, respectively.*

Remarks

(a) The graphs of f and g are the mirror images of each other in the line $y = x$. As shown, in the figure given below a point (x', y') corresponding to $y = x^2 (x \geq 0)$ changes to (y', x') corresponding to $y = +\sqrt{x}$, the changed form of $x = \sqrt{y}$.

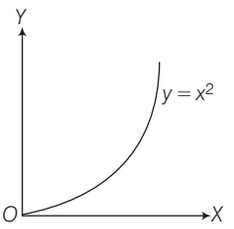

Figure 3.46

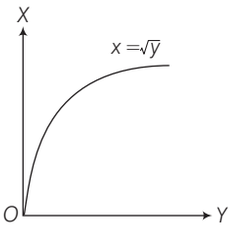

Figure 3.47

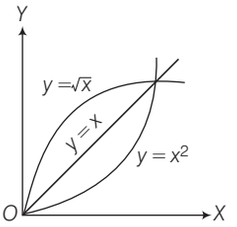

Figure 3.48

(b) If $f(x)$ has its own inverse as in $f(x) = \frac{1}{x}$, then $f(x) = f^{-1}(x)$ will have infinite solutions but $f(x) = f^{-1}(x) = x$ will have only one solution.

(iii) *The inverse of a bijection is also a bijection.*

Proof Let $f : A \to B$ be a bijection and $g : B \to A$ be its inverse. We have to show that g is one-one and onto.

One-one Let $g(b_1) = a_1$ and

$g(b_2) = a_2 : a_1, a_2 \in A$ and $b_1, b_2 \in B$

Then, $\quad g(b_1) = g(b_2)$

$\Rightarrow \quad a_1 = a_2$

$\Rightarrow \quad f(a_1) = f(a_2)$

$\Rightarrow \quad b_1 = b_2 \qquad [\because f$ is a bijection$]$

$[\because g(b_1) = a_1 \Rightarrow b_1 = f(a_1), g(b_2) = a_2 \Rightarrow\ b_2 = f(a_2)]$

which proves that g is one-one.

Onto Again, if $a \in A$, then

$a \in A \Rightarrow \exists\, b \in B$ such that $f(a) = b$ [by definition of f]

$\Rightarrow \exists\, b \in B$ such that $g(b) = a \ [\because f(a) = b \Rightarrow a = g(b)]$

which proves that g is onto.

Hence, g is also a bijection.

(iv) If f *and* g are two bijections $f : A \to B, g : B \to C$, then the inverse of gof exists and $(gof)^{-1} = f^{-1}og^{-1}$.

Proof Since, $f : A \to B$ and $g : B \to C$ are two bijections.

$\therefore\ gof : A \to C$ is also a bijection.

[by theorem, the composite of two bijections is a bijection]

As such gof has an inverse function $(gof)^{-1} : C \to A$.

We have to show that $(gof)^{-1} = f^{-1}og^{-1}$.

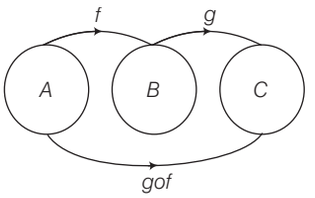

Figure 3.49

Now, let $a \in A, b \in B, c \in C$ such that

$$f(a) = b \text{ and } g(b) = c$$

So, $\quad (gof)(a) = g[f(a)] = g(b) = c$

Now, $\quad f(a) = b \Rightarrow\ a = f^{-1}(b) \qquad \ldots(i)$

$$g(b) = c \Rightarrow\ b = g^{-1}(c) \qquad \ldots(ii)$$

$$(gof)(a) = c \Rightarrow\ a = (gof)^{-1}(c) \qquad \ldots(iii)$$

Also, $(f^{-1}og^{-1})(c) = f^{-1}[g^{-1}(c)]$ [by definition]

$= f^{-1}(b)$ [by Eq. (ii)]

$= a$ [by Eq. (i)]

$= (gof)^{-1}(c)$ [by Eq. (iii)]

$\therefore \quad (gof)^{-1} = f^{-1}og^{-1}$,

which proves the theorem.

Example 115 Let $g(x)$ be the inverse of $f(x)$ and $f'(x) = \frac{1}{1+x^3}$. Find $g'(x)$ in terms of $g(x)$.

Sol. We know, if $g(x)$ is inverse of $f(x)$.

$\Rightarrow \quad g\{f(x)\} = x \Rightarrow g'\{f(x)\} \cdot f'(x) = 1$

$\Rightarrow g'\{f(x)\} = \frac{1}{f'(x)} = 1 + x^3 \Rightarrow g'\{f(g(x))\} = 1 + (g(x))^3$

$\Rightarrow \quad g'(x) = 1 + (g(x))^3 \qquad [\because f(g(x)) = x]$

Example 116 ***If*** $f : R \to R$ ***is defined by*** $f(x) = x^2 + 1$, ***find the value of*** $f^{-1}(17)$ ***and*** $f^{-1}(-3)$***.***

Sol. $f(x) = x^2 + 1$; $f^{-1}(17) \Rightarrow f(x) = 17 \Rightarrow x^2 + 1 = 17$

$\Rightarrow \quad x = \pm 4$ and $f^{-1}(-3)$

$\Rightarrow \quad f(x) = -3 \Rightarrow x^2 + 1 = -3$

$\Rightarrow \quad x^2 = -4$ [which is not possible]

Hence, $f^{-1}(17) = \pm 4$ and $f^{-1}(-3) = \phi$

Example 117 If the function f and g are defined as $f(x) = e^x$ and $g(x) = 3x - 2$, where $f : R \to R$ and $g : R \to R$, find the function fog and gof. A***lso,*** find the domain of $(fog)^{-1}$ and $(gof)^{-1}$.

Sol. $(fog)(x) = f\{g(x)\}$

$\Rightarrow \quad f\{g(x)\} = f(3x - 2)$

$\Rightarrow \quad f\{g(x)\} = e^{3x-2}$ ...(i)

and $(gof)(x) = g\{f(x)\}$

$\Rightarrow \quad g\{f(x)\} = g\{e^x\}$

$\Rightarrow \quad g\{f(x)\} = 3e^x - 2$ ...(ii)

For finding $(fog)^{-1}$ and $(gof)^{-1}$.

Let $(fog)(x) = y = e^{3x-2}$

$\Rightarrow \quad 3x - 2 = \log y \quad \Rightarrow \quad x = \frac{\log y + 2}{3}$

$\Rightarrow \quad (fog)^{-1} y = \frac{\log y + 2}{3}$ and $(fog)^{-1} x = \frac{\log x + 2}{3}$

and domain of $(fog)^{-1}$ is $x > 0$, i.e. $x \in (0, \infty)$.

Again, let $(gof)x = y = 3e^x - 2 \Rightarrow e^x = \frac{y+2}{3}$

$\Rightarrow \quad x = \log\left(\frac{y+2}{3}\right)$

$\Rightarrow \quad (gof)^{-1} y = \log\left(\frac{y+2}{3}\right)$

$\Rightarrow \quad (gof)^{-1} x = \log\left(\frac{x+2}{3}\right)$

and domain of $(gof)^{-1}$ is $\frac{x+2}{3} > 0$.

Hence, domain of $(gof)^{-1}$ is $x > -2$, i.e. $x \in (-2, \infty)$.

Example 118 If $f(x) = ax + b$ and the equation $f(x) = f^{-1}(x)$ be satisfied by every real value of x, then

(a) $a = 2, b = -1$ (b) $a = -1, b \in R$

(c) $a = 1, b \in R$ (d) $a = 1, b = -1$

Sol. If $f(x) = ax + b$

$\Rightarrow \quad f^{-1}(x) = \frac{x}{a} - \frac{b}{a}$

Since, $f(x) = f^{-1}(x), \forall \ x \in R$

$\Rightarrow \quad \frac{1}{a} = a$ and $b = -\frac{b}{a} \Rightarrow a = -1$ and $b \in R$

Hence, (b) is the correct answer.

Example 119 If $g(x)$ is the inverse of $f(x)$ and $f'(x) = \sin x$, then $g'(x)$ is equal to

(a) $\sin(g(x))$ (b) $\text{cosec}(g(x))$

(c) $\tan(g(x))$ (d) None of these

Sol. Given, $g(x) = f^{-1}(x)$

So, $x = f(g(x))$

On differentiating w.r.t. 'x', we get $1 = f'(g(x)) \cdot g'(x)$

Therefore, $g'(x) = \frac{1}{f'(g(x))} = \frac{1}{\sin(g(x))}$

$\therefore \quad g'(x) = \text{cosec}(g(x))$

Hence, (b) is the correct answer.

Example 120 If A and B are the points of intersection of $y = f(x)$ and $y = f^{-1}(x)$, then

(a) A and B necessarily lie on the line $y = x$

(b) A and B must be coincident

(c) slope of line AB may be -1

(d) None of the above

Sol. If solution of $f(x) = f^{-1}(x)$ doesn't lie on $y = x$, then they must be of the form (α, β) and (β, α).

$\therefore$ Slope of line AB may be -1. Hence, (c) is the correct answer.

General Results

If x, y are independent variables, then

(i) $f(xy) = f(x) + f(y) \Rightarrow f(x) = k \ln x$ or $f(x) = 0$.

(ii) $f(xy) = f(x) \cdot f(y) \Rightarrow f(x) = x^n, n \in R$.

(iii) $f(x + y) = f(x) \cdot f(y) \Rightarrow f(x) = a^{kx}$.

(iv) $f(x + y) = f(x) = f(y) \in f(x) = k$, where k is constant.

(v) $f(x)$ takes rational values for all $x \Rightarrow f(x)$ is a constant function.

Exercise for Session 11

1. Find the inverse of the following functions

(i) $f(x) = \sin^{-1}\left(\frac{x}{3}\right), x \in [-3, 3]$

(ii) $f(x) = \log_e (x^2 + 3x + 1), x \in [1, 3]$

(iii) $f(x) = 5^{\log_e x}, x > 0$

(iv) $f(x) = \log_e (x + \sqrt{x^2 + 1})$

(v) $f(x) = \begin{cases} x, & x < 1 \\ x^2, & 1 \le x \le 4 \\ 8\sqrt{x}, & x > 4 \end{cases}$

2. If the function $f : [1, \infty) \to [1, \infty)$ is defined by $f(x) = 2^{x(x-1)}$, then find $f^{-1}(x)$.

Session 12

Miscellaneous Problems on Functions

Miscellaneous Problems On Functions

We should consider certain examples to make the concept clear.

Example 121 For $x \in R$, the function $f(x)$ satisfies $2f(x)+f(1-x)=x^2$. The value of $f(4)$ is equal to

(a) $\frac{13}{3}$ (b) $\frac{43}{3}$ (c) $\frac{23}{3}$ (d) None of these

Sol. We have, $2f(x)+f(1-x)=x^2$ ...(i)

In Eq. (i) x is replaced by $(1-x)$, we get

$$2f(1-x)+f(x)=(1-x)^2 \quad ...(ii)$$

On solving Eqs. (i) and (ii), we get

$$\therefore \quad 2f(x)+f(1-x)=x^2 \} \times 2$$

$$\Rightarrow \quad \underline{-2f(1-x) \pm f(x)=(1-x)^2}$$

$$\Rightarrow \quad 3f(x)=2x^2-(1-x)^2$$

$$\Rightarrow \quad f(x)=\frac{1}{3}\{x^2+2x-1\}$$

$$\therefore \quad f(4)=\frac{1}{3}\{16+8-1\}=\frac{23}{3}$$

Example 122 ***Let*** $f(x)=ax^7+bx^3+cx-5$***, where*** a, b and c ***are constants. If*** $f(-7)=7$, ***find*** $f(7)$.

Sol. As, $f(x)=ax^7+bx^3+cx-5$

$$\therefore \quad f(-x)=-ax^7-bx^3-cx-5$$

$$\Rightarrow \quad f(x)+f(-x)=-10$$

Put $x=7$, $f(7)+f(-7)=-10 \Rightarrow f(7)=-17$

Example 123 If $f(x)+f\left(1-\frac{1}{x}\right)=1+x$ for $x \in R-\{0,1\}$. The value of $4f(2)$ is equal to

Sol. Here, $f(x)+f\left(1-\frac{1}{x}\right)=1+x$ ...(i)

$$\Rightarrow \quad f(y)+f\left(1-\frac{1}{y}\right)=1+y, \text{ let } y=1-\frac{1}{x}$$

$$\Rightarrow \quad f\left(1-\frac{1}{x}\right)+f\left(1-\frac{x}{x-1}\right)=1+\left(1-\frac{1}{x}\right)$$

$$\Rightarrow \quad f\left(1-\frac{1}{x}\right)+f\left(\frac{-1}{x-1}\right)=2-\frac{1}{x}$$

or $$f\left(1-\frac{1}{x}\right)+f\left(\frac{1}{1-x}\right)=2-\frac{1}{x} \quad ...(ii)$$

Also, $f(z)+f\left(1-\frac{1}{z}\right)=1+z$, put $z=\frac{1}{1-x}$

$$f\left(\frac{1}{1-x}\right)+f(1-(1-x)=1+\frac{1}{1-x}$$

$$\Rightarrow \quad f\left(\frac{1}{1-x}\right)+f(x)=1+\frac{1}{1-x} \quad ...(iii)$$

On subtracting Eq. (ii) from Eq. (iii), we get

$$f(x)-f\left(1-\frac{1}{x}\right)=\frac{1}{1-x}+\frac{1}{x}-1 \quad ...(iv)$$

From Eqs. (i) and (iv), we get

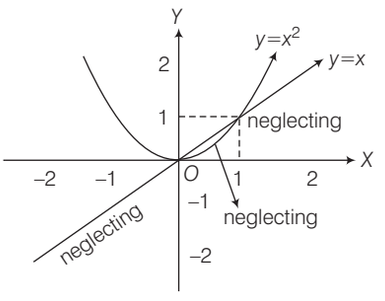
$$2f(x)=\frac{1}{1-x}+\frac{1}{x}+x$$

$$\therefore \quad 2f(2)=\frac{1}{-1}+\frac{1}{2}+2=\frac{3}{2}$$

$$\Rightarrow \quad f(2)=\frac{3}{4} \Rightarrow 4f(2)=3$$

Example 124 Let $f(x)=\max\{x, x^2\}$. Then, find equivalent definition of $f(x)$.

Sol. **Note** *These type of questions, where $f(x)$ are either maximum or minimum should be solved graphically for better representation.*



Let $f_1(x)=x$ and $f_2(x)=x^2$

Now, draw graph for $f_1(x) = x$ and $f_2(x) = x^2$.

Here, neglecting the graph, below point of intersection. Since, we want to find the maximum of two functions $f_1(x)$ and $f_2(x)$.

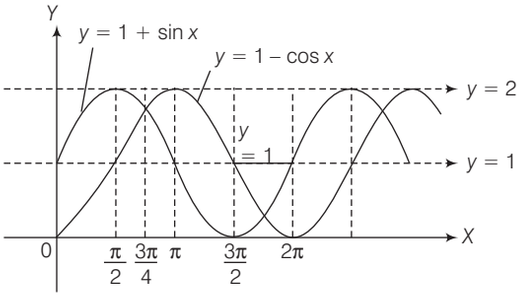
$$\therefore \quad f(x) = \begin{cases} x^2, & x \le 0 \text{ or } x \ge 1 \\ x, & 0 \le x \le 1 \end{cases}$$

Example 125 *Let*

$f(x) = \max\{1+\sin x, 1-\cos x, 1\}, \forall\ x \in [0, 2\pi]$ ***and*** $g(x) = \max\{1, |x-1|\}, \forall\ x \in R$. ***Determine*** $f\{g(x)\}$ ***and*** $g\{f(x)\}$ ***in terms of x.***

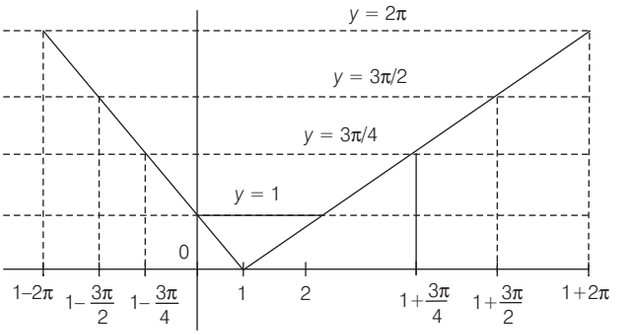
Sol. Here, $f(x) = \max\{1+\sin x, 1-\cos x, 1\}$.

Graphically it can be shown as



$$f(x) = \begin{cases} 1+\sin x, & 0 \le x \le \dfrac{3\pi}{4} \\ 1-\cos x, & \dfrac{3\pi}{4} < x \le \dfrac{3\pi}{2} \\ 1, & \dfrac{3\pi}{2} < x \le 2\pi \end{cases} \qquad \text{[using above graph]}$$

Again, $g(x) = \max\{1, |x-1|\}$, graphically it can be shown as



$$\therefore \quad g(x) = \begin{cases} 1-x, & x \le 0 \\ 1, & 0 < x \le 2 \\ x-1, & x > 2 \end{cases}$$

$$\text{Now,} \quad g\{f(x)\} = \begin{cases} 1-f(x), & f(x) \le 0 \\ 1, & 0 < f(x) \le 2 \\ f(x)-1, & f(x) > 2 \end{cases}$$

Since, $f(x) \in [1, 2], \forall\ x \in [0, 2\pi]$; $g(f(x)) = 1, \forall\ x \in [0, 2\pi]$

$$\text{Also,} \quad f\{g(x)\} = \begin{cases} 1+\sin\{g(x)\}, & 0 \le g(x) \le \dfrac{3\pi}{4} \\ 1-\cos\{g(x)\}, & \dfrac{3\pi}{4} < g(x) \le \dfrac{3\pi}{2} \\ 1, & \dfrac{3\pi}{2} < g(x) \le 2\pi \end{cases}$$

$$\Rightarrow f(g(x)) = \begin{cases} 1, & 1-2\pi \le x < 1-3\pi/2 \\ 1-\cos(1-x), & 1-3\pi/2 \le x < 1-3\pi/4 \\ 1+\sin(1-x), & 1-3\pi/4 \le x \le 0 \\ 1+\sin 1, & 0 < x \le 2 \\ 1+\sin(x-1), & 2 < x \le 1+3\pi/4 \\ 1-\cos(x-1), & 1+3\pi/4 < x \le 1+3\pi/2 \\ 1, & 1+3\pi/2 < x \le 2\pi+1 \end{cases}$$

Exercise for Session 12

1. For $x \in R - \{1\}$, the function $f(x)$ satisfies $f(x) + 2f\left(\dfrac{1}{1-x}\right) = x$. Find $f(2)$.
2. Let $f(x)$ and $g(x)$ be functions which take integers as arguments. Let $f(x+y) = f(x) + g(y) + 8$ for all integers x and y. Let $f(x) = x$ for all negative integers x and let $g(8) = 17$. Find $f(0)$.
3. The function $f : R \to R$ satisfies the condition $mf(x-1) + nf(-x) = 2|x| + 1$. If $f(-2) = 5$ and $f(1) = 1$, find $(m+n)$.
4. The equivalent definition of $f(x) = \max\{x^2, (1-x)^2, 2x(1-x)\}$, where $0 \le x \le 1$.

JEE Type Solved Examples :
Single Option Correct Type Questions

● **Ex. 1** *Let* $f(x)=\dfrac{a_{2k}x^{2k}+a_{2k-1}x^{2k-1}+\ldots+a_1x+a_0}{b_{2k}x^{2k}+b_{2k-1}x^{2k-1}+\ldots+b_1x+b_0}$, *where k is a positive integer,* $a_i, b_i \in R$ *and* $a_{2k}\neq 0$, $b_{2k}\neq 0$ *such that* $b_{2k}x^{2k}+b_{2k-1}x^{2k-1}+\ldots+b_1x+b_0=0$ *has no real roots, then*

(a) $f(x)$ must be one to one

(b) $a_{2k}x^{2k}+a_{2k-1}x^{2k-1}+\ldots+a_1x+a_0=0$ must have real roots

(c) $f(x)$ must be many to one

(d) Nothing can be said about the above options

Sol. (*c*) $f(x)$ is continuous, $\forall\ x\in R$.

$$\lim_{x\to-\infty} f(x)=\lim_{x\to\infty} f(x)=\frac{a_{2k}}{b_{2k}}$$

$\therefore f(x)$ is many to one.

● **Ex. 2** *If* $\log_{10}\left(\sin\left(x+\dfrac{\pi}{4}\right)\right)=\dfrac{\log_{10}6-1}{2}$, *the value of* $\log_{10}(\sin x)+\log_{10}(\cos x)$ *is*

(a) −1 (b) −2 (c) 2 (d) 1

Sol. (*a*) $2\log_{10}\left(\dfrac{\sin x+\cos x}{\sqrt{2}}\right)=\log_{10}\left(\dfrac{6}{10}\right)$

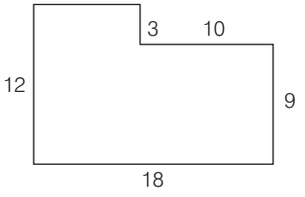
$$\Rightarrow \log_{10}\left(\frac{1+2\sin x\cos x}{2}\right)=\log_{10}\left(\frac{6}{10}\right)$$

$$\Rightarrow \frac{1}{2}+\sin x\cos x=\frac{3}{5}$$

$$\Rightarrow \sin x\cos x=\frac{1}{10}$$

$$\therefore \log_{10}(\sin x)+\log_{10}(\cos x)=-1$$

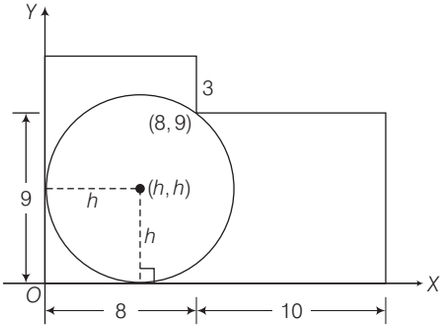
● **Ex. 3** *The diagram shows the dimensions of the floor of an L-shaped room. (All the angles are right angles). The area of the largest circle that can be drawn on the floor of this room is*



(a) 16π (b) 25π

(c) $\dfrac{81\pi}{4}$ (d) $\dfrac{145\pi}{4}$

Sol. (*b*)



Here, $(x-h)^2+(y-h)^2=h^2$ passes through (8, 9).

$$(8-h)^2+(9-h)^2=h^2$$

$$\Rightarrow h^2-34h+145=0$$

$$\Rightarrow (h-5)(h-29)=0$$

$$\Rightarrow h=5, \text{ neglecting } h=29$$

$$\therefore r=5$$

Area of the largest circle $=\pi(5)^2=25\pi$.

● **Ex. 4** *Suppose that the temperature T at every point* (x, y) *in the cartesian plane is given by the formula* $T=1-x^2+2y^2$. *The correct statement about the maximum and minimum temperature along the line* $x+y=1$ *is*

(a) Minimum is −1. There is no maximum

(b) Maximum is −1. There is no minimum

(c) Maximum is 0. Minimum is − 1

(d) There is neither a maximum nor a minimum along the line

Sol. (*a*) $T=1-x^2+2y^2$, where $x+y=1$

$$T=1-x^2+2(1-x)^2$$

$$=1-x^2+2(1+x^2-2x)$$

$$T=x^2-4x+3$$

$$=(x-2)^2-1$$

$$\therefore T_{\max}=\text{doesn't exist}$$

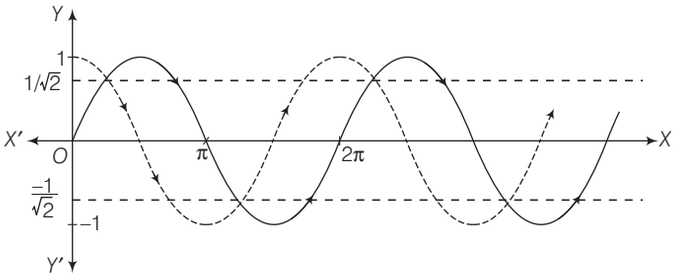
and $T_{\min}=-1$

● **Ex. 5** *The domain of the function* $f(x)=\max\{\sin x, \cos x\}$ *is* $(-\infty,\infty)$. *The range of* $f(x)$ *is*

(a) $\left[-\dfrac{1}{\sqrt{2}}, 1\right]$ (b) $\left[-\dfrac{1}{\sqrt{2}}, \dfrac{1}{\sqrt{2}}\right]$

(c) [0, 1] (d) [− 1, 1]

Sol. (*a*) Here, $f(x) = \max\{\sin x, \cos x\}$



From graph, range of $f(x) \in \left[-\frac{1}{\sqrt{2}}, 1\right]$.

● **Ex. 6** *Let a function f be defined as* $f: \{1,2,3,4\} \to \{1,2,3,4\}$. *If f satisfy* $f(f(x)) = f(x)$, $\forall\ x \in \{1,2,3,4\}$, *the number of such functions is*

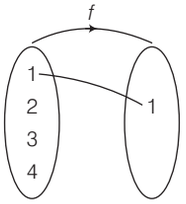
(a) 10 (b) 40 (c) 41 (d) 31

Sol. (*c*) Here, $f(f(x)) = f(x)$, let $f(x) = y$

$\Rightarrow$ $f(y) = y$

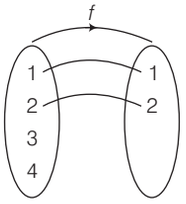
***Case* I** Range contains exactly one element.

It can be done in ${}^4C_1$ ways.



Say, $f(1) = 1$ remaining 3 elements 2, 3, 4 can be mapped only in one way $\Rightarrow$ Total $= {}^4C_1 \cdot 1 = 4$ ...(i)

***Case* II** Range contains two elements, this can be done in ${}^4C_2$ ways.

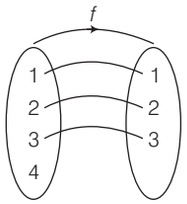


Say, $f(1) = 1, f(2) = 2$

Remaining 2 elements, i.e. 3 and 4 each can be mapped in 2 ways.

$\therefore$ Total $= {}^4C_2 \times 2 \times 2 = 24$ ...(ii)

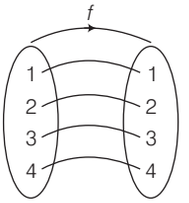
***Case* III** Range contains exactly 3 elements which can be done in ${}^4C_3 = 4$ ways. Say, $f(1) = 1, f(2) = 2, f(3) = 3$.



Now, remaining element can be mapped only in 3 ways.

$\therefore$ Total $= {}^4C_3 \cdot 3 = 12$ ways ...(iii)

***Case* IV** Range contains all 4 elements $f(1) = 1, f(2) = 2$, $f(3) = 3, f(4) = 4$.



$\therefore$ Only 1 way.

$\therefore$ Total ways $= 4 + 24 + 12 + 1 = 41$

● **Ex. 7** *Area bounded by the relation* $[2x] + [y] = 5$, $x, y > 0$ *is* (*where* $[\cdot]$ *represent greatest integer function*)

(a) 2 (b) 3 (c) 4 (d) 5

Sol. (*b*) Here, $[2x] + [y] = 5$

Let us consider $[2x] = 0 \Rightarrow 0 \le 2x < 1$ and $[y] = 5$

i.e. $x \in [0, 1/2)$ and $y \in [5, 6)$.

Similarly, we can consider $[2x] = 1, 2, 3, 4$ and 5.

when, $[2x] = 1 \Rightarrow 1/2 \le x < 1$ and $y \in [4, 5)$

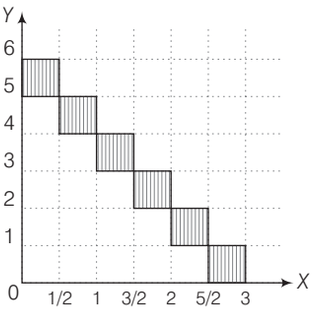
$[2x] = 2 \Rightarrow 1 \le x < 3/2$ and $y \in [3, 4)$

$[2x] = 3 \Rightarrow 3/2 \le x < 2$ and $y \in [2, 3)$

$[2x] = 4 \Rightarrow 2 \le x < \frac{5}{2}$ and $y \in [1, 2)$

$[2x] = 5 \Rightarrow 5/2 \le x < 3$ and $y \in [0, 1)$

which can be shown as



$\therefore$ From the graph, area is 3 sq units.

● **Ex. 8** *If the integers a, b, c, d are in arithmetic progression and* $a < b < c < d$ *and* $d = a^2 + b^2 + c^2$, *the value of* $(a + 10b + 100c + 1000d)$ *is*

(a) 2008 (b) 2010 (c) 2099 (d) 2016

Sol. (*c*) Let $a = x - t$, $b = x$, $c = x + t$ and $d = x + 2t$.

Where, $x \in I$ and $t > 0$ and t is an integer (as $a < b < c < d$).

Now, $d = a^2 + b^2 + c^2$

$\Rightarrow$ $x + 2t = (x - t)^2 + x^2 + (x + t)^2$

$\Rightarrow$ $x + 2t = 3x^2 + 2t^2$

$\Rightarrow$ $x(1 - 3x) = 2t(t - 1)$ ...(i)

as $t > 0$ and $t \in I$, hence $t \ge 1 \Rightarrow$ RHS ≥ 0

$\therefore$ LHS $= x(1-3x) \geq 0 \Rightarrow x \in [0, 1/3]$

The only integer is zero $\Rightarrow x = 0$

From Eq. (i), $t = 0$ or $t = 1$

But $t > 0 \Rightarrow t = 1$

$\therefore$ $a = -1, b = 0, c = 1, d = 2$

$\Rightarrow$ $a + 10b + 100c + 1000d = 2099$

● ***Ex. 9*** *Let $f(n)$ denotes the square of the sum of the digits of natural number n, where $f^2(n)$ denotes $f(f(n))$, $f^3(n)$ denotes $f(f(f(n)))$ and so on. Then, the value of* $\dfrac{f^{2017}(2011) - f^{2016}(2011)}{f^{2017}(2011) - f^{2018}(2011)}$*, is*

(a) 1 (b) 3 (c) 5 (d) 7

Sol. (*a*) Here, $f(n) =$ (sum of digits of natural number $n)^2$

$\therefore$ $f(2011) = (2+0+1+1)^2 = 16$

$f^2(2011) = f(f(2011)) = f(16) = (1+6)^2 = 49$

$f^3(2011) = f(49) = (4+9)^2 = 169$

$f^4(2011) = f(169) = (1+6+9)^2 = 256$

$f^5(2011) = f(256) = (2+5+6)^2 = 169$

$f^6(2011) = f(169) = (1+6+9)^2 = 256$

Thus, $f^{2n}(2011) = 256$ and $f^{2n+1}(2011) = 169$ $n \geq 2$

$\Rightarrow$ $\dfrac{f^{2017}(2011) - f^{2016}(2011)}{f^{2017}(2011) - f^{2018}(2011)} = \dfrac{169 - 256}{169 - 256} = 1$

JEE Type Solved Examples :
More Than One Correct Option Type Questions

● ***Ex. 10*** *If $\sum_{i=1}^{4} a_i^2 x^2 - 2\sum_{i=1}^{4} a_i a_{i+1} x + \sum_{i=1}^{4} a_{i+1}^2 \leq 0$, where $a_i > 0$ and all are distinct. Then,*

(a) $a_1 + a_5 > 2a_3$ (b) $\sqrt{a_1 a_5} = a_3$

(c) $\dfrac{2}{\sqrt{a_1 a_4}} > \dfrac{1}{a_1} + \dfrac{1}{a_4}$ (d) $\prod_{i=1}^{5} a_i = a_3^5$

Sol. (*a, b, d*) $(a_1^2 + a_2^2 + a_3^2 + a_4^2)x^2 - 2(a_1a_2 + a_2a_3 + a_3a_4 + a_4a_5)x + (a_2^2 + a_3^2 + a_4^2 + a_5^2) \leq 0$

$\Rightarrow (a_1^2 x^2 - 2a_1a_2 x + a_2^2) + (a_2^2 x^2 - 2a_2a_3 x + a_3^2) + \ldots + (a_4^2 x^2 - 2a_4a_5 x + a_5^2) \leq 0$

$\Rightarrow (a_1x - a_2)^2 + (a_2x - a_3)^2 + \ldots + (a_4x - a_5)^2 \leq 0$

$\therefore$ $(a_1x - a_2)^2 + (a_2x - a_3)^2 + \ldots + (a_4x - a_5)^2 = 0$

$\therefore$ $x = \dfrac{a_2}{a_1} = \dfrac{a_3}{a_2} = \dfrac{a_4}{a_3} = \dfrac{a_5}{a_4}$

$\Rightarrow$ a_1, a_2, a_3, a_4, a_5 are in GP.

$\therefore$ $\dfrac{a_1 + a_5}{2} > \sqrt{a_1 a_5} \Rightarrow a_1 + a_5 > 2a_3.$ $(\because \sqrt{a_1 a_5} = a_3)$

HM of a_1 and a_4 < GM of a_1 and $a_4 \Rightarrow \dfrac{2}{\sqrt{a_1 a_4}} < \dfrac{1}{a_1} + \dfrac{1}{a_4}$

$a_1 \cdot a_2 \cdot a_3 \cdot a_4 \cdot a_5 = a_3^5.$ $[\because a_1 a_5 = a_3^2, a_2 \cdot a_4 = a_3^2]$

● ***Ex. 11*** *If $f(x-y)$, $f(x) \cdot f(y)$, $f(x+y)$ are in AP for all $x, y \in R$ and $f(0) \neq 0$, then*

(a) $f'(x)$ is an even function

(b) $f'(1) + f'(-1) = 0$

(c) $f'(2) - f'(-2) = 0$

(d) $f'(3) + f'(-3) = 0$

Sol. (*b, d*) Given, $2f(x) \cdot f(y) = f(x+y) + f(x-y)$

At $x = y = 0$,

$2f(0) \cdot f(0) = 2f(0)$

$\Rightarrow$ $2f(0) \cdot (f(0) - 1) = 0$

$\Rightarrow$ $f(0) = 1$ [as $f(0) \neq 0$] ...(i)

At $x = 0$,

$2f(0) \cdot f(y) = f(y) + f(-y)$ [using Eq. (i), $f(0) = 1$]

$\Rightarrow$ $2f(y) = f(y) + f(-y)$

$\therefore$ $f(y) = f(-y) \Rightarrow f(x)$ is even function.

We know, if $f(x)$ is even, then $f'(x)$ is odd.

$\Rightarrow$ $f'(-x) = -f'(x)$

$\therefore$ $f'(1) = -f'(-1)$ and $f'(3) = -f'(-3)$

● ***Ex. 12*** *If the equation $x^2 + 4 + 3\cos(ax + b) = 2x$ has atleast one solution where $a, b \in [0, 5]$, the value of $(a + b)$ equal to*

(a) 5π (b) 3π (c) 2π (d) π

Sol. (*b, d*) $x^2 - 2x + 4 = -3\cos(ax + b)$

$(x-1)^2 + 3 = -3\cos(ax + b)$

Here, LHS ≥ 3 and RHS ≤ 3. Thus, the above equation have solution if LHS = RHS = 3

$\Rightarrow$ $x = 1$ and $\cos(ax + b) = -1$

Hence, $\cos(a + b) = -1 \therefore a + b = \pi, 3\pi, 5\pi$

But, $0 \leq a + b \leq 10$ $\Rightarrow$ $a + b = \pi$ or 3π

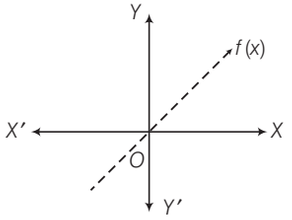
Hence, (b) and (d) are the correct answers.

● ***Ex. 13*** *Which of the following functions have the same graph?*

(a) $f(x) = \log_e e^x$ (b) $g(x) = |x| \operatorname{sgn} x$

(c) $h(x) = \cot^{-1}(\cot x)$ (d) $k(x) = \lim_{n \to \infty} \frac{2|x|}{\pi} \tan^{-1}(nx)$

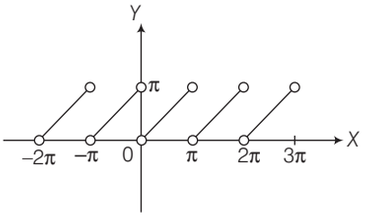
Sol. (a,b,d) (a) $f(x) = \log_e e^x = x \cdot \log_e e = x$ shown as,



(b) $g(x) = |x| \operatorname{sgn} x = \begin{cases} |x| \cdot \frac{x}{|x|}, & x \neq 0 \\ 0, & x = 0 \end{cases} = \begin{cases} x, & x \neq 0 \\ 0, & x = 0 \end{cases}$

$\therefore \quad g(x) = x$, which is same as $f(x)$.

(c) $h(x) = \cot^{-1}(\cot x)$ is shown as,



which is not same as $f(x)$ and $g(x)$.

(d) $k(x) = \lim_{n \to \infty} \frac{2|x|}{\pi} \cdot \tan^{-1}(nx)$

$$= \begin{cases} \frac{2x}{\pi} \cdot \frac{\pi}{2}, & x > 0 \\ -\frac{2x}{\pi} \cdot -\frac{\pi}{2}, & x < 0 \\ 0, & x = 0 \end{cases} = \begin{cases} x, & x > 0 \\ x, & x < 0 \\ 0, & x = 0 \end{cases}$$

$\therefore k(x) = x, \forall x.$

Hence, (a), (b) and (d) are the correct answers.

JEE Type Solved Examples :
Statements I and II Type Questions

■ **Directions** (Q. Nos. 14 to 15) *For the following questions, choose the correct answers from the codes* (a), (b), (c) *and* (d) *defined as follows*

(a) Statement I is true, Statement II is also true; Statement II is the correct explanation of Statement I

(b) Statement I is true, Statement II is also true; Statement II is not the correct explanation of Statement I

(c) Statement I is true, Statement II is false

(d) Statement I is false, Statement II is true

● ***Ex. 14*** *Let* $f(\theta) = \frac{\sin^2 \theta \cos \theta}{(\sin \theta + \cos \theta)} - \frac{1}{4} \tan\left(\frac{\pi}{4} - \theta\right)$, $\forall \theta \in R - \left\{m\pi - \frac{\pi}{4}\right\}, n \in I.$

Statement I *The largest and smallest value of* $f(\theta)$ *differ by* $\frac{1}{\sqrt{2}}$.

Statement II $a \sin x + b \cos x + c \in [c - \sqrt{a^2 + b^2}, c + \sqrt{a^2 + b^2}], \forall x \in R$, *where* $a, b, c \in R$.

Sol. *(a)* We have, $f(\theta) = \frac{4 \sin^2 \theta \cos \theta - \cos \theta + \sin \theta}{4(\cos \theta + \sin \theta)}$

$$= \frac{2 \sin \theta ((\sin \theta + \cos \theta)^2 - 1) - (\cos \theta + \sin \theta) + 2 \sin \theta}{4(\cos \theta + \sin \theta)}$$

$$= \frac{1}{2} \sin \theta (\sin \theta + \cos \theta) - \frac{1}{4}$$

$$= \frac{1}{4}(\sin 2\theta - \cos 2\theta) \in \left[-\frac{\sqrt{2}}{4}, \frac{\sqrt{2}}{4}\right]$$

● ***Ex. 15*** *Consider two functions* $f(x) = 1 + e^{\cot^2 x}$ *and* $g(x) = \sqrt{2|\sin x| - 1} + \frac{1 - \cos 2x}{1 + \sin^4 x}$.

Statement I *The solutions of the equation* $f(x) = g(x)$ *is given by* $x = (2n + 1)\frac{\pi}{2}, \forall n \in I.$

Statement II *If* $f(x) \geq k$ *and* $g(x) \leq k$ *(where* $k \in R$*), then solutions of the equation* $f(x) = g(x)$ *is the solution corresponding to the equation* $f(x) = k$.

Sol. *(c)* LHS $= 1 + e^{\cot^2 x} \geq 2$

As, $\sqrt{2|\sin x| - 1} \leq 1$

and $$\frac{1-\cos 2x}{1+\sin^4 x}=\frac{2\sin^2 x}{1+\sin^4 x}=\frac{2}{\frac{1}{\sin^2 x}+\sin^2 x}\le 1$$

$\therefore$ RHS $=\sqrt{2|\sin x|-1}+\frac{1-\cos 2x}{1+\sin^4 x}\le 2$

Equation will satisfy, if LHS = RHS = 2 which is possible when $\cot^2 x=0$ and $|\sin x|=1$.

$\Rightarrow$ $x=(2n+1)\frac{\pi}{2}, n\in I$

$\therefore$ Statement I is correct.

Statement II is not always correct because solution of the equation $f(x)=g(x)$ will be solutions corresponding to $f(x)=g(x)=k$ in the domain of $f(x)$ and $g(x)$ both. Hence, (c) is the correct answer.

JEE Type Solved Examples : Passage Based Questions

Passage I

(Ex. Nos. 16 to 18)

Let $a_m\,(m=1,2,\ldots,p)$ be the possible integral values of a for which the graphs of

$$f(x)=ax^2+2bx+b$$

and $$g(x)=5x^2-3bx-a$$

meet at some points for all real values of b.

Let $t_r=\prod_{m=1}^{p}(r-a_m)$ *and* $S_n=\sum_{r=1}^{n}t_r, n\in N.$

● ***Ex. 16*** *The minimum possible value of a is*

(a) $\frac{1}{5}$ (b) $\frac{5}{26}$ (c) $\frac{3}{28}$ (d) $\frac{2}{43}$

● ***Ex.17*** *The sum of values of n for which S_n vanishes is*

(a) 8 (b) 9
(c) 10 (d) 15

● ***Ex. 18*** *The value of* $\sum_{r=5}^{\infty}\frac{1}{t_r}$ *is equal to*

(a) $\frac{1}{3}$ (b) $\frac{1}{6}$ (c) $\frac{1}{15}$ (d) $\frac{1}{18}$

■ ***Sol.*** (Q. Nos. 16 to 18)

16. (a) **17.** (c) **18.** (d)

$$ax^2+2bx+b=5x^2-3bx-a$$

$\Rightarrow$ $(a-5)x^2+5bx+(b+a)=0$

If $a\ne 5$, then since $x\in R$,

$$D=25b^2-4(b+a)(a-5)\ge 0,\forall\ b\in R$$

$\Rightarrow$ $25b^2-4(a-5)b-4a(a-5)\ge 0,\forall\ b\in R$

$\therefore$ $16(a-5)^2+16(25)a(a-5)\le 0$

$\Rightarrow$ $16(a-5)(a-5+25a)\le 0$

$\Rightarrow$ $(a-5)(26a-5)\le 0$ $\therefore$ $a\in\left[\frac{5}{26},5\right)$

If $a=5$, $5bx+(b+5)=0$ is not satisfied for $b=0$.

$\therefore$ $a_m\in\{1,2,3,4\};\ t_r=(r-1)(r-2)(r-3)(r-4)$

$$S_n=\frac{1}{5}\sum_{r=1}^{n}(r-4)(r-3)(r-2)(r-1)(r-(r-5))$$

$$=\frac{1}{5}\sum_{r=1}^{n}[(r-4)(r-3)(r-2)(r-1)r-(r-5)(r-4)(r-3)(r-2)(r-1)]$$

$$=\frac{1}{5}n(n-1)(n-2)(n-3)(n-4)$$

$S_n=0$

$\Rightarrow$ $n=1,2,3,4$

$\therefore$ Sum of values of n for which S_n vanishes is

$1+2+3+4=10$ [$n=0$ rejected]

$$\sum_{r=5}^{\infty}\frac{1}{t_r}=\frac{1}{3}\lim_{n\to\infty}\sum_{r=5}^{n}\frac{(r-1)-(r-4)}{(r-4)(r-3)(r-2)(r-1)}$$

$$=\frac{1}{3}\lim_{n\to\infty}\sum_{r=5}^{n}\left[\frac{1}{(r-4)(r-3)(r-2)}-\frac{1}{(r-3)(r-2)(r-1)}\right]$$

$$=\lim_{n\to\infty}\frac{1}{3}\left[\frac{1}{6}-\frac{1}{(n-3)(n-2)(n-1)}\right]=\frac{1}{18}$$

Passage II

(Ex. Nos. 19 to 21)

Let w be non-real fifth root of 3 and $x=w^3+w^4$. If $x^5=f(x)$, where $f(x)$ is real quadratic polynomial, with roots α and β, $(\alpha,\beta\in C)$, then determine $f(x)$ and answer the following questions.

● ***Ex. 19*** *Every term of the sequence $\{f(n)\}, n\in N$ is divisible by*

(a) 12 (b) 18
(c) 24 (d) 27

● ***Ex. 20*** *Which of the following is not true?*

(a) $\alpha+\beta=-3$ (b) $\alpha\beta=12/5$
(c) $|\alpha-\beta|=\sqrt{3/5}$ (d) $|\alpha|+|\beta|=2\sqrt{3/5}$

● ***Ex. 21*** *If α and β are represented by points A and B in argand plane, then circumradius of ΔOAB, where O is origin, is*

(a) 4 / 5 (b) 8 / 5 (c) 16 / 5 (d) 32 / 5

■ ***Sol.*** (Q. Nos. 19 to 21)

19. (b) **20.** (d) **21.** (a)

Here, $x=w^3+w^4$

$\Rightarrow \quad x^5=(w^2)^5(w+w^2)^5$

$=(w^5)^2\ [w^5+5w^4\cdot w^2+10w^3\cdot w^4+10w^2\cdot w^6+5w\cdot w^8+w^{10}]$

Put $w^5=3$ and $w^{10}=9$

Now, $x^5=9\ [3+5\cdot(3w)+10\cdot(3w^2)+10\cdot 3w^3+5\cdot(3w^4)+3^2]$

$=9[12+15(w+w^2)+15(w^2+w^3)+15(w^3+w^4)]$

$=9\left[12+15\left(\frac{x}{w^2}\right)+15\cdot\left(\frac{x}{w}\right)+15x\right]$

$=9\left[12+15x\left(\frac{1}{w^2}+\frac{1}{w}\right)+15x\right]$

$=9\left[12+15x\cdot\frac{w+w^2}{w^3}\cdot\frac{w^2}{w^2}+15x\right]$

$=9\left[12+15x\cdot\frac{(w^3+w^4)}{w^5}+15x\right]$

$=9\left[12+15x\cdot\frac{x}{3}+15x\right]$

$=9[12+15x+5x^2]=f(x)$

Now, $f(x)=9(5x^2+15x+12)$

$\therefore \quad f(x)=0$

$\Rightarrow \quad x=\frac{-15\pm\sqrt{-15}}{10}=\frac{-15\pm i\sqrt{15}}{10}=\alpha,\beta$

(i) For sequence $\{f(n)\}$,

$f(n)=9(5n^2+15n+12)=9[5n(n+1)+10n+12]$

$=9\times$ an even number

$\therefore$ Every term of $\{f(n)\}$ is always divisible by 18.

(ii) Clearly, $\alpha+\beta=-3, \alpha\beta=\frac{12}{5}, \ |\alpha-\beta|=\left|\frac{2i\sqrt{15}}{10}\right|=\sqrt{\frac{3}{5}}$

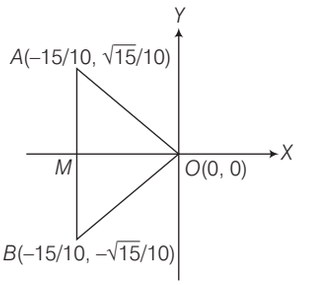
But $|\alpha|+|\beta|=2\left(\sqrt{\left(\frac{15}{10}\right)^2+\left(\frac{\sqrt{15}}{10}\right)^2}\right)=4\sqrt{\frac{3}{5}}$

(iii) In argand plane,

$OA=OB=\sqrt{\frac{12}{5}}$ and $AB=2\frac{\sqrt{15}}{10}=\sqrt{\frac{3}{5}}$

and area of ΔOAB,

$\Delta=\frac{1}{2}AB(OM)=\frac{1}{2}\cdot\sqrt{\frac{3}{5}}\cdot\left(\frac{15}{10}\right)$



$\therefore$ Circumradius, $R=\frac{OA\cdot AB\cdot OB}{4\Delta}=\frac{\sqrt{\frac{12}{5}}\sqrt{\frac{3}{5}}\sqrt{\frac{12}{5}}}{4\cdot\frac{1}{2}\cdot\sqrt{\frac{3}{5}}\left(\frac{15}{10}\right)}=\frac{4}{5}$

Passage III
(Ex. Nos. 22 to 24)

Let $A=\{1,2,3,4,5\}$ and $B=\{-2,-1,0,1,2,3,4,5\}$.

● ***Ex. 22*** *Increasing function from A to B is*

(a) 120 (b) 72 (c) 60 (d) 56

● ***Ex. 23*** *Non-decreasing functions from A to B is*

(a) 216 (b) 540 (c) 792 (d) 840

● ***Ex. 24*** *Onto functions from A to A such that $f(i)\neq i$ for all i, is*

(a) 44 (b) 120 (c) 56 (d) 76

■ ***Sol.*** (Q. Nos. 22 to 24)

22. (*d*) The desired number is ${}^8C_5=56$

23. (*c*) Here, for non-decreasing functions from A to B, is

${}^8C_1\cdot 1+{}^8C_2\cdot 4+{}^8C_3\cdot 6+{}^8C_4\cdot 4+{}^8C_5\cdot 1=792$

Explanation for case ${}^8C_2$, say two elements of set B are selected in ${}^8C_2$ is $\{-1,0\}$.

Now, $x_1+x_2=5 \qquad [x_1\geq 1, x_2\geq 1]$

where, x_1 denotes number of elements of set A maps to -1 and x_2 denotes number of elements of set A maps to 0.

$\therefore$ Total number of solutions is ${}^4C_1$.

Similarly, explanation for case ${}^8C_3$ say three elements selected in ${}^8C_3$ is $\{-1,0,1\}$.

Now, $x_1+x_2+x_3=5 \qquad (x_1\geq 1, x_2\geq 1, x_3\geq 1)$

$\therefore$ Total number of solutions is ${}^4C_2$ etc.

24. (*a*) Onto functions from A to A such that $f(i)\neq i$ for all i.

$\Rightarrow \quad 5!\left(1-\frac{1}{1!}+\frac{1}{2!}-\frac{1}{3!}+\frac{1}{4!}-\frac{1}{5!}\right)=44$

JEE Type Solved Examples :
Matching Type Questions

● ***Ex. 25*** *Match the statements of Column I with values of Column II.*

	Column I	Column II
(A)	Let $f(x)$ be a function on $(-\infty, \infty)$ and $f(x+2) = f(x-2)$. If $f(x) = 0$ has only three real roots in $[0, 4]$ and one of them is 4, then the number of real roots of $f(x) = 0$ in $(-8, 10]$ is	(p) 4
(B)	Let $r_1, r_2, r_3, \ldots, r_n$ be n positive integers, not necessarily distinct, such that $(x + r_1)(x + r_2) \ldots (x + r_n) = x^n + 56x^{n-1} + \ldots + 2009$. The possible value of n is	(q) 5
(C)	If x and y are positive integers and $2xy = 2009 - 3y$, then the number of ordered pairs of (x, y) is	(r) 8
(D)	If $x, y \in R$, satisfying the equation $\frac{(x-4)^2}{4} + \frac{y^2}{9} = 1$, then the difference between the largest and smallest value of the expression $\frac{x^2}{4} + \frac{y^2}{9}$ is	(s) 9

Sol. (A) → (s), (B) → (p), (C) → (q), (D) → (r)

(A) Given, $f(x+2) = f(x-2)$, domain is R $x \to x+2$

$f(x+4) = f(x)$

$\Rightarrow f$ is periodic with period 4.

Put $x = 0, f(4) = f(0)$

But $f(4) = 0$

$\Rightarrow \quad f(0) = 0$

$\Rightarrow \quad x = 0$, is also the root.

Since, in $[0, 4]$, f has only 3 roots.

So, $f(x)$ is the form of $\sin\left(\frac{\pi x}{2}\right)$ fulfilling all conditions given in the question, hence the 3rd root in $[0, 4]$ is 2 as $f(2) = 0$.

$\therefore$ The number of real roots in $(-8, 10]$ is 9 and the roots are $(-6, -4, -2, 0, 2, 4, 6, 8, 10)$.

(B) $(r_1 + r_2 + \ldots + r_n) = 56$

and $\quad r_1 r_2 \ldots r_n = 2009 = 7^2 \cdot 41$

[using theory of equation]

As $\quad 2009 = 7^2 \cdot 41$

Therefore, no value of r_i can be 49 or larger factor of 2009 otherwise their sum is larger than 56.

As $\quad 56 = 41 + 7 + 7 + 1$

Therefore, $\quad r_1 = 41; r_2 = r_3 = 7$

and $\quad r_4 = 1$

Hence, $\quad n = 4$

(C) $2xy = 2009 - 3y$ yields $2xy + 3y = 2009$

$\Rightarrow \quad y = \frac{2009}{2x+3}$

So, $2x + 3$ must be the factors of 2009.

Since, $\quad 2009 = 7^2 \cdot 41$

Thus, $2x + 3$ can be one of the factors 7, 49, 41, 287 and 2009.

or $\quad 2x + 3 = 7; 2x + 3 = 49; 2x + 3 = 41;$
$2x + 3 = 287$

and $\quad 2x + 3 = 2009.$

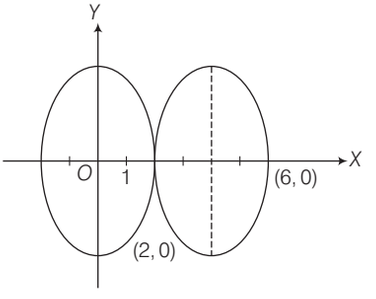
Hence, $x = 2, 23, 19, 142$ and 1003

$\Rightarrow$ Ordered pairs are (2, 287), (23, 41), (19, 49), (142, 7), (1003, 1).

(D) Let $x - 4 = 2\cos\theta$

$\Rightarrow \quad x = 2\cos\theta + 4$

and $\quad y = 3\sin\theta$



Now, $\quad z = \frac{x^2}{4} + \frac{y^2}{9} = \frac{(2\cos\theta + 4)^2}{4} + \sin^2\theta$

$= \frac{4\cos^2\theta + 16 + 16\cos\theta + 4\sin^2\theta}{4} = \frac{20 + 16\cos\theta}{4}$

$z = 5 + 4\cos\theta$

Hence, $\quad z_{\max} - z_{\min} = (9 - 1) = 8$

JEE Type Solved Examples :
Single Integer Answer Type Questions

● **Ex. 26** *Let* $f(x)=\sin^{23}x-\cos^{22}x$ *and*

$$g(x)=1+\frac{1}{2}\tan^{-1}|x|.$$

The number of values of x *in interval* $[-10\pi, 20\pi]$ *satisfying the equation* $f(x)=sgn(g(x))$, *is* $5a$. *Then,* a *is equal to ..... .*

Sol. (3) $g(x)=\frac{1}{2}\tan^{-1}|x|+1$

$\Rightarrow \quad \text{sgn}\,(g(x))=1$

$\Rightarrow \quad \sin^{23}x-\cos^{22}x=1$

$\Rightarrow \quad \sin^{23}x=1+\cos^{22}x$

which is possible, if $\sin x=1$ and $\cos x=0$

$$x=2n\pi+\frac{\pi}{2}$$

Hence, $\quad -10\pi\le 2n\pi+\frac{\pi}{2}\le 20\pi$

$\Rightarrow \quad -\frac{21}{2}\le 2n\le\frac{39}{2}$

$\Rightarrow \quad -\frac{21}{4}\le n\le\frac{39}{4}$

$\Rightarrow \quad -5\le n\le 9$

Hence, number of values of $x=15\Rightarrow a=3$.

● **Ex. 27** *Consider the function* $g(x)$ *defined as*

$g(x)\cdot(x^{(2^{2008}-1)}-1)=(x+1)(x^2+1)(x^4+1)$

$\ldots(x^{2^{2007}}+1)-1$ *the value of* $g(2)$ *equals ..... .*

Sol. (2) RHS $=\dfrac{(x-1)(x+1)(x^2+1)(x^4+1)\ldots(x^{2^{2007}}+1)}{(x-1)}-1$

$$=\frac{(x^2-1)(x^2+1)\ldots(x^{2^{2007}}+1)}{(x-1)}-1$$

$$=\frac{(x^{2^2}-1)(x^{2^2}+1)\ldots(x^{2^{2007}}+1)}{(x-1)}-1$$

Hence, $g(x)\cdot(x^{(2^{2008}-1)}-1)=\dfrac{(x^{2^{2008}}-1)-(x-1)}{(x-1)}$

$$=\frac{x(x^{2^{2008}-1}-1)}{(x-1)}$$

$\Rightarrow \quad g(x)=\dfrac{x}{x-1}$

$\therefore \quad g(2)=2$

● **Ex. 28** *If* $f(x)=\sqrt[3]{\dfrac{9}{\log_2(3-2x)}-1}$, *the value of 'a'*

which satisfies $f^{-1}(2a-4)=\dfrac{1}{2}$, *is*

Sol. (3) Given, $f^{-1}(2a-4)=\frac{1}{2}$

$\therefore \quad f\left(\frac{1}{2}\right)=2a-4$

Put $x=\frac{1}{2}$ in $f(x)=\sqrt[3]{\dfrac{9}{\log_2(3-2x)}-1}$

$\therefore \quad 2a-4=\sqrt[3]{\dfrac{9}{\log_2 2}-1}$

$\Rightarrow \quad 2a-4=\sqrt[3]{9-1}$

$\Rightarrow \quad 2a-4=2$

$\Rightarrow \quad 2a=6$

$\therefore \quad a=3$

● **Ex. 29** *Let* f *be defined on the natural numbers as follow:*

$f(1)=1$ *and for* $n>1$, $f(n)=f[f(n-1)]+f[n-f(n-1)]$,

the value of $\dfrac{1}{30}\sum_{r=1}^{20}f(r)$ *is*

Sol. (7) Here, $\quad f(1)=1$

$f(2)=f[f(1)]+f[2-f(1)]$, using $f(1)=1$

$f(2)=f(1)+f(1)=2.$

$f(3)=f[f(z)]+f[3-f(2)]$

$=f(2)+f(1)=2+1=3$

Thus, $\quad f(n)=n$

$\therefore \quad \dfrac{1}{30}\sum_{r=1}^{20}f(r)=\dfrac{1}{30}[1+2+3+\ldots+20]$

$$=\frac{1}{30}\times\frac{20(20+1)}{2}=7$$

● **Ex. 30** *If* a,b,c *are real roots of the cubic equation* $f(x)=0$ *such that* $(x-1)^2$ *is a factor of* $f(x)+2$ *and* $(x+1)^2$ *is a factor of* $f(x)-2$, *then* $|ab+bc+ca|$ *is equal to*

Sol. (3) Let $f(x)=Ax^3+Bx^2+Cx+D$

Since, $(x-1)^2$ is a factor of $f(x)+2$.

$\Rightarrow \quad f(1)+2=0$

$\Rightarrow \quad A+B+C+D+2=0$ ...(i)

Also, $(x+1)^2$ is a factor of $f(x)-2$.

$\Rightarrow \quad f(-1)-2=0$

$\Rightarrow \quad -A+B-C+D-2=0$ ...(ii)

From Eq. (i), $D=-A-B-C-2$

$\therefore \quad f(x)=Ax^3+Bx^2+Cx-A-B-C-2$

$\Rightarrow \quad f(x)+2=A(x^3-1)+B(x^2-1)+C(x-1)$

Since, $(x-1)^2$ is factor of $f(x)+2$.

$\Rightarrow \quad f'(1)=0 \Rightarrow 3A+2B+C=0$ ...(iii)

Similarly, $(x+1)^2$ is factor of $f(x)-2$.

$\Rightarrow \quad f'(-1)=0 \Rightarrow 3A-2B+C=0$ ...(iv)

From Eqs. (i), (ii), (iii) and (iv), $A=1, C=-3, B=D=0$.

$\therefore \quad f(x)=x^3-3x$

Hence, $|ab+bc+ca|=3$

● ***Ex. 31*** *The minimum value of $k(k\in I)$ for which the equation $e^x=kx^2$ has exactly three real solutions, is*

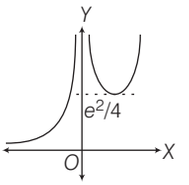
Sol. (2) Here, $e^x=kx^2 \Rightarrow \dfrac{e^x}{x^2}=k$ ...(i)

Let $f(x)=\dfrac{e^x}{x^2}$

$$f'(x)=\frac{(x-2)e^x}{x^3}$$

$\therefore f(x)$ is increasing on $(-\infty,0)\cup[2,\infty)$ and decreasing on $(0,2)$.

$\therefore f(x)$ can be plotted as



So, clearly from graph , $k>\dfrac{e^2}{4}, k\in I$

Hence, $k_{\min}=2$

● ***Ex. 32*** *The value of expression*

$$\sqrt{1+2\sqrt{1+3\sqrt{1+4\sqrt{1+5\sqrt{\ldots\infty}}}}}$$ *is*

Sol. (3) As, we can write

$$n=\sqrt{n^2}=\sqrt{1+(n^2-1)}=\sqrt{1+(n-1)(n+1)}$$

$$=\sqrt{1+(n-1)\cdot\sqrt{(n+1)^2}}.$$

$$=\sqrt{1+(n-1)\cdot\sqrt{1+(n+1)^2-1}}$$

$$=\sqrt{1+(n-1)\cdot\sqrt{1+(n)\cdot(n+2)}}\cdot$$

$$=\sqrt{1+(n-1)\cdot\sqrt{1+n\cdot\sqrt{(n+2)^2}}}$$

$$=\sqrt{1+(n-1)\cdot\sqrt{1+n\cdot\sqrt{1+(n+2)^2-1}}}$$

$$=\sqrt{1+(n-1)\cdot\sqrt{1+n\cdot\sqrt{1+(n+1)(n+3)}}}$$

$$=\sqrt{1+(n-1)\cdot\sqrt{1+n\cdot\sqrt{1+(n+1)\cdot\sqrt{(n+3)^2}}}}$$ ... and so on.

$\therefore \quad \sqrt{1+2\cdot\sqrt{1+3\cdot\sqrt{1+4\cdot\sqrt{1+5\sqrt{.....\infty}}}}}=3.$

Subjective Type Questions

● ***Ex. 33*** *Let a sequence $x_1, x_2, x_3, \ldots$ of complex numbers be defined by $x_1=0$, $x_{n+1}=x_n^2-i$ for all $n>1$, where $i^2=-1$. Find the distance of x_{2000} from x_{1997} in the complex plane.*

Sol. Given, $x_1=0$

Then, $x_2=0^2-i=-i$

$$x_3=(-i)^2-i=-1-i=-(1+i)$$

$$x_4=[-(1+i)]^2-i=2i-i=i$$

$$x_5=(i)^2-i=-1-i=x_3$$

$\therefore \quad x_6=x_4$ and hence $x_7=x_5$ and so on.

$\therefore \quad x_{2n}=i,\ x_{2n+1}=-(1+i)$

$\therefore \quad x_{2000}=i=(0,1)$ and

$x_{1997}=-1-i=(-1,-1)$ in the complex plane.

So, the distance between x_{2000} and x_{1997} is $\sqrt{1+4}=\sqrt{5}$.

● ***Ex. 34*** *If a, b, c, d, e are positive real numbers, such that $a+b+c+d+e=8$ and $a^2+b^2+c^2+d^2+e^2=16$, find the range of e.*

Sol. As we know,

$$\left(\frac{a+b+c+d}{4}\right)^2 \le \frac{a^2+b^2+c^2+d^2}{4}$$ ...(i)

[using Tchebycheff's Inequality]

where $a+b+c+d+e=8$

and $a^2+b^2+c^2+d^2+e^2=16$

From Eq (i), reduces to

$$\left(\frac{8-e}{4}\right)^2 \le \frac{16-e^2}{4}$$

$\Rightarrow \quad 64+e^2-16e \le 4(16-e^2)$

$\Rightarrow \quad 5e^2 - 16e \le 0$

$\Rightarrow \quad e(5e - 16) \le 0$

$\Rightarrow \quad 0 \le e \le \frac{16}{5}$ [using number line rule]

Thus, $e \in \left[0, \frac{16}{5}\right]$.

● **Ex. 35** *Find the set of all solutions of the equation* $2^{|y|} - \left|2^{y-1} - 1\right| = 2^{y-1} + 1$. ***[IIT JEE 1997]***

Sol. Here, $2^{|y|} - \left|2^{y-1} - 1\right| = 2^{y-1} + 1$

We know, how to define modulus, we have three cases as

***Case* I** $y < 0$

$$\Rightarrow \quad 2^{-y} + (2^{y-1} - 1) = 2^{y-1} + 1; \begin{cases} \text{as when } y < 0 \\ |y| = -y \\ \text{and } \left|2^{y-1} - 1\right| = -(2^{y-1} - 1) \end{cases}$$

$$\Rightarrow \quad 2^{-y} = 2^1$$

Hence, $y = -1$, which is true when $y < 0$. ...(i)

***Case* II** $0 \le y < 1$

$$\Rightarrow \quad 2^{y} + (2^{y-1} - 1) = 2^{y-1} + 1; \begin{cases} \text{as when } 0 \le y < 1 \\ |y| = y \\ \text{and } \left|2^{y-1} - 1\right| = -(2^{y-1} - 1) \end{cases}$$

$$\Rightarrow \quad 2^{y} = 2$$

$\Rightarrow \quad y = 1$, which shows no solution as,

$0 \le y < 1$ ...(ii)

***Case* III** $y \ge 1$

$$\Rightarrow \quad 2^{y} - (2^{y-1} - 1) = 2^{y-1} + 1 \qquad \begin{cases} \text{as when } y \ge 0 \\ |y| = y \\ \text{and } \left|2^{y-1} - 1\right| = (2^{y-1} - 1) \end{cases}$$

$$\Rightarrow \quad 2^{y} = 2^{y-1} + 2^{y-1};$$

$$\Rightarrow \quad 2^{y} = 2 \cdot 2^{y-1}$$

$\Rightarrow 2^y = 2^y$, which is an identity, therefore it is true, $\forall\ y \ge 1$. ...(iii)

Hence, from Eqs. (i), (ii) and (iii) the solution set is $\{y : y \ge 1 \cup y = -1\}$.

● **Ex. 36** *Solve the equation* $[x]\{x\} = x$, *where* [ ] *and* { } *denote the greatest integer function and fractional part, respectively.*

Sol. We know that, $x = [x] + \{x\}$ ...(i)

Thus, we have $[x]\{x\} = [x] + \{x\}$

$$\Rightarrow \quad \{x\} = \frac{[x]}{[x] - 1} \qquad \text{...(ii)}$$

Here, in Eq. (ii), $[x] \ne 1$

But, if $[x] = 1$, then given equation

$\{x\} = x$ ...(iii)

which is true only when $x \in [0, 1)$

and $[x] = 1 \Rightarrow x \in [1, 2)$ ...(iv)

From Eqs. (iii) and (iv) no value of x,

when $[x] = 1$ ...(v)

Now, from Eq. (ii), $\{x\} = \frac{[x]}{[x] - 1}$,

when $[x] \ne 1$

Again, as we know $\{x\} \in [0, 1)$

$\therefore \quad 0 \le \frac{[x]}{[x] - 1} < 1$

i.e. $\frac{[x]}{[x] - 1} < 1$ and $\frac{[x]}{[x] - 1} \ge 0$

i.e. $\frac{1}{[x] - 1} < 0$ and $\{[x] \le 0$ or $[x] > 1\}$

i.e. $[x] < 1$ and $\{[x] \le 0$ or $[x] > 1\}$

[using number line rule]

i.e. $[x] \le 0$

$\therefore \quad x = [x] + \{x\} \Rightarrow x = [x] + \frac{[x]}{[x] - 1}$

$\Rightarrow \quad x = \frac{[x]^2}{[x] - 1}$, [where x takes values less than 1]

$\therefore \quad x = \frac{[x]^2}{[x] - 1}$, [where $x < 1$]

$\Rightarrow \quad x = \frac{[x]^2}{[x] - 1}$, [where $[x]$ is any non-positive integer]

● **Ex. 37** *Find all possible values of x satisfying*

$$\frac{[x]}{[x-2]} - \frac{[x-2]}{[x]} = \frac{8\{x\} + 12}{[x-2][x]}$$

(*where* [ ] *denotes the greatest integer function and* { } *is the fractional part*).

Sol. Here, $\frac{[x]}{[x-2]} - \frac{[x-2]}{[x]} = \frac{8\{x\} + 12}{[x-2][x]}$

$$\Rightarrow \quad \frac{[x]^2 - [x-2]^2}{[x-2][x]} = \frac{8\{x\} + 12}{[x][x-2]}$$

$$\Rightarrow \frac{([x] - [x-2])([x] + [x-2])}{[x-2][x]} = \frac{8\{x\} + 12}{[x][x-2]}$$

$\Rightarrow ([x] - [x-2])([x] + [x-2]) = 8\{x\} + 12$

$\Rightarrow ([x] - [x] + 2)([x] + [x] - 2) = 8\{x\} + 12$

$[\because [x + I] = [x] + I]$

$\Rightarrow \quad 4([x] - 1) = 8\{x\} + 12$

$\Rightarrow \quad [x] - 4 = 2\{x\}$ ...(i)

Now, as we know $0 \le \{x\} < 1 \Rightarrow 0 \le 2\{x\} < 2$

$\Rightarrow \quad 0 \le [x]-4 < 2 \;\Rightarrow\; 4 \le [x] < 6$

$\Rightarrow \quad [x] = 4, 5$

$$\left.\begin{array}{c}\text{if } [x]=4 \;\Rightarrow\; 2\{x\}=[x]-4 \\ \text{becomes } \{x\}=0\end{array}\right\} \quad \ldots(\text{ii})$$

$$\left.\begin{array}{c}\text{and if } [x]=5 \Rightarrow 2\{x\}=[x]-4 \\ \text{becomes } \{x\}=\dfrac{1}{2}\end{array}\right\} \quad \ldots(\text{iii})$$

Thus, from Eqs. (ii) and (iii), we have

$$x = [x] + \{x\}$$

i.e. $x = 4 + 0 = 4$ [using Eq. (ii)]

and $x = 5 + \dfrac{1}{2} = \dfrac{11}{2}$ [using Eq. (iii)]

$\Rightarrow \quad x \in \left\{4, \dfrac{11}{2}\right\}$

● ***Ex. 38*** *If $f(x)$ is a polynomial function satisfying $f(x)\cdot f\left(\dfrac{1}{x}\right) = f(x) + f\left(\dfrac{1}{x}\right)$ and $f(4) = 65$. Find $f(6)$.*

Sol. Here, $f(x)\cdot f\left(\dfrac{1}{x}\right) = f(x) + f\left(\dfrac{1}{x}\right)$

$\Rightarrow \quad f(x)\cdot f\left(\dfrac{1}{x}\right) - f(x) = f\left(\dfrac{1}{x}\right)$

$\Rightarrow \quad f(x) = \dfrac{f(1/x)}{f(1/x)-1} \quad \ldots(\text{i})$

Also, $f(x)\cdot f\left(\dfrac{1}{x}\right) = f(x) + f\left(\dfrac{1}{x}\right)$

$\Rightarrow \quad f(x)\cdot f\left(\dfrac{1}{x}\right) - f\left(\dfrac{1}{x}\right) = f(x)$

$\Rightarrow \quad f\left(\dfrac{1}{x}\right) = \dfrac{f(x)}{f(x)-1} \quad \ldots(\text{ii})$

On multiplying Eqs. (i) and (ii), we get

$$f(x)\cdot f\left(\frac{1}{x}\right) = \frac{f(1/x)\cdot f(x)}{\{f(1/x)-1\}\{f(x)-1\}}$$

$\Rightarrow \quad \left[f\left(\dfrac{1}{x}\right)-1\right][f(x)-1] = 1 \quad \ldots(\text{iii})$

Since, $f(x)$ is a polynomial function, so $\{f(x)-1\}$ and $\left\{f\left(\dfrac{1}{x}\right)-1\right\}$ are reciprocals of each other. Also, x and $\dfrac{1}{x}$ are reciprocals of each other.

Thus, Eq. (iii) can hold only when

$f(x) - 1 = \pm x^n$, where $n \in R$

$\therefore \quad f(x) = \pm x^n + 1$, but $f(4) = 65$

$\Rightarrow \quad \pm 4^n + 1 = 65 \;\Rightarrow\; 4^n = 64$

$\Rightarrow \quad 4^n = 4^3 \;\Rightarrow\; n = 3 \quad [\because 4^n > 0]$

So, $f(x) = x^3 + 1$

Hence, $f(6) = 6^3 + 1 = 217$

Aliter Let $f(x) = a_0x^n + a_1x^{n-1} + a_2x^{n-2} + \ldots + a_{n-1}x + a_n$

Then, $f(x)\cdot f\left(\dfrac{1}{x}\right) = f(x) + f\left(\dfrac{1}{x}\right)$

$$\Rightarrow (a_0x^n + a_1x^{n-1} + \ldots + a_n)\left(\frac{a_0}{x^n} + \frac{a_1}{x^{n-1}} + \ldots + a_n\right)$$

$$= (a_0x^n + a_1x^{n-1} + \ldots + a_n) + \left(\frac{a_0}{x^n} + \frac{a_1}{x^{n-1}} + \ldots + a_n\right)$$

On comparing the coefficient of x^n, we have

$a_0a_n = a_0 \;\Rightarrow\; a_n = 1$ [as $a_0 \neq 0$]

Comparing the coefficient of x^{n-1}, we have

$a_0a_{n-1} + a_na_1 = a_1$

$\Rightarrow \quad a_0a_{n-1} + a_1 = a_1$ [as $a_n = 1$]

$\Rightarrow \quad a_0a_{n-1} = 0$

$\Rightarrow \quad a_{n-1} = 0$ [as $a_0 \neq 0$]

Similarly, $a_{n-1} = a_{n-2} = \ldots\ldots = a_1 = 0$

and $a_0 = \pm 1$

$\therefore \quad f(x) = \pm x^n + 1$

$\Rightarrow \quad f(4) = \pm 4^n + 1$

$\Rightarrow \quad 4^n + 1 = 65 \;\Rightarrow\; 4^n = 64$

$\Rightarrow \quad n = 3$

So, $f(x) = x^3 + 1$

Hence, $f(6) = 6^3 + 1 = 217$

● ***Ex. 39*** *If $f(x)$ satisfies the relation, $f(x+y) = f(x) + f(y)$ for all $x, y \in R$ and $f(1) = 5$, then find $\sum_{n=1}^{m} f(n)$. Also, prove that $f(x)$ is odd.*

Sol. Here, $f(x+y) = f(x) + f(y)$, put $x = r-1, y = 1$

$f(r) = f(r-1) + f(1)$ ...(i)

$\therefore \quad f(r) = f(r-1) + 5$

$\Rightarrow \quad f(r) = \{f(r-2) + 5\} + 5$ [using definition]

$\Rightarrow \quad f(r) = f(r-2) + 2\cdot(5)$

$\Rightarrow \quad f(r) = f(r-3) + 3\cdot(5)$

.....

.....

$\Rightarrow \quad f(r) = f\{r-(r-1)\} + (r-1)\cdot 5$

$\Rightarrow \quad f(r) = f(1) + (r-1)\cdot 5$

$\Rightarrow \quad f(r) = 5 + (r-1)\cdot 5$

$\Rightarrow \quad f(r) = 5r$

$\therefore \quad \sum_{n=1}^{m} f(n) = \sum_{n=1}^{m} (5n) = 5[1 + 2 + 3 + \ldots + m]$

$$= \frac{5m(m+1)}{2}$$

Hence, $\sum_{n=1}^{m} f(n) = \frac{5m(m+1)}{2}$ ...(ii)

Now, putting $x = 0, y = 0$ in the given function, we have

$f(0+0) = f(0) + f(0)$

$\therefore \quad f(0) = 0$

Also, putting $(-x)$ for (y) in the given function,

$f(x-x) = f(x) + f(-x)$

$\Rightarrow \quad f(0) = f(x) + f(-x)$

$\Rightarrow \quad 0 = f(x) + f(-x)$

$\Rightarrow \quad f(-x) = -f(x)$ ...(iii)

Thus, $\sum_{n=1}^{m} f(n) = \frac{5m(m+1)}{2}$ and $f(x)$ is odd.

● ***Ex. 40*** *Let* $f(x) = \frac{9^x}{9^x + 3}$. *Show that* $f(x) + f(1-x) = 1$ *and hence evaluate* $f\left(\frac{1}{1996}\right) + f\left(\frac{2}{1996}\right) + f\left(\frac{3}{1996}\right) + \ldots + f\left(\frac{1995}{1996}\right)$.

Sol. Given, $f(x) = \frac{9^x}{9^x + 3}$ ...(i)

$\Rightarrow \quad f(1-x) = \frac{9^{1-x}}{9^{1-x} + 3}$

$\Rightarrow \quad f(1-x) = \frac{\frac{9}{9^x}}{\frac{9}{9^x} + 3} = \frac{9}{9 + 3 \cdot 9^x}$

$f(1-x) = \frac{9}{3(3 + 9^x)}$ ...(ii)

On adding Eqs. (i) and (ii), we get

$f(x) + f(1-x) = \frac{9^x}{9^x + 3} + \frac{9}{3(3 + 9^x)}$

$= \frac{3 \cdot 9^x + 9}{3(9^x + 3)} = \frac{3(9^x + 3)}{3(9^x + 3)}$

$\therefore \quad f(x) + f(1-x) = 1$ ...(iii)

Now, putting $x = \frac{1}{1996}, \frac{2}{1996}, \frac{3}{1996}, \ldots, \frac{998}{1996}$ in Eq. (iii), we get

$f\left(\frac{1}{1996}\right) + f\left(\frac{1995}{1996}\right) = 1$

$\Rightarrow \quad f\left(\frac{2}{1996}\right) + f\left(\frac{1994}{1996}\right) = 1$

$\Rightarrow \quad f\left(\frac{3}{1996}\right) + f\left(\frac{1993}{1996}\right) = 1$

.....

.....

$\Rightarrow \quad f\left(\frac{997}{1996}\right) + f\left(\frac{999}{1996}\right) = 1$

$\Rightarrow \quad f\left(\frac{998}{1996}\right) + f\left(\frac{998}{1996}\right) = 1$

or $f\left(\frac{998}{1996}\right) = \frac{1}{2}$

On adding all the above expressions, we get

$f\left(\frac{1}{1996}\right) + f\left(\frac{2}{1996}\right) + \ldots + f\left(\frac{1995}{1996}\right)$

$= (1 + 1 + 1 + \ldots + \text{to 997 times}) + \frac{1}{2}$

$= 997 + \frac{1}{2}$

$= 997.5$

● ***Ex. 41*** *ABCD is a square of side a. A line parallel to the diagonal BD at a distance x from the vertex A cuts the two adjacent sides. Express the area of the segment of the square with A at a vertex, as a function of x.*

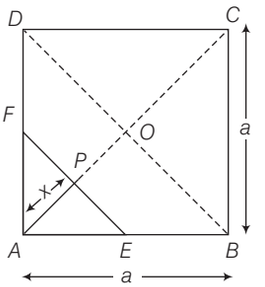
Sol. There are two different situations,

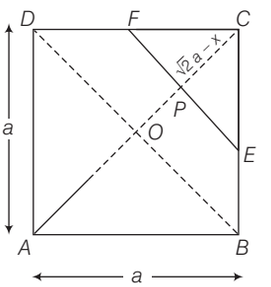
(i) when $x = AP \le OA$,

i.e. $x \le \frac{a}{\sqrt{2}}$

(ii) when $x = AP > OA$,

i.e. $x > \frac{a}{\sqrt{2}}$ but $x \le \sqrt{2}a$





***Case* I** $\text{ar}(\Delta AEF) = \frac{1}{2} x \cdot 2x = x^2$

***Case* II** $\text{ar}(ABEFDA) = \text{ar}(ABCD) - \text{ar}(\Delta CEF)$

$= a^2 - \frac{1}{2}(\sqrt{2}a - x)2(\sqrt{2}a - x)$

$\text{ar}(ABEFDA) = 2\sqrt{2}\,ax - x^2 - a^2$

$\therefore \quad f(x) = \begin{cases} x^2, & 0 \le x \le \frac{a}{\sqrt{2}} \\ 2\sqrt{2}\,ax - x^2 - a^2, & \frac{a}{\sqrt{2}} < x \le \sqrt{2}a \end{cases}$

Ex. 42 *A function $R \to R$ is defined by $f(x) = \dfrac{\alpha x^2 + 6x - 8}{\alpha + 6x - 8x^2}$. Find the interval of values of α for which f is onto. Is the function one-one for $\alpha = 3$? Justify your answer.* ***[IIT JEE 1996]***

Sol. Since, $f : R \longrightarrow R$ is an onto mapping.

$\therefore$ Range of $f = R$

$\Rightarrow$ $\dfrac{\alpha x^2 + 6x - 8}{\alpha + 6x - 8x^2}$ assumes all real values of x.

Let $y = \dfrac{\alpha x^2 + 6x - 8}{\alpha + 6x - 8x^2}$

Then, y assumes all real values for real values of x.

$\Rightarrow \alpha y + 6xy - 8x^2 y = \alpha x^2 + 6x - 8, \ \forall\ y \in R$

$\Rightarrow x^2(\alpha + 8y) + 6x(1 - y) - (8 + \alpha y) = 0, \ \forall\ y \in R$

We know, above equation assumes all real values.

So, $D \geq 0$

$\Rightarrow 36(1 - y)^2 + 4(\alpha + 8y)(8 + \alpha y) \geq 0$

$\Rightarrow 4[9(1 - 2y + y^2) + (8\alpha + \alpha^2 y + 64y + 8\alpha y^2)] \geq 0$

$\Rightarrow [9 - 18y + 9y^2 + 8\alpha + \alpha^2 y + 64y + 8\alpha y^2] \geq 0$

$\Rightarrow [y^2(8\alpha + 9) + y(\alpha^2 + 46) + (8\alpha + 9)] \geq 0$

We know, if $ax^2 + bx + c \geq 0, \forall\ x$ and $a > 0 \ \Rightarrow \ D \leq 0$

So, $(\alpha^2 + 46)^2 - 4(8\alpha + 9)(8\alpha + 9) \leq 0$ and $(8\alpha + 9) > 0$

$\Rightarrow (\alpha^2 + 46)^2 - [2(8\alpha + 9)]^2 \leq 0$ and $\alpha > -9/8$

$\Rightarrow (\alpha^2 + 46 - 16\alpha - 18)(\alpha^2 + 46 + 16\alpha + 18) \leq 0$

and $\alpha > -9/8$

$(\alpha^2 - 16\alpha + 28)(\alpha^2 + 16\alpha + 64) \leq 0$ and $\alpha > -9/8$

$\Rightarrow (\alpha - 14)(\alpha - 2)(\alpha + 8)^2 \leq 0$ and $\alpha > -9/8$

$\alpha \in [2, 14] \cup \{-8\}$ and $\alpha > -9/8$

Thus, $\alpha \in [2, 14]$

Hence, f is onto when $\alpha \in [2, 14]$.

Again, if $\alpha = 3$, we have, $f(x) = \dfrac{3x^2 + 6x - 8}{3 + 6x - 8x^2}$.

Clearly, $f(1) = f(-1)$, which shows $f(x)$ is not one-one.

Ex. 43 *Let $f(x, y)$ be a periodic function satisfying the condition $f(x, y) = f((2x + 2y), (2y - 2x)), \forall\ x, y \in R$. Now, define a function g by $g(x, 0) = f(2^x, 0)$. Then, prove that $g(x)$ is a periodic function and find its period.*

Sol. We have $f(x, y) = f(2x + 2y, 2y - 2x)$ ...(i)

$\Rightarrow f(2x + 2y, 2y - 2x) = f\{2(2x + 2y) + 2(2y - 2x), 2(2y - 2x) - 2(2x + 2y)\}$ [using Eq. (i)]

$\Rightarrow f(x, y) = f(2x + 2y, 2y - 2x) = f(8y, -8x)$

$\Rightarrow f(x, y) = f(8y, -8x)$ ...(ii)

$\Rightarrow f(8y, -8x) = f\{8(-8x), -8(8y)\}$ [using Eq. (ii)]

$\Rightarrow f(x, y) = f(2x + 2y, 2y - 2x) = f(8y, -8x)$

$= f(-64x, -64y)$

$\Rightarrow f(x, y) = f(-64x, -64y)$ ...(iii)

$\Rightarrow f(-64x, -64y) = f(64 \times 64x, 64 \times 64y)$

$= f(2^{12} x, 2^{12} y)$

$\Rightarrow f(x, y) = f(2^{12} x, 2^{12} y)$ [using Eq. (iii)]

$\Rightarrow f(2^x, 0) = f(2^{12} \cdot 2^x, 0) = f(2^{12 + x}, 0)$ ...(iv)

Given, $g(x, 0) = f(2^x, 0)$

$\Rightarrow g(x, 0) = f(2^x, 0) = f(2^{12 + x}, 0)$ [using Eq. (iv)]

$\Rightarrow g(x, 0) = g(x + 12, 0)$

Hence, $g(x)$ is periodic with period 12.

Ex. 44 *Solve the equation $10^{(x+1)(3x+4)} - 2 \cdot 10^{(x+1)(x+2)} = 10^{1 - x - x^2}$.*

Sol. Given equation is

$$10^{3x^2 + 7x + 4} - 2 \cdot 10^{x^2 + 3x + 2} = \frac{10}{10^{x + x^2}}$$

$\Rightarrow 10^{4x^2 + 8x + 4} - 2 \cdot 10^{2x^2 + 4x + 2} = 10$

$\Rightarrow 10^{4(x^2 + 2x + 1)} - 2 \cdot 10^{2(x^2 + 2x + 1)} = 10$

$\Rightarrow 10^{4(x + 1)^2} - 2 \cdot 10^{2(x + 1)^2} = 10$

$\Rightarrow \{10^{2(x + 1)^2}\}^2 - 2 \cdot \{10^{2(x + 1)^2}\} = 10$ ...(i)

Let $10^{2(x + 1)^2} = y$ ...(ii)

$\Rightarrow y^2 - 2y = 10 \ \Rightarrow \ y^2 - 2y - 10 = 0$

$\Rightarrow y = \dfrac{2 \pm \sqrt{4 + 40}}{2}$

$\Rightarrow y = 1 \pm \sqrt{11}$

$\Rightarrow y = 1 + \sqrt{11}$ [neglecting –ve sign as $y > 0$]

$\Rightarrow 10^{2(x + 1)^2} = 1 + \sqrt{11}$

$\Rightarrow 2(x + 1)^2 = \log_{10}(1 + \sqrt{11})$

$\Rightarrow (x + 1)^2 = \dfrac{1}{2}\log_{10}(1 + \sqrt{11})$

$\Rightarrow x + 1 = \pm\sqrt{\dfrac{1}{2}\log_{10}(1 + \sqrt{11})}$

Hence, $x = -1 \pm \sqrt{\dfrac{1}{2}\log_{10}(1 + \sqrt{11})}$

Ex. 45 *Find the real solution of $[x] + [5x] + [10x] + [20x] = 36K + 35, K \in$ integer, where $[\cdot]$ denotes the greatest integral function.*

Sol. Let $x = a + r$, where $a \in$ integer and $r \in [0, 1)$. Then, there are four cases

(i) $0 \le r < \frac{1}{20}$ (ii) $\frac{1}{20} \le r < \frac{1}{10}$

(iii) $\frac{1}{10} \le r < \frac{1}{5}$ (iv) $\frac{1}{5} \le r < 1$

***Case* I** If $0 \le r < \frac{1}{20}$.

$\therefore\ [x] + [5x] + [10x] + [20x] = 36K + 35$

$\Rightarrow [a + r] + [5a + 5r] + [10a + 10r] + [20a + 20r] = 36K + 35$

$\Rightarrow a + 5a + 10a + 20a = 36K + 35$

[by definition of the greatest integer function]

$\Rightarrow \quad 36a = 36K + 35,$

which is not possible for any values of a and K as they belongs to integers. ...(i)

***Case* II** If $\frac{1}{20} \le r < \frac{1}{10}$.

$\therefore \quad [x] + [5x] + [10x] + [20x] = 36K + 35$

$\Rightarrow \quad [a + r] + [5a + 5r] + [10a + 10r] + [20a + 20r] = 36K + 35$

$\Rightarrow \quad a + 5a + 10a + 20a + 1 = 36K + 35$

$\Rightarrow \quad 36a + 1 = 36K + 35$

$\Rightarrow \quad 36a = 36K + 34,$

which is again not possible, $\forall\ a, K \in$ integer. ...(ii)

***Case* III** If $\frac{1}{10} \le r < \frac{1}{5}$.

$\therefore\ [x] + [5x] + [10x] + [20x] = 36K + 35$

$\Rightarrow [a + r] + [5a + 5r] + [10a + 10r] + [20a + 20r] = 36K + 35$

$\Rightarrow\ a + 5a + 10a + 1 + 20a + 2 = 36K + 35$

$\Rightarrow \quad 36a + 3 = 36K + 35$

$\Rightarrow \quad 36a = 36K + 32,$

which shows no value of a and K can be given. ...(iii)

***Case* IV** If $\frac{1}{5} \le r < 1$.

$\therefore\ [x] + [5x] + [10x] + [20x] = 36K + 35$

$\Rightarrow [a + r] + [5a + 5r] + [10a + 10r] + [20a + 20r] = 36K + 35$

$\Rightarrow \quad a + 5a + 1 + 10a + 2 + 20a + 4 = 36K + 35$

$\Rightarrow \quad 36a + 7 = 36K + 35$

$\Rightarrow \quad 36a = 36K + 28$

Again, no solution is possible. ...(iv)

Hence, from Eqs. (i), (ii), (iii), (iv) there exists no real value which possesses solution.

● ***Ex. 46*** *Let $f : N \to N$ be a function such that*

(i) $x - f(x) = 19\left[\frac{x}{19}\right] - 90\left[\frac{f(x)}{90}\right], \forall\ x \in N$, *where* $[\cdot]$ *denotes the greatest integer function.*

(ii) $1900 < f(1990) < 2000$.

Find all the possible values of $f(1990)$.

Sol. Since, $1900 < f(1990) < 2000$

$\Rightarrow \quad \frac{1900}{90} < \frac{f(1990)}{90} < \frac{2000}{90} \Rightarrow 21.1 < \frac{f(1990)}{90} < 22.2$

$\therefore \quad \left[\frac{f(1990)}{90}\right] = 21,22$ ...(i)

Given, $x - f(x) = 19\left[\frac{x}{19}\right] - 90\left[\frac{f(x)}{90}\right]$.

Now, there are two cases arise.

***Case* I** $\left[\frac{f(1990)}{90}\right] = 21$

We have, $1990 - f(1990) = 19\left[\frac{1990}{19}\right] - 90\left[\frac{f(1990)}{90}\right]$

$1990 - f(1990) = 19 \cdot (104) - 90 \cdot (21)$

$\Rightarrow \quad f(1990) = 1904$ ... (ii)

***Case* II** $\left[\frac{f(1990)}{90}\right] = 22$

We have, $1990 - f(1990) = 19\left[\frac{1990}{19}\right] - 90\left[\frac{f(1990)}{90}\right]$

$\Rightarrow \quad f(1990) = 1994$ ... (iii)

From Eqs. (ii) and (iii), we have $f(1990) = 1904$ or 1994.

● ***Ex. 47*** *Solve the system of equations;*

$$|x^2 - 2x| + y = 1, x^2 + |y| = 1.$$

Sol. Here, $|x^2 - 2x| + y = 1$ and $x^2 + |y| = 1$ gives four cases as

***Case* I** $x^2 - 2x \ge 0$ and $y \ge 0$ ...(i)

Equations are $x^2 - 2x + y = 1$ and $x^2 + y = 1$

$\Rightarrow \quad 1 - 2x = 1 \Rightarrow x = 0$ and $y = 1$ ...(ii)

From Eq. (i), $x^2 - 2x \ge 0 \Rightarrow x \le 0 \quad x \ge 2$ and $y \ge 0$

Thus, $x = 0$ and $y = 1$ is the only solution when

$x^2 - 2x \ge 0$ and $y \ge 0$

***Case* II** $x^2 - 2x \ge 0$ and $y < 0$

$\Rightarrow \quad (x \le 0$ or $x \ge 2)$ and $(y < 0)$ ...(iii)

$\therefore$ Equations are $x^2 - 2x + y = 1$ and $x^2 - y = 1$.

Adding these equations, we get

$2x^2 - 2x = 2$

or $x = \frac{1 \pm \sqrt{5}}{2}$ and $y = \frac{1 \pm \sqrt{5}}{2}$ ...(iv)

From Eqs. (iii) and (iv), $x = \frac{1 - \sqrt{5}}{2}$ and $y = \frac{1 - \sqrt{5}}{2}$

***Case* III** $x^2 - 2x \le 0$ and $y \ge 0$.

$\Rightarrow \quad (0 \le x \le 2)$ and $(y \ge 0)$ ...(v)

Equations are $-x^2 + 2x + y = 1$ and

$x^2 + y = 1$, subtracting, we get

$-2x^2 + 2x = 0 \Rightarrow x = 0, 1$

i.e. $x = 0, y = 1$ or $x = 1, y = 0$ ...(vi)

which satisfy Eq. (v).

***Case* IV** $x^2 - 2x \le 0$ and $y \le 0$.

$\Rightarrow \quad (0 \le x \le 2)$ and $(y \le 0)$ ...(vii)

$\therefore$ Equations are $-x^2 + 2x + y = 1$ and $x^2 - y = 1$,

adding, we get $2x = 2 \Rightarrow x = 1$

and $y = 0$ which satisfies Eq. (vii).

Thus, solutions are

$(x = 0, y = 1)(x = 1, y = 0)$ and $\left(x = y = \frac{1-\sqrt{5}}{2}\right)$.

● ***Ex. 48*** *Let f and g be real-valued functions such that $f(x+y) + f(x-y) = 2f(x) \cdot g(y), \forall\ x, y \in R$. Prove that, if $f(x)$ is not identically zero and $|f(x)| \le 1, \forall\ x \in R$, then $|g(y)| \le 1, \forall\ y \in R$.*

Sol. Let maximum value of $f(x)$ be M.

$\Rightarrow \quad \max |f(x)| = M$, where $0 < M \le 1$ ...(i)

[since, f is not identically zero and $|f(x)| \le 1, \forall\ x \in R$]

Now, $f(x+y) + f(x-y) = 2f(x) \cdot g(y)$

$\Rightarrow \quad |2f(x)| \cdot |g(y)| = |f(x+y) + f(x-y)|$

$\Rightarrow \quad 2|f(x)| \cdot |g(y)| \le |f(x+y)| + |f(x-y)|$

[as $|a+b| \le |a| + |b|$]

$\Rightarrow \quad 2|f(x)| \cdot |g(y)| \le M + M$

[using Eq. (i), i.e. $\max |f(x)| = M$]

$\Rightarrow \quad |g(y)| \le 1, \forall\ y \in R$

Thus, if $f(x)$ is not identically zero and $|f(x)| \le 1, \forall\ x \in R$, then $|g(y)| \le 1, \forall\ y \in R$.

● ***Ex. 49*** *If p and q are positive integers, f is a function defined for positive numbers and attains only positive values such that $f(x\ f(y)) = x^p y^q$, then prove that $q = p^2$.*

Sol. For $x = \frac{1}{f(y)}$, we have

$$f\left(x \cdot \frac{1}{x}\right) = \frac{1}{f(y)^p} \cdot y^q$$

$\Rightarrow \quad f(1) = \frac{y^q}{\{f(y)\}^p}$

$\Rightarrow \quad f(y) = \frac{y^{q/p}}{\{f(1)\}^{1/p}}$

For $y = 1$, we have $f(1) = 1$

$\therefore \quad f(y) = y^{q/p}$

or $\quad f(x) = x^{q/p}$ ...(i)

Hence, $\quad f(x \cdot y^{q/p}) = x^p \cdot y^q$

Let $\quad y^{q/p} = z$

$\Rightarrow \quad y = z^{p/q}$

$\Rightarrow \quad f(x \cdot z) = x^p \cdot z^p$

or $\quad f(x) = x^p$ ...(ii)

From Eqs. (i) and (ii), we have $x^{q/p} = x^p$

$\Rightarrow \quad \frac{q}{p} = p$ or $q = p^2$

Functions Exercise 1 :
Single Option Correct Type Questions

1. $f_1(x) = \begin{cases} x, \text{ for } 0 \le x \le 1 \\ 1, \text{ for } x > 1 \\ 0, \text{ otherwise} \end{cases}$ $f_2(x) = f_1(-x)$, for all x and $f_3(x) = -f_2(x)$, for all x. $f_4(x) = f_3(-x)$, for all x

Which of the following is necessarily true?
(a) $f_4(x) = f_1(x)$, for all x (b) $f_1(x) = -f_3(-x)$, for all x
(c) $f_2(-x) = f_4(x)$, for all x (d) $f_1(x) + f_3(x) = 0$, for all x

2. Which one of the following is an odd function?

(a) 
(b) 
(c) 
(d) 
3. If $f(x) = \sqrt{\frac{8}{1-x} + \frac{8}{1+x}}$ and $g(x) = \frac{4}{f(\sin x)} + \frac{4}{f(\cos x)}$, the $g(x)$ is periodic with period
(a) $\frac{\pi}{2}$ (b) π (c) $\frac{3\pi}{2}$ (d) 2π

4. Let f be a function defined by $f(xy) = \frac{f(x)}{y}$ for all positive real numbers x and y. If $f(30) = 20$, the value of $f(40)$ is
(a) 15 (b) 20 (c) 40 (d) 60

5. Let $f(x) = e^{\{e^{|x|} \text{ sgn } x\}}$ and $g(x) = e^{[e^{|x|} \text{ sgn } x]}$, $x \in R$, where $\{x\}$ and $[x]$ denote fractional part and greatest integer function, respectively. Also, $h(x) = \log(f(x)) + \log(g(x))$, then for all real x, $h(x)$ is
(a) an odd function
(b) an even function
(c) neither odd nor even function
(d) both odd as well as even function

6. Which of the following function is surjective but not injective?
(a) $f : R \to R$, $f(x) = x^4 + 2x^3 - x^2 + 1$
(b) $f : R \to R$, $f(x) = x^3 + x + 1$
(c) $f : R \to R^+$, $f(x) = \sqrt{1 + x^2}$
(d) $f : R \to R$, $f(x) = x^3 + 2x^2 - x + 1$

7. If $f(x) = 2x^3 + 7x - 9$, then $f^{-1}(4)$ is
(a) 1 (b) 2 (c) 1/3 (d) non-existent

8. The range of the function

$$f(x) = \frac{e^x \cdot \log x \cdot 5^{x^2+2} \cdot (x^2 - 7x + 10)}{2x^2 - 11x + 12} \text{ is}$$

(a) $(-\infty, \infty)$ (b) $[0, \infty)$ (c) $\left(\frac{3}{2}, \infty\right)$ (d) $\left(\frac{3}{2}, 4\right)$

9. If $x = \cos^{-1}(\cos 4)$ and $y = \sin^{-1}(\sin 3)$, then which of the following holds?
(a) $x - y = 1$ (b) $x + y + 1 = 0$
(c) $x + 2y = 2$ (d) $x + y = 3\pi - 7$

10. Let $f(x) = \left(\frac{2\sin x + \sin 2x}{2\cos x + \sin 2x} \cdot \frac{1 - \cos x}{1 - \sin x}\right)^{2/3}$; $x \in R$.

Consider the following statements.
I. Domain of f is R.
II. Range of f is R.
III. Domain of f is $R - (4n-1)\frac{\pi}{2}$, $n \in I$.
IV. Domain of f is $R - (4n+1)\frac{\pi}{2}$, $n \in I$.

Which one of the following is correct?
(a) I and II (b) II and III
(c) III and IV (d) II, III and IV

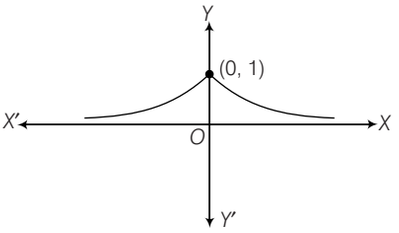
11. If $f(x) = e^{\sin(x - [x])\cos \pi x}$, where $[x]$ denotes the greatest integer function, then $f(x)$ is
(a) non-periodic
(b) periodic with no fundamental period
(c) periodic with period 2
(d) periodic with period π

12. The range of the function, $f(x) = \cot^{-1}(\log_{0.5}(x^4 - 2x^2 + 3))$ is
(a) $(0, \pi)$ (b) $\left(0, \frac{3\pi}{4}\right]$ (c) $\left[\frac{3\pi}{4}, \pi\right)$ (d) $\left[\frac{\pi}{2}, \frac{3\pi}{4}\right]$

13. Range of $f(x) = \left[\frac{1}{\log(x^2 + e)}\right] + \frac{1}{\sqrt{1 + x^2}}$, where $[\cdot]$ denotes greatest integer function, is
(a) $\left(0, \frac{e+1}{e}\right) \cup \{2\}$ (b) $(0, 1)$
(c) $(0, 1] \cup \{2\}$ (d) $[0, 1) \cup \{2\}$

14. The period of the function $f(x) = \sin(x + 3 - [x + 3])$, where $[\cdot]$ denotes greatest integer function, is
(a) $2\pi + 3$ (b) 2π (c) 1 (d) 4

15. Which one of the following functions best represent the graph as shown below?



(a) $f(x)=\dfrac{1}{1+x^2}$ (b) $f(x)=\dfrac{1}{\sqrt{1+|x|}}$

(c) $f(x)=e^{-|x|}$ (d) $f(x)=a^{|x|}, a>1$

16. The solution set for $[x]\{x\}=1$, where $\{x\}$ and $[x]$ denote fractional part and greatest integer functions, is

(a) $R^+-(0,1)$ (b) $R^+-\{1\}$

(c) $\left\{m+\dfrac{1}{m}; m\in I-\{0\}\right\}$ (d) $\left\{m+\dfrac{1}{m}; m\in N-\{1\}\right\}$

17. The domain of definition of function $f(x)=\log(\sqrt{x^2-5x-24}-x-2)$, is

(a) $(-\infty,-3]$ (b) $(-\infty-3]\cup[8,\infty)$

(c) $\left(-\infty,\dfrac{-28}{9}\right)$ (d) None of these

18. If $f(x)$ is a function $f:R\to R$, we say $f(x)$ has property

I. If $f(f(x))=x$ for all real numbers x.

II. If $f(-f(x))=-x$ for all real numbers x.

How many linear functions, have both property I and II?

(a) 0 (b) 2

(c) 3 (d) Infinite

19. Let $f(x)=\dfrac{x}{1+x}$ and $g(x)=\dfrac{rx}{1-x}$. Let S be the set of all real numbers r, such that $f(g(x))=g(f(x))$ for infinitely many real numbers x. The number of elements in set S is

(a) 1 (b) 2

(c) 3 (d) 5

20. Let $f(x)$ be linear functions with the properties that $f(1)\le f(2)$, $f(3)\ge f(4)$ and $f(5)=5$. Which one of the following statements is true?

(a) $f(0)<0$ (b) $f(0)=0$

(c) $f(1)<f(0)<f(-1)$ (d) $f(0)=5$

21. Suppose R is relation whose graph is symmetric to both X-axis and Y-axis and that the point $(1,2)$ is on the graph of R. Which one of the following is not necessarily on the graph of R?

(a) $(-1,2)$ (b) $(1,-2)$

(c) $(-1,-2)$ (d) $(2,1)$

22. The area between the curve $2\{y\}=[x]+1, 0\le y<1$, where $\{\cdot\}$ and $[\cdot]$ are the fractional part and greatest integer functions, respectively and the X-axis, is

(a) $\dfrac{1}{2}$ (b) 1 (c) 0 (d) $\dfrac{3}{2}$

23. If $f(x)=\sin^{-1}x$ and $g(x)=[\sin(\cos x)]+[\cos(\sin x)]$, then range of $f(g(x))$ is (where, $[\cdot]$ denotes greatest integer function)

(a) $\left\{\dfrac{-\pi}{2},\dfrac{\pi}{2}\right\}$ (b) $\left\{\dfrac{-\pi}{2},0\right\}$

(c) $\left\{0,\dfrac{\pi}{2}\right\}$ (d) $\left\{-\dfrac{\pi}{2},0,\dfrac{\pi}{2}\right\}$

24. The number of solutions of the equation $e^{2x}+e^x-2=[\{x^2+10x+11\}]$ is

(where, $\{x\}$ denotes fractional part of x and $[x]$ denotes greatest integer function)

(a) 0 (b) 1 (c) 2 (d) 3

25. Total number of values of x, of the form $\dfrac{1}{n}, n\in N$ in the interval $x\in\left[\dfrac{1}{25},\dfrac{1}{10}\right]$, which satisfy the equation $\{x\}+\{2x\}+\ldots+\{12x\}=78x$ (where, $\{\cdot\}$ represents fractional part function), is

(a) 12 (b) 13

(c) 14 (d) 15

26. The sum of the maximum and minimum values of the function $f(x)=\dfrac{1}{1+(2\cos x-4\sin x)^2}$ is

(a) $\dfrac{22}{21}$ (b) $\dfrac{21}{20}$ (c) $\dfrac{22}{20}$ (d) $\dfrac{21}{11}$

27. Let $f:X\to Y$, $f(x)=\sin x+\cos x+2\sqrt{2}$ be invertible, then $X\to Y$ is/are

(a) $\left[\dfrac{\pi}{4},\dfrac{5\pi}{4}\right]\to[\sqrt{2},3\sqrt{2}]$

(b) $\left[-\dfrac{\pi}{4},\dfrac{3\pi}{4}\right]\to[\sqrt{2},3\sqrt{2}]$

(c) $\left[-\dfrac{3\pi}{4},\dfrac{3\pi}{4}\right]\to[\sqrt{2},-3\sqrt{2}]$

(d) $\left[-\dfrac{3\pi}{4},-\dfrac{\pi}{4}\right]\to[\sqrt{2},3\sqrt{2}]$

28. The range of values of a, so that all the roots of the equation $2x^3-3x^2-12x+a=0$ are real and distinct, belongs to

(a) (7, 20) (b) (−7, 20)

(c) (−20, 7) (d) (−7, 7)

29. If $f(x)$ is continuous such that $|f(x)| \le 1, \forall\ x \in R$ and $g(x) = \dfrac{e^{f(x)} - e^{|f(x)|}}{e^{f(x)} + e^{|f(x)|}}$, then range of $g(x)$ is

(a) $[0, 1]$ (b) $\left[0, \dfrac{e^2+1}{e^2-1}\right]$

(c) $\left[0, \dfrac{e^2-1}{e^2+1}\right]$ (d) $\left[\dfrac{1-e^2}{1+e^2}, 0\right]$

30. Let $f(x) = \sqrt{|x| - \{x\}}$, where $\{\}$ denotes the fractional part of x and X, Y and its domain and range respectively, then

(a) $f : X \to Y : y = f(x)$ is one-one function

(b) $X \in \left(-\infty, -\dfrac{1}{2}\right] \cup [0, \infty)$ and $Y \in \left[\dfrac{1}{2}, \infty\right)$

(c) $X \in \left(-\infty, -\dfrac{1}{2}\right] \cup [0, \infty)$ and $Y \in [0, \infty)$

(d) None of the above

31. If the graphs of the functions $y = \ln x$ and $y = ax$ intersect at exactly two points, then a must be

(a) $(0, e)$ (b) $\left(\dfrac{1}{e}, 0\right)$

(c) $\left(0, \dfrac{1}{e}\right)$ (d) None of these

32. A quadratic polynomial maps from $[-2, 3]$ onto $[0, 3]$ and touches X-axis at $x = 3$, then the polynomial is

(a) $\dfrac{3}{16}(x^2 - 6x + 16)$ (b) $\dfrac{3}{25}(x^2 - 6x + 9)$

(c) $\dfrac{3}{25}(x^2 - 6x + 16)$ (d) $\dfrac{3}{16}(x^2 - 6x + 9)$

33. The range of the function $y = \sqrt{2\{x\} - \{x\}^2 - \dfrac{3}{4}}$ (where, $\{\cdot\}$ denotes the fractional part) is

(a) $\left[-\dfrac{1}{4}, \dfrac{1}{4}\right]$ (b) $\left[0, \dfrac{1}{2}\right)$

(c) $\left[0, \dfrac{1}{4}\right]$ (d) $\left[\dfrac{1}{4}, \dfrac{1}{2}\right]$

34. Let $f(x)$ be a fourth differentiable function such that $f(2x^2 - 1) = 2xf(x), \forall\ x \in R$, then $f^{iv}(0)$ is equal to (where, $f^{iv}(0)$ represents fourth derivative of $f(x)$ at $x = 0$)

(a) 0 (b) 1

(c) -1 (d) Data insufficient

35. Number of solutions of the equation $[y + [y]] = 2 \cos x$ is (where, $y = \dfrac{1}{3}[\sin x + [\sin x + [\sin x]]]$ and $[\cdot]$ denotes the greatest integer function)

(a) 1 (b) 2

(c) 3 (d) None of these

36. If a function satisfies $f(x+1) + f(x-1) = \sqrt{2} f(x)$, then period of $f(x)$ can be

(a) 2 (b) 4 (c) 6 (d) 8

37. If x and α are real, then the inequation $\log_2 x + \log_x 2 + 2 \cos \alpha \le 0$

(a) has no solution

(b) has exactly two solutions

(c) is satisfied for any real α and any real x in $(0, 1)$

(d) is satisfied for any real α and any real x in $(1, \infty)$

38. The range of values of 'a' such that $\left(\dfrac{1}{2}\right)^{|x|} = x^2 - a$ is satisfied for maximum number of values of 'x'

(a) $(-\infty, -1)$ (b) $(-\infty, \infty)$ (c) $(-1, 1)$ (d) $(-1, \infty)$

39. Let $f : R \to R$ be a function defined by $f(x) = \{|\cos x|\}$, where $\{x\}$ represents fractional part of x. Let S be the set containing all real values x lying in the interval $[0, 2\pi]$ for which $f(x) \ne |\cos x|$. The number of elements in the set S is

(a) 0 (b) 1 (c) 3 (d) infinite

40. The domain of the function $f(x) = \sqrt{\log_{\sin x + \cos x}(|\cos x| + \cos x)}$, $0 \le x \le \pi$ is

(a) $(0, \pi)$ (b) $\left(0, \dfrac{\pi}{2}\right)$

(c) $\left(0, \dfrac{\pi}{3}\right)$ (d) None of these

41. If $f(x) = (x^2 + 2\alpha x + \alpha^2 - 1)^{1/4}$ has its domain and range such that their union is set of real numbers, then α satisfies

(a) $-1 < \alpha < 1$ (b) $\alpha \le -1$

(c) $\alpha \ge 1$ (d) $\alpha \le 1$

42. Let $f : (e, \infty) \to R$ be a function defined by $f(x) = \log(\log(\log x))$, the base of the logarithm being e. Then,

(a) f is one-one and onto

(b) f is one-one but not onto

(c) f is onto but not one-one

(d) the range of f is equal to its domain

43. The expression $x^2 - 4px + q^2 > 0$ for all real x and also $r^2 + p^2 < qr$, the range of $f(x) = \dfrac{x + r}{x^2 + qx + p^2}$ is

(a) $\left[\dfrac{p}{2r}, \dfrac{q}{2r}\right]$ (b) $(0, \infty)$

(c) $(-\infty, 0)$ (d) $(-\infty, \infty)$

44. Let $f(x) = \dfrac{x^4 - \lambda x^3 - 3x^2 + 3\lambda x}{x - \lambda}$. If range of $f(x)$ is the set of entire real numbers, the true set in which λ lies is

(a) $[-2,2]$ (b) $[0,4]$

(c) $(1,3)$ (d) None of these

45. Let $a = 3^{1/224} + 1$ and for all $n \geq 3$,

let $f(n) = {}^{n}C_0\, a^{n-1} - {}^{n}C_1 a^{n-2} + {}^{n}C_2 a^{n-3} + \ldots + (-1)^{n-1} \cdot {}^{n}C_{n-1} \cdot a^0$.

If the value of $f(2016) + f(2017) = 3^K$, the value of K is

(a) 6 (b) 8
(c) 9 (d) 10

46. The area bounded by $f(x) = \sin^{-1}(\sin x)$ and

$g(x) = \dfrac{\pi}{2} - \sqrt{\dfrac{\pi^2}{2} - \left(x - \dfrac{\pi}{2}\right)^2}$ is

(a) $\dfrac{\pi^3}{8}$ sq units (b) $\dfrac{\pi^2}{8}$ sq units
(c) $\dfrac{\pi^3}{2}$ sq units (d) $\dfrac{\pi^2}{2}$ sq units

47. If $f : R \to R$, $f(x) = \dfrac{x^2 + bx + 1}{x^2 + 2x + b}, (b > 1)$ and $f(x), \dfrac{1}{f(x)}$ have the same bounded set as their range, the value of b is

(a) $2\sqrt{3} - 2$ (b) $2\sqrt{3} + 2$
(c) $2\sqrt{2} - 2$ (d) $2\sqrt{2} + 2$

48. The period of $\sin \dfrac{\pi [x]}{12} + \cos \dfrac{\pi [x]}{4} + \tan \dfrac{\pi [x]}{3}$, where $[x]$ represents the greatest integer less than or equal to x is

(a) 12 (b) 4
(c) 3 (d) 24

49. If $f(2x + 3y, 2x - 7y) = 20x$, then $f(x, y)$ equals

(a) $7x - 3y$ (b) $7x + 3y$
(c) $3x - 7y$ (d) $x - y$

50. The range of the function $f(x) = \sqrt{x - 1} + 2\sqrt{3 - x}$ is

(a) $[\sqrt{2}, 2\sqrt{2}]$ (b) $[\sqrt{2}, \sqrt{10}]$
(c) $[2\sqrt{2}, \sqrt{10}]$ (d) $[1, 3]$

51. The domain of the function

$f(x) = \cos^{-1}(\sec(\cos^{-1} x)) + \sin^{-1}(\operatorname{cosec}(\sin^{-1} x))$ is

(a) $x \in R$ (b) $x = 1, -1$
(c) $-1 \leq x \leq 1$ (d) $x \in \phi$

52. Let $f(x)$ be a polynomial one-one function such that $f(x)f(y) + 2 = f(x) + f(y) + f(xy), \forall\ x, y \in R - \{0\}$, $f(1) \neq 1, f'(1) = 3$.

Let $g(x) = \dfrac{x}{4}(f(x) + 3) - \int_0^x f(x)\, dx$, then

(a) $g(x) = 0$ has exactly one root for $x \in (0, 1)$
(b) $g(x) = 0$ has exactly two roots for $x \in (0, 1)$
(c) $g(x) \neq 0, \ \forall\ x \in R - \{0\}$
(d) $g(x) = 0, \ \forall\ x \in R - \{0\}$

53. Let $f(x)$ be a polynomial with real coefficients such that $f(x) = f'(x) \times f'''(x)$. If $f(x) = 0$ is satisfied $x = 1, 2, 3$ only, then the value of $f'(1)\, f'(2)\, f'(3)$ is

(a) positive (b) negative
(c) 0 (d) Inadequate data

54. Let $A = \{1, 2, 3, 4, 5\}$ and $f : A \to A$ be an into function such that $f(i) \neq i, \forall\ i \in A$, then number of such functions f are

(a) 1024 (b) 904
(c) 980 (d) None of these

55. If functions $f : \{1, 2, \ldots, n\} \to \{1995, 1996\}$ satisfying $f(1) + f(2) + \ldots + f(1996) =$ odd integer are formed, the number of such functions can be

(a) 2^n (b) $2^{n/2}$ (c) n^2 (d) 2^{n-1}

56. The range of $y = \sin^3 x - 6\sin^2 x + 11 \sin x - 6$ is

(a) $[-24, 2]$ (b) $[-24, 0]$
(c) $[0, 24]$ (d) None of these

57. Let $f(x) = x^2 - 2x$ and $g(x) = f(f(x) - 1) + f(5 - f(x))$, then

(a) $g(x) < 0, \forall x \in R$
(b) $g(x) < 0$, for some $x \in R$
(c) $g(x) \geq 0$, for some $x \in R$
(d) $g(x) \geq 0, \forall x \in R$

58. If $f(x)$ and $g(x)$ are non-periodic functions, then $h(x) = f(g(x))$ is

(a) non-periodic
(b) periodic
(c) may be periodic
(d) always periodic, if domain of $h(x)$ is a proper subset of real numbers

59. If $f(x)$ is a real-valued function discontinuous at all integral points lying in $[0, n]$ and if $(f(x))^2 = 1$, $\forall\ x \in [0, n]$, then number of functions $f(x)$ are

(a) 2^{n+1} (b) 6×3^n (c) $2 \times 3^{n-1}$ (d) 3^{n+1}

60. A function f from integers to integers is defined as

$$f(x) = \begin{cases} n + 3, & n \in \text{odd} \\ n/2, & n \in \text{even} \end{cases}$$

Suppose $k \in$ odd and $f(f(f(k))) = 27$, then the sum of digits of k is

(a) 3 (b) 6 (c) 9 (d) 12

61. If $f : R \to R$ and $f(x) = \dfrac{\sin(\pi\{x\})}{x^4 + 3x^2 + 7}$, where $\{\}$ is a fractional part of x, then

(a) f is injective
(b) f is not one-one and non-constant
(c) f is a surjective
(d) f is a zero function

62. Let $f: R \to R$ and $g: R \to R$ be two one-one and onto functions, such that they are the mirror images of each other about the line $y = a$. If $h(x) = f(x) + g(x)$, then $h(x)$ is
(a) one-one and onto
(b) only one-one and not onto
(c) only onto but not one-one
(d) None of the above

63. Domain of the function $f(x)$, if $3^x + 3^{f(x)}$ = minimum of $\phi(t)$, where $\phi(t) = \min\{2t^3 - 15t^2 + 36t - 25, 2 + |\sin t|\}$ is
(a) $(-\infty, 1)$
(b) $(-\infty, \log_3 e)$
(c) $(0, \log_3 2)$
(d) $(-\infty, \log_3 2)$

64. Let x be the elements of the set $A = \{1,2,3,4,5,6,8,10,12,15,20,24,30,40,60,120\}$ and x_1, x_2, x_3 be positive integers and d be the number of integral solutions of $x_1 x_2 x_3 = x$, then d is
(a) 100 (b) 150
(c) 320 (d) 250

65. If $A > 0, c, d, u, v$ are non-zero constants and the graph of $f(x) = |Ax + c| + d$ and $g(x) = -|Ax + u| + v$ intersect exactly at two points $(1, 4)$ and $(3, 1)$, then the value of $\frac{u+c}{A}$ equals
(a) 4 (b) -4
(c) 2 (d) -2

66. If $f(x) = x^3 + 3x^2 + 4x + a\sin x + b\cos x, \forall x \in R$ is a one-one function, then the greatest value of $(a^2 + b^2)$ is
(a) 1 (b) 2
(c) $\sqrt{2}$ (d) None of these

67. If two roots of the equation $(p-1)(x^2 + x + 1)^2 - (p+1)(x^4 + x^2 + 1) = 0$ are real and distinct and $f(x) = \frac{1-x}{1+x}$, then $f(f(x)) + f\left(f\left(\frac{1}{x}\right)\right)$ is equal to
(a) p (b) $-p$
(c) $2p$ (d) $-2p$

68. Let $f(x) = x^{13} + 2x^{12} + 3x^{11} + \ldots + 13x + 14$ and $\alpha = \cos\frac{2\pi}{15} + i\sin\frac{2\pi}{15}$. If $N = f(\alpha) f(\alpha^2) \ldots f(\alpha^{14})$, then
(a) number of divisors of N is 144
(b) number of divisors of N is 196
(c) number of divisors of N which are perfect squares of 49
(d) number of divisors of N which are perfect square of 12

69. The sum of the maximum and minimum values of function $f(x) = \sin^{-1} 2x + \cos^{-1} 2x + \sec^{-1} 2x$ is
(a) π (b) $\frac{\pi}{2}$
(c) 2π (d) $\frac{3\pi}{2}$

70. The complete set of values of 'a' for which the function $f(x) = \tan^{-1}(x^2 - 18x + a) > 0, \forall\ x \in R$, is
(a) $(81, \infty)$ (b) $[81, \infty)$
(c) $(-\infty, 81)$ (d) $(-\infty, 81]$

71. The domain of the function $f(x) = \sin^{-1}\frac{1}{|x^2 - 1|} + \frac{1}{\sqrt{\sin^2 x + \sin x + 1}}$ is
(a) $(-\infty, \infty)$
(b) $(-\infty, -\sqrt{2}] \cup [\sqrt{2}, \infty)$
(c) $(-\infty, -\sqrt{2}] \cup [\sqrt{2}, \infty) \cup \{0\}$
(d) None of the above

72. The domain of $f(x) = \frac{\log(\sin^{-1}\sqrt{x^2 + x + 1})}{\log(x^2 - x + 1)}$ is
(a) $(-1, 1)$ (b) $(-1, 0) \cup (0, 1)$
(c) $(-1, 0) \cup \{1\}$ (d) None of these

73. The domain of $f(x) = \sqrt{\sin^{-1}(3x - 4x^3)} + \sqrt{\cos^{-1} x}$ is equal to
(a) $\left[-1, -\frac{\sqrt{3}}{2}\right] \cup \left[0, \frac{\sqrt{3}}{2}\right]$ (b) $\left[-1, -\frac{1}{2}\right] \cup \left[0, \frac{1}{2}\right]$
(c) $\left[0, \frac{1}{2}\right]$ (d) None of these

74. The domain of the function $f(x) = \sqrt[6]{4^x + 8^{2/3(x-2)} - 52 - 2^{2(x-1)}}$ is
(a) (0, 1) (b) [3, ∞)
(c) [1, 0) (d) None of these

75. The domain of derivative of the function $f(x) = |\sin^{-1}(2x^2 - 1)|$ is
(a) $(-1, 1)$ (b) $(-1, 1) \sim \left\{0, \pm\frac{1}{\sqrt{2}}\right\}$
(c) $(-1, 1) \sim \{0\}$ (d) $(-1, 1) \sim \left\{\pm\frac{1}{\sqrt{2}}\right\}$

76. The range of a function $f(x) = \tan^{-1}\{\log_{5/4}(5x^2 - 8x + 4)\}$ is
(a) $\left(\frac{-\pi}{4}, \frac{\pi}{2}\right)$ (b) $\left[\frac{-\pi}{4}, \frac{\pi}{2}\right)$
(c) $\left(\frac{-\pi}{4}, \frac{\pi}{2}\right]$ (d) $\left[\frac{-\pi}{4}, \frac{\pi}{2}\right]$

Functions Exercise 2 :
More Than One Option Correct Type Questions

77. Which of the following function(s) is/are transcendal?

(a) $f(x) = 5\sin(\sqrt{x})$ (b) $f(x) = \dfrac{2\sin 3x}{x^2 + 2x - 1}$

(c) $f(x) = \sqrt{x^2 + 2x + 1}$ (d) $f(x) = (x^2 + 3)\cdot 2^x$

78. Let $f(x) = \dfrac{\sqrt{x - 2\sqrt{x-1}}}{\sqrt{x-1} - 1}\cdot x$, then

(a) domain of $f(x)$ is $x \geq 1$ (b) domain of $f(x)$ is $[1, \infty) - \{2\}$

(c) $f'(10) = 1$ (d) $f'\left(\dfrac{3}{2}\right) = -1$

79. $f(x) = \cos^2 x + \cos^2\left(\dfrac{\pi}{3} + x\right) - \cos x \cdot \cos\left(x + \dfrac{\pi}{3}\right)$ is

(a) an odd function (b) an even function

(c) a periodic function (d) $f(0) = f(1)$

80. If the following functions are defined from $[-1, 1]$ to $[-1, 1]$, identify these which are into.

(a) $\sin(\sin^{-1} x)$ (b) $\dfrac{2}{\pi}\cdot\sin^{-1}(\sin x)$

(c) $\text{sgn}(x)\cdot\log(e^x)$ (d) $x^3\text{sgn}(x)$

81. Let $f(x) = \begin{cases} x^2 - 4x + 3, & x < 3 \\ x - 4, & x \geq 3 \end{cases}$

and $g(x) = \begin{cases} x - 3, & x < 4 \\ x^2 + 2x + 2, & x \geq 4 \end{cases}$, which one of the following is/are true?

(a) $(f + g)(3.5) = 0$ (b) $f(g(3)) = 3$

(c) $f(g(2)) = 1$ (d) $(f - g)(4) = 0$

82. If $f(x) = x^2 - 2ax + a(a+1)$, $f : [a, \infty) \to [a, \infty)$. If one of the solutions of the equation $f(x) = f^{-1}(x)$ is 5049, the other may be

(a) 5051 (b) 5048 (c) 5052 (d) 5050

83. The function g defined by $g(x) = \sin\alpha + \cos\alpha - 1; \alpha = \sin^{-1}\sqrt{\{x\}}$, where $\{\}$ denotes fractional part function, is

(a) an even function (b) periodic function

(c) odd function (d) neither even nor odd

84. The graph of $f : R \to R$ defined by $y = f(x)$ is symmetric with respect to $x = a$ and $x = b$. Which of the following is true?

(a) $f(2a - x) = f(x)$ (b) $f(2a + x) = f(-x)$

(c) $f(2b + x) = f(-x)$ (d) f is periodic

85. Let f be the continuous and differentiable function such that $f(x) = f(2 - x)$, $\forall\, x \in R$ and $g(x) = f(1 + x)$, then

(a) $g(x)$ is an odd function

(b) $g(x)$ is an even function

(c) $f(x)$ is symmetric about $x = 1$

(d) None of the above

86. Let $f(x) = |x-1| + |x-2| + |x-3| + |x-4|$, then

(a) least value of $f(x)$ is 4

(b) least value is not attained at unique point

(c) the number of integral solution of $f(x) = 4$ is 2

(d) the value of $\dfrac{f(\pi - 1) + f(e)}{2f\left(\dfrac{12}{5}\right)}$ is 1

87. Let $A = \{1, 2, 3, 4, 5\}$, $B = \{1, 2, 3, 4\}$ and $f : A \to B$ is a function, the

(a) number of onto functions, if $n(f(A)) = 4$ is 240

(b) number of onto functions, if $n(f(A)) = 3$ is 600

(c) number of onto functions, if $n(f(A)) = 2$ is 180

(d) number of onto functions, if $n(f(A)) = 1$ is 4

88. If $2f(x) + x\, f\left(\dfrac{1}{x}\right) - 2f\left(\left|\sqrt{2}\sin\pi\left(x + \dfrac{1}{4}\right)\right|\right)$

$= 4\cos^2\left(\dfrac{\pi x}{2}\right) + x\cos\left(\dfrac{\pi}{x}\right)$, $\forall\, x \in R - \{0\}$, which of the following statement(s) is/are true?

(a) $f(2) + f\left(\dfrac{1}{2}\right) = 1$ (b) $f(2) + f(1) = 0$

(c) $f(2) + f(1) = f\left(\dfrac{1}{2}\right)$ (d) $f(1)\cdot f\left(\dfrac{1}{2}\right)\cdot f(2) = 1$

89. If $f(x)$ is a differentiable function satisfying the condition $f(100x) = x + f(100x - 100)$, $\forall\, x \in R$ and $f(100) = 1$, then $f(10^4)$ is

(a) 5049 (b) $\sum_{r=1}^{100} r$ (c) $\sum_{r=2}^{100} r$ (d) 5050

90. If $[x]$ denotes the greatest integer function then the extreme values of the function $f(x) = [1 + \sin x] + [1 + \sin 2x] + \ldots + [1 + \sin nx]$, $n \in I^+$, $x \in (0, \pi)$ are

(a) $(n - 1)$ (b) n (c) $(n + 1)$ (d) $(n + 2)$

91. Which of the following is/are periodic?

(a) $f(x) = \begin{cases} 1, & \text{if } x \text{ is rational} \\ 0, & \text{if } x \text{ is irrational} \end{cases}$

(b) $f(x) = \begin{cases} x - [x], & 2n \leq x < 2n + 1 \\ \dfrac{1}{2}, & 2n + 1 \leq x < 2n + 2 \end{cases}$, where $[\cdot]$ denotes the greatest integer function

(c) $f(x) = (-1)^{\left[\frac{2x}{\pi}\right]}$, where $[\cdot]$ denotes the greatest integer function

(d) $f(x) = ax - [ax + a] + \tan\left(\dfrac{\pi x}{2}\right)$, where $[\cdot]$ denotes the greatest integer function

92. If $f(x)$ is a polynomial of degree n, such that $f(0)=0$, $f(1)=1/2, \ldots, f(n)=\frac{n}{n+1}$, then the value of $f(n+1)$ is

(a) 1, when n is even (b) $\frac{n}{n+2}$, when n is odd

(c) 1, when n is odd (d) $\frac{n}{n+2}$, when n is even

93. Let $f: R \to R$ be a function defined by $f(x+1)=\frac{f(x)-5}{f(x)-3}, \forall\ x \in R$. Then, which of the following statement(s) is/are true?

(a) $f(2008)=f(2004)$ (b) $f(2006)=f(2010)$

(c) $f(2006)=f(2002)$ (d) $f(2006)=f(2018)$

94. Let $f(x)=1-x-x^3$. Then, the real values of x satisfying the inequality, $1-f(x)-f^3(x)>f(1-5x)$, are

(a) $(-2, 0)$ (b) $(0, 2)$

(c) $(2, \infty)$ (d) $(-\infty, -2)$

95. If a function satisfies $(x-y)f(x+y)-(x+y)f(x-y)=2(x^2y-y^3)$, $\forall\ x, y \in R$ and $f(1)=2$, then

(a) $f(x)$ must be polynomial function

(b) $f(3)=12$

(c) $f(0)=0$

(d) $f(x)$ may not be differentiable

96. If the fundamental period of function $f(x)=\sin x+\cos\left(\sqrt{4-a^2}\right)x$ is 4π, then the value of a is/are

(a) $\frac{\sqrt{15}}{2}$ (b) $-\frac{\sqrt{15}}{2}$ (c) $\frac{\sqrt{7}}{2}$ (d) $-\frac{\sqrt{7}}{2}$

97. Let $f(x)$ be a real valued function such that $f(0)=\frac{1}{2}$ and $f(x+y)=f(x)f(a-y)+f(y)f(a-x)$, $\forall\ x, y \in R$, then for some real a,

(a) $f(x)$ is a periodic function

(b) $f(x)$ is a constant function

(c) $f(x)=\frac{1}{2}$ (d) $f(x)=\frac{\cos x}{2}$

98. If $f(g(x))$ is one-one function, then

(a) $g(x)$ must be one-one (b) $f(x)$ must be one-one

(c) $f(x)$ may not be one-one (d) $g(x)$ may not be one-one

99. Which of the following functions have their range equal to R (the set of real numbers)?

(a) $x \sin x$

(b) $\frac{[x]}{\tan 2x} \cdot x \in \left(-\frac{\pi}{4}\cdot\frac{\pi}{4}\right)-\{0\}$, where $[\cdot]$ denotes the greatest integer function

(c) $\frac{x}{\sin x}$

(d) $[x]+\sqrt{\{x\}}$, where $[\cdot]$ and $\{\cdot\}$, respectively denote the greatest integer and fractional part functions

100. Which of the following pairs of function are identical?

(a) $f(x)=e^{\ln \sec^{-1} x}$ and $g(x)=\sec^{-1} x$

(b) $f(x)=\tan(\tan^{-1} x)$ and $g(x)=\cot(\cot^{-1} x)$

(c) $f(x)=\text{sgn}(x)$ and $g(x)=\text{sgn}(\text{sgn}(x))$

(d) $f(x)=\cot^2 x \cdot \cos^2 x$ and $g(x)=\cot^2 x-\cos^2 x$

101. Let $f: R \to R$ defined by $f(x)=\cos^{-1}(-\{-x\})$, where $\{x\}$ denotes fractional part of x. Then, which of the following is/are correct?

(a) f is many one but not even function

(b) Range of f contains two prime numbers

(c) f is non-periodic

(d) Graph of f does not lie below X-axis

Functions Exercise 3 : Statements I and II Type Questions

■ **Directions** (Q. Nos. 102 to 112) *For the following questions, choose the correct answers from the codes (a), (b), (c) and (d) defined as follows :*

(a) Statement I is true, Statement II is also true; Statement II is the correct explanation of Statement I

(b) Statement I is true, Statement II is also true; Statement II is not the correct explanation of Statement I

(c) Statement I is true, Statement II is false

(d) Statement I is false, Statement II is true

102. **Statement I** The function $f(x)=x \sin x$ and $f'(x)=x \cos x+\sin x$ are both non-periodic.

Statement II The derivative of differentiable function (non-periodic) is non-periodic function.

103. **Statement I** The maximum value of $\sin\sqrt{2}x+\sin ax$ cannot be 2 (where a is positive rational number).

Statement II $\frac{\sqrt{2}}{a}$ is irrational.

104. Let $f: R \to R$ be a function such that $f(x)=\frac{e^{|x|}-e^{-x}}{e^x+e^{-x}}$.

Statement I $f(x)$ is into function.

Statement II $f(x)$ is many-one function and the many-one function is not onto.

105. **Statement I** The range of
$f(x)=\sin\left(\frac{\pi}{5}+x\right)-\sin\left(\frac{\pi}{5}-x\right)-\sin\left(\frac{2\pi}{5}+x\right)+\sin\left(\frac{2\pi}{5}-x\right)$ is $[-1, 1]$.

Statement II $\cos\frac{\pi}{5}-\cos\frac{2\pi}{5}=\frac{1}{2}$

106. **Statement I** The period of
$f(x)=2\cos\frac{1}{3}(x-\pi)+4\sin\frac{1}{3}(x-\pi)$ is 3π.

Statement II If T is the period of $f(x)$, then the period of $f(ax+b)$ is $\frac{T}{|a|}$.

107. f is a function defined on the interval $[-1, 1]$ such that $f(\sin 2x)=\sin x+\cos x$.

Statement I If $x\in\left[-\frac{\pi}{4},\frac{\pi}{4}\right]$, then $f(\tan^2 x)=\sec x$

Statement II $f(x)=\sqrt{1+x}, \forall\ x\in[-1, 1]$

108. **Statement I** The equation $f(x)=4x^5+20x-9=0$ has only one real root.

Statement II $f'(x)=20x^4+20=0$ has no real root.

109. **Statement I** The range of $\log\left(\frac{1}{1+x^2}\right)$ is $(-\infty,\infty)$.

Statement II When $0<x\le 1$, $\log x\in(-\infty, 0]$.

110. Let $f: X\to Y$ be a function defined by
$f(x)=2\sin\left(x+\frac{\pi}{4}\right)-\sqrt{2}\cos x+c$.

Statement I For set X, $x\in\left[0,\frac{\pi}{2}\right]\cup\left[\pi,\frac{3\pi}{2}\right]$, $f(x)$ is one-one function.

Statement II $f'(x)\ge 0, x\in\left[0,\frac{\pi}{2}\right]$

111. Let $f(x)=\sin x$

Statement I f is not a polynomial function.

Statement II nth derivative of $f(x)$, w.r.t. x, is not a zero function for any positive integer n.

112. **Statement I** The function $f: R\to R$, given $f(x)=\log_a(x+\sqrt{x^2+1}), a>0, a\ne 1$ is invertible.

Statement II f is many-one and into.

Functions Exercise 4 : Passage Based Questions

Passage I (Q. Nos. 113 to 115)

Let $f: R\to R$ be a continuous function such that $f(x)-2f\left(\frac{x}{2}\right)+f\left(\frac{x}{4}\right)=x^2$.

113. $f(3)$ is equal to
(a) $f(0)$ (b) $4+f(0)$ (c) $9+f(0)$ (d) $16+f(0)$

114. The equation $f(x)-x-f(0)=0$ have exactly
(a) no solution (b) one solution
(c) two solutions (d) infinite solutions

115. $f'(0)$ is equal to
(a) 0 (b) 1 (c) $f(0)$ (d) $-f(0)$

Passage II (Q. Nos. 116 to 117)

Consider the equation $x+y-[x][y]=0$, where $[\cdot]$ is the greatest integer function.

116. The number of integral solutions to the equation is
(a) 0 (b) 1
(c) 2 (d) None of these

117. Equation of one of the lines on which the non-integral solution of given equation lies, is
(a) $x+y=-1$ (b) $x+y=0$
(c) $x+y=1$ (d) $x+y=5$

Passage III (Q. Nos. 118 to 120)

Let $f(x)=\frac{1}{2}\left[f(xy)+f\left(\frac{x}{y}\right)\right]$ *for $x, y\in R^+$ such that $f(1)=0$; $f'(1)=2$.*

118. $f(x)-f(y)$ is equal to
(a) $f\left(\frac{y}{x}\right)$ (b) $f\left(\frac{x}{y}\right)$ (c) $f(2x)$ (d) $f(2y)$

119. $f'(3)$ is equal to
(a) $\frac{1}{3}$ (b) $\frac{2}{3}$ (c) $\frac{1}{2}$ (d) $\frac{1}{4}$

120. $f(e)$ is equal to
(a) 2 (b) 1 (c) 3 (d) 4

Passage IV (Q. Nos. 121 to 123)

If $f: R\to R$ and $f(x)=g(x)+h(x)$, where $g(x)$ is a polynomial and $h(x)$ is a continuous and differentiable bounded function on both sides, then $f(x)$ is one-one, we need to differentiate $f(x)$. If $f'(x)$ changes sign in domain of f, then f, if many-one else one-one.

121. If $f: R\to R$ and $f(x)=a_1x+a_3x^3+a_5x^5+\ldots+a_{2n+1}x^{2n+1}-\cot^{-1}x$
where $0<a_1<a_3<\ldots<a_{2n+1}$, then the function $f(x)$ is
(a) one-one into (b) many-one onto
(c) one-one onto (d) many-one into

122. If $f: R \to R$ and $f(x) = \dfrac{x(x^4+1)(x+1)+x^4+2}{x^2+x+1}$, then $f(x)$ is

(a) one-one into (b) many-one onto
(c) one-one onto (d) many-one into

123. If $f: R \to R$ and $f(x) = 2ax + \sin 2x$, then the set of values of a for which $f(x)$ is one-one and onto is

(a) $a \in \left(-\frac{1}{2}, \frac{1}{2}\right)$ (b) $a \in (-1, 1)$
(c) $a \in R - \left(-\frac{1}{2}, \frac{1}{2}\right)$ (d) $a \in R - (-1, 1)$

Passage V (Q. Nos. 124 to 126)

Let $g(x) = a_0 + a_1x + a_2x^2 + a_3x^3$ and $f(x) = \sqrt{g(x)}$, $f(x)$ has its non-zero local minimum and maximum values at -3 and 3, respectively. If $a_3 \in$ the domain of the function

$h(x) = \sin^{-1}\left(\dfrac{1+x^2}{2x}\right)$.

124. The value of $a_1 + a_2$ is

(a) 30 (b) -30 (c) 27 (d) -27

125. The value of a_0 is

(a) equal to 50 (b) greater than 54
(c) less than 54 (d) less than 50

126. $f(10)$ is defined for

(a) $a_0 > 830$ (b) $a_0 < 830$
(c) $a_0 = 830$ (d) None of these

Passage VI (Q. Nos. 127 to 129)

Let $f: [2, \infty) \to [1, \infty)$ defined by $f(x) = 2^{x^4 - 4x^2}$ and $g: \left[\frac{\pi}{2}, \pi\right] \to A$ defined by $g(x) = \dfrac{\sin x + 4}{\sin x - 2}$ be two invertible functions.

127. $f^{-1}(x)$ is equal to

(a) $\sqrt{2+\sqrt{4-\log_2 x}}$ (b) $\sqrt{2+\sqrt{4+\log_2 x}}$
(c) $\sqrt{2-\sqrt{4+\log_2 x}}$ (d) None of these

128. The set A is equal to

(a) $[-5, -2]$ (b) $[2, 5]$ (c) $[-5, 2]$ (d) $[-3, -2]$

129. The domain of $f^{-1}g^{-1}(x)$ is

(a) $[-5, \sin 1]$ (b) $\left[-5, \dfrac{\sin 1}{2 - \sin 1}\right]$
(c) $\left[-5, -\dfrac{(4+\sin 1)}{2-\sin 1}\right]$ (d) $\left[-\dfrac{(4+\sin 1)}{2-\sin 1}, -2\right]$

Passage VII (Q. Nos. 130 to 132)

Let $P(x)$ be polynomial of degree atmost 5 which leaves remainders -1 and 1 upon division by $(x-1)^3$ and $(x+1)^3$, respectively.

130. Numbers of real roots of $P(x) = 0$ is

(a) 1 (b) 3 (c) 5 (d) 2

131. The maximum value of $y = P''(x)$ can be obtained at x is equal to

(a) $-\dfrac{1}{\sqrt{3}}$ (b) 0 (c) $\dfrac{1}{\sqrt{3}}$ (d) 1

132. The sum of pairwise product of all roots (real and complex) of $P(x) = 0$ is

(a) $-\dfrac{5}{3}$ (b) $-\dfrac{10}{3}$ (c) 2 (d) -5

Passage VIII (Q. Nos. 133 to 135)

Consider $\alpha > 1$ and $f: \left[\frac{1}{\alpha}, \alpha\right] \to \left[\frac{1}{\alpha}, \alpha\right]$ be bijective function.

Suppose that $f^{-1}(x) = \dfrac{1}{f(x)}$; for all $x \in \left[\frac{1}{\alpha}, \alpha\right]$.

133. $f(1)$ is equal to

(a) 1 (b) 0
(c) -1 (d) does'nt attain a unique value

134. Which of the following statements can be concluded about $(f(x))$?

(a) $f(x)$ is discontinuous in $\left[\frac{1}{\alpha}, \alpha\right]$
(b) $f(x)$ is increasing in $\left[\frac{1}{\alpha}, \alpha\right]$
(c) $f(x)$ is decreasing in $\left[\frac{1}{\alpha}, \alpha\right]$
(d) None of the above

135. Which of the following statements can be concluded about $f(f(x))$?

(a) $f(f(x))$ is continuous in $\left[\frac{1}{\alpha}, \alpha\right]$
(b) $f(f(x))$ is increasing in $\left[\frac{1}{\alpha}, \alpha\right]$
(c) $f(f(x))$ is decreasing in $\left[\frac{1}{\alpha}, \alpha\right]$
(d) None of the above

Passage IX (Q. Nos. 136 to 137)

Let f be a real valued function from N to N satisfying. The relation $f(m+n) = f(m) + f(n)$ for all $m, n \in N$.

136. The range of f contains all the even numbers, the value of $f(1)$ is

(a) 1 (b) 2 (c) 1 or 2 (d) 4

137. If domain of f is first $3m$ natural numbers and if the number of elements common in domain and range is m, then the value of $f(1)$ is

(a) 2 (b) 3
(c) 6 (d) Can't say

Functions Exercise 5 : Matching Type Questions

138. Match the statements of Column I with values of Column II.

	Column I		Column II
(A)	$\sqrt{\sin(\cos x)}$ has domain	(p)	$x \in R$
(B)	$(\sqrt{\cos(\sin x)})^{-1}$ has domain	(q)	$R - \left\{n\pi \pm \frac{\pi}{6}\right\}$
(C)	$\tan(\pi \sin x)$ has domain	(r)	$x \in \left(n\pi, n\pi + \frac{\pi}{2}\right)$
(D)	$\ln(\tan x)$ has domain	(s)	$x \in \left[2n\pi - \frac{\pi}{2}, 2n\pi + \frac{\pi}{2}\right]$

139. Match the statements of Column I with values of Column II.

	Column I	Column II
(A)	$\lvert 4\sin x - 1\rvert < \sqrt{5}$, $x \in [0, \pi]$, the domain is	(p) $\left[0, \frac{\pi}{4}\right] \cup \left[\frac{3\pi}{4}, \pi\right]$
(B)	$\frac{4\sin^2 x - 8}{\sin x + 3} \le 0$, $[0, 2\pi]$, the domain is	(q) $\left[\frac{3\pi}{2}, 2\pi\right] \cup \{0\}$
(C)	$\lvert\tan x\rvert \le 1$ and $x \in [0, \pi]$, the domain is	(r) $\left[0, \frac{3\pi}{10}\right)$
(D)	$\cos x - \sin x \ge 1$ and $[0, 2\pi]$, the domain is	(s) $\left[\frac{\pi}{6}, \frac{5\pi}{6}\right]$

140. Match the statements of Column I with values of Column II.

	Column I	Column II
(A)	If $f(x) = \begin{cases} x+1, & \text{when } x < 0 \\ x^2 - 1, & \text{when } x \ge 0 \end{cases}$, the $fof(x)$ for $-1 \le x < 0$ is	(p) $\frac{x-3}{2}$
(B)	If $f\left(\frac{2\tan x}{1+\tan^2 x}\right) = \frac{(\cos 2x + 1)(\sec^2 x + 2\tan x)}{2}$, then $f(x)$ is	(q) $x^2 + 2x$
(C)	If $f(x+y+1) = (\sqrt{f(x)} + \sqrt{f(y)})^2$ for all $x, y \in R$ and $f(0) = 1$, then $f(x)$ is	(r) $1 + x$
(D)	If $4 < x < 5$ and $f(x) = \left[\frac{x}{4}\right] + 2x + 2$, where $[y]$ is the greatest integer $\le y$, then $f^{-1}(x)$ is	(s) $(x+1)^2$

141. Match the statements of Column I with values of Column II.

	Column I	Column II
(A)	$f(x) = \sin^2 x + \sin^2\left(x + \frac{\pi}{3}\right) + \cos x \cos\left(x + \frac{\pi}{3}\right)$ then $f(x)$ is	(p) Defined for all real 'x'
(B)	$g(x) = \tan(e^{\{x\}}) + [x + \alpha] - 5 - x$, where $[\cdot]$ denotes the greatest integer less than or equal to x, then $g(x)$ is	(q) Even function
(C)	$h(x) = \frac{x}{5^x - 1} + \frac{x}{2} + 5$, then $h(x)$ is	(r) Odd function
(D)	$k(x) = 2\sin^2 x - \cos 2\alpha + 4\sin\alpha \cdot \sin x \cos(x + \alpha) + \cos 2(x + \alpha)$, $\alpha \in R$, then $k(x)$ is	(s) Periodic function

Functions Exercise 6 : Single Integer Answer Type Questions

142. A function $f : R \to R$ is defined by $f(x+y) - k\,xy = f(x) + 2y^2$, $\forall\ x, y \in R$ and $f(1) = 2$; $f(2) = 8$, where k is some real constant, then $f(x+y) \cdot f\left(\frac{1}{x+y}\right)$ is ..... .

143. If $f : R \to R$ satisfying $f(x - f(y)) = f(f(y)) + x\,f(y) + f(x) - 1$, for all $x, y \in R$, then $\frac{-f(10)}{7}$ is ..... .

144. Let $f : N \to R$ be such that $f(1) = 1$ and $f(1) + 2\,f(2) + 3f(3) + \ldots + nf(n) = n(n+1)f(n)$, for $n \ge 2$, then $\frac{1}{2010\,f(2010)}$ is ..... .

145. If $f(x) = \frac{2010x + 163}{165x - 2010}$, $x > 0$ and $x \ne \frac{2010}{165}$, the least value of $f(f(x)) + f\left(f\left(\frac{4}{x}\right)\right)$ is ..... .

146. If $\alpha, \beta, \gamma \in R; \alpha + \beta + \gamma = 4$ and $\alpha^2 + \beta^2 + \gamma^2 = 6$, the number of integers lie in the exhaustive range of α is ..... .

147. The number of linear functions satisfying $f(x + f(x)) = x + f(x), \forall\ x$ is ..... .

148. If $A = \{1, 2, 3\}$, $B = \{1, 3, 5, 7, 9\}$, the ratio of number of one-one functions to the number of strictly monotonic functions is ..... .

149. If $n(A) = 4, n(B) = 5$ and number of functions from A to B such that range contains exactly 3 elements is k, $\frac{k}{60}$ is ..... .

150. If a and b are constants, such that $f(x) = a\sin x + bx\cos x + 2x^2$ and $f(2) = 15$, $f(-2)$ is ..... .

151. If the functions $f(x) = x^5 + e^{x/3}$ and $g(x) = f^{-1}(x)$, the value of $g'(1)$ is ..... .

152. If $f(x) = x^3 - 12x + p$; $p \in \{1, 2, 3, ..., 15\}$ and for each 'p', the number of real roots of equation $f(x) = 0$ is denoted by θ, the $\frac{1}{5}\Sigma\theta$ is equal to ..... .

153. Let $f(x)$ denotes the number of zeroes in $f'(x)$. If $f(m) - f(n) = 3$, the value of $\frac{(m-n)_{\max} - (m-n)_{\min}}{2}$ is ..... .

154. If $x^2 + y^2 = 4$, the maximum value of $\left(\frac{x^3 + y^3}{x + y}\right)$ is

155. Let $f(n)$ denotes the square of the sum of the digits of natural number n, where $f^2(n)$ denotes $f(f(n))$, $f^3(n)$ denotes $f(f(f(n)))$ and so on. The value of $\frac{f^{2011}(2011) - f^{2010}(2011)}{f^{2013}(2011) - f^{2012}(2011)}$ is ..... .

156. If $[\sin x] + \left[\frac{x}{2\pi}\right] + \left[\frac{2x}{5\pi}\right] = \frac{9x}{10\pi}$, where $[\cdot]$ denotes the greatest integer function, the number of solutions in the interval $(30, 40)$ is ..... .

157. The number of integral solutions of $\frac{1}{x} + \frac{1}{y} = \frac{1}{6}$ with $x \le y$ is 'α'. The value of '$\alpha - 6$' is ..... .

158. If $f(x)$ is a polynomial of degree 4 with leading coefficient '1' satisfying $f(1) = 10$, $f(2) = 20$ and $f(3) = 30$, then $\left(\frac{f(12) + f(-8)}{19840}\right)$ is ..... .

159. If $a + b = 3 - \cos 4\theta$ and $a - b = 4\sin 2\theta$, then ab is always less than or equal to ..... .

160. Let 'n' be the number of elements in the domain set of the function $f(x) = \left|\ \ln \sqrt{{}^{x^2+4x}C_{2x^2+3}}\right|$ and 'Y' be the global maximum value of $f(x)$, then $[n + [Y]]$ is ..... (where $[\cdot]$ = greatest integer function).

161. If $f(x)$ is a function such that $f(x-1) + f(x+1) = \sqrt{3}f(x)$ and $f(5) = 10$, then the sum of digits of the value of $\sum_{r=0}^{19} f(5 + 12r)$ is ..... .

162. If $2f(x) = f(xy) + f\left(\frac{x}{y}\right)$ for all positive values of x and y, $f(1) = 0$ and $f'(1) = 1$, then $f(e)$ is ..... .

163. Let f be a function from the set of positive integers to the set of real number such that $f(1) = 1$ and $\sum_{r=1}^{n} r\,f(r) = n(n+1)f(n),\ \forall\ n \ge 2$, the value of $2126\ f(1063)$ is ..... .

164. If $f(x) = \frac{x^4 + x^2 + 1}{x^2 - x + 1}$, the value of $f(\omega^n)$ (where 'ω' is the non-real root of the equation $z^3 = 1$ and 'n' is a multiple of 3), is ..... .

165. If $f^2(x) \cdot f\left(\frac{1-x}{1+x}\right) = x^3, [x \ne -1, 1$ and $f(x) \ne 0]$, the value of $|[f(-2)]|$ (where $[\cdot]$ is the greatest integer function), is ..... .

166. An odd function is symmetric about the vertical line $x = a (a > 0)$ and if $\sum_{r=0}^{\infty} [f(1 + 4r)]^r = 8$, find the numerical value of $8f(1)$.

167. Let $\frac{e^x - e^{-x}}{e^x + e^{-x}} = \ln\sqrt{\frac{1+x}{1-x}}$, then find x.

168. If the maximum value of $f(x) = \frac{3x^2 + 9x + 17}{3x^2 + 9x + 7}$ is $5k + 1$, the value of k is ..... .

169. The period of the function $f(x)$ which satisfies the relation $f(x) + f(x+4) = f(x+2) + f(x+6)$ is ..... .

170. If a non-zero function $f(x)$ is symmetrical about $y = x$, then the value of p (constant) such that $f^2(x) = (f^{-1}(x))^2 - px \cdot f(x) \cdot f^{-1}(x) + 2x^2 f(x)$ for all $x \in R^+$ is ..... .

171. Let $f:R\to R$ and $f(x)=\dfrac{3x^2+mx+n}{x^2+1}$. If the range of this function is $[-4,3]$, then the value of $\dfrac{m^2+n^2}{4}$ is....

172. Let $f(x)$ be a monotonic polynomial of $(2m-1)$ degree where $m\in N$, then the equation $f(x)+f(3x)+f(5x)+\ldots+f(2m-1)\,x=(2m-1)$ has ..... . roots.

Functions Exercise 7 : Subjective Type Questions

173. Let x be a real number. $[x]$ denotes the greatest integer function, $\{x\}$ denotes the fractional part and (x) denotes the least integer function, then solve the following :

(i) $(x)^2=[x]^2+2x$

(ii) $[2x]-2x=[x+1]$

(iii) $[x^2]+2[x]=3x, 0\le x\le 2$

(iv) $y=4-[x]^2$ and $[y]+y=6$

(v) $[x]+|x-2|\le 0$ and $-1\le x\le 3$

174. Let n be a positive integer and define $f(n)=1!+2!+3!+\ldots+n!$. Find polynomials $P(x)$ and $Q(x)$ such that $f(n+2)=Q(n)\,f(n)+P(n)\,f(n+1)$ for all $n\ge 1$.

175. If $f(x)=\dfrac{a^x}{a^x+\sqrt{a}}(a>0)$, evaluate $\displaystyle\sum_{r=1}^{2n-1}2f\left(\frac{r}{2n}\right)$.

176. Find the domain of the function $f(x)=\log\left\{\log_{|\sin x|}(x^2-8x+23)-\dfrac{3}{\log_2|\sin x|}\right\}$.

177. Let $S(n)$ denotes the number of ordered pairs (x, y) satisfying $\dfrac{1}{x}+\dfrac{1}{y}=\dfrac{1}{n}$, where $n>1$ and $x, y, n\in N$.

(i) Find the value of $S(6)$.

(ii) Show that, if n is prime, then $S(n)=3$, always.

178. Solve $\dfrac{1}{[x]}+\dfrac{1}{[2x]}=\{x\}+\dfrac{1}{3}$, where $[\cdot]$ denotes the greatest integer function and $\{\}$ denotes fractional part of x.

179. Let $f(x)=x^2+3x-3, x\ge 0$. n points $x_1, x_2, \ldots, x_n$ are so chosen on the X-axis that

(i) $\dfrac{1}{n}\displaystyle\sum_{i=1}^{n}f^{-1}(x_i)=f\left(\frac{1}{n}\sum_{i=1}^{n}x_i\right)$

(ii) $\displaystyle\sum_{i=1}^{n}f^{-1}(x_i)=\sum_{i=1}^{n}x_i$, where f^{-1} denotes the inverse of f. Find the AM of x_i's.

180. Let $f(x)=x^2-2x, x\in R$ and $g(x)=f(f(x)-1)+f(5-f(x))$, show that $g(x)\ge 0$, $\forall\ x\in R$.

181. If f is a polynomial function satisfying $2+f(x)\cdot f(y)=f(x)+f(y)+f(xy), \forall\ x, y\in R$ and if $f(2)=5$, find $f(f(2))$.

182. If $a+b+c=abc$, a, b and $c\in R^+$, prove that $a+b+c\ge 3\sqrt{3}$.

183. Consider the function $f(x)=\begin{cases}x-[x]-\dfrac{1}{2}, & \text{if } x\notin I\\ 0, & \text{if } x\in I\end{cases}$, where $[\cdot]$ denotes the greatest integral function and I is the set of integers. Find $g(x)=\max\{x^2, f(x), |x|\}$; $-2\le x\le 2$.

184. If $f(x)$ is continuous function in $[0, 2\pi]$ and $f(0)=f(2\pi)$, then prove that there exists a point $c\in(0,\pi)$ such that $f(c)=f(c+\pi)$.

185. Let $g(t)=|t-1|-|t|+|t+1|, \forall\ t\in R$. Find $f(x)=\max\{g(t): -\dfrac{3}{2}\le t\le x\}, \forall\ x\in\left(\dfrac{-3}{2},\infty\right)$.

186. Find the integral solution for $n_1n_2=2n_1-n_2$, where $n_1, n_2\in$ integer.

Functions Exercise 8 : Questions Asked in Previous 10 Year's Exams

(i) JEE Advanced & IIT-JEE

187. Let $f_1 : R \to R, f_2 : [0, \infty) \to R, f_3 : R \to R$ and $f_4 : R \to [0, \infty)$ be defined by

[Match Type Question, 2014 Adv.]

$$f_1(x) = \begin{cases} |x|, & \text{if } x < 0 \\ e^x, & \text{if } x \geq 0 \end{cases}; f_2(x) = x^2; f_3(x) = \begin{cases} \sin x, & \text{if } x < 0 \\ x, & \text{if } x \geq 0 \end{cases}$$

and $f_4(x) = \begin{cases} f_2[f_1(x)], & \text{if } x < 0 \\ f_2[f_1(x)] - 1, & \text{if } x \geq 0 \end{cases}$

Column I		Column II	
A.	f_4 is	p.	onto but not one-one
B.	f_3 is	q.	neither continuous nor one-one
C.	$f_2 of_1$, is	r.	differentiable but not one-one
D.	f_2 is	s.	continuous and one-one

Codes

	A	B	C	D
(a)	r	p	s	q
(c)	r	p	q	s

	A	B	C	D
(b)	p	r	s	q
(d)	p	r	q	s

188. If function $f(x) = x^2 + e^{x/2}$ and $g(x) = f^{-1}(x)$, then the value of $g'(1)$ is **[Integer Type Question, 2009]**

189. For the following questions, choose the correct answer from the codes (a), (b), (c) and (d) defined as follows.

(a) Statement I is true, Statement II is also true; Statement II is the correct explanation of Statement I.

(b) Statement I is true, Statement II is also true; Statement II is not the correct explanation of Statement I.

(c) Statement I is true; Statement II is false.

(d) Statement I is false; Statement II is true.

Let $F(x)$ be an indefinite integral of $\sin^2 x$.

Statement I The function $F(x)$ satisfies $F(x + \pi) = F(x)$ for all real x. Because

Statement II $\sin^2(x + \pi) = \sin^2 x$, for all real x.

[Assertion and Reason Type Question, 2007]

190. Match the conditons/expressions in Column I with statement in Column II.

Let $f(x) = \dfrac{x^2 - 6x + 5}{x^2 - 5x + 6}$. **[Match Type Question, 2007]**

Column I		Column II	
A.	If $-1 < x < 1$, then $f(x)$ satisfies	p.	$0 < f(x) < 1$
B.	If $1 < x < 2$, then $f(x)$ satisfies	q.	$f(x) < 0$
C.	If $3 < x < 5$, then $f(x)$ satisfies	r.	$f(x) > 0$
D.	If $x > 5$, then $f(x)$ satisfies	s.	$f(x) < 1$

191. Find the range of values of t for which

$$2 \sin t = \frac{1 - 2x + 5x^2}{3x^2 - 2x - 1}, \; t \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right].$$

[Subjective Type Question, 2005]

(ii) JEE Main & AIEEE

192. If $f_k(x) = \dfrac{1}{k}(\sin^k x + \cos^k x)$, where $x \in R$ and $k \geq 1$, then $f_4(x) - f_6(x)$ is equal to **[2014 JEE Main]**

(a) 1/6 (b) 1/3 (c) 1/4 (d) 1/12

193. The function $f : [0, 3] \to [1, 29]$, defined by $f(x) = 2x^3 - 15x^2 + 36x + 1$, is **[2012 AIEEE]**

(a) one-one and onto

(b) onto but not one-one

(c) one-one but not onto

(d) neither one-one nor onto

194. Let $f(x) = x^2$ and $g(x) = \sin x$ for all $x \in R$. Then, the set of all x satisfying $(fogogof)(x) = (gogof)(x)$, where $(fog)(x) = f(g(x))$, is **[2011 AIEEE]**

(a) $\pm\sqrt{n\pi}, n \in \{0, 1, 2, \ldots\}$

(b) $\pm\sqrt{n\pi}, n \in \{1, 2, \ldots\}$

(c) $\pi/2 + 2n\pi, n \in \{\ldots, -2, -1, 0, 1, 2, \ldots\}$

(d) $2n\pi, n \in \{\ldots, -2, -1, 0, 1, 2, \ldots\}$

195. Let $f : (0, 1) \to R$ be defined by $f(x) = \dfrac{b - x}{1 - bx}$, where b is a constant such that $0 < b < 1$. Then, **[2011 AIEEE]**

(a) f is not invertible on (0, 1)

(b) $f \neq f^{-1}$ on (0, 1) and $f'(b) = \dfrac{1}{f'(0)}$

(c) $f = f^{-1}$ on (0, 1) and $f'(b) = \dfrac{1}{f'(0)}$

(d) f^{-1} is differentiable on (0, 1)

196. Let f be a real-valued function defined on the interval $(-1, 1)$ such that $e^{-x} f(x) = 2 + \int_0^x \sqrt{t^4 + 1}\cdot dt, \forall x \in (-1, 1)$ and let f^{-1} be the inverse function of f. Then, $[f^{-1}(2)]'$ is equal to **[2010 AIEEE]**

(a) 1 (b) 1/3 (c) 1/2 (d) $1/e$

197. If X and Y are two non-empty sets, where $f : X \to Y$, is function defined such that

$f(C) = \{f(x) : x \in C\}$ for $C \subseteq X$ and

$f^{-1}(D) = \{x : f(x) \in D\}$ for $D \subseteq Y$,

for any $A \subseteq Y$ and $B \subseteq Y$, then **[2005 AIEEE]**

(a) $f^{-1}\{f(A)\} = A$

(b) $f^{-1}\{f(A)\} = A$, only if $f(X) = Y$

(c) $f\{f^{-1}(B)\} = B$, only if $B \subseteq f(x)$

(d) $f\{f^{-1}(B)\} = B$

198. $f(x) = \begin{cases} x, & \text{if } x \text{ is rational} \\ 0, & \text{if } x \text{ is irrational} \end{cases}$, $g(x) = \begin{cases} 0, & \text{if } x \text{ is rational} \\ x, & \text{if } x \text{ is irrational.} \end{cases}$

Then, $f - g$ is **[2005 AIEEE]**

(a) one-one and into (b) neither one-one nor onto

(c) many one and onto (d) one-one and onto

199. If $f(x) = \sin x + \cos x$, $g(x) = x^2 - 1$, then $g\{f(x)\}$ is invertible in the domain **[2004 AIEEE]**

(a) $\left[0, \frac{\pi}{2}\right]$ (b) $\left[-\frac{\pi}{4}, \frac{\pi}{4}\right]$ (c) $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ (d) $[0, \pi]$

200. Domain of definition of the function $f(x) = \sqrt{\sin^{-1}(2x) + \frac{\pi}{6}}$ for real valued x, is **[2003 AIEEE]**

(a) $\left[-\frac{1}{4}, \frac{1}{2}\right]$ (b) $\left[-\frac{1}{2}, \frac{1}{2}\right]$ (c) $\left(-\frac{1}{2}, \frac{1}{9}\right)$ (d) $\left[-\frac{1}{4}, \frac{1}{4}\right]$

201. Range of the function $f(x) = \frac{x^2 + x + 2}{x^2 + x + 1}; x \in R$ is **[2003 AIEEE]**

(a) $(1, \infty)$ (b) (1, 11/7)

(c) (1, 7/3] (d) (1, 7/5)

202. If $f : [0, \infty) \to [0, \infty)$ and $f(x) = \frac{x}{1 + x}$, then f is **[2003 AIEEE]**

(a) one-one and onto (b) one-one but not onto

(c) onto but not one-one (d) neither one-one nor onto

203. Let function $f : R \to R$ be defined by $f(x) = 2x + \sin x$ for $x \in R$. Then, f is **[2002 AIEEE]**

(a) one-to-one and onto

(b) one-to-one but not onto

(c) onto but not one-to-one

(d) neither one-to-one nor onto

204. Let $E = \{1, 2, 3, 4\}$ and $F = \{1, 2\}$. Then, the number of onto functions from E to F is **[2001 AIEEE]**

(a) 14 (b) 16 (c) 12 (d) 8

205. Suppose $f(x) = (x + 1)^2$ for $x \geq -1$. If $g(x)$ is the function whose graph is reflection of the graph of $f(x)$ with respect to the line $y = x$, then $g(x)$ equals **[2002 AIEEE]**

(a) $-\sqrt{x} - 1, x \geq 0$ (b) $\frac{1}{(x + 1)^2}, x > -1$

(c) $\sqrt{x + 1}, x \geq -1$ (d) $\sqrt{x} - 1, x \geq 0$

206. If $f : [1, \infty) \to [2, \infty)$ is given by $f(x) = x + \frac{1}{x}$, then $f^{-1}(x)$ equals **[2001 AIEEE]**

(a) $\frac{x + \sqrt{x^2 - 4}}{2}$ (b) $\frac{x}{1 + x^2}$

(c) $\frac{x - \sqrt{x^2 - 4}}{2}$ (d) $1 + \sqrt{x^2 - 4}$

207. Let $f(x) = (1 + b^2)x^2 + 2bx + 1$ and let $m(b)$ be the minimum value of $f(x)$. As b varies, the range of $m(b)$ is **[2001 AIEEE]**

(a) [0, 1] (b) $\left[0, \frac{1}{2}\right]$

(c) $\left[\frac{1}{2}, 1\right]$ (d) (0, 1]

208. The domain of definition of $f(x) = \frac{\log_2(x + 3)}{(x^2 + 3x + 2)}$ is **[2001 AIEEE]**

(a) $R / \{-1, -2\}$ (b) $(-2, \infty)$

(c) $R / \{-1, -2, -3\}$ (d) $(-3, \infty) / \{-1, -2\}$

209. Let $f(x) = \frac{\alpha x}{x + 1}, x \neq -1$. Then, for what value of α is $f[f(x)] = x$? **[2001 AIEEE]**

(a) $\sqrt{2}$ (b) $-\sqrt{2}$

(c) 1 (d) -1

210. Let $g(x) = 1 + x - [x]$ and $f(x) = \begin{cases} -1, & x < 0 \\ 0, & x = 0 \\ 1, & x > 0 \end{cases}$, then for all x, $f[g(x)]$ is equal to **[2001 AIEEE]**

(a) x (b) 1

(c) $f(x)$ (d) $g(x)$

211. The domain of definition of the function $y(x)$ is given by the equation $2^x + 2^y = 2$, is **[2000 AIEEE]**

(a) $0 < x \leq 1$

(b) $0 \leq x \leq 1$

(c) $-\infty < x \leq 0$

(d) $-\infty < x < 1$

212. Let $f(\theta) = \sin\theta(\sin\theta + \sin 3\theta)$. Then, $f(\theta)$ **[2000 AIEEE]**

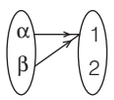
(a) ≥ 0, only when $\theta \geq 0$ (b) ≤ 0, for all real θ

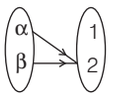
(c) ≥ 0, for all real θ (d) ≤ 0, only when $\theta \leq 0$

Answers

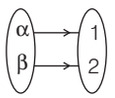
Exercise for Session 1

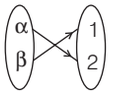
1. (i) not a function (ii) not a function (iii) function (iv) function (v) not a function (vi) function (vii) function (viii) not a function (ix) function (x) not a function.
2. (i) not a function (ii) not a function (iii) not a function (iv) is a function (v) not a function
3. (a)
4. (a) $f:A \to B$ (b) $f:A \to B$





(c) $f:A \to B$ (d) $f:A \to B$





5. (b)

Exercise for Session 2

1. $(-\infty, 2] \cup [3, \infty)$
2. $(-\infty, -1/2] \cup (0, 1) \cup (2, \infty)$
3. $[-1, 1]$
4. $(-\infty, \infty)$
5. $\{2, 3\}$
6. $\{1, 2, 3\}$

Exercise for Session 3

1. $[4, 6]$
2. $(0, 1] \cup [4, 5)$
3. $[1-\sqrt{2}, 0) \cup [1+\sqrt{2}, 3)$
4. $x \in [2, 4]$
5. $(2, 3)$
6. $[-\pi/4, \pi/4]$
7. $[-2, -1/2] \cup [1/2, 2]$
8. $[-1, 3]$
9. $\left(0, \frac{1}{2}\right) \cup \left(\frac{1}{2}, 1\right)$
10. ϕ

Exercise for Session 4

1. $R - (-2, 2)$
2. $[-2, 2]$
3. $(0, 1) \cup (1, \infty)$
4. $[0, 3)$
5. $R - I$
6. $(-\infty, -2) \cup (4, \infty)$
7. R
8. $(2, \infty)$
9. $(-\infty, 0) \cup (0, 1] \cup [2, \infty)$

11. $\left(-\sqrt{\frac{5}{2}}, -1\right] \cup \left[1, \sqrt{\frac{5}{2}}\right)$
12. $(-\sqrt{8}, -1] \cup [1, \sqrt{8})$
13. $\left[-1, -\frac{1}{2}\right] \cup \left[0, \frac{1}{2}\right] \cup \{1\}$
14. $R - (1, 2) \cup \{2, 3, 4, 5, 6, 7, 8, 9, 10\} \cup (10, 11)$
15. $\left[\frac{\pi}{6}, \frac{\pi}{2}\right)$
16. No solution
18. Integral solutions are (2, 2) and (0, 0), all non-integral solutions lie on exactly two lines $x + y = 0$ and $x + y = 6$.

Exercise for Session 5

1. $[0, 3]$
2. $[-1/2, 1/2]$
3. $[3-\sqrt{2}, 3+\sqrt{2}]$
4. $[1, 5]$
5. $(-\infty, \log_3 9)$
6. $\left(-\infty, \frac{2}{3}\right] \cup (1, \infty)$
7. $R - (2-2\sqrt{3}, 2+2\sqrt{3})$
8. $[2, \infty)$
9. $(-\infty, 0]$
10. $\left\{\frac{\pi}{2}\right\}$
11. $\{0, 1\}$
12. $\{\pi\}$
13. $\left[\frac{\pi}{3}, \frac{\pi}{2}\right]$
14. $\left(0, \frac{\pi}{2}\right]$
15. $\{0\}$
16. $\left[\frac{-1}{2\sqrt{2}}, \frac{1}{2\sqrt{2}}\right]$
17. $[-1, 1]$
18. $\{0\}$
19. $[1, \infty)$
20. $\{1\}$
21. $[0, 2]$
22. Image of $(-\infty, 1)$ under f is $(1, \infty)$, Image of $[1, 2]$ under f is $[1, 2]$
23. Range of $f(x)$ is $\{0\}$ and domain is $\cup \left[\left(2n\pi - \frac{\pi}{3}\right), \left(2n\pi + \frac{\pi}{3}\right)\right]$
24. Range of $f(x)$ is $\left\{\log \frac{\pi}{2}\right\}$ and domain is $[1, 2)$
25. Range of $f(x)$ is the set of all non-positive integers and domain is $\left[\frac{-3-\sqrt{5}}{2}, -2\right) \cup \left(-1, \frac{-3+\sqrt{5}}{2}\right]$.

Exercise for Session 6

1. (i) odd (ii) even (iii) neither even nor odd (iv) even (v) odd (vi) odd (vii) neither even nor odd (viii) even
2. f is an even function when $x \in$ integer f is an odd function when $x \notin$ integer.
3. (i) $f(x) = \begin{cases} -2x, & x \le -1 \\ -x|x|, & -1 < x \le 0 \end{cases}$ (ii) $f(x) = \begin{cases} 2x, & x \le -1 \\ x|x|, & -1 < x \le 0 \end{cases}$
5. $a \in (400, \infty)$

Exercise for Session 7

1. (i) $\pi/3$ (ii) 2π (iii) 1 (iv) 24 (v) Does not exist (vi) $2(n+1)!$ (vii) 1 (viii) 2π
2. Period is 8.
3. $f(x)$ is periodic with period 2λ.
4. $f(x)$ is periodic with period $2p$.
5. $f(x)$ is periodic with period 12 and $\sum_{r=0}^{99} f(5+12r) = 10000$

Exercise for Session 8

1. $x = 0$ and $y = \frac{3}{2}$
2. $f^{-1}(1) = y$
3. As monotonic and range = Codomain $\Rightarrow$ Bijective
5. $A \in [0, 1)$
6. $A \in \left[0, \frac{1}{2}\right)$
7. $b^2 < 3a(c - |d|)$
8. $X \in \left[-\frac{\pi}{2} - \alpha, \frac{\pi}{2} - \alpha\right]$ and $Y \in [c-r, c+r]$, where $\alpha = \tan^{-1}\left(\frac{a + b\sqrt{2}}{a}\right)$ and $r = \sqrt{a^2 + \sqrt{2}ab + b^2}$

Exercise for Session 9

1. Not Identical
2. Identical
3. Not Identical
4. Identical
5. Identical
6. Not Identical
7. Identical
8. Identical
9. Identical
10. Identical

Exercise for Session 10

1. Domain $\in [-1, 1]$ and range $\in \left[\frac{-2\pi}{3}, \frac{\pi}{3}\right]$

2. Domain for $f([|x|]) \in (-3, 3)$

Domain for $f([2x + 3]) \in [-3, 0)$

3. $h(x) = \begin{cases} \sin^2 x - \sin x + 1, & -1 < x < 0 \\ 2\sin^2 x, & 0 < x \le 1 \end{cases}$

4. $g(x) = \begin{cases} -x, & -2 \le x \le 0 \\ 0, & 0 \le x \le 1 \\ 2(x-1), & 1 \le x \le 2 \end{cases}$ **5.** $gof = \{(x+1)^2, -2 \le x \le 1\}$

Exercise for Session 11

1. (i) $f^{-1}(x) = 3 \sin x$ (ii) $f^{-1}(x) = \dfrac{-3 + \sqrt{5 + 4e^x}}{2}$

(iii) $f^{-1}(x) = x^{\log_5 e}$, $x > 0$ (iv) $f^{-1}(x) = \dfrac{1}{2}(e^x - e^{-x})$

(v) $f^{-1}(x) = \begin{cases} x, & x < 1 \\ \sqrt{x}, & 1 \le x \le 16 \\ \dfrac{x^2}{64}, & x > 16 \end{cases}$

2. $f^{-1}(x) = \dfrac{1 + \sqrt{1 + 4\log_2 x}}{2}$, $x > 0$

Exercise for Session 12

1. $\frac{2}{3}$ **2.** 17 **3.** $\frac{4}{3}$ **4.** $f(x) = \begin{cases} (1-x)^2, & 0 \le x \le \frac{1}{3} \\ 2x(1-x), & \frac{1}{3} \le x \le \frac{2}{3} \\ x^2, & \frac{2}{3} \le x \le 1 \end{cases}$

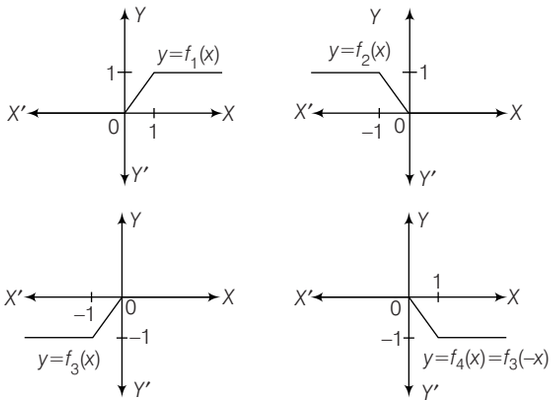
Solutions

1. Here,



$\Rightarrow \qquad f_1(x) = -f_3(-x)$

2. Only in option (d), the graph has a symmetry w.r.t. origin.

3. Here, $\qquad f(x) = \dfrac{4}{\sqrt{1-x^2}}$

$\Rightarrow \qquad f(\sin x) = \dfrac{4}{|\cos x|}$

and $\qquad f(\cos x) = \dfrac{4}{|\sin x|}$

$\therefore \qquad g(x) = |\sin x| + |\cos x|$

$\therefore \qquad$ Period of $g(x) = \dfrac{\pi}{2}$

4. If $x = 1$, we see $f(y) = \dfrac{f(1)}{y}$ for all y

Put $\qquad y = 30$

$\Rightarrow \qquad f(1) = 30 \cdot f(30) = 30(20)$

$= 600 \qquad$ ...(i)

Now, $\qquad$ let $y = 40$

$\Rightarrow \qquad f(40) = \dfrac{f(1)}{40} = \dfrac{600}{40} = 15$

5. $h(x) = \log(f(x) \cdot g(x)) = \log e^{\{e^{|x|} \text{ sgn } x\}} \cdot e^{[e^{|x|} \text{ sgn } x]}$

$= \log e^{e^{|x|} \text{ sgn } x} = e^{|x|} \text{ sgn } x$

$\therefore \qquad h(x) = e^{|x|} \text{ sgn } x$

$$= \begin{cases} e^x, & x > 0 \\ 0, & x = 0 \\ -e^{-x}, & x < 0 \end{cases}$$

$\Rightarrow \qquad h(x) + h(-x) = 0$ for all x

$\therefore \quad h(x)$ is odd.

6. (a) $f(x) = x^4 + 2x^3 - x^2 + 1$

A polynomial of degree even will always be into.

(b) $f(x) = x^3 + x + 1$

$\Rightarrow f'(x) = 3x^2 + 1$, i.e. injective as well as surjective.

(c) $f(x) = \sqrt{1 + x^2}$, neither injective nor surjective as range $\in [1, \infty)$.

(d) $f(x) = x^3 + 2x^2 - x + 1$

$\Rightarrow \quad f'(x) = 3x^2 + 4x - 1$

$\Rightarrow \qquad D > 0$

$\therefore \quad f(x)$ is surjective but not injective.

7. Here, $f(x)$ is bijective, hence $f^{-1}(4)$ exists when $y = 4$.

$\therefore \qquad 2x^3 + 7x - 9 = 0$

$\Rightarrow \qquad (2x^2 + 2x + 9)(x - 1) = 0$

$\Rightarrow x = 1$ only, as $2x^2 + 2x + 9 = 0$ has no other root.

8. Here, $f(x) = \dfrac{e^x \cdot \log x \cdot 5^{x^2+2} \cdot (x^2 - 7x + 10)}{2x^2 - 11x + 12}$

$$= \frac{e^x \cdot \log x \cdot 5^{x^2+2} \cdot (x-2)(x-5)}{(2x-3)(x-4)}$$

Note that at $x = \dfrac{3}{2}$ and $x = 4$, function is not defined and in open interval $\left(\dfrac{3}{2}, 4\right)$, function is continuous.

$\therefore \quad \lim\limits_{x \to \frac{3}{2}^+} \dfrac{e^x \cdot \log x \cdot 5^{x^2+2} \cdot (x-2)(x-5)}{(2x-3)(x-4)}$

$$= \frac{(+\text{ ve})(+\text{ve})(-\text{ ve})(-\text{ ve})}{(+\text{ ve})(-\text{ ve})} = -\infty$$

and $\lim\limits_{x \to 4^-} \dfrac{e^x \cdot \log x \cdot 5^{x^2+2} \cdot (x-2)(x-5)}{(2x-3)(x-4)}$

$$= \frac{(+\text{ve})(+\text{ve})(-\text{ve})}{(+\text{ve})(-\text{ve})} = \infty$$

In the open interval $\left(\dfrac{3}{2}, 4\right)$, the function is continuous and takes up all real values from $(-\infty, \infty)$.
Hence, range of the function is $(-\infty, \infty)$.

9. As, $x = \cos^{-1}(\cos 4) = \cos^{-1}(\cos(2\pi - 4)) = 2\pi - 4$

and $\qquad y = \sin^{-1}(\sin 3)$

$= \sin^{-1}(\sin(\pi - 3)) = \pi - 3$

$\therefore \qquad x + y = 3\pi - 7$

10. $f(x) = \left(\dfrac{2\sin x + \sin 2x}{2\cos x + \sin 2x} \cdot \dfrac{1 - \cos x}{1 - \sin x}\right)^{2/3}$

$$= \left(\frac{2\sin x \cdot (1 + \cos x)}{2\cos x \cdot (1 + \sin x)} \cdot \frac{(1 - \cos x)}{(1 - \sin x)}\right)^{2/3}$$

For domain, $\sin x \neq \pm 1$

$\Rightarrow \qquad x \in R - \left\{(4n-1)\dfrac{\pi}{2}, (4n+1)\dfrac{\pi}{2}\right\}$

$\therefore \quad f(x) = \left(\tan x \cdot \dfrac{(1-\cos^2 x)}{(1-\sin^2 x)} \right)^{2/3} = \tan^2 x$

$\Rightarrow \quad$ Range $\in [0, \infty)$

11. As, $f(x+2) = e^{\sin\{x+2\} \cdot \cos \pi(x+2)} = e^{\sin\{x\} \cdot \cos \pi x} = f(x)$

$\therefore$ Periodic with period 2.

12. Here, $y = x^4 - 2x^2 + 3 = (x^2-1)^2 + 2 \Rightarrow y_{\min} = 2$

$\Rightarrow \quad \log_{0.5}(x^4 - 2x^2 + 3) \le \log_{1/2} 2 = -1$

$\therefore \quad f(x) = \cot^{-1}(\log_{0.5}(x^4 - 2x^2 + 3)) \ge \cot^{-1}(-1)$

$\Rightarrow$ Range $\in \left[\dfrac{3\pi}{4}, \pi \right)$

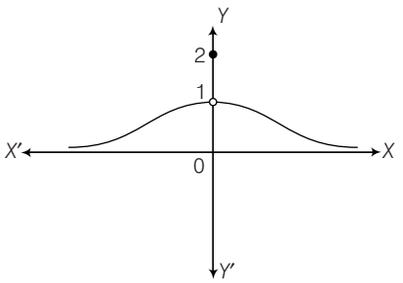
13. Here, $\log_e(x^2 + e) \ge 1$, for all $x \in R$

$\therefore \quad 0 < \dfrac{1}{\log(x^2+e)} \le 1$

$\Rightarrow \quad \left[\dfrac{1}{\log(x^2+e)} \right] = \begin{cases} 0, & x \ne 0 \\ 1, & x = 0 \end{cases}$

$\Rightarrow \quad f(x) = \begin{cases} \dfrac{1}{\sqrt{1+x^2}}, & x \ne 0 \\ 2, & x = 0 \end{cases}$

Which is shown in figure as

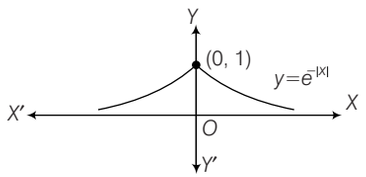


$\therefore$ Range of $f(x) \in [0, 1) \cup \{2\}$.

14. Let $x + 3 = t$

$\therefore \quad f(t) = \sin(\{t\}) \Rightarrow$ Period $= 1$

15. As, $e^{-|x|}$ can be shown by graphical transformation.



16. Here, $[x]\{x\} = 1$

$\Rightarrow \quad \{x\} = \dfrac{1}{[x]}$ or $x - [x] = \dfrac{1}{[x]} \Rightarrow x = [x] + \dfrac{1}{[x]}$

Obviously, $x > 2$

$\therefore \quad x = m + \dfrac{1}{m}, m \in N - \{1\}$

17. Here, $\sqrt{x^2 - 5x - 24} > x + 2$ is equivalent to the collection of two system of inequations.

***Case* I** $x^2 - 5x - 24 \ge 0$ and $x + 2 < 0$

$\Rightarrow \quad (x-8)(x+3) \ge 0$ and $x < -2$

$\Rightarrow \quad x \le -3 \quad \ldots(i)$

***Case* II** $x^2 - 5x - 24 \ge 0, x + 2 \ge 0$

and $\quad x^2 - 5x - 24 > (x+2)^2$

$\Rightarrow \quad x \in (-\infty, -3] \cup [8, \infty), x \in [-2, \infty)$

and $\quad x^2 - 5x - 24 > x^2 + 4x + 4$

$\Rightarrow \quad 9x < -28$

$\Rightarrow \quad x < \dfrac{-28}{9}$

$\therefore$ No solution, i.e. $x \in \phi$. $\quad \ldots(ii)$

From Eqs. (i) and (ii), we get

$x \in (-\infty, -3]$

18. Here, $\quad f(f(x)) = x$

$\Rightarrow \quad m(mx + b) + b = x$

$\Rightarrow \quad m^2 x + b(m+1) = x$

$\Rightarrow \quad m = \pm 1, b = 0$

If $f(-f(x)) = -x \Rightarrow -m(mx + b) + b = -x$

$\Rightarrow \quad -m^2 x + b(-m+1) = -x$

$\Rightarrow \quad m = \pm 1$ and $b = 0$

$\therefore$ Only 2 straight lines, i.e. $y = \pm x$.

19. Here, $f(g(x)) = \dfrac{rx}{1 + (r-1)x}$ and $g(f(x)) = rx$

If $f(g(x)) = g(f(x))$, then $\dfrac{rx}{1 + (r-1)x} = rx$

$\Rightarrow \quad rx = rx(1 + (r-1)x)$

$\Rightarrow \quad r(r-1)\, x^2 = 0$

If this is to be true for infinitely many x, then

$r(r-1) = 0 \Rightarrow r = 0, 1$

20. Since, f is a linear function, so it has the form $f(x) = mx + b$ because $f(1) \le f(2)$, we have $m \ge 0$. Similarly, $f(3) \le f(4)$ $\Rightarrow m \le 0$.

Hence, $m = 0$ and f is constant function. Thus, $f(0) = f(5) = 5$

21. Suppose R is just a rectangle whose four vertices are $(1, 2), (1, -2), (-1, -2), (-1, 2)$.

The X-axis and Y-axis symmetries in the problem are satisfied, but the point $(2, 1)$ is not contained in R.

22. Here, $2\{y\} = [x] + 1$

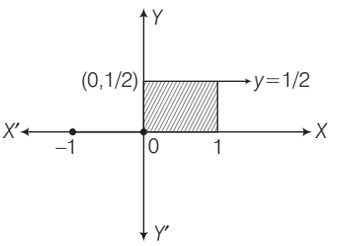
Since, $0 \le y < 1$

$\therefore \quad \{y\} = y$

and $\quad 0 \le [x] + 1 < 2$, i.e. $-1 \le [x] < 1$

When $-1 \le x < 0 \Rightarrow y = 0$

When $\quad 0 \le x < 1 \Rightarrow y = \dfrac{1}{2}$



$\therefore \quad$ The required area $= \dfrac{1}{2}$.

23. Here, $-1 \le \cos x \le 1$

$\Rightarrow \quad -\sin 1 \le \sin(\cos x) \le \sin 1$

$\Rightarrow \quad [\sin(\cos x)] = 0, -1$

Also, $\quad -1 \le \sin x \le 1$

$\Rightarrow \quad \cos 1 \le \cos(\sin x) \le 1$

$\therefore \quad [\cos(\sin x)] = 0, 1$

$\therefore \quad f(g(x))$ has range $\left\{\frac{-\pi}{2}, 0, \frac{\pi}{2}\right\}$.

24. As we know, $\quad \{f(x)\} \in [0, 1)$

$\Rightarrow \quad [\{f(x)\}] = 0$

$\therefore \quad e^{2x} + e^x - 2 = [\{x^2 + 10x + 11\}]$

$\Rightarrow \quad e^{2x} + e^x - 2 = 0$

$\Rightarrow \quad (e^x + 2)(e^x - 1) = 0$

$\therefore \quad e^x = 1$ is the only solution.

$\Rightarrow \quad x = 0$

$\Rightarrow$ Number of solutions is 1.

25. We know that, $\{x\} = x - [x]$.

$\therefore \quad \{x\} + \{2x\} + \{3x\} + \ldots + \{12x\} = 78x.$

$\Rightarrow \quad x - [x] + 2x - [2x] + 3x - [3x] + \ldots + 12x - [12x] = 78x$

$\Rightarrow \quad (x + 2x + 3x + \ldots + 12x) - ([x] + [2x] + \ldots + [12x]) = 78x$

$\Rightarrow \quad [x] + [2x] + \ldots + [12x] = 0$

$\therefore \quad 0 \le 12x < 1$

$\Rightarrow \quad 0 \le x < \frac{1}{12}, \ \forall \ \frac{1}{25} \le x \le \frac{1}{10}$

$\therefore \quad$ Common values of $x \in \left[\frac{1}{25}, \frac{1}{12}\right)$.

Since, x is of the form $\frac{1}{n}$.

$\therefore \quad x = \frac{1}{25}, \frac{1}{24}, \frac{1}{23}, \ldots, \frac{1}{14}, \frac{1}{13}$

i.e. 13 solutions.

26. $-\sqrt{20} \le 2\cos x - 4\sin x \le \sqrt{20}$

$\Rightarrow \quad 0 \le (2\cos x - 4\sin x)^2 \le 20$

$\min = \frac{1}{1 + 20} = \frac{1}{21}; \ \max = 1$

$\Rightarrow \quad M + m = \frac{22}{21}$

27. $f(x) = \sqrt{2}\sin\left(x + \frac{\pi}{4}\right) + 2\sqrt{2}$

or $\quad f(x) = \sqrt{2}\cos\left(x - \frac{\pi}{4}\right) + 2\sqrt{2}$

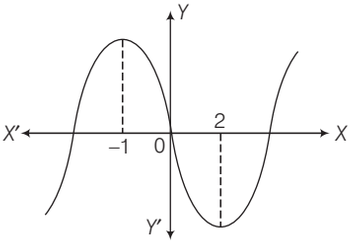
$\Rightarrow \quad Y = [\sqrt{2}, 3\sqrt{2}]$

and $\quad X = \left[-\frac{3\pi}{4}, \frac{\pi}{4}\right]$ or $\left[\frac{\pi}{4}, \frac{5\pi}{4}\right]$

28. Let $f(x) = 2x^3 - 3x^2 - 12x + a$, then

$f'(x) = 6(x^2 - x - 2) = 6(x + 1)(x - 2)$

So, the roots of $f'(x) = 0$ are $x = -1, 2$.



Now, $f(x) = 0$ will have all real roots, if $f(-1) > 0$ and $f(2) < 0$.

$\Rightarrow \quad -2 - 3 + 12 + a > 0$ and $16 - 12 - 24 + a < 0$

$\Rightarrow \quad -7 < a < 20$

29. $g(x) = \frac{e^{f(x)} - e^{|f(x)|}}{e^{f(x)} + e^{|f(x)|}}, \ -1 \le f(x) \le 1$

For $\quad 0 \le f(x) \le 1,$

$g(x) = 0$

$-1 \le f(x) < 0$

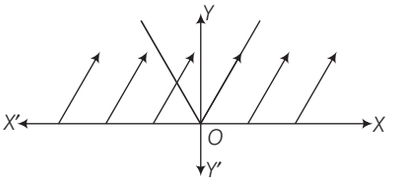
$g(x) = \frac{e^{f(x)} - e^{-f(x)}}{e^{f(x)} + e^{-f(x)}} = \frac{e^{2f(x)} - 1}{e^{2f(x)} + 1} = 1 - \frac{2}{e^{2f(x)} + 1}$

For $\quad -1 \le f(x) < 0,$

$$g(x) \in \left[\frac{1 - e^2}{1 + e^2}, 0\right)$$

For $\quad -1 \le f(x) < 1$, $g(x) \in \left[\frac{1 - e^2}{1 + e^2}, 0\right]$

30. $f(x) = \sqrt{|x| - \{x\}}; \ |x| \ge \{x\}$



$\Rightarrow \quad X \in \left(-\infty, -\frac{1}{2}\right] \cup [0, \infty)$

$\Rightarrow \quad Y \in [0, \infty)$ and $f(x)$ is many-one.

31. Given, curves are $y = \ln x$ and $y = ax$.

$\Rightarrow \ln x = ax$ has exactly two solutions.

$\Rightarrow \frac{\ln x}{x} = a$ has exactly two solutions to find the range of $\frac{\ln x}{x}$.

Let $y = \frac{\ln x}{x}, \ x > 0; \ \ \frac{dy}{dx} = \frac{x \cdot \frac{1}{x} - \ln x}{x^2} = \frac{1 - \ln x}{x^2}$

y is increasing, if $1 - \ln x > 0$ or $\ln x < 1 \Rightarrow 0 < x < e$

Range of $y \in \left(-\infty, \frac{1}{e}\right]$ graph of $y = \frac{\ln x}{x}$

For exactly two solutions of $\frac{\ln x}{x} = a$

$\Rightarrow \quad a \in \left(0, \frac{1}{e}\right)$

32. Let $f(x) = ax^2 + bx + c$ as it touches X-axis at $x = 3$

$$\Rightarrow \quad \frac{-b}{2a} = 3$$

$$\Rightarrow \quad b = -6a \qquad \ldots(i)$$

Also, $\quad 9a + 3b + c = 0 \qquad \ldots(ii)$

$$4a - 2b + c = 3 \qquad \ldots(iii)$$

$$\Rightarrow \quad a = \frac{3}{25}, b = -\frac{18}{25}, c = \frac{27}{25}$$

$$\Rightarrow \quad f(x) = \frac{3}{25}(x^2 - 6x + 9)$$

33. $y = \sqrt{2\{x\} - \{x\}^2 - \frac{3}{4}}$

$$\Rightarrow \quad 2\{x\} - \{x\}^2 - \frac{3}{4} \geq 0 \Rightarrow \frac{1}{2} \leq \{x\} \leq \frac{3}{2}$$

$$\Rightarrow \quad \frac{1}{2} \leq \{x\} < 1 \qquad (\because 0 \leq \{x\} < 1)$$

$\therefore \quad 2\{x\} - \{x\}^2 - \frac{3}{4}$ is increasing for $\frac{1}{2} \leq \{x\} < 1$.

$\Rightarrow$ Range $= \left[0, \frac{1}{4}\right]$

34. Replace x by $-x$

$$\Rightarrow \quad x[f(x) + f(-x)] = 0$$

$\Rightarrow \quad f(x)$ is an odd function.

$\Rightarrow \quad f^{iv}(x)$ is also odd $\Rightarrow f^{iv}(0) = 0$

35. $[y + [y]] = 2\cos x \quad \Rightarrow \quad [y] = \cos x$

$$\Rightarrow \quad y = \frac{1}{3}[\sin x + [\sin x + [\sin x]]] = [\sin x]$$

$\Rightarrow [\sin x] = \cos x$

Number of solutions in $[0, 2\pi]$ is 0.

Hence, total solution is 0.

$\therefore$ Both are periodic with period 2π.

36. By replacing $x = x + 1$ and $x = x - 1$, we get

$$f(x + 2) + f(x) = \sqrt{2} f(x + 1) \qquad \ldots(i)$$

$$f(x) + f(x - 2) = \sqrt{2} f(x - 1) \qquad \ldots(ii)$$

From Eqs. (i) and (ii), gives

$$f(x + 2) + f(x - 2) + 2f(x)$$
$$= \sqrt{2}\,[f(x + 1) + f(x - 1)]$$
$$= \sqrt{2}\sqrt{2} f(x)$$

$\therefore \quad f(x + 2) + f(x - 2) = 0$

On replacing x by $x + 2$, we get

$$f(x + 4) + f(x) = 0$$
$$f(x + 8) = -f(x + 4) = f(x), \forall\ x$$

$\therefore \quad f(x)$ is periodic with period 8.

37. The equation has meaning, if $x > 0, x \neq 1$.

$\therefore \quad$ Domain $= (0, 1) \cup (1, \infty)$

If $x \in (0, 1)$, then $\log_2 x < 0$

and $\quad \log_2 x + \log_x 2 = \frac{\log x}{\log 2} + \frac{\log 2}{\log x}$

$$= \text{sum of a negative number} \leq -2$$

In this case any α will satisfy, since $2\cos\alpha$ can never be more than 2.

Thus, the inequation is satisfied for any x in (0, 1) and for any α.

If $x \in (1, \infty)$, then $\log_2 x > 0 \Rightarrow \frac{\log x}{\log 2} + \frac{\log 2}{\log x} > 0$

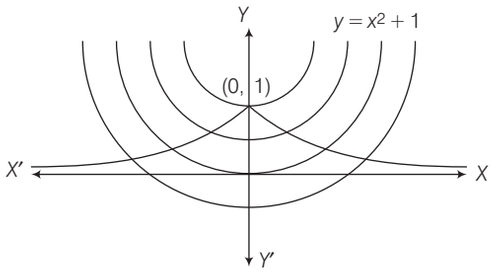
The inequation cannot be satisfied unless

$$\cos\alpha = -1 \text{ and } x = 2$$

i.e. $\quad \log_2 x = 1$

Option (d) is wrong, since in the last case there are infinite solution.

38. If we draw the graph of $\left(\frac{1}{2}\right)^{|x|}$ and $x^2 - a$, then the range of value of a will be $(-1, \infty)$.



Maximum possible solution for 'x' is '2'.

39. $f(x) \neq |\cos x|$ is true only when

$$|\cos x| = 1 \quad \Rightarrow \quad x = 0, \pi, 2\pi$$

40. $|\cos x| + \cos x > 0 \rightarrow x \in \left[0, \frac{\pi}{2}\right)$

For $\quad x \in \left[0, \frac{\pi}{2}\right), 1 \leq \sin x + \cos x \leq \sqrt{2}$

But $\quad \sin x + \cos x \neq 1 \Rightarrow x \in \left(0, \frac{\pi}{2}\right)$

Now, for $x \in \left(0, \frac{\pi}{2}\right)$,

$$\log_{\sin x + \cos x}(|\cos x| + \cos x) \geq 0$$

$$\Rightarrow \quad \cos x \geq \frac{1}{2} \Rightarrow x \in \left(0, \frac{\pi}{3}\right]$$

41. $y = ((x + \alpha)^2 - 1)^{1/4} = [(x + \alpha - 1)(x + \alpha + 1)]^{1/4}$

$$(x + \alpha - 1)(x + \alpha + 1) \geq 0$$

$$x \geq 1 - \alpha \text{ and } x \leq -1 - \alpha \text{ for } \alpha > 0$$

For $\quad \alpha < 0, x \leq 1 - \alpha, x \geq -1 - \alpha$

$$(x + \alpha) \leq 1 \text{ and } (x + \alpha) \geq -1$$

For $\alpha \leq -1, x \leq 0$ and range is $[0, \infty)$.

42. $f(x) = \log(\log(\log x))$

$$\log x > 1 \text{ when } x \in (e, \infty)$$

$\therefore \log(\log x) > 0$ and hence, $\log(\log(\log x))$ is well defined and uniquely.

It is evidently one-one. Since, the range of $\log x = R$, $f(x)$ is one-one and onto.

43. $\quad x^2 - 4px + q^2 > 0, \forall\ x \in R$

$$\Rightarrow \quad 4p^2 - q^2 < 0 \qquad \ldots(i)$$

$$r^2 + p^2 < qr \qquad \ldots(ii)$$

Let $y = \dfrac{x + r}{x^2 + qx + p^2}$

$\Rightarrow$ $x^2y + x(qy - 1) + p^2y - r = 0$ ...(iii)

x is real,

$\Rightarrow$ $(q^2 - 4p^2)y^2 + y(-2q + 4r) + 1 > 0$

From Eq. (i) $\Rightarrow$ Coefficient of y^2 is a positive discriminant.

$= (4r - 2q)^2 - 4(q^2 - 4p^2)$

$= 16(r^2 + p^2 - qr) < 0$ [from Eq. (ii)]

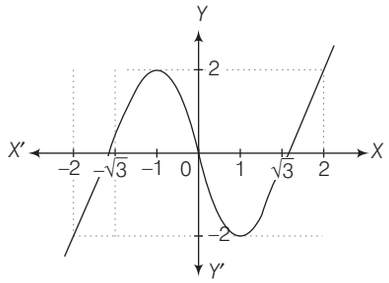
Hence, Eq. (iii) is true for all real y or $y \in (-\infty, \infty)$.

44. Here,

$$f(x) = \frac{x^4 - \lambda x^3 - 3x^2 + 3\lambda x}{x - \lambda}$$

$\therefore$ $f(x) = \dfrac{(x^3 - 3x)(x - \lambda)}{(x - \lambda)}$

Consider, $g(x) = x^3 - 3x$ that can be shown as



Now, the range of $f(x)$ is the set of entire real numbers, if $\lambda \in [-2,2]$.

Because, if $\lambda > 2$ or $\lambda < -2$, then range of $f(x) \notin R$.

45. We know that,

$$(a-1)^n = {}^nC_0a^n - {}^nC_1a^{n-1} + {}^nC_2a^{n-2} - \ldots + (-1)^{n-1} \cdot {}^nC_{n-1} \cdot a + (-1)^n \cdot {}^nC_n$$

$\therefore$ $\dfrac{(a-1)^n}{a} = {}^nC_0a^{n-1} - {}^nC_1 \cdot a^{n-2} + {}^nC_2 \cdot a^{n-3} + \ldots + (-1)^{n-1} \cdot {}^nC_{n-1} + (-1)^n \cdot \dfrac{{}^nC_n}{a}$

Hence, $f(n) = \dfrac{(a-1)^n - (-1)^n}{a}$

Now, $f(2016) + f(2017) = \dfrac{(a-1)^{2016} - 1}{a} + \dfrac{(a-1)^{2017} + 1}{a}$

$= \dfrac{(a-1)^{2016}[1 + a - 1]}{a} = (a-1)^{2016}$, where $a = 3^{\frac{1}{224}} + 1$

$\therefore$ $f(2016) + f(2017) = (3^{\frac{1}{224}})^{2016} = 3^9 = 3^K$

$\Rightarrow$ $K = 9$

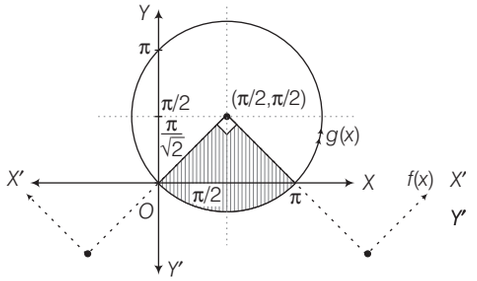
46. Here,

$$g(x) = \frac{\pi}{2} - \sqrt{\frac{\pi^2}{2} - \left(x - \frac{\pi}{2}\right)^2}$$

or $\left(y - \dfrac{\pi}{2}\right)^2 = \dfrac{\pi^2}{2} - \left(x - \dfrac{\pi}{2}\right)^2$

$\Rightarrow$ $\left(x - \dfrac{\pi}{2}\right)^2 + \left(y - \dfrac{\pi}{2}\right)^2 = \dfrac{\pi^2}{2}$, i.e. circle

and $f(x) = \sin^{-1}(\sin x)$ is shown as



$\therefore$ Area of shaded part $= \dfrac{\theta}{360^\circ} \times \pi r^2$

$= \dfrac{90^\circ}{360^\circ} \times \pi \times \dfrac{\pi^2}{2} = \dfrac{\pi^3}{8}$ sq units

47. Let $y = \dfrac{x^2 + bx + 1}{x^2 + 2x + b}\ (b > 1)$

$\Rightarrow$ $(y-1)x^2 + (2y - b)x + (by - 1) = 0$

$\Rightarrow$ $D \geq 0 \Rightarrow (4 - 4b)y^2 + 4y + (b^2 - 4) \geq 0$ ...(i)

Since, $f(x)$ and $\dfrac{1}{f(x)}$ have the same bounded set as their range.

Thus, $(4 - 4b)y^2 + 4y + (b^2 - 4) \geq 0$ have roots α and $\dfrac{1}{\alpha}$.

$\therefore$ Product of roots $= 1$

$\Rightarrow$ $\dfrac{b^2 - 4}{4(1 - b)} = 1 \Rightarrow b^2 - 4 = 4 - 4b$

or $b^2 + 4b - 8 = 0$

$$b = \frac{-4 \pm \sqrt{16 + 32}}{2} = \frac{-4 \pm 4\sqrt{3}}{2} = 2\sqrt{3} - 2$$

48. Since, $\sin\dfrac{\pi[x + 24]}{12} = \sin\dfrac{\pi}{12}(24 + [x])$

$= \sin\left(2\pi + \dfrac{\pi[x]}{2}\right) = \sin\dfrac{\pi[x]}{12}$

The period of $\sin\dfrac{\pi[x]}{12}$ is 24.

Similarly, period of $\cos\dfrac{\pi[x]}{4}$ is 8 and period of $\tan\dfrac{\pi[x]}{3} = 3$.

Hence, the period of the given function = LCM of 24, 8, 3 = 24.

49. Let $f(x, y) = ax + by$

Then, $f(2x + 3y, 2x - 7y)$

$= a(2x + 3y) + b(2x - 7y) = 20x$ [given]

$\therefore$ $2a + 2b = 20$ and $3a - 7b = 0$

$\therefore$ $a = 7$ and $b = 3$

$\therefore$ $f(x, y) = 7x + 3y$

50. Domain of $f(x)$ is [1, 3] and the function is continuous.

$$f'(x) = \frac{1}{2\sqrt{x-1}} - \frac{1}{\sqrt{3-x}} = 0$$

$\Rightarrow$ $\sqrt{3 - x} = 2\sqrt{x - 1}$

$\Rightarrow \quad 3 - x = 4x - 4 \Rightarrow x = \frac{7}{5}$

$\therefore$ Critical points in $[1, 3]$ are $1, \frac{7}{5}$ and 3.

$f(1) = 2\sqrt{2},\ f(3) = \sqrt{2}$

and $f\left(\frac{7}{5}\right) = \sqrt{\frac{2}{5}} + 2\sqrt{\frac{8}{5}} = \sqrt{10}, 2\sqrt{2}$ being $< \sqrt{10}$, the range $= [\sqrt{2}, \sqrt{10}]$.

51. $f(x) = \cos^{-1}(\sec(\cos^{-1} x)) + \sin^{-1}(\operatorname{cosec}(\sin^{-1} x))$

$\Rightarrow \quad -1 \le \sec(\cos^{-1} x) \le 1$

and $\quad -1 \le \operatorname{cosec}(\sin^{-1} x) \le 1$

$\Rightarrow \quad \sec(\cos^{-1} x) = \pm 1$

and $\quad \operatorname{cosec}(\sin^{-1} x) = \pm 1$

$\Rightarrow \quad \cos^{-1} x = 0, \pi \quad \text{and} \quad \sin^{-1} x = \frac{\pi}{2}, -\frac{\pi}{2}$

$\Rightarrow \quad x = \pm 1$ and $x = \pm 1$

$\therefore$ Domain is $x = \pm 1$.

52. Put $x = y = 1 \Rightarrow f(1) = 2$

Put $\quad y = \frac{1}{x} \Rightarrow f(x) + f\left(\frac{1}{x}\right) = f(x)\, f\left(\frac{1}{x}\right)$

$\Rightarrow \quad f(x) = x^3 + 1$

$\Rightarrow \quad g(x) = 0, \forall\ x \in R - \{0\}$

53. $f(x) = f'(x) \times f''(x)$ is satisfied by only the polynomial of degree 4.

Since, $f(x) = 0$ satisfies $x = 1, 2, 3$ only. It is clear one of the roots is twice repeated.

$\therefore \quad f'(1) f'(2) f'(3) = 0$

54. Total number of functions for which $f(i) \ne i = 4^5$ and number of onto functions in which $f(i) \ne i = 44$.

$\therefore$ Required number of functions $= 980$

55. We can send $1, 2, \ldots, n-1$ anywhere and the value of $f(n)$ will then be uniquely determined.

56. Put $\sin x = t$,

$y = t^3 - 6t^2 + 11t - 6, -1 \le t \le 1$

$f(-1) = -24,\ f(1) = 0$

57. $g(x) = f(x^2 - 2x - 1) + f(5 - x^2 + 2x)$

$= 2x^4 - 8x^3 - 4x^2 + 24x + 18$

$g'(x) = 8x^3 - 24x^2 - 8x + 24$

$g'(x) = 0 \quad \Rightarrow \quad x = -1, 1, 3$

We observe that,

$g(x) \ge \min\{g(-1), g(1), g(3)\} = 0$

$\therefore \quad g(x) \ge 0, \forall\ x \in R$

58. Let $f(x) = [x],\ g(x) = \frac{e^{-|x|}}{2}$

$\Rightarrow \quad h(x) = \left[\frac{e^{-|x|}}{2}\right] = 0, \forall\ x \in R$

59. There are four possible functions defined in $0 \le x < 1$, of them 2 are continuous and two are discontinuous, now for each of the points $(1, 2, \ldots, n-1)$, keep functions fixed from left of the point, so there are 4 possible functions defined in between next two consecutive integral points of them only one is continuous and at last for $x = n$, there is only one possibility of discontinuity of the function. So, total number of functions

$= 2 \times 3^{n-1} \times 1$

60. $\because \quad k \in$ odd

$f(x) = k + 3$ [even]

$f(f(k)) = \frac{k+3}{2}$

If $\frac{k+3}{2} \in$ odd $\Rightarrow 27 = \frac{k+3}{2} + 3$

$\Rightarrow \quad k = 45$ not possible.

Now, let $\frac{k+3}{2} \in$ even

$\therefore \quad 27 = f(f(f(k))) = f\left(\frac{k+3}{2}\right) = \frac{k+3}{4}$

$\therefore \quad k = 105$

Verifying $f(f(f(105))) = f(f(108)) = f(54) = 27$

$\therefore \quad k = 105$

Hence, sum of digits of $k = 1 + 0 + 5 = 6$

61. $f(x) = \frac{\sin(\pi\{x\})}{x^4 + 3x^2 + 7}$

Here, $\quad f(1/2) = f(-1/2)$

Clearly, $f(x)$ is not one-one and also it is dependent on x.

62. Since, $f(x)$ and $g(x)$ are one-one and onto and are also the mirror images of each other which respect to the line $y = a$. It clearly indicates that $h(x) = f(x) + g(x)$ will be a constant function and will always be equal to $2a$.

63. Let $g(t) = 2t^3 - 15t^2 + 36t - 25$

$g'(t) = 6t^2 - 30t + 36 = 6(t^2 - 5t + 6)$

$= 6(t-2)(t-3) = 0 \quad \Rightarrow \quad t = 2, 3$

For $\quad 2 \le t \le 3$,

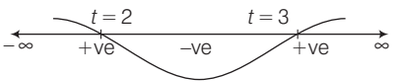
$g(t)_{\min} = g(3) = 2 \times 27 - 15 \times 9 + 36 \times 3 - 25 = 2$

Also, $\quad 2 + |\sin t| \ge 2$

Hence, minimum $\phi(t) = 2$

$\therefore \quad 3^x + 3^{f(x)} = 2$

$\Rightarrow \quad 3^{f(x)} = 2 - 3^x \quad \because \quad 3^{f(x)} > 0$



$\Rightarrow\ 2 - 3^x > 0 \quad \Rightarrow \quad 3^x < 2 \quad \Rightarrow \quad x < \log_3 2$

$\therefore \quad x \in (-\infty, \log_3 2)$

64. Here, $x_1 x_2 x_3 = x$ and x be the element of A.

$\therefore \quad x_1 x_2 x_3 = \frac{120}{x_4}$

$\Rightarrow\ x_1 x_2 x_3 x_4 = 120 = 2^3 \times 3^1 \times 5^1$.

Thus, to find number of positive integer solutions of

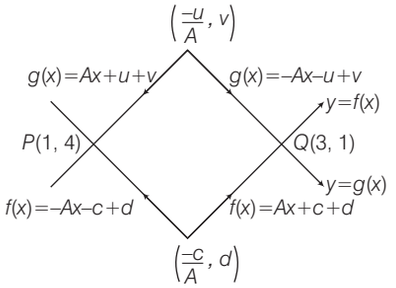
$$x_1 x_2 x_3 x_4 = 2^3 \times 3^1 \times 5^1.$$

i.e. $\alpha+\beta+\gamma+\delta=3, \alpha+\beta+\gamma+\delta=1, \alpha+\beta+\gamma+\delta=1$

$$\Rightarrow \quad {}^{3+4-1}C_{4-1} \cdot {}^{1+4-1}C_{4-1} \cdot {}^{1+4-1}C_{4-1} = {}^6C_3 \cdot {}^4C_3 \cdot {}^4C_3$$

$$= 20 \times 4 \times 4 = 320 \quad \therefore \quad d = 320$$

65.



From above figure,

$4 = A + u + v, \quad 1 = -3A - u + v.$ ...(i)

and $1 = 3A + c + d, 4 = -A - c + d$ ...(ii)

From Eq. (i), $3 = 4A + 2u$ ...(iii)

From Eq. (ii), $-3 = 4A + 2c$ ...(iv)

On adding Eqs. (iii) and (iv), we get

$$8A + 2u + 2c = 0$$

$$\therefore \quad \frac{u+c}{A} = -4$$

66. As, $f(x)$ is one-one, if $f'(x) \geq 0, \forall x \in R$.

$\therefore \quad 3x^2 + 2x + 4 + a\cos x - b\sin x \geq 0, \forall x \in R.$

$\Rightarrow \quad 3x^2 + 2x + 4 \geq b\sin x - a\cos x, \forall x \in R$

$\Rightarrow \quad 3x^2 + 6x + 4 \geq \sqrt{a^2+b^2}, \forall x \in R$

$[\text{as}, |b\sin x - a\cos x| \leq \sqrt{a^2+b^2}]$

$\Rightarrow \quad 3x^2 + 6x + 3 + 1 \geq \sqrt{a^2+b^2}, \forall x \in R$

$\Rightarrow \quad 3(x+1)^2 + 1 \geq \sqrt{a^2+b^2}, \forall x \in R$

$\therefore \quad \sqrt{a^2+b^2} \leq 1 + 3(x+1)^2$, since $1 + 3(x+1)^2 \geq 1$

$\Rightarrow \quad \sqrt{a^2+b^2} \leq 1$

$\therefore$ Greatest value of $(a^2+b^2) = 1$

67. Here, $\frac{p-1}{p+1} = \frac{x^4+x^2+1}{(x^2+x+1)^2} = \frac{x^4+2x^2+1-x^2}{(x^2+x+1)^2} = \frac{(x^2+1)^2-x^2}{(x^2+x+1)^2}$

$$= \frac{(x^2+x+1)(x^2-x+1)}{(x^2+x+1)^2}$$

$\therefore \quad \frac{p-1}{p+1} = \frac{x^2-x+1}{x^2+x+1}$, using componendo and dividendo

$\Rightarrow \quad \frac{2p}{2} = \frac{2(x^2+1)}{2x}$

$\Rightarrow \quad p = x + \frac{1}{x}$ ...(i)

As, $f(x) = \frac{1-x}{1+x} \Rightarrow f(f(x)) + f\left(f\left(\frac{1}{x}\right)\right) = x + \frac{1}{x}$ ...(ii)

From Eqs. (i) and (ii), we get $f(f(x)) + f\left(f\left(\frac{1}{x}\right)\right) = p$

68. As, α^{15} and α is the root of $x^{14} + x^{13} + \ldots + x + 1 = 0$

Now, $f(x) = x^{13} + 2x^{12} + 3x^{11} + \ldots + 13x + 14$

$\therefore \quad \frac{f(x)}{x} = x^{12} + 2x^{11} + 3x^{10} + \ldots + \frac{14}{x}$

On subtracting, we get

$$\left(1 - \frac{1}{x}\right) f(x) = x^{13} + x^{12} + x^{11} + \ldots + x + 1 - \frac{14}{x}$$

Put $x = \alpha, \left(\frac{\alpha-1}{\alpha}\right) f(\alpha) = -\alpha^{14} - \frac{14}{\alpha} = \frac{-\alpha^{15}-14}{\alpha} = -\frac{15}{\alpha}$

$\therefore \quad f(\alpha) = \frac{15}{1-\alpha}.$

Hence, $N = \frac{15^{14}}{(1-\alpha)(1-\alpha^2)\ldots(1-\alpha^{14})}$

and we know that

$x^{15} - 1 = (x-1)(x-\alpha)(x-\alpha^2)(x-\alpha^3)\ldots(x-\alpha^{14})$

$\therefore \quad (x-\alpha)(x-\alpha^2)(x-\alpha^3)\ldots(x-\alpha^{14}) = \frac{x^{15}-1}{x-1}$

As, $x \to 1$.

$$(1-\alpha)(1-\alpha^2)(1-\alpha^3)\ldots(1-\alpha^{14}) = \lim_{x\to 1} \frac{x^{15}-1}{x-1} = 15$$

$\therefore \quad N = 15^3 = 3^{13} \cdot 5^{13}$

Thus, number of divisors $= (13+1)(13+1) = 14^2 = 196.$

69. Here, domain of $f(x) \Rightarrow x \in \left\{-\frac{1}{2}, \frac{1}{2}\right\}$ only

$\therefore \quad f(x)$ is minimum when $x = \frac{1}{2}$, i.e. $f_{\min}\left(\frac{1}{2}\right) = \frac{\pi}{2}$

and $f(x)$ is maximum when $x = -\frac{1}{2}$, i.e. $f_{\max}\left(-\frac{1}{2}\right) = \frac{3\pi}{2}$

$\therefore$ Sum of maximum and minimum value of function is 2π.

70. Here, $\tan^{-1}(x^2 - 18x + a) > 0, \forall \ x \in R$

$\Rightarrow \quad x^2 - 18x + a > 0, \ \forall \ x \in R$

$\Rightarrow \quad (18)^2 - 4a < 0$

$\Rightarrow \quad a > 81$

$\Rightarrow \quad a \in (81, \infty)$

71. As, $\sin^2 x + \sin x + 1 > 0, \forall x \in R.$

$\therefore \quad \frac{1}{\sqrt{\sin^2 x + \sin x + 1}}$ is always exists.

For $\sin^{-1}\left(\frac{1}{|x^2-1|}\right)$ to exists,

$$0 < \frac{1}{|x^2-1|} \leq 1$$

$\Rightarrow \quad |x^2 - 1| \geq 1$

$\Rightarrow \quad x^2 - 1 \leq -1 \quad \text{or} \quad x^2 - 1 \geq 1$

$\Rightarrow \quad x^2 \leq 0 \quad \text{or} \quad x^2 \geq 2$

$\Rightarrow \quad x = 0 \quad \text{or} \quad (x \leq -\sqrt{2} \text{ or } x \geq \sqrt{2})$

$\therefore \quad x \in (-\infty, -\sqrt{2}] \cup [\sqrt{2}, \infty) \cup \{0\}.$

72. Here, $\log(x^2 - x + 1)$ is defined, when

$$x^2 - x + 1 > 0 \quad \text{and} \quad x^2 - x + 1 \neq 1$$

$$\Rightarrow \qquad x \in R \quad \text{and } x \neq 0, 1 \Rightarrow x \in R - \{0, 1\} \qquad \ldots(i)$$

Again, $\log(\sin^{-1}\sqrt{x^2 + x + 1})$ exists, when

$$0 < x^2 + x + 1 \leq 1$$

$$\Rightarrow \qquad x^2 + x \leq 0 \quad \Rightarrow \quad x \in [-1, 0] \qquad \ldots(ii)$$

$$x \in [-1, 0)$$

73. Here, $\sqrt{\cos^{-1} x}$ is defined for $x \in [-1, 1]$ for $\sqrt{\sin^{-1}(3x - 4x^3)}$ for x defined $0 \leq 3x - 4x^3 \leq 1$

$$\therefore \qquad 3x - 4x^3 \geq 0 \text{ and } 3x - 4x^3 \leq 1$$

$$\Rightarrow \quad x \in \left(-\infty, -\frac{\sqrt{3}}{2}\right] \cup \left[0, \frac{\sqrt{3}}{2}\right] \text{ and } x \in [-1, \infty)$$

$$\Rightarrow \quad x \in \left[-1, -\frac{\sqrt{3}}{2}\right] \cup \left[0, \frac{\sqrt{3}}{2}\right]$$

74. Here, $f(x)$ exists only, if

$$4^x + 8^{\frac{2}{3}(x-2)} - 52 - 2^{2(x-1)} \geq 0.$$

$$\Rightarrow \qquad 2^{2x} + 2^{2(x-2)} - 2^{2(x-1)} \geq 52$$

$$\Rightarrow \qquad 2^{2x} \geq 64 \Rightarrow x \geq 3$$

75. $y = |\sin^{-1}(2x^2 - 1)|$

$$\therefore \quad \frac{dy}{dx} = \frac{|\sin^{-1}(2x^2 - 1)|}{\sin^{-1}(2x^2 - 1)} \cdot \frac{4x}{|2x|\sqrt{1 - x^2}}$$

which would exist, if

$$|2x| \neq 0, \ \sin^{-1}(2x^2 - 1) \neq 0 \quad \text{and} \quad 1 - x^2 > 0$$

$$\Rightarrow \qquad x \neq 0, \ 2x^2 - 1 \neq 0$$

and $\quad |x| < 1 \Rightarrow x \neq 0, \pm\frac{1}{\sqrt{2}}$ and $|x| < 1$

$$\Rightarrow \qquad x \in (-1, 1) \sim \left\{0, \pm\frac{1}{\sqrt{2}}\right\}$$

76. The given function is defined for $5x^2 - 8x + 4 > 0$ which is true, $\forall\ x \in R$.

Since, coefficient of $x^2 = 5 > 0$ and $D = 64 - 80 = -16 < 0$

Let $\qquad g(x) = 5x^2 - 8x + 4$

Here, $\qquad a = 5 > 0$

$$\therefore \text{Range of } g(x) = \left[-\frac{D}{4a}, \infty\right) = \left[-\frac{-16}{4 \times 5}, \infty\right) = \left[\frac{4}{5}, \infty\right)$$

As, $\frac{4}{5} \leq 5x^2 - 8x + 4 < \infty$

$$\therefore \qquad \log_{5/4}\left(\frac{4}{5}\right) \leq \log_{5/4}(5x^2 - 8x + 4) < \log_{5/4} \infty$$

$$\Rightarrow \qquad -1 \leq \log_{5/4}(5x^2 - 8x + 4) < \infty$$

$$\Rightarrow \quad \tan^{-1}(-1) \leq \tan^{-1}\{\log_{5/4}(5x^2 - 8x + 4)\} < \tan^{-1}(\infty)$$

$$\Rightarrow \qquad -\frac{\pi}{4} \leq f(x) < \frac{\pi}{2}$$

$$\therefore \qquad R_f = \left[\frac{-\pi}{4}, \frac{\pi}{2}\right)$$

77. Functions which are not algebraic, are known as transcendal functions.

78. $f(x) = \dfrac{\sqrt{(\sqrt{x-1})^2 + 1 - 2\sqrt{x-1}}}{\sqrt{x-1} - 1} \cdot x$

$$= \frac{\left|\sqrt{x-1} - 1\right|}{\sqrt{x-1} - 1} \cdot x = \begin{cases} x, & \text{when } x \in [2, \infty) \\ -x, & \text{when } x \in [1, 2) \end{cases}$$

$$f'(x) = \begin{cases} 1, & x \in [2, \infty) \\ -1, & x \in [1, 2) \end{cases}$$

$$\therefore \ f'(10) = 1, \ f'\left(\frac{3}{2}\right) = -1$$

79. $f(x) = \dfrac{1 + \cos 2x}{2} + \dfrac{1 + \cos\left(\frac{2\pi}{3} + 2x\right)}{2} - \dfrac{\left[\cos\left(2x + \frac{\pi}{3}\right) + \cos\left(\frac{\pi}{3}\right)\right.}{2}$

$$= \frac{1}{2}\left[2 + \cos 2x + \cos\left(\frac{2\pi}{3} + 2x\right) - \cos\left(2x + \frac{\pi}{3}\right) - \frac{1}{2}\right]$$

$$= \frac{1}{2}\left[\frac{3}{2} + 2\cos\left(2x + \frac{\pi}{3}\right) \cdot \cos\frac{\pi}{3} - \cos\left(2x + \frac{\pi}{3}\right)\right] = \frac{3}{4}$$

$\therefore\ f(x)$ is even function, periodic function and

$$f(0) = f(1) = \frac{3}{4}.$$

80. (a) Let $f(x) = \sin(\sin^{-1} x) = x, \forall\ x \in [-1, 1]$

So, $f(x)$ is one-one and onto.

(b) Let $f(x) = \dfrac{2}{\pi}\sin^{-1}(\sin x) = \dfrac{2}{\pi}x$

The range is $\left[-\frac{2}{\pi}, \frac{2}{\pi}\right]$.

So, $f(x)$ is one-one and into.

(c) Let $f(x) = \text{sgn}(x) \cdot \log e^x = \begin{cases} x, & x > 0 \\ -x, & x < 0 \\ 0, & x = 0 \end{cases}$

$\therefore$ Range is $[0, 1]$ for $x \in [-1, 1]$

So, $f(x)$ is many-one and into.

(d) Let $f(x) = x^3 \cdot \text{sgn}(x) = \begin{cases} x^3, & x > 0 \\ -x^3, & x < 0 \\ 0, & x = 0 \end{cases}$

So, $f(x)$ is many-one and into.

81. (a) $(f + g)(3.5) = f(3.5) + g(3.5) = (-0.5) + (0.5) = 0$

(b) $f(g(3)) = f(0) = 3$

(c) $f(g(2)) = f(-1) = 8$

(d) $(f - g)(4) = f(4) - g(4) = 0 - 26 = -26$

82. Here, $f(x) = x^2 - 2ax + a(a + 1)$

$$\Rightarrow \qquad f(x) = (x - a)^2 + a, \ x \in [a, \infty)$$

Let $\qquad y = f(x) = (x - a)^2 + a$

Clearly, $y \geq a$

$\Rightarrow \quad (x-a)^2 = (y-a) \Rightarrow x = a + \sqrt{y-a}$

$\therefore \quad f^{-1}(x) = a + \sqrt{x-a}$

Now, $\quad f(x) = f^{-1}(x)$

$\Rightarrow \quad (x-a)^2 + a = a + \sqrt{x-a}$

$\Rightarrow \quad (x-a)^2 = \sqrt{x-a}$

or $\quad (x-a)\left((x-a)^3 - 1\right) = 0$

$\Rightarrow \quad x = a \text{ or } a+1$

If $a = 5049$, then $a + 1 = 5050$

If $a + 1 = 5049$, then $a = 5048$

83. Here, $g(x) = \sin(\sin^{-1}\sqrt{\{x\}}) + \cos(\sin^{-1}\sqrt{\{x\}}) - 1$

$= \sqrt{\{x\}} + \cos(\cos^{-1}\sqrt{1-\{x\}}) - 1$

$= \sqrt{x} + \sqrt{1-\{x\}} - 1$

If $x \in I$, then $\{x\} = 0 \Rightarrow g(x) = 0$

Also, $g(-x) = g(x) \Rightarrow g(x)$ is even.

If $x \notin I$, then $\{-x\} = 1 - \{x\}$

$\Rightarrow \quad g(-x) = \sqrt{1-\{x\}} + \sqrt{\{x^2\}-1} = g(x)$

$\Rightarrow g(x)$ is even function.

$\therefore g(x) = 0, x \in I$ and $g(x) = g(-x), x \notin I$

$\Rightarrow g(x)$ is periodic function.

84. Given, $f(a + x) = f(a - x)$

(a) $f(2a - x) = f(a + (a - x)) = f(a - (a - x)) = f(x)$

$\therefore \quad f(2a - x) = f(x)$ ...(i)

(b) $f(2a + x) = f(a + (a + x)) = f(a - (a + x)) = f(-x)$

$\therefore \quad f(2a + x) = f(-x)$ ...(ii)

(c) $f(2b + x) = f(-x)$ [from Eq. (ii)] ...(iii)

(d) From Eqs. (ii) and (iii), we get

$f(2a + x) = f(2b + x)$

$\therefore$ Period is $(2b - 2a)$.

85. Here, $f(1 + x) = f(1 - x)$

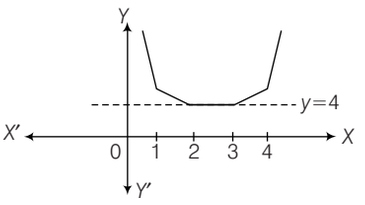
$\Rightarrow f(x)$ is symmetric about $x = 1$.

$\therefore \quad g(x) = f(1 + x) \Rightarrow g(-x) = f(1 - x) = f(1 + x) = g(x)$

$\Rightarrow g(x)$ is an even function.

86. $f(x) = \begin{cases} 10 - 4x, & \text{if } -\infty < x < 1 \\ 8 - 2x, & \text{if } 1 < x \leq 2 \\ 4, & \text{if } 2 < x \leq 3 \\ 2x - 2, & \text{if } 3 < x \leq 4 \\ 4x - 10, & \text{if } 4 < x < \infty \end{cases}$

Could be shown as



Clearly, the least value of $f(x)$ is 4.

The number of integral solutions of $f(x) = 4$ are two, i.e. $\{2, 3\}$.

Also, $\quad \pi - 1, e, \frac{12}{5} \in \{2, 3\}$

$\therefore \quad \dfrac{f(\pi - 1) + f(e)}{2\, f\left(\dfrac{12}{5}\right)} = 1$

87. (a) Number of onto functions

$= 4^5 - 4 \cdot 3^5 + 6 \cdot 2^5 - 4 = 240$

(b) Number of onto functions, whose range is 3 elements

$= {}^4C_3(3^5 - 3 \cdot 2^5 + 3) = 4 \times 150 = 600$

(c) Number of onto functions, whose range is 2 elements

$= {}^4C_2(2^5 - 2) = 6 \times 30 = 180$

(d) Number of onto functions, whose range is 1 element

$= {}^4C_1 = 4$

88. Replacing x by 2,

$\Rightarrow \quad 2f(2) + 2f\left(\frac{1}{2}\right) - 2f(1) = 4$

$\Rightarrow \quad f(2) + f\left(\frac{1}{2}\right) = 2 + f(1)$ ...(i)

Replacing x by 1,

$f(1) = -1$ ...(ii)

Replacing x by $\frac{1}{2}$, $2f\left(\frac{1}{2}\right) + \frac{1}{2}f(2) + 2 = \frac{5}{2}$

$\therefore \quad 2f(2) + \frac{1}{2}f\left(\frac{1}{2}\right) = \frac{1}{2}$ ...(iii)

From Eqs. (i) and (iii), we get

$f(2) = 1, f\left(\frac{1}{2}\right) = 0$

89. Let $g(x) = f(100x)$, $g(1) = 1$

$\Rightarrow \quad g(x + 1) - g(x) = x + 1$

Putting $x = 1, 2, 3, \ldots, 99$ and adding, we get

$$g(100) = 5050 = \sum_{r=1}^{100} r = \frac{100}{2}(100 + 1) = 5050$$

90. We have, $f(x) = [1 + \sin x] + [1 + \sin 2x] + \ldots + [1 + \sin nx]$

$= n + [\sin x] + [\sin 2x] + \ldots + [\sin nx]$

$\because \quad x \in (0, \pi)$

$\Rightarrow \quad 0 < \sin x \leq 1$

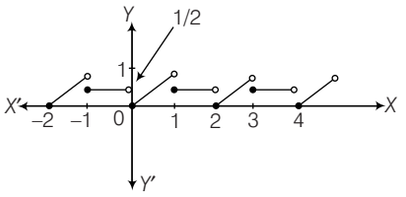
$\Rightarrow \quad f(x) = \begin{cases} n, & \text{if } n \text{ is even} \\ n + 1, & \text{if } n \text{ is odd} \end{cases}$

91. (a) $f(x) = \begin{cases} 1, & \text{if } x \text{ is rational} \\ 0, & \text{if } x \text{ is irrational} \end{cases}$

$\Rightarrow f(x + k) = \begin{cases} 1, & \text{if } x \text{ is rational} \\ 0, & \text{if } x \text{ is irrational} \end{cases}$

$\Rightarrow f(x)$ is periodic but period cannot be determined.

(b) $f(x)=\begin{cases} x-[x], & 2n\le x<2n+1 \\ \frac{1}{2}, & 2n+1\le x<2n+2 \end{cases}$



$\therefore f(x)$ is periodic with period 2.

(c) $f(x)=(-1)^{\left[\frac{2x}{\pi}\right]}$

$\Rightarrow f(x+\pi)=(-1)^{\left[\frac{2(x+\pi)}{\pi}\right]}=(-1)^{\left[\frac{2x}{\pi}\right]}$

$\therefore\ f(x)$ is periodic with period π.

(d) $f(x)=(ax+a)-[ax+a]+\tan\left(\frac{\pi x}{2}\right)$

$=\{ax+a\}+\tan\left(\frac{\pi x}{2}\right)$

$\therefore$ Period of $f(x)$ is LCM of $\left\{\frac{1}{a},\frac{2}{1}\right\}=2$

92. Here, $(x+1)\,f(x)=x$

$\Rightarrow\ (x+1)\,f(x)-x=0$ is $(n+1)$th degree

$\Rightarrow\ (x+1)f(x)-x=(x-0)\,(x-1)(x-2)\ldots(x-n)\cdot k$

Put $x=n+1\Rightarrow(n+2)f(n+1)-(n+1)=(n+1)!\,(k)$ ...(i)

Put $x=-1\Rightarrow 1=(-1)^{n+1}\cdot(n+1)!(k)$ ...(ii)

From Eqs. (i) and (ii), we get

$$f(n+1)=\frac{(n+1)+(-1)^{n+1}}{(n+2)}=\begin{cases}1, & \text{when } n \text{ is odd}\\ \frac{n}{n+2}, & \text{when } n \text{ is even}\end{cases}$$

93. We have, $f(x+1)=\frac{f(x)-5}{f(x)-3}$ ...(i)

$f(x)\cdot f(x+1)-3f(x+1)=f(x)-5$

$\Rightarrow\quad f(x)=\frac{3f(x+1)-5}{f(x+1)-1}$

On replacing x by $(x-1)$, we have $f(x-1)=\frac{3f(x)-5}{f(x)-1}$ ...(ii)

Using Eq. (i), we get $f(x+2)=\frac{f(x+1)-5}{f(x+1)-3}$

$$=\frac{\frac{f(x)-5}{f(x)-3}-5}{\frac{f(x)-5}{f(x)-3}-3}=\frac{2f(x)-5}{f(x)-2} \quad \text{...(iii)}$$

Using Eq. (ii), we get $f(x-2)=\frac{3f(x-1)-5}{f(x-1)-1}$

$$=\frac{3\left(\frac{3f(x)-5}{f(x)-1}\right)-5}{\frac{3f(x)-5}{f(x)-1}}=\frac{2f(x)-5}{f(x)-2} \quad \text{...(iv)}$$

Using Eqs. (iii) and (iv), we have $f(x+2)=f(x-2)$

$\Rightarrow\quad f(x+4)=f(x)$

$\therefore\ f(x)$ is periodic with period 4.

94. $f(x)=1-x-x^3$

Replacing x by $f(x)$, $f(f(x))=1-f(x)-f^3(x)$

Hence, the given equation is

$f(f(x))>f(1-5x),\ f(x)<1-5x$

$f(x)=1-x-x^3$

$1-x-x^3<1-5x$

$x^3-4x>0$

$x(x-2)(x+2)>0$

So, $x\in(-2,0)\cup(2,\infty)$

95. $(x-y)f(x+y)-(x+y)f(x-y)=2y\,((x-y)(x+y))$

Let $x-y=u,\ x+y=v$

$uf(v)-vf(u)=uv\,(v-u)$

$\frac{f(v)}{v}-\frac{f(u)}{u}=v-u$

$\Rightarrow\quad \left(\frac{f(v)}{v}-v\right)=\left(\frac{f(u)}{u}-u\right)=\text{constant}$

Let $\frac{f(x)}{x}-x=\lambda\Rightarrow\ f(x)=(\lambda x+x^2)$

$f(1)=2$

$\lambda+1=2\quad\Rightarrow\quad\lambda=1$

$f(x)=x^2+x$

96. Period of $\sin x=2\pi$

and period of $\cos(\sqrt{4-a^2}x)=\frac{2\pi}{\sqrt{4-a^2}}$.

$\Rightarrow\quad \text{LCM}\left(2\pi,\frac{2\pi}{\sqrt{4-a^2}}\right)=4\pi$ [given]

i.e. $\sqrt{4-a^2}=\frac{p}{2}$, where $p=1,3$

Hence, $a^2=\frac{15}{4},\frac{7}{4};\ a=\pm\frac{\sqrt{15}}{2},\pm\frac{\sqrt{7}}{2}$

97. $f(x+y)=f(x)f(a-y)+f(y)\,f(a-x)$ ...(i)

Put $x=y=0$, we get $f(a)=\frac{1}{2}$

Let $y=0$

$\Rightarrow\quad f(x)=f(x)f(a)+f(0)\cdot f(a-x)$

$\Rightarrow\quad f(x)=\frac{1}{2}f(x)+\frac{1}{2}f(a-x)$

$\Rightarrow\quad f(x)=f(a-x)$

Put $y=a-x$ in Eq. (i),

$f(a)=(f(x))^2+(f(a-x))^2$

$\Rightarrow\quad (f(x))^2=\frac{1}{4}$

$\Rightarrow\quad f(x)=\pm\frac{1}{2}\qquad\left[\because f(x)\neq-\frac{1}{2}\right]$

Hence, $f(x)=\frac{1}{2}$

98. Since, $f(g(x))$ is one-one function.

$\Rightarrow$ $f(g(x_1)) = f(g(x_2))$ whenever $x_1 \neq x_2$

$\Rightarrow$ $g(x_1) = g(x_2)$ whenever $x_1 \neq x_2$

$\Rightarrow$ $g(x)$ must be one-one.

Let $f(x) = y$ is satisfied by $x = x_1$ and x_2.

If $g(x)$ is such that its range has only one of x_1 and x_2, then $f(g(x))$ can be one-one even, if $f(x)$ is many-one.

99. $x \sin x$ is a continuous function value of $|x \sin x|$ can be made as large as we like for sufficiently large values of x.

Therefore, range of $x \sin x = R \Rightarrow \dfrac{[x]}{\tan 2x} = 0$

For $x \in \left(0, \dfrac{\pi}{4}\right)$, $[x] = 0$

For $x \in \left(-\dfrac{\pi}{4}, 0\right)$, $\dfrac{[x]}{\tan 2x} > 0$.

Therefore, values of $\dfrac{[x]}{\tan 2x}$ are never negative.

Thus, range of $\dfrac{[x]}{\tan 2x} \neq R$.

$\left|\dfrac{x}{\sin x}\right| > 1$, whenever defined.

Thus, range of $\dfrac{x}{\sin x}$ is not R.

$|x| + \sqrt{\{x\}}$ is a continuous function and

$$\lim_{x \to \infty} ([x] + \sqrt{\{x\}}) = \infty,$$

$$\lim_{x \to -\infty} ([x] - \sqrt{\{x\}}) = -\infty$$

Thus, range of $[x] + \sqrt{\{x\}} = R$.

100. (a) $f(x) = e^{\ln \sec^{-1} x}$. $g(1) = 0$ but $f(1)$ is not defined.

Thus, f and g are not identical.

(b) $f(x) = \tan(\tan^{-1} x) = x, \forall\ x \in R$

and $g(x) = \cot(\cot^{-1} x) = x, \forall\ x \in R$

Thus, f and g are identical.

(c) $f(x) = \begin{cases} 1, & x > 0 \\ 0, & x = 0 \\ -1, & x < 0 \end{cases}$

$$g(x) = \text{sgn}(\text{sgn } x) = \text{sgn} \begin{cases} 1, & x > 0 \\ 0, & x = 0 \\ -1, & x < 0 \end{cases}$$

$$g(x) = \begin{cases} 1, & x > 0 \\ 0, & x = 0 \\ -1, & x < 0 \end{cases}$$

Thus, f and g are identical.

(d) $g(x) = \cot^2 x - \cos^2 x = \dfrac{\cos^2 x}{\sin^2 x} - \cos^2 x$

$= \cot^2 x \cos^2 x = f(x), \forall\ x \neq \pi$

Thus, f and g are identical.

101. We have, $f(x) = \cos^{-1}(-\{-x\})$

Domain of $f(x) \in R$.

As, $0 \leq \{-x\} < 1$ for all $x \in R$

$\Rightarrow$ $-1 < -\{-x\} \leq 0$

So, range of $f(x) \in \left[\dfrac{\pi}{2}, \pi\right)$.

$\therefore$ Range of $f(x)$ contains two prime numbers 2 and 3. Graph of $f(x)$ does not lie below X-axis. Clearly, f is neither even nor odd but many-one.

$\therefore$ $f(x+1) = f(x) \Rightarrow f(x)$ is periodic.

102. If we take example of $x + \sin x$, it is non-periodic whereas its derivative $1 + \cos x$ is periodic.

103. The value of $\sin \sqrt{2}x + \sin ax$ can be equal to 2, if $\sin \sqrt{2}x$ and $\sin ax$ both are equal to one but both are not equal one for any common value of x.

104. Clearly, $f(x)$ is many-one and into function.

105. $f(x) = 2 \cos \dfrac{\pi}{5} \sin x - 2 \cos \dfrac{2\pi}{5} \sin x$

$= 2 \sin x \left[\cos \dfrac{\pi}{5} - \cos \dfrac{2\pi}{5}\right]$

$= 2 \sin x [\cos 36^\circ - \cos 72^\circ]$

$= 2 \sin x [\cos 36^\circ - \sin 18^\circ]$

$= 2 \sin x \left[\dfrac{\sqrt{5}+1}{4} - \left(\dfrac{\sqrt{5}-1}{4}\right)\right] = \sin x$

$\therefore$ Range is $[-1, 1]$.

106. Period of $2 \cos \dfrac{1}{3}(x - \pi)$ and $4 \sin \dfrac{1}{3}(x - \pi)$ are $\dfrac{2\pi}{\frac{1}{3}}, \dfrac{2\pi}{\frac{1}{3}}$

or $6\pi, 6\pi$.

$\therefore$ Period of their sums $= 6\pi$

107. $(f(\sin 2x))^2 = \sin^2 x + \cos^2 x + 2 \sin x \cos x$

$= 1 + \sin 2x$

$\Rightarrow$ $f(x) = \sqrt{1 + x}, \forall\ x \in [-1, 1]$

$\Rightarrow$ If $x \in \left[-\dfrac{\pi}{4}, \dfrac{\pi}{4}\right]$, then

$f(\tan^2 x) = \sqrt{1 + \tan^2 x} = \sec x$

108. Fifth degree equation must have atleast one real root. If it had two real roots, $f'(x) = 0$ must have one real root.

109. Range of $\dfrac{1}{1 + x^2} \in (0, 1]$

For domain R, $\log\left(\dfrac{1}{1 + x^2}\right) \in (-\infty, 0]$

110. $f(x) = \sqrt{2} \sin x + \sqrt{2} \cos x - \sqrt{2} \cos x + c = \sqrt{2} \sin x + c$

$\Rightarrow$ $f(0) = f(\pi) = c$

Hence, many-one function.

111. If $f(x) = a_0 + a_1 x + a_2 x^2 + \ldots + a_n x^n$, $a_n \neq 0$.

Then, $f^{(n+1)}(x) = 0$, for all x while any derivative of $\sin x$ is never a zero function.

Hence, $\sin x$ is not polynomial function.

112. f is injective, since $x \neq y$ $(x, y \in R)$.

$\Rightarrow \log_a \{x + \sqrt{x^2+1}\} \neq \log_a \{y + \sqrt{y^2+1}\}$

$\Rightarrow f(x) \neq f(y)$

f is onto because $\log_a (x + \sqrt{x^2+1}) = y$

$\Rightarrow x = \dfrac{a^y - a^{-y}}{2}$

113. $f(x) - 2f\left(\dfrac{x}{2}\right) + f\left(\dfrac{x}{4}\right) = x^2$

$\therefore \quad f\left(\dfrac{x}{2}\right) - 2f\left(\dfrac{x}{4}\right) + f\left(\dfrac{x}{8}\right) = \left(\dfrac{x}{2}\right)^2$

$f\left(\dfrac{x}{4}\right) - 2f\left(\dfrac{x}{8}\right) + f\left(\dfrac{x}{16}\right) = \left(\dfrac{x}{4}\right)^2$

$\vdots \qquad \vdots \qquad \vdots \qquad \vdots$

$f\left(\dfrac{x}{2^n}\right) - 2f\left(\dfrac{x}{2^{n+1}}\right) + f\left(\dfrac{x}{2^{n+2}}\right) = \left(\dfrac{x}{2^n}\right)^2$

On adding, we get

$$f(x) - f\left(\frac{x}{2}\right) - f\left(\frac{x}{2^{n+1}}\right) + f\left(\frac{x}{2^{n+2}}\right) = x^2\left(1 + \frac{1}{2^2} + \ldots + \frac{1}{2^{2n}}\right)$$

As $n \to \infty$, we get $\quad f(x) - f\left(\dfrac{x}{2}\right) = \dfrac{4x^2}{3}$

Repeating the same procedure again, we get

$$f(x) - f(0) = \frac{16x^2}{9}$$

$\therefore \qquad f(3) = 16 + f(0)$

114. $f(x) - f(0) - x = 0$

$\Rightarrow \quad \dfrac{16x^2}{9} - x = 0 \quad \Rightarrow \quad x = 0, \dfrac{9}{16}$

$\therefore$ Two solutions.

115. $f'(x) = \dfrac{32x}{9} \quad \therefore \; f'(0) = 0$

116. For integral solution,

$x + y - [x][y] = 0 \quad \Rightarrow \quad x + y - xy = 0$

$\Rightarrow \quad -1 + x + y - xy = -1 \quad \Rightarrow (x-1)(y-1) = 1$

i.e. only possible, if

$(x - 1 = 1, y - 1 = 1)$ or $(x - 1 = -1, y - 1 = -1)$

$\Rightarrow \quad x = 2, y = 2 \quad$ or $\quad x = 0, y = 0$

$\therefore$ Solutions are (0, 0) or (2, 2).

117. For non-integral solution,

Let $\qquad x = [x] + f_1$

and $\qquad y = [y] + f_2$

$\therefore \qquad [x][y] = [x] + f_1 + [y] + f_2$

$([x] - 1)([y] - 1) = f_1 + f_2 + 1$

Now, $\qquad 0 \leq f_1 + f_2 < 2$

$\therefore \qquad f_1 + f_2 = 1$

$\Rightarrow ([x] - 1)([y] - 1) = 2$

Which is possible for

$\therefore \qquad [x] = 3$ and $[y] = 2$

$\Rightarrow \qquad [x] = 2$ and $[y] = 3$

$\Rightarrow \qquad [x] = -1$ and $[y] = 0$

$\Rightarrow \qquad [x] = 0$ and $[y] = -1$

$\therefore$ The $x + y = [x][y]$ becomes $x + y = 6 \Rightarrow x + y = 0$

$\therefore$ Non-integer solution lies on $x + y = 6$

$\Rightarrow \qquad x + y = 0$

118. We have, $f(x) = \dfrac{1}{2}\left[f(xy) + f\left(\dfrac{x}{y}\right)\right]$ ...(i)

Interchanging x and y, we get

$$f(y) = \frac{1}{2}\left[f(xy) + f\left(\frac{y}{x}\right)\right] \quad \text{...(ii)}$$

On subtracting, we get

$$f(x) - f(y) = \frac{1}{2}\left\{f\left(\frac{x}{y}\right) - f\left(\frac{y}{x}\right)\right\} \quad \text{...(iii)}$$

From Eq. (i), put $x = 1$, we get

$$f(1) = \frac{1}{2}\left[f(y) + f\left(\frac{1}{y}\right)\right] \quad \text{...(iv)}$$

$$f(1) = 0 \Rightarrow f(y) = -f\left(\frac{1}{y}\right)$$

Hence, $\qquad f\left(\dfrac{x}{y}\right) = -f\left(\dfrac{y}{x}\right)$

$\therefore$ From Eq. (iii) becomes $f(x) - f(y) = f\left(\dfrac{x}{y}\right)$

119. $f'(x) = \lim\limits_{h \to 0} = \dfrac{f(x+h) - f(x)}{h}$

Using the result in Q. No. 118.

$$\lim_{h \to 0} \frac{f\left(\dfrac{x+h}{x}\right)}{h} = \lim_{h \to 0} \frac{f\left(1 + \dfrac{h}{x}\right)}{h}$$

$$= \lim_{h \to 0} \frac{f\left(1 + \dfrac{h}{x}\right)}{\dfrac{h}{x} \cdot x} = \frac{1}{x} f'(1) = \frac{1}{x} \cdot 2 = \frac{2}{x}$$

$\therefore \qquad f'(3) = \dfrac{2}{3}$

120. From Q. No. 119, $f'(x) = \dfrac{2}{x}$

$f(x) = 2 \log x + C$

$\Rightarrow \qquad f(1) = 0 \Rightarrow C = 0$

$\therefore \qquad f(x) = 2 \log x$

$\therefore \qquad f(e) = 2 \log e = 2$

121. $f(x)$ = odd degree polynomial + bounded function

$\cot^{-1} x \in (0, \pi)$

Also, $\qquad f'(x) > 0$

$\therefore \; f(x)$ is one-one and range of $f(x) \in R$

$\therefore \; f(x)$ is onto.

$\Rightarrow \; f(x)$ is one-one onto.

122. We have, $f(x) = x^4 + 1 + \dfrac{1}{x^2 + x + 1}$

= even degree polynomial + bounded function

$$\frac{1}{x^2 + x + 1} \in \left(0, \frac{4}{3}\right)$$

$$f'(x) = \frac{4x^3(x^2 + x + 1)^2 - 2x - 1}{(x^2 + x + 1)^2}$$

$\Rightarrow f'(x) = 0$ has at least one root which is repeated odd number of times or it has one root which is not repeated, since numerator of $f'(x)$ is a polynomial of degree 7.

$\Rightarrow$ $f(x) = 0$ has a point of extreme.

$\therefore$ $f(x)$ is many-one into.

123. $f(x)$ = odd degree polynomial + bounded function $\sin 2x \Rightarrow$ $f(x)$ is onto.

$f(x)$ is one-one, if $f'(x) \geq 0$ or $f'(x) \leq 0, \forall\, x$

$\Rightarrow$ $a \geq 1 \cup a \leq -1 \Rightarrow a \in R - (-1, 1)$

124. $D_h = \{-1, 1\}$, as minimum occurs before maxima for $f(x)$.

$\therefore$ $a_3 = -1$

Now, $g(x) = a_0 + a_1x + a_2x^2 - x^3$

$$g'(x) = a_1 + 2a_2x - 3x^2$$

$$= -3(x - 3)(x + 3) = -3x^2 + 27$$

$\therefore$ $a_1 = 27, a_2 = 0$

$\therefore$ $a_1 + a_2 = 27$

125. Also, $g(-3) > 0$ and $g(3) > 0$

$\Rightarrow$ $a_0 > 54$ and $a_0 < -54$

$\therefore$ $a_0 > 54$

126. Now, $g(x) = a_0 + 27x - x^3$

$$f(x) = \sqrt{a_0 + 27x - x^3}$$

$$f(10) = \sqrt{a_0 + 270 - 1000}$$

Clearly, $f(10)$ is defined for $a_0 > 730$.

127. $\because ff^{-1}(x) = x$

$$2^{(f^{-1}(x))^4 - 4(f^{-1}(x))^2} = x$$

$\Rightarrow (f^{-1}(x))^4 - 4(f^{-1}(x))^2 - \log_2 x = 0$

$\therefore$ $(f^{-1}(x))^2 = 2 + \sqrt{4 + \log_2 x}$

$\therefore$ Range of $f^{-1}(x)$ is $[2, \infty)$.

$\therefore$ $f^{-1}(x) = \sqrt{2 + \sqrt{4 + \log_2 x}}$

$\therefore$ $f^{-1}(x) > 0$

128. $g(x) = \dfrac{\sin x + 4}{\sin x - 2}$

$\Rightarrow$ $g'(x) = \dfrac{-6\cos x}{(\sin x - 2)^2} \geq 0 \qquad \left[\because x \in \left[\frac{\pi}{2}, \pi\right]\right]$

$\Rightarrow g(x)$ is an increasing function, hence one-one function.

$\therefore$ Range is $\left[g\left(\dfrac{\pi}{2}\right), g(\pi)\right]$ and lies in $[-5, -2]$.

129. $x : x$ in domain of $g^{-1}(x)$,

$g^{-1}(x)$ in domain of $f^{-1}(x)$

$$g^{-1}(x) = \sin^{-1}\frac{2(x + 2)}{x - 1}, \forall\, x \in [-5, -2] \qquad \ldots(i)$$

$\Rightarrow$ $\sin^{-1}\dfrac{2(x + 2)}{x - 1} \geq 1$

i.e. $1 \leq \sin^{-1}\dfrac{2(x + 2)}{x - 1} \leq \dfrac{\pi}{2}$

$\Rightarrow$ $\sin 1 \leq \dfrac{2(x + 2)}{x - 1} \leq 1$

Solving this, we get

$$x \leq -\frac{(4 - \sin 1)}{2 - \sin 1} \text{ or } x > 1 \qquad \ldots(ii)$$

From Eqs. (i) and (ii), we get

$$x \in \left[-5, -\frac{(4 + \sin 1)}{2 - \sin 1}\right]$$

Sol. (Q. Nos. 130 to 132)

$P(x) + 1 = 0$ has a thrice repeated root at $x = 1$.

$P'(x) = 0$ has a twice repeated root at $x = 1$.

Similarly, $P'(x) = 0$ has a twice repeated root at $x = -1$.

$\Rightarrow P'(x)$ is divisible by $(x - 1)^2(x + 1)^2$

$\because$ $P'(x)$ is degree at most 4.

$\Rightarrow$ $P'(x) = \alpha(x - 1)^2(x + 1)^2$

$\therefore$ $P(x) = \alpha\left(\dfrac{x^5}{5} - \dfrac{2}{3}x^3 + x\right) + c$

Now, $P(1) = -1$ and $P(-1) = 1 \Rightarrow \alpha = -\dfrac{15}{8}$ and $c = 0$

$\therefore$ $P(x) = -\dfrac{15}{8}\left(\dfrac{x^5}{5} - \dfrac{2}{3}x^3 + x\right)$

$$= -\frac{15}{8}x\left(\frac{x^4}{5} - \frac{2x^2}{3} + 1\right)$$

has only one real root $x = 0$, as $\dfrac{x^4}{5} - \dfrac{2x^2}{3} + 1$ has imaginary roots.

Also, sum of pairwise product of all roots $= -\dfrac{10}{3}$.

Also, $P''(x) = -\dfrac{15}{2}(x^3 - x)$

Let $f(x) = -\dfrac{15}{2}(x^3 - x)$

$$f'(x) = -\frac{15}{2}(3x^2 - 1) = -\frac{15}{2}(\sqrt{3}x - 1)(\sqrt{3}x + 1)$$

$$\underset{-}{\qquad} \; \underset{+}{\qquad} \; \underset{-}{\qquad}$$

$\Rightarrow$ Maximum at $x = \dfrac{1}{\sqrt{3}}$.

130. (a) ***131.*** (c) ***132.*** (b)

Sol. (Q. Nos. 133 to 135)

Given, $f^{-1}(x) = \dfrac{1}{f(x)}$ ...(i)

Replace x by $f(x)$.

$\Rightarrow$ $f(f(x)) = \dfrac{1}{x} \Rightarrow f^{-1}\left(\dfrac{1}{x}\right) = f(x)$

$\Rightarrow$ $f^{-1}(x) = f\left(\dfrac{1}{x}\right)$ ...(ii)

From Eqs. (i) and (ii), we get,

$$\frac{1}{f(x)} = f\left(\frac{1}{x}\right) \Rightarrow \quad f(x)\cdot f\left(\frac{1}{x}\right) = 1 \qquad \text{...(iii)}$$

Putting $x = 1$, we get

$$(f(1))^2 = 1$$

133. $f(1) = 1 \qquad [\text{as } f(1) > 0]$

134. If $f(x)$ is continuous, then being bijective, it will be monotonic.

135. $f(f(x))$ would be increasing but $f(f(x)) = \frac{1}{x}$, i.e. decreasing.

Thus, contradicts the facts of $f(x)$ being continuous.

Sol. (Q. Nos. 136 to 137)

$$f(m+n) = f(m) + f(n)$$
$$n = N-1$$
$$\therefore \quad f(N) = f(1) + f(N-1)$$
$$f(N-1) = f(1) + f(N-2)$$
$$f(N-2) = f(1) + f(N-3)$$
$$\vdots \qquad \vdots \qquad \vdots$$
$$f(2) = f(1) + f(1)$$

On adding all, we get

$$f(N) = Nf(1)$$

Now, if $f(1) = 1$

$\Rightarrow f(N) = N$, which contains even numbers

If $f(1) = 2 \Rightarrow f(N) = 2N$, which contains even numbers

$\therefore$ $f(1)$ is 1 or 2.

136. (c) **137.** (a)

138. (A) $\sqrt{\sin(\cos x)}$, $\sin(\cos x) \geq 0$

$$\Rightarrow \quad -\frac{\pi}{10} < x < \frac{3\pi}{10}$$

But $x \in [0, \pi]$ domain $x \in [0, 3\pi/10)$.

(B) $4\sin^2 x - 8\sin x + 3 \leq 0, \quad 0 \leq x \leq 2\pi$

$\Rightarrow (2\sin x - 1)(2\sin x - 3) \leq 0 \Rightarrow 2\sin x - 1 \geq 0$

$$\Rightarrow \quad \sin x \geq \frac{1}{2} \quad \Rightarrow \quad x \in \left[\frac{\pi}{6}, \frac{5\pi}{6}\right]$$

(C) $|\tan x| \leq 1; x \in [-\pi, \pi], \quad -1 \leq \tan x \leq 1$

$$n\pi - \frac{\pi}{4} \leq x \leq n\pi + \frac{\pi}{4}$$

Put $n = 0, \qquad -\frac{\pi}{4} \leq x \leq \frac{\pi}{4}$

Put $n = 1, \qquad \pi - \frac{\pi}{4} \leq x \leq \pi + \frac{\pi}{4}$

$$\frac{3\pi}{4} \leq x \leq \frac{5\pi}{4}$$

But, from domain $\frac{3\pi}{4} \leq x \leq \pi$

Put $x = -1, \; -\pi - \frac{\pi}{4} \leq x \leq -\pi + \frac{\pi}{4} \Rightarrow -\frac{5\pi}{4} \leq x \leq -\frac{3\pi}{4}$

But from domain $-\pi \leq x \leq -\frac{3\pi}{4}$

Finally, $\left[-\pi, -\frac{3\pi}{4}\right] \cup \left[-\frac{\pi}{4}, \frac{\pi}{4}\right] \cup \left[\frac{3\pi}{4}, \pi\right]$

But, $x \in [0, \pi] \;\; \therefore \; x \in \left[0, \frac{\pi}{4}\right] \cup \left[\frac{3\pi}{4}, \pi\right]$

(D) $\cos x - \sin x \geq 1, 0 \leq x \leq 2\pi \Rightarrow \sqrt{2}\left(\frac{1}{\sqrt{2}}\cos x - \frac{\sin x}{\sqrt{2}}\right) \geq 1$

$$\Rightarrow \quad \left(\cos x \cdot \cos\frac{\pi}{4} - \sin x \cdot \sin\frac{\pi}{4}\right) \geq \frac{1}{\sqrt{2}}$$
$$\Rightarrow \quad \cos\left(x + \frac{\pi}{4}\right) \geq \frac{1}{\sqrt{2}}$$
$$\Rightarrow \quad 2n\pi - \frac{\pi}{4} \leq x + \frac{\pi}{4} \leq 2n\pi + \frac{\pi}{4}$$
$$\Rightarrow \quad 2n\pi - \frac{\pi}{2} \leq x \leq 2n\pi$$

On substituting suitable values of n, according to domain

$$x \in \left[\frac{3\pi}{2}, 2\pi\right] \cup \{0\}$$

140. (A) When $-1 \leq x < 0$,

$$f(x) \in [0, 1) \text{ and } f(x) = x + 1$$
$$\therefore \quad f(f(x)) = (x+1)^2 - 1 = x^2 + 2x$$

(B) $\frac{(\cos 2x + 1)(\sec^2 x + 2\tan x)}{2}$

$$= \left(\frac{1 - \tan^2 x}{1 + \tan^2 x} + 1\right)\left(\frac{1 + \tan^2 x + 2\tan x}{2}\right)$$
$$= \frac{1 + \tan^2 x + 2\tan x}{1 + \tan^2 x}$$

i.e. $\quad f\left(\frac{2\tan x}{1 + \tan^2 x}\right) = 1 + \frac{2\tan x}{1 + \tan^2 x}$

$\therefore \; f(x) = 1 + x$

(C) Put $x = 0, y = 0, f(1) = (1 + 1)^2 = 2^2$

Put $x = 0, y = 1,\ f(2) = (1 + 2)^2 = 3^2$

By induction, $f(x) = (x + 1)^2$

(D) When $4 < x < 5, \left[\frac{x}{4}\right] = 1$

$\Rightarrow \quad f(x) = 2x + 3$

$\therefore \quad y = 2x + 3 \Rightarrow x = \frac{y - 3}{2}$

$\therefore \quad f^{-1}(x) = \frac{x - 3}{2}$

141. (A) Simplifying the expression, we get $f(x) = \frac{5}{4}$.

(B) Period of $\tan(e^{\{x\}}) = 1$, the period of

$[x + \alpha] - (x + \alpha) + \alpha - 5$ is also 1, hence 1 is the period.

(C) $h(x) - h(-x) = 0$, hence even function.

(D) Simplifying the expression, $k(x) = 0$.

142. Here, $f(x + y) - kxy = f(x) + 2y^2$

Put $x = 0 \Rightarrow f(y) = f(0) + 2y^2$

$\Rightarrow \quad f(x) = 2x^2 + f(0)$

Now, $f(1) = 2 + f(0) \Rightarrow f(0) = 0$

$\therefore \quad f(x) = 2x^2$

Hence, $f(x+y) \cdot f\left(\frac{1}{x+y}\right) = 4$

143. Given, $f(x - f(y)) = f(f(y)) + xf(y) + f(x) - 1$ ...(i)

On putting $x = 0$ and $f(y) = 0$, we get

$f(0) = f(0) + f(0) - 1$

$\Rightarrow \quad f(0) = 1$ ...(ii)

On putting $x = a$ and $f(y) = a$, we get

$f(0) = f(a) + a^2 + f(a) - 1$

$\Rightarrow \quad f(a) = 1 - \frac{a^2}{2} \therefore f(x) = 1 - \frac{x^2}{2}$

$\Rightarrow \quad -f(10) = -1 + \frac{(10)^2}{2} = 49$

Hence, $\frac{-f(10)}{7} = 7$

144. Given,

$f(1) + 2f(2) + 3f(3) + \ldots + nf(n) = n(n + 1)f(n)$ ...(i)

On putting $(n + 1)$ in place of n, we get

$f(1) + 2f(2) + \ldots + nf(n) + (n + 1) f(n + 1)$

$= (n + 1)(n + 2) f(n + 1)$ ...(ii)

On subtracting Eq. (i) from Eq. (ii), we get

$(n + 1) f(n + 1) = (n + 1)(n + 2) f(n + 1) - n(n + 1) f(n)$

$\Rightarrow (n + 1) f(n + 1) - nf(n) = 0$

$\Rightarrow \quad nf(n) = (n + 1) f(n + 1)$

$\Rightarrow \quad 2f(2) = 3f(3) = \ldots = nf(n)$

From Eq. (i),

$f(1) + [nf(n) + nf(n) + \ldots \text{ to } (n - 1) \text{ terms}] = n(n + 1) f(n)$

$\Rightarrow \quad f(1) + (n - 1) nf(n) = n(n + 1) f(n)$

$\Rightarrow \quad f(1) = 2n f(n) \Rightarrow 1 = 2n f(n)$

$\Rightarrow \quad \frac{1}{f(n)} = 2n$

$\Rightarrow \quad \frac{1}{f(2010)} = 4020 \Rightarrow \frac{1}{(2010) f(2010)} = 2$

145. If $f(x) = \frac{ax + b}{cx - a}, x \neq \frac{a}{c}$

Then, $f(f(x)) = x$

$\therefore \quad f(f(x)) = x$ and $f\left(f\left(\frac{4}{x}\right)\right) = \frac{4}{x}$

$\therefore \quad f(f(x)) + f\left(f\left(\frac{4}{x}\right)\right) = x + \frac{4}{x} \geq 4$

146. Here, $\gamma = 4 - (\alpha + \beta)$

$\Rightarrow \quad \alpha^2 + \beta^2 + \gamma^2 = \alpha^2 + \beta^2 + (4 - (\alpha + \beta))^2 = 6$

$\Rightarrow \quad 2\beta^2 + 2\beta(\alpha - 4) + (2\alpha^2 - 8\alpha + 10) = 0$

But, $\beta \in R \Rightarrow D \geq 0$

$\Rightarrow \quad 3\alpha^2 - 8\alpha + 4 \geq 0$

$\Rightarrow \quad \alpha \in [2/3, 2]$

$\therefore$ Integer values of α are $\{1, 2\}$.

147. Here, $f(x) = ax + b$

$\Rightarrow \quad a(x + f(x)) + b = x + ax + b$

$\Rightarrow \quad a f(x) = x$

$\Rightarrow \quad f(x) = \frac{x}{a}$

$\Rightarrow \quad \frac{x}{a} = ax + b$

$\Rightarrow \quad b = 0 \Rightarrow a^2 = 1$

$\Rightarrow \quad a = \pm 1$

$\Rightarrow \quad f(x) = \pm x$, i.e. 2 functions.

148. Number of one-one functions $= {}^5P_3 = 60$

Number of strictly monotonic functions $= 10 + 10 = 20$

$\therefore \quad \frac{\text{Number of one - one functions}}{\text{Number of strictly monotonic functions}} = \frac{60}{20} = 3$

149. The number of different sets contains exactly 3 elements of $B = {}^5C_3 = 10$

The number of onto functions from A to the set contains 3 elements $= 10[3^4 - 3(2)^4 + 3] = 360$

$\therefore \quad \frac{k}{60} = 6$

150. Here, $f(2) = a \sin(2) + 2b \cos(2) + 8$

and $f(-2) = -a \sin(2) - 2b \cos(2) + 8$

On adding, we get

$f(2) + f(-2) = 16$

$\therefore \quad f(-2) = 1$

151. Let $y = f(x) = x^5 + e^{x/3}$

Then, $y(0) = 1$

Also, $g'(y) = \frac{1}{f'(x)}$

$\therefore \quad g'(1) = \frac{1}{f'(0)} = 3$

152. $f(x) = x^3 - 12x + p$

$\Rightarrow \quad f'(x) = 3x^2 - 12 = 0$

$\Rightarrow \quad x = \pm 2$

$\therefore \quad f(-2) = p + 16$ and $f(2) = p - 16$ for all $p \in \{1, 2, ..., 15\}$

$f(-2) > 0$, $f(2) < 0$. It has 3 roots in each case.

$\therefore \quad \Sigma\theta = 3 \times 15 = 45 \Rightarrow \frac{1}{5} \cdot \Sigma\theta = 9$

153. Given, $f(m) - f(n) = 3$

If $m = 125, n = 124 \Rightarrow (m-n)_{\min} = 1$

$m = 24, n = 5$

$\Rightarrow \quad f(m) - f(n) = 3 \Rightarrow (m-n)_{\max} = 19$

$\therefore \quad \frac{(m-n)_{\max} - (m-n)_{\min}}{2} = \frac{19-1}{2} = 9$

154. As, $x^2 + y^2 = 4$

$\Rightarrow \quad x = 2\cos\theta, y = 2\sin\theta$

$\therefore \quad \frac{x^3 + y^3}{x + y} = x^2 + y^2 - xy = 4 - 2\sin 2\theta$

$\Rightarrow \quad \left(\frac{x^3 + y^3}{x + y}\right)_{\max} = (4 - 2(\sin 2\theta))_{\max} = 4 + 2 = 6$

155. $f(2011) = (2 + 0 + 1 + 1)^2 = 16$

$f^2(2011) = (1 + 6)^2 = 49$

$f^3(2011) = (4 + 9)^2 = 169$

$f^4(2011) = (1 + 6 + 9)^2 = 256$

$f^5(2011) = (2 + 5 + 6) = 169$

$\vdots \qquad \vdots$

$f^{2n}(2011) = 256$

$\therefore \quad f^{2n+1}(2011) = 169$

$\Rightarrow \quad \frac{f^{2011}(2011) - f^{2010}(2011)}{f^{2013}(2011) - f^{2012}(2011)} = \frac{169 - 256}{169 - 256} = 1$

156. As, $[\sin x] = \frac{x}{2\pi} - \left[\frac{x}{2\pi}\right] + \frac{2x}{5\pi} - \left[\frac{2x}{5\pi}\right]$

$[\sin x] = \left\{\frac{x}{2\pi}\right\} + \left\{\frac{2x}{5\pi}\right\}$

Thus, only one solution, i.e. $x = 10\pi$.

157. As, $xy - 6(x + y) = 0 \Rightarrow (x-6)(y-6) = 36$

$\therefore (x-6, y-6) = (1, 36), (2, 18), (3, 12), (4, 9), (6, 6),$

$(-36, -1), (-18, -2), (-12, -3), (-4, -9), (-6, -6),$

$\because \quad x \le y \Rightarrow \alpha = 10$

$\therefore \quad (\alpha - 6) = 4$

158. Here, $f(x) - 10x = (x-1)(x-2)(x-3)(x-\alpha)$

$\therefore \quad f(12) + f(-8) = 19840$

$\Rightarrow \quad \frac{f(12) + f(-8)}{19840} = 1$

159. On adding, $a = \frac{3 - \cos 4\theta + 4\sin 2\theta}{2} = (1 + \sin 2\theta)^2$

On subtracting, $b = (1 - \sin 2\theta)^2$

$\Rightarrow \quad ab = \cos^4 2\theta \le 1$

160. Clearly, $x^2 + 4x \ge 0$

$2x^2 + 3 \ge 0 \Rightarrow x^2 + 4x \ge 2x^2 + 3$

and x is an integer.

$\therefore \quad x \in \{1, 2, 3\}$

$\therefore \quad n = 3$

Now, maximum value ${}^{x^2+4x}C_{2x^2+3} = 12$

$\therefore \quad Y = |\ln 12|$

$\therefore \quad [Y] = 2 \ (\ln e^2 < \ln 12 < \ln e^3)$

$\therefore \quad [n + [Y]] = [3 + 2] = 5$

161. $f(x-1) + f(x+1) = \sqrt{3} f(x)$

$\Rightarrow \quad f(x) + f(x+2) = \sqrt{3} f(x+1)$

Putting $x = x + 2$,

$f(x+1) + f(x+3) = \sqrt{3} f(x+2)$

$f(x-1) + 2f(x+2) + f(x+3) = \sqrt{3}[\sqrt{3} f(x+1)]$

$f(x-1) + f(x+3) = f(x+1)$

Again, putting $x = x + 2$,

$f(x+1) + f(x+5) = f(x+3)$

$f(x-1) + f(x+5) = 0$

$f(x+5) = -f(x-1)$

$f(x) = -f(x+6)$

$f(x+12) = f(x)$

$\Rightarrow \sum_{r=0}^{19} f(5 + 12r) = 20 f(5) = 20 \times 10 = 200$

Hence, the sum of digits $= 2 + 0 + 0 = 2$

162. Put $x = 1$,

$$2f(x) = f(xy) + f\left(\frac{x}{y}\right) \qquad \text{...(i)}$$

$$2f(1) = f(y) + f\left(\frac{1}{y}\right) \qquad \text{...(ii)}$$

$$\Rightarrow \quad f(y) = -f\left(\frac{1}{y}\right)$$

Replacing x by y and y by x in Eq. (i), we get

$$2f(y) = f(yx) + f\left(\frac{y}{x}\right) \qquad \text{...(iii)}$$

From Eqs. (i) and (iii), we get

$$2\{f(x) - f(y)\} = f\left(\frac{x}{y}\right) - \left\{-f\left(\frac{x}{y}\right)\right\} = 2f\left(\frac{x}{y}\right) \qquad \text{...(iv)}$$

$$f(x) - f(y) = f\left(\frac{x}{y}\right) \qquad \text{...(v)}$$

$\lim_{h \to 0} \frac{f(1+h) - f(1)}{h} = f'(1) = 1$

$\lim_{h \to 0} \frac{f(1+h)}{h} = 1, \quad \text{as} \quad f(1) = 0$

$f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h} = \lim_{h \to 0} \frac{f\left(1 + \frac{h}{x}\right)}{h} = \frac{1}{x}$

$f(x) = \log |x| + c$

$f(1) = 0 \Rightarrow c = 0$

$f(e) = 1$

163. $f(1) + 2f(2) + 3f(3) + \ldots + n(f(n)) = n(n+1)f(n)$

$\Rightarrow f(1) + 2f(2) + 3f(3) + \ldots + (n+1)f(n+1)$
$= (n+1)(n+2)f(n+1)$

$\Rightarrow n(n+1)f(n) = (n+1)^2 f(n+1)$

$\Rightarrow nf(n) = (n+1)f(n+1)$

i.e. $2f(2) = 3f(3) = \ldots = n(f(n))$

i.e. $f(n) = \dfrac{1}{n}$

$\therefore \quad 2126\ f(1063) = 2126 \times \dfrac{1}{1063} = 2$

164. Now, $f(x) = \dfrac{x^4 + x^2 + 1}{x^2 - x + 1} \Rightarrow f(x) = x^2 + x + 1$

Now, $f(\omega^n) = \omega^{2n} + \omega^n + 1 = 3$

$\because \quad \omega^n = 1$, when n is a multiple of 3.

165. $f^2(x) \cdot f\left(\dfrac{1-x}{1+x}\right) = x^3$ ...(i)

Replacing x by $\dfrac{1-x}{1+x}$, we get

$$f^2\left(\frac{1-x}{1+x}\right) f(x) = \left(\frac{1-x}{1+x}\right)^3 \quad \text{...(ii)}$$

By using Eqs. (i) and (ii), we get $f^3(x) = x^6 \left(\dfrac{1+x}{1-x}\right)^3$

$\Rightarrow \quad f(x) = x^3 \left(\dfrac{1+x}{1-x}\right) \Rightarrow f(-2) = \dfrac{8}{3}$

$\Rightarrow \quad [f(-2)] = 2 \Rightarrow |[f(-2)]| = 2$

166. $f(2a - x) = f(x)$

$\Rightarrow \quad f(2a - x) = -f(x)$

$\because \quad f$ is odd $\Rightarrow f(x + 4a) = f(x)$

$\Rightarrow f$ is periodic with period $4a$.

$\Rightarrow \quad f(1 + 4r) = f(1)$

Now, $\sum_{r=0}^{\infty} [f(1)]^r = 8 \Rightarrow \dfrac{1}{1 - f(1)} = 8$

$\Rightarrow \quad f(1) = \dfrac{7}{8} \Rightarrow 8f(1) = 7$

167. Consider, $f(x) = \dfrac{e^x - e^{-x}}{e^x + e^{-x}} = \dfrac{e^{2x} - 1}{e^{2x} + 1} = 1 - \dfrac{2}{e^{2x} + 1}$

$\Rightarrow \quad f'(x) = \dfrac{4e^{2x}}{(e^{2x} + 1)^2} > 0, \ \forall\ x \in R$

$\Rightarrow f(x)$ is an increasing function.

$\Rightarrow$ Domain : R, Range : $(-1, 1)$

For $f : R \to (-1, 1)$,

$$f(x) = \frac{e^x - e^{-x}}{e^x + e^{-x}},\ f^{-x} : (-1, 1) \to R$$

$\Rightarrow \quad x = \dfrac{e^y - e^{-y}}{e^y + e^{-y}}$

$\Rightarrow \quad e^y = \sqrt{\dfrac{1+x}{1-x}} \Rightarrow f^{-1}(x) = \ln \sqrt{\dfrac{1+x}{1-x}}$

Hence, given equation is equivalent to $f(x) = f^{-1}(x)$.

$\Leftrightarrow \quad f(x) = x$ [as f is an increasing function]

$\Rightarrow \quad \ln \sqrt{\dfrac{1+x}{1-x}} = x \Rightarrow \dfrac{1+x}{1-x} = e^{2x}$

Now, draw the graph of $y = \dfrac{1+x}{1-x}$ and $y = e^{2x}$. They intersect each other at $x = 0$.

168. Let $y = \dfrac{3x^2 + 9x + 17}{3x^2 + 9x + 7} = 1 + \dfrac{10}{3x^2 + 9x - 7}$

Now, $3x^2 + 9x + 7 = 3(x^2 + 3x) + 7$

$= 3\left(x + \dfrac{3}{2}\right)^2 + \dfrac{1}{4} \geq \dfrac{1}{4}$ for all $x \in R$

Maximum value of $\dfrac{10}{3x^2 + 9x + 7}$ is 40.

Maximum value of y is $1 + 40 = 41$

$\therefore \quad 5k + 1 = 41 \Rightarrow k = 8$

169. The period of the function is found as follows

Given, $f(x) + f(x+4) = f(x+2) + f(x+6)$ ...(i)

$\therefore$ Replacing x by $x + 2$, we get

$f(x+2) + f(x+6) = f(x+4) + f(x+8)$ ...(ii)

From Eqs. (i) and (ii), we get

$f(x) + f(x+4) = f(x+4) + f(x+8)$

$\Rightarrow \quad f(x) = f(x+8) \Rightarrow$ Thus, 8 is the period.

170. Since, $f(x)$ is symmetric about $y = x$.

$\Rightarrow \quad f^{-1}(x) = f(x)$

$\therefore \quad f^2(x) = (f^{-1}(x))^2 - px \cdot f(x) f^{-1}(x) + 2x^2 f(x)$

$\Rightarrow \quad f^2(x) = f^2(x) - px \cdot f(x) \cdot f(x) + 2x^2 f(x)$

$\Rightarrow \quad f(x) \cdot \{2x^2 - px \cdot f(x)\} = 0$

$\Rightarrow \quad f(x) = \dfrac{2x^2}{px}$ [as $f(x) \neq 0$]

$\Rightarrow \quad f(x) = \dfrac{2x}{p} \Rightarrow p = 2$

171. Here, $f(x) = \dfrac{3x^2 + mx + n}{x^2 + 1} = 3 + \dfrac{mx + n - 3}{x^2 + 1}$

$\therefore \quad y = 3 + \dfrac{mx + n - 3}{1 + x^2}$

For y to lie in $[-4, 3)$.

$mx + n - 3 < 0, \forall x \in R.$

This is possible only if $m = 0$.

When $m = 0$, then $y = 3 + \dfrac{n-3}{1+x^2}$.

If $x \to \infty \Rightarrow y_{\max} \to 3^-$

Now, $y_{\min}$ occurs at $x = 0$. [as $1 + x^2$ is maximum]

$$y_{\min} = 3 + \frac{n-3}{1} = n \quad \text{...(i)}$$

Since, $-4 \leq y < 3$

$\therefore \quad y_{\min} = -4$ ...(ii)

From Eqs. (i) and (ii), $n = -4$

$\therefore \quad \dfrac{m^2 + n^2}{4} = \dfrac{16}{4} = 4$

172. Since, $f(x)$ is monotonic.

$\Rightarrow f'(x) < 0$ or $f'(x) > 0, \forall x \in R.$

$\Rightarrow f'(px) < 0$ or $f'(px) > 0, \forall x \in R.$

$\Rightarrow f(px)$ is monotonic

$\Rightarrow f(x) + f(3x) + f(5x) + ... + f((2m-1)x)$

is a monotonic polynomial of odd degree $(2m-1)$, so it will attains all real values only once.

$\therefore \quad f(x) + f(3x) + f(5x) + ... + f((2m-1)x) = (2m-1)$ has only one root.

173. (i) We have,

$$(x)^2 = [x]^2 + 2x \qquad ...(i)$$

$$\Rightarrow (i+f)^2 = [i+f]^2 = [i+f]^2 + 2i + 2f$$

$[\because x = i + f$, where i is integer and f is fraction$]$

$$\Rightarrow \{i+f\}^2 = (i)^2 + 2i + 2f$$

$$\Rightarrow i^2 + 2i + 1 = i^2 + 2i + 2f$$

$$\Rightarrow f = \frac{1}{2} \Rightarrow [x] = 0, (x) = 1$$

Put the value of (x) and $[x]$ in Eq. (i), we get

$$x = 0, \ n + \frac{1}{2}, n \in Z$$

(ii) We have,

$$[2x] - 2x = [x+1]$$

$$\Rightarrow -\{2x\} = [x] + 1 \Rightarrow [x] + \{2x\} = -1$$

$$\therefore \quad x = -1, -\frac{1}{2}$$

(iii) We have, $[x]^2 + 2(x) = 0, [x]^2 = 3x, 0 \le x \le 2$

For $0 \le x < 1, [x] = 0, [x^2] = 0 \Rightarrow x = 0$

$1 \le x < \sqrt{2}, [x] = 1, [x^2] = 1 \Rightarrow x = 1$

$\sqrt{2} \le x < \sqrt{2}, [x] = 1, [x^2] = 2 \Rightarrow x = \frac{4}{3}$

$\sqrt{3} \le x < 2, [x] = 1, [x^2] = 3 \Rightarrow x = \frac{5}{3}$

$x = 2, [x] = 2, [x^2] = 4 \Rightarrow x = \frac{8}{3}$

$\therefore x \in \left\{0, 1, \frac{4}{3}, \frac{5}{3}\right\} \qquad \left[\because \frac{8}{3} \notin [0, 2]\right]$

(iv) We have, $y = 4 - [x]^2$ and $[y] + y = 6$

Now, $[y] + y = 6, \Rightarrow y = 3$

On substituting the value of y in $y = 4 - [x]^2$

$\Rightarrow [x]^2 = 1, x = \pm 1, \pm 1 + k$, where k is fraction.

(v) We have,

$[x] + |x-2| \le 0, -1 \le x \le 3$

For $-1 \le x < 0, [x] = - \Rightarrow -1 - x + 2 \le 0 \quad x \ge 1$, Not possible.

$0 \le x \le 3, [x]$ and $|x-2|$ are positive.

Hence, no solution.

174. Given, $f(n) = 1! + 2! + 3! + ... + n!$

$$\therefore \quad f(n+2) = Q(n)\ f(n) + P(n) f(n+1)$$

$$\Rightarrow \{1! + 2! + ... + (n+2)!\} = Q(n)\{1! + 2! + ... + n!\} + P(n)\{1! + 2! + ... + (n+1)!\}$$

$$\Rightarrow (1! + 2! + \ldots + n!) + \{(n+1)! + (n+2)!\} = \{Q(n) + P(n)\}$$

$$\{1! + 2! + 3! + \ldots + n!\} + P(n).(n+1)!$$

Equating coefficients of $\{1! + 2! + ... + n!\}$ and $(n+1)!$ on both sides, we get

$$Q(n) + P(n) = 1 \text{ and } P(n) = (n+3)$$

So, $\quad P(n) = n + 3$

or $\quad P(x) = x + 3 \quad$ and $\quad Q(x) = 1 - P(x)$

Hence, $\quad P(x) = x + 3$ and $Q(x) = -x - 2.$

175. Given, $f(x) = \dfrac{a^x}{a^x + \sqrt{a}}$ ...(i)

Now, $f(1-x) = \dfrac{a^{1-x}}{a^{1-x} + \sqrt{a}} = \dfrac{\sqrt{a}}{\sqrt{a} + a^x}$ ...(ii)

From Eqs. (i) and (ii), we have $f(x) + f(1-x) = 1$ ...(iii)

$$\Rightarrow f\left(\frac{r}{2n}\right) + f\left(\frac{2n-r}{2n}\right) = 1$$

$$\Rightarrow \sum_{r=1}^{2n-1} f\left(\frac{r}{2n}\right) + \sum_{r=1}^{2n-1} f\left(\frac{2n-r}{2n}\right) = 2n-1$$

$$\Rightarrow \sum_{r=1}^{2n-1} f\left(\frac{r}{2n}\right) + \sum_{t=1}^{2n-1} f\left(\frac{t}{2n}\right) = 2n-1 \qquad [\text{putting } 2n - r = t]$$

Hence, $\quad \sum_{r=1}^{2n-1} 2f\left(\frac{r}{2n}\right) = 2n-1$

176. $f(x)$ is defined if $\left(\log_{|\sin x|}(x^2 - 8x + 23) - \dfrac{3}{\log_2 |\sin x|}\right) > 0$

$$\Rightarrow \log_{|\sin x|}\left(\frac{x^2 - 8x + 23}{8}\right) > 0$$

$$\left[\text{as } \frac{3}{\log_2 |\sin x|} = \frac{\log_2 8}{\log_2 |\sin x|} = \log_{|\sin x|} 8\right]$$

This is true, if

$$|\sin x| \ne 0, 1 \quad \text{and} \quad \frac{x^2 - 8x + 23}{8} < 1$$

$$[\text{as } |\sin x| < 1 \Rightarrow \log_{|\sin x|} a > 0 \Rightarrow a < 1]$$

Now, $\quad \dfrac{x^2 - 8x + 23}{8} < 1$

$$\Rightarrow x^2 - 8x + 15 < 0$$

$$\Rightarrow x \in (3, 5) - \left\{\pi, \frac{3\pi}{2}\right\}$$

Hence, domain $= (3, \pi) \cup \left(\pi, \dfrac{3\pi}{2}\right) \cup \left(\dfrac{3\pi}{2}, 5\right).$

177. Given, $\quad nx + ny = xy$

$\Rightarrow \ xy - nx - ny + n^2 = n^2 \ \Rightarrow (x-n)(y-n) = n^2$

$\Rightarrow (x-n)$ and $(y-n)$ are two integral factors of n^2.

[as $x, y, n \in N$]

Obviously, if d is one divisor of n^2, then for each such divisor, there will be an ordered pair (x, y).

So, $S(n) =$ number of divisors of n^2.

(i) For $n = 6$, we have $d = 1, 2, 3, 6, 9, 12, 18, 36.$

Thus, $\quad S(6) = 9$

(ii) If n is prime, then $d = 1, n$ and n^2.

Hence, $S(n) = 3$, whenever n is prime.

178. We have, $\frac{1}{[x]} + \frac{1}{[2x]} = \{x\} + \frac{1}{3}$

Case I $x \in I$, $[x] = x$, $[2x] = 2x$ $\{x\} = 0$

$$\therefore \quad \frac{1}{x} + \frac{1}{2x} = \frac{1}{3} \Rightarrow \frac{3}{2x} = \frac{1}{3} \Rightarrow x = \frac{9}{2}$$

$\frac{9}{2} \notin I$, Not possible.

Case II, $x \in I + f$, where I is an integer and f is fraction

$$[x] = I, [2x] = 2I \ \ \{x\} = f, 0 \le f < \frac{1}{2}$$

$$\Rightarrow \quad \frac{1}{I} + \frac{1}{2I} = f + \frac{1}{3} \Rightarrow f = \frac{3}{2I} - \frac{1}{3}$$

$$\Rightarrow \quad 0 \le \frac{3}{2I} = -\frac{1}{3} < \frac{1}{2} \Rightarrow \frac{1}{3} \le \frac{3}{2I} < \frac{5}{6}$$

$$\Rightarrow \quad \frac{9}{5} < I \le \frac{9}{2} \Rightarrow I = 2, 3, 4$$

When $I = 2$, $f = \frac{5}{12}$; $I = 3$, $f = \frac{1}{6}$; $I = 4$, $f = \frac{1}{24}$

$$\therefore \quad x \in \left\{\frac{29}{12}, \frac{19}{6}, \frac{97}{24}\right\}.$$

179. The condition, $\sum_{i=1}^{n} f^{-1}(x_i) = \sum_{i=1}^{n} x_i$ can be written as;

$$\frac{1}{n}\sum_{i=1}^{n} f^{-1}(x_i) = \frac{1}{n}\sum_{i=1}^{n} x_i$$

i.e. AM of y-coordinates of f^{-1} = AM of x-coordinates of f

The given two conditions hold if and only if

$$x^2 + 3x - 3 = x$$

$$\Rightarrow \quad x^2 + 2x - 3 = 0$$

So, $x = -3, +1$

But $x \ge 0 \Rightarrow x = 1$ [neglecting $x = -3$]

Hence, we can write $\frac{1}{n}\sum_{i=1}^{n} x_i = 1$, which is the required result.

180. We have, $f(x) = x^2 - 2x$ ...(i)

and $g(x) = f(f(x) - 1) + f(5 - f(x))$ ...(ii)

$$\therefore \quad g(x) = f(x^2 - 2x - 1) + f(5 - x^2 + 2x)$$

$$= [\{x^2 - 2x - 1\}^2 - 2\{x^2 - 2x - 1\}] + [(5 - x^2 + 2x)^2 - 2\{5 - x^2 + 2x\}]$$

$$\Rightarrow \quad g(x) = 2x^4 - 8x^3 - 4x^2 + 24x + 18$$

To show $g(x) \ge 0$, we find its range.

i.e. $g'(x) = 8x^3 - 24x^2 - 8x + 24$ let $g'(x) = 0$

$$\Rightarrow \quad x = -1, 1 \text{ and } 3$$

$$\Rightarrow \quad g(x) \ge \min \{ g(-1), g(1), g(3)\} = 0$$

Hence, $g(x) \ge 0, \forall x \in R$.

181. Given, $2 + f(x)f(y) = f(x) + f(y) + f(xy)$

or $1 - f(x) - f(y) + f(x)f(y) = f(xy) - 1$

or $(1 - f(x))(1 - f(y)) = f(xy) - 1$

The above result holds if and only if,

$$f(x) = 1 + x^n$$

If $f(x) = a_n x^n + a_{n-1} x^{n-1} + ... + a_0$

Then, consider $(1 + f(x))(1 - f(y)) = f(xy) - 1$

Compare constant term on either side, we have

$1 - a_0 = a_0 - 1 \Rightarrow a_0 = 1$

Comparing coefficient of $x^n y^n$, we get

$a_n^2 = a_n \Rightarrow a_n = 1$ or otherwise polynomial would not be of n degree.

Comparing coefficient of x, x^1, ..., x^{n-1} on either sides, we have

$$a_1 = a_2 = ... = a_{n-1} = 0$$

$$\Rightarrow \quad a_n = 1 \text{ and } f(x) = x^n + 1$$

Given, $f(2) = 5$, i.e. $2^n + 1 = 5$

$$\Rightarrow \quad n = 2$$

Thus, $f(x) = x^2 + 1$

$$\Rightarrow \quad f(f(2)) = f(5) = 5^2 + 1 = 26$$

182. Using AM $\ge$ GM, we have $\frac{a + b + c}{3} \ge (abc)^{1/3}$

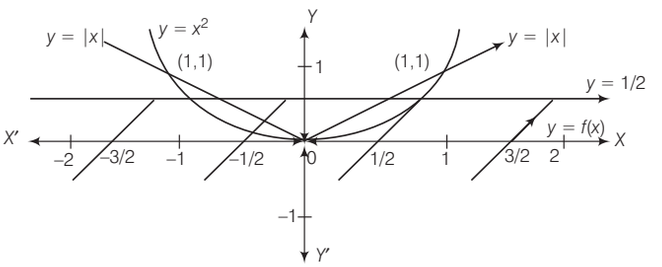
$$\Rightarrow \quad \frac{a + b + c}{3} \ge (a + b + c)^{1/3} \qquad [\because a + b + c = abc]$$

$$\Rightarrow \quad (a + b + c)^{2/3} \ge 3$$

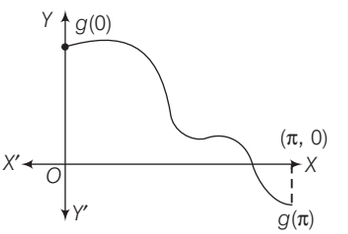
$$\Rightarrow \quad (a + b + c) \ge 3\sqrt{3}$$

183. Clearly, $g(x) =$

$$\begin{cases} x^2, -2 \le x \le -1 \\ -x, -1 \le x \le -\frac{1}{4} \\ x + \frac{1}{2}, -\frac{1}{4} \le x < 0 \text{ as graphically if,} \\ x, 0 \le x \le 1 \\ x^2, 1 \le x \le 2 \text{ can be expressed as shown in the following figure} \end{cases}$$



184. Let $g(x) = f(x) - f(x + \pi)$ ...(i)



At $x = \pi$, $g(\pi) = f(\pi) - f(2\pi)$ ...(ii)

At $x = 0$, $g(0) = f(0) - f(\pi)$ ...(iii)

Adding Eqs. (ii) and (iii), we have

$$g(0) + g(\pi) = f(0) - f(2\pi) = 0$$

$$\Rightarrow \quad g(0) = -g(\pi)$$

$\Rightarrow g(0)$ and $g(\pi)$ are of opposite sign.

$\Rightarrow$ There is a point c between 0 and π such that

$$g(c) = 0 \quad \text{...(iv)}$$

From Eq. (i) putting $x = c$, we have

$$g(c) = f(c) - f(\pi + c) \quad \text{...(v)}$$

From Eqs. (iv) and (v), we have

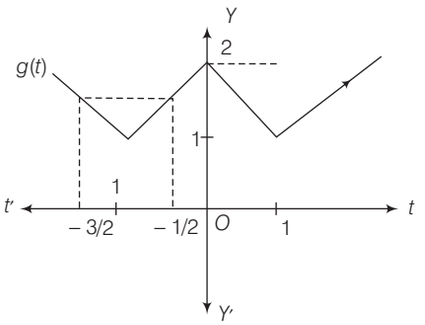
$$f(c) - f(\pi + c) = 0$$

Hence, $f(c) = f(\pi + c)$

185. We have, $g(t) = |t-1| - |t| + |t+1|$

$$\Rightarrow \quad g(t) = \begin{cases} -t, & t < -1 \\ t+2, & -1 \le t < 0 \\ 2-t, & 0 \le t < 1 \\ t, & t \ge 1 \end{cases}$$

Graph of $g(t)$ is



$$f(x) = \max\left\{ g(t) : \frac{-3}{2} \le t \le x \right\} \quad x \in \left(\frac{-3}{2}, \infty \right)$$

Clearly from the graph,

$$f(x) = \begin{cases} 3/2, & \frac{-3}{2} < x \le \frac{-1}{2} \\ x+2, & \frac{-1}{2} \le x < 0 \\ 2, & 0 \le x \le 2 \\ x, & x \ge 2 \end{cases}$$

186. $n_1 n_2 = 2n_1 - n_2$ [given]

$$\Rightarrow \quad n_2(n_1 + 1) = 2n_1 \quad \Rightarrow \quad n_2 = \frac{2n_1}{n_1 + 1}$$

$$\Rightarrow \quad n_2 = 2 - \frac{2}{n_1 + 1}$$

Since, n_1, n_2 are integers.

$$\therefore \quad \frac{2}{n_1 + 1} \in \text{Integer}$$

$$\Rightarrow \quad n_1 + 1 = -2, -1, 1, 2$$

$$\Rightarrow \quad n_1 = -3, -2, 0, 1$$

$$\Rightarrow \quad n_2 = 3, 4, 0, 1$$

$\Rightarrow$ Integral solutions of the form (n_1, n_2) are $(-3, 3), (-2, 4), (0, 0), (1, 1)$.

187. **PLAN**

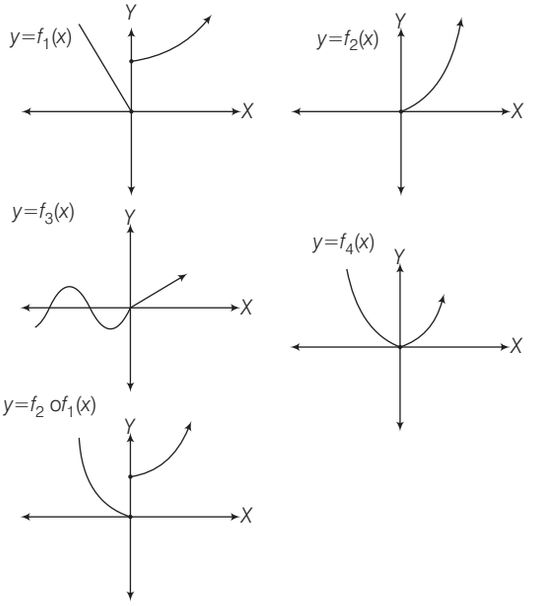
(i) For such questions, we need to properly define the functions and then we draw their graphs.

(ii) From the graphs, we can examine the function for continuity, differentiability, one-one and onto.

$$f_1(x) = \begin{cases} -x, & x < 0 \\ e^x, & x \ge 0 \end{cases} \quad \Rightarrow \quad f_2(x) = x^2,\ x \ge 0$$

$$f_3(x) = \begin{cases} \sin x, & x < 0 \\ x, & x \ge 0 \end{cases} \Rightarrow f_4(x) = \begin{cases} f_2(f_1(x)), & x < 0 \\ f_2(f_1(x)) - 1, & x \ge 0 \end{cases}$$

Now, $f_2(f_1(x)) = \begin{cases} x^2, & x < 0 \\ e^{2x}, & x \ge 0 \end{cases} \Rightarrow f_4 = \begin{cases} x^2, & x < 0 \\ e^{2x} - 1, & x \ge 0 \end{cases}$



As, $f_4(x)$ is continuous, $f'_4(x) = \begin{cases} 2x, & x < 0 \\ 2e^{2x}, & x > 0 \end{cases}$

$f_4'(0)$ is not defined. Its range is $[0, \infty)$, thus f_4 is onto.

Also, horizontal line (drawn parallel to X-axis) meets the curve more than once, thus function is not one-one.

188. Given, $g\{f(x)\} = x \Rightarrow g'\{f(x)\} f'(x) = 1$

If $f(x) = 1 \Rightarrow x = 0,\ f(0) = 1$

Substitute $x = 0$ in Eq. (i), we get

$$g'(1) = \frac{1}{f'(0)}$$

$$\Rightarrow \quad g'(1) = 2 \qquad \left[\because f'(x) = 3x^2 + \frac{1}{2} e^{x/2} \Rightarrow f'(0) = \frac{1}{2} \right]$$

Alternate Solution

Given, $f(x) = x^2 + e^{x/2}$

$$\Rightarrow \quad f'(x) = 3x^2 + \frac{1}{2} e^{x/2}$$

For $x = 0,\ f(0) = 1,\ f'(0) = \frac{1}{2}$ and $g(x) = f^{-1}(x)$

Replacing x by $f(x)$, we have

$$g(f(x)) = x \ \Rightarrow \ g'(f(x)) \cdot f'(x) = 1$$

Put $x = 0$, we get $g'(1) = \frac{1}{f'(0)} = 2$

189. Given, $F(x)=\int \sin^2 x\,dx=\int \frac{1-\cos 2x}{2}dx$

$$F(x)=\frac{1}{4}(2x-\sin 2x)+C$$

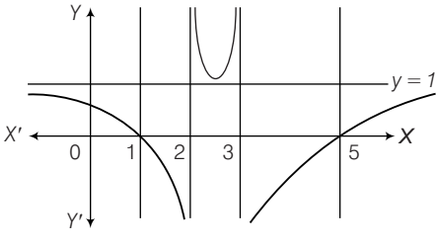
Since, $F(x+\pi)\neq F(x)$

Hence, Statement I is false.

But Statement II is true, as $\sin^2 x$ is periodic with period π.

190. Given, $f(x)=\frac{(x-1)(x-5)}{(x-2)(x-3)}$

The graph of $f(x)$ is shown as



A. If $-1<x<1 \Rightarrow \quad 0<f(x)<1$

B. If $1<x<2 \Rightarrow f(x)<0$

C. If $3<x<5 \Rightarrow f(x)<0$

D. If $x>5 \Rightarrow 0<f(x)<1$

191. Given, $\quad 2\sin t=\frac{1-2x+5x^2}{3x^2-2x-1},\ t\in\left[-\frac{\pi}{2},\frac{\pi}{2}\right]$

Put $\quad 2\sin t=y \Rightarrow -2\le y\le 2$

$$\therefore \quad y=\frac{1-2x+5x^2}{3x^2-2x-1}$$

$$\Rightarrow \quad (3y-5)x^2-2x(y-1)-(y+1)=0$$

Since, $x\in R-\{1,-1/3\}$

$$[\text{as}, 3x^2-2x-1\neq 0 \Rightarrow (x-1)(x+1/3)\neq 0]$$

$$\therefore \quad D\ge 0$$

$$\Rightarrow \quad 4(y-1)^2+4(3y-5)(y+1)\ge 0$$

$$\Rightarrow \quad y^2-y-1\ge 0$$

$$\Rightarrow \quad \left(y-\frac{1}{2}\right)^2-\frac{5}{4}\ge 0$$

$$\Rightarrow \quad \left(y-\frac{1}{2}-\frac{\sqrt{5}}{2}\right)\left(y-\frac{1}{2}+\frac{\sqrt{5}}{2}\right)\ge 0$$

$$\Rightarrow \quad y\le\frac{1-\sqrt{5}}{2} \quad \text{or} \quad y\ge\frac{1+\sqrt{5}}{2}$$

$$\Rightarrow \quad 2\sin t\le\frac{1-\sqrt{5}}{2} \quad \text{or} \quad 2\sin t\ge\frac{1+\sqrt{5}}{2}$$

$$\Rightarrow \quad \sin t\le\sin\left(-\frac{\pi}{10}\right) \quad \text{or} \quad \sin t\ge\sin\left(\frac{3\pi}{10}\right)$$

$$\Rightarrow \quad t\le-\frac{\pi}{10} \quad \text{or} \quad t\ge\frac{3\pi}{10}$$

Hence, range of t is $\left[-\frac{\pi}{2},-\frac{\pi}{10}\right]\cup\left[\frac{3\pi}{10},\frac{\pi}{2}\right]$.

192. Given, $f_k(x)=\frac{1}{k}(\sin^k x+\cos^k x)$,

where $x\in R$ and $k>1$

$$f_4(x)-f_6(x)=\frac{1}{4}(\sin^4 x+\cos^4 x)-\frac{1}{6}(\sin^6 x+\cos^6 x)$$

$$=\frac{1}{4}(1-2\sin^2 x\cdot\cos^2 x)-\frac{1}{6}(1-3\sin^2 x\cdot\cos^2 x)$$

$$=\frac{1}{4}-\frac{1}{6}=\frac{1}{12}$$

193. **Plan** To check nature of function.

(i) **One-one** To check one-one, we must check whether $f'(x)>0$ or $f'(x)<0$ in given domain.

(ii) **Onto** To check onto, we must check

$$\text{Range}=\text{Codomain}$$

Description of Situation To find range in given domain $[a,b]$, put $f'(x)=0$ and find $x=\alpha_1,\alpha_2,\ldots,\alpha_n\in[a,b]$

Now, find $\{f(a),f(\alpha_1),f(\alpha_2),\ldots,f(\alpha_n),f(b)\}$

its greatest and least values gives you range.

Now, $f:[0,3]\to[1,29]$

$$f(x)=2x^3-15x^2+36x+1$$

$$\therefore \quad f'(x)=6x^2-30x+36=6(x^2-5x+6)$$

$$=6(x-2)(x-3)$$

For given domain [0, 3], $f(x)$ is increasing as well as decreasing $\Rightarrow$ many-one

Now, put $f'(x)=0$

$$\Rightarrow \quad x=2,3$$

Thus, for range $\quad f(0)=1,\ f(2)=29,\ f(3)=28$

$\Rightarrow$ Range $\in[1,29]$

$\therefore$ Hence, the function is into.

194. $f(x)=x^2,\ g(x)=\sin x$

$$(gof)(x)=\sin x^2$$

$$go(gof)(x)=\sin(\sin x^2)$$

$$(fogogof)(x)=(\sin(\sin x^2))^2$$

Given, $(fogogof)(x)=(gogof)(x)$

$$\Rightarrow \quad (\sin(\sin x^2))^2=\sin(\sin x^2)$$

$$\Rightarrow \quad \sin(\sin x^2)\{\sin(\sin x^2)-1\}=0$$

$$\Rightarrow \sin(\sin x^2)=0 \ \text{ or } \ \sin(\sin x^2)=1$$

$$\Rightarrow \quad \sin x^2=0 \quad \text{or} \quad \sin x^2=\frac{\pi}{2}$$

$$\therefore \quad x^2=n\pi \qquad [\text{i.e. not possible as } -1\le\sin\theta\le 1]$$

$$x=\pm\sqrt{n\pi}$$

195. Here, $f(x)=\frac{b-x}{1-bx}$, where $0<b<1,\ 0<x<1$

For function to be invertible, it should be one-one onto.

Check Range

Let $\quad f(x)=y \Rightarrow y=\frac{b-x}{1-bx}$

$$\Rightarrow \quad y-bxy=b-x \Rightarrow x(1-by)=b-y$$

$\Rightarrow \quad x = \dfrac{b-y}{1-by}$, where $0 < x < 1$

$\therefore \quad 0 < \dfrac{b-y}{1-by} < 1$

$\Rightarrow \quad \dfrac{b-y}{1-by} > 0$ and $\dfrac{b-y}{1-by} < 1$

$\Rightarrow \quad y < b$ or $y > \dfrac{1}{b}$

and $\dfrac{(b-1)(y+1)}{1-by} < 0 \Rightarrow -1 < y < \dfrac{1}{b}$ ...(i)

From Eqs. (i) and (ii), we get ...(ii)

$$y \in (-1, b) \subset \text{codomain}$$

196. We have, $e^{-x} f(x) = 2 + \int_0^x \sqrt{t^4+1}\, dt, \forall\ x \in (-1, 1)$

On differentiating w.r.t. x, we get

$$e^{-x}[f'(x) - f(x)] = \sqrt{x^4+1}$$

$\Rightarrow \quad f'(x) = f(x) + \sqrt{x^4+1} \cdot e^x$

$\because$ f^{-1} is the inverse of f.

$\therefore \quad f^{-1}\{f(x)\} = x$

$\Rightarrow \quad [f^{-1}\{f(x)\}]'\, f'(x) = 1$

$\Rightarrow \quad [f^{-1}\{f(x)\}]' = \dfrac{1}{f'(x)}$

$\Rightarrow \quad [f^{-1}\{f(x)\}]' = \dfrac{1}{f(x) + \sqrt{x^4+1} \cdot e^x}$

At $x = 0$, $f(x) = 2$

$\Rightarrow \quad \{f^{-1}(2)\}' = \dfrac{1}{2+1} = \dfrac{1}{3}$

197. Since, only (c) satisfy given definition,

i.e. $f\{f^{-1}(B)\} = B$

Only, if $B \subseteq f(x)$

198. Let $\phi(x) = f(x) - g(x) = \begin{cases} x, & x \in Q \\ -x, & x \notin Q \end{cases}$

Now, to check one-one.

Take any straight line parallel to X-axis which will intersect $\phi(x)$ only at one point.

$\Rightarrow$ $\phi(x)$ is one-one.

To check onto

As, $f(x) = \begin{cases} x, & x \in Q \\ -x, & x \notin Q \end{cases}$, which shows

$y = x$ and $y = -x$ for rational and irrational values

$\Rightarrow$ $y \in$ real numbers.

$\therefore$ Range = Codomain $\Rightarrow$ onto

Thus, $f - g$ is one-one and onto.

199. By definition of composition of function,

$g(f(x)) = (\sin x + \cos x)^2 - 1$, is invertible (i.e. bijective)

$\Rightarrow \quad g\{f(x)\} = \sin 2x$ is bijective.

We know, $\sin x$ is bijective, only when $x \in \left[-\dfrac{\pi}{2}, \dfrac{\pi}{2}\right]$

Thus, $g\{f(x)\}$ is bijective, if $-\dfrac{\pi}{2} \le 2x \le \dfrac{\pi}{2}$

$\Rightarrow \quad -\dfrac{\pi}{4} \le x \le \dfrac{\pi}{4}$

200. Here, $f(x) = \sqrt{\sin^{-1}(2x) + \dfrac{\pi}{6}}$, to find domain we must have,

$$\sin^{-1}(2x) + \frac{\pi}{6} \ge 0 \qquad \left[\text{but } -\frac{\pi}{2} \le \sin^{-1}\theta \le \frac{\pi}{2}\right]$$

$$-\frac{\pi}{6} \le \sin^{-1}(2x) \le \frac{\pi}{2} \Rightarrow \sin\left(\frac{-\pi}{6}\right) \le 2x \le \sin\frac{\pi}{2}$$

$$\frac{-1}{2} \le 2x \le 1$$

$\Rightarrow \quad \dfrac{-1}{4} \le x \le \dfrac{1}{2}$

$\because \quad x \in \left[\dfrac{-1}{4}, \dfrac{1}{2}\right]$

201. Let $y = f(x) = \dfrac{x^2+x+2}{x^2+x+1}$, $x \in R$

$\therefore \quad y = \dfrac{x^2+x+2}{x^2+x+1}$

$$y = 1 + \frac{1}{x^2+x+1} \qquad [\text{i.e. } y > 1] \ldots(i)$$

$\Rightarrow \quad yx^2 + yx + y = x^2 + x + 2$

$\Rightarrow \quad x^2(y-1) + x(y-1) + (y-2) = 0, \forall\, x \in R$

Since, x is real, $D \ge 0$

$\Rightarrow \quad (y-1)^2 - 4(y-1)(y-2) \ge 0$

$\Rightarrow \quad (y-1)\{(y-1) - 4(y-2)\} \ge 0$

$\Rightarrow \quad (y-1)(-3y+7) \ge 0$

$\Rightarrow \quad 1 \le y \le \dfrac{7}{3}$ ...(ii)

From Eqs. (i) and (ii), Range $\in \left(1, \dfrac{7}{3}\right]$

202. Given, $f : [0, \infty) \to [0, \infty)$

Here, domain is $[0, \infty)$ and codomain is $[0, \infty)$. Thus, to check one-one

Since, $f(x) = \dfrac{x}{1+x}$

$\Rightarrow \quad f'(x) = \dfrac{1}{(1+x)^2} > 0, \forall\ x \in [0, \infty)$

$\therefore$ $f(x)$ is increasing in its domain. Thus, $f(x)$ is one-one in its domain. To check onto (we find range)

Again, $y = f(x) = \dfrac{x}{1+x}$

$\Rightarrow \quad y + yx = x$

$\Rightarrow \quad x = \dfrac{y}{1-y} \Rightarrow \dfrac{y}{1-y} \ge 0$

Since, $x \ge 0$, therefore $0 \le y < 1$

i.e. Range $\neq$ Codomain

$\therefore$ $f(x)$ is one-one but not onto.

203. Given, $f(x) = 2x + \sin x$

$\Rightarrow$ $f'(x) = 2 + \cos x$

$\Rightarrow$ $f'(x) > 0, \forall x \in R$

which shows $f(x)$ is one-one, as $f(x)$ is strictly increasing.

Since, $f(x)$ is increasing for every $x \in R$.

$\therefore$ $f(x)$ takes all intermediate values between $(-\infty, \infty)$.

Range of $f(x) \in R$.

Hence, $f(x)$ is one-to-one and onto.

204. The number of onto functions from

$E = \{1, 2, 3, 4\}$ to $F = \{1, 2\}$

= Total number of functions which map E to F

– Number of functions for which map $f(x) = 1$ and $f(x) = 2$ for all $x \in E = 2^4 - 2 = 14$

205. It is only to find the inverse.

Let $y = f(x) = (x + 1)^2$ for $x \geq -1$

$\Rightarrow \pm\sqrt{y} = x + 1,\ x \geq -1$

$\Rightarrow \sqrt{y} = x + 1 \Rightarrow y \geq 0,\ x + 1 \geq 0$

$\Rightarrow x = \sqrt{y} - 1$

$\Rightarrow f^{-1}(y) = \sqrt{y} - 1$

$\Rightarrow f^{-1}(x) = \sqrt{x} - 1$

$\Rightarrow x \geq 0$

206. Let $y = x + \frac{1}{x} \Rightarrow y = \frac{x^2 + 1}{x}$

$\Rightarrow xy = x^2 + 1$

$\Rightarrow x^2 - xy + 1 = 0$

$\Rightarrow x = \frac{y \pm \sqrt{y^2 - 4}}{2}$

$\Rightarrow f^{-1}(y) = \frac{y \pm \sqrt{y^2 - 4}}{2}$

$\Rightarrow f^{-1}(x) = \frac{x \pm \sqrt{x^2 - 4}}{2}$

Since, the range of the inverse function is $[1, \infty)$, then

we take $f^{-1}(x) = \frac{x + \sqrt{x^2 - 4}}{2}$

If we consider $f^{-1}(x) = \frac{x - \sqrt{x^2 - 4}}{2}$, then $f^{-1}(x) > 1$

This is possible only if $(x - 2)^2 > x^2 - 4$

$\Rightarrow x^2 + 4 - 4x > x^2 - 4$

$\Rightarrow 8 > 4x$

$\Rightarrow x < 2$, where $x > 2$

Therefore, (a) is the correct answer.

207. Given, $f(x) = (1 + b^2)\, x^2 + 2bx + 1$

$$= (1 + b^2)\left(x + \frac{b}{1 + b^2}\right)^2 + 1 - \frac{b^2}{1 + b^2}$$

$m(b)$ = minimum value of $f(x) = \frac{1}{1 + b^2}$ is positive and $m(b)$ varies from 1 to 0, so range = $(0, 1]$

208. Given, $f(x) = \frac{\log_2 (x + 3)}{(x^2 + 3x + 2)} = \frac{\log_2 (x + 3)}{(x + 1)(x + 2)}$

For numerator, $x + 3 > 0$

$\Rightarrow x > -3$ ...(i)

and for denominator, $(x + 1)(x + 2) \neq 0$

$\Rightarrow x \neq -1, -2$ ...(ii)

From Eqs. (i) and (ii), we get

Domain is $(-3, \infty) / \{-1, -2\}$

209. Given, $f(x) = \frac{\alpha x}{x + 1}$

$$f[f(x)] = f\left(\frac{\alpha x}{x + 1}\right) = \frac{\alpha\left(\frac{\alpha x}{x + 1}\right)}{\frac{\alpha x}{x + 1} + 1}$$

$$= \frac{\frac{\alpha^2 x}{x + 1}}{\frac{\alpha x + (x + 1)}{x + 1}} = \frac{\alpha^2 x}{(\alpha + 1)\, x + 1} = x \text{ [given]} \quad \text{...(i)}$$

$\Rightarrow \alpha^2 x = (\alpha + 1)\, x^2 + x$

$\Rightarrow x[\alpha^2 - (\alpha + 1)\, x - 1] = 0$

$\Rightarrow x(\alpha + 1)(\alpha - 1 - x) = 0$

$\Rightarrow \alpha - 1 = 0$ and $\alpha + 1 = 0 \Rightarrow \alpha = -1$

But $\alpha = 1$ does not satisfy the Eq. (i).

210. $g(x) = 1 + x - [x] \geq 1$

since $x - [x] \geq 0$

$f[g(x)] = 1$, since $f(x) = 1$ for all $x > 0$

211. Given, $2^x + 2^y = 2,\ \forall\ x, y \in R$

But $2^x, 2^y > 0, \forall\ x, y \in R$

Therefore, $2^x = 2 - 2^y < 2 \Rightarrow 0 < 2^x < 2$

Taking log on both sides with base 2, we get

$$\log_2 0 < \log_2 2^x < \log_2 2 \Rightarrow -\infty < x < 1$$

212. It is given,

$f(\theta) = \sin\theta(\sin\theta + \sin 3\theta)$

$= (\sin\theta + 3\sin\theta - 4\sin^3\theta)\sin\theta$

$= (4\sin\theta - 4\sin^3\theta)\sin\theta = \sin^2\theta(4 - 4\sin^2\theta)$

$= 4\sin^2\theta\cos^2\theta = (2\sin\theta\cos\theta)^2 = (\sin 2\theta)^2 \geq 0$

which is true for all θ.

CHAPTER

Graphical Transformations

Learning Part

Session 1

- When $f(x)$ vertically transforms to $f(x) \pm a$

Session 2

- When $f(x)$ horizontally transforms to $f(x \pm a)$, where a is any positive constant
- When $f(x)$ transforms to $a\, f(x)$ or $\frac{1}{a} f(x)$
- When $f(x)$ transforms to $f(ax)$ or $f(x/a)$
- When $f(x)$ transforms to $f(-x)$
- When $f(x)$ transforms to $-f(x)$

Session 3

- To draw $y = |f(x)|$, when $y = f(x)$ is given
- To draw $y = f(|x|)$, when $f(x)$ is given
- $f(x)$ transforms to $|f(|x|)|$, i.e. $f(x) \rightarrow |f(|x|)|$
- To draw the graph of $|y| = f(x)$ when $y = f(x)$ is given

Session 4

- To draw $y = [f(x)]$ when the graph of $y = f(x)$ is given and $[\cdot]$ denotes greatest integer or integral function
- To draw $y = f([x])$ when the graph of $y = f(x)$ is given
- When $f(x)$ transforms to $y = f(\{x\})$, where $\{\cdot\}$ denotes fractional part of x, i.e. $\{x\} = x - [x]$ or $f(x) \rightarrow f(\{x\})$
- When $f(x)$ and $g(x)$ are two functions and are transformed to their sum
- When $f(x)$ transforms to $f(x) \rightarrow \frac{1}{f(x)} = h(x)$
- To draw the graph for $y = f(x) \cdot \sin x$ when graph of $y = f(x)$ is given
- When $f(x)$ and $g(x)$ are given, then find $h(x) = \max(f(x), g(x))$ or $h(x) = \min(f(x), g(x))$

Arihant on Your Mobile !
Exercises with this symbol can be practised on your mobile. See title inside to activate for free.

Graph and diagram provide a simple and powerful approach to a variety of problems, from which we can solve them in a very short time. In this chapter, we will discuss how the graph of a function may be transformed either by shifting, stretching or compressing or reflection.

Graphical Transformations

A graphical transformation takes whatever its basic function $f(x)$. The graph of new function is the graph of the original function shifted vertically or horizontally.

Session 1

When $f(x)$ Vertically Transforms to $f(x) \pm a$

(Where a is Any Positive Constant)

For $f(x) \to f(x) + a$,

First, draw the graph of $f(x)$, then shift the graph of $f(x)$ upwards through 'a' units such that the distance between graphs of $f(x)$ and $f(x) + a$ at every point is same and is equal to 'a' units.

For $f(x) \to f(x) - a$,

First, draw the graph of $f(x)$, then shift the graph of $f(x)$ downwards through 'a' units such that the distance between the graphs of $f(x)$ and $f(x) - a$ at every point is same and is equal to 'a' units.

Graphically, it could be stated as shown in figure.

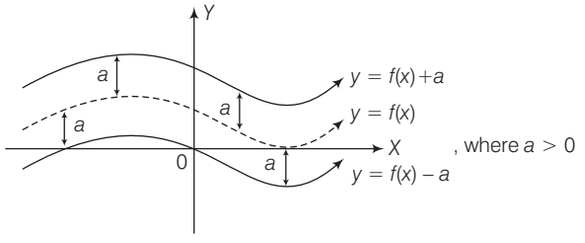

Figure 4.1

Example 1 Plot $y = |x|$ and $y = |x| + 2$.

Sol. We know, $y = |x|$ (modulus function) is define as

$$y = \begin{cases} x, & x \geq 0 \\ -x, & x < 0 \end{cases}$$

So, we have to plot two straight lines $y = x$ and $y = -x$.

For $y = x$, $x \geq 0$

x	1	2	3	4
y	1	2	3	4

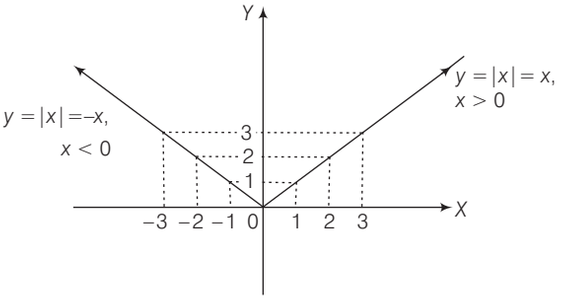
$\therefore$ Locate the points (1, 1), (2, 2), (3, 3), (4, 4) and join them.

For $y = -x$, $x < 0$

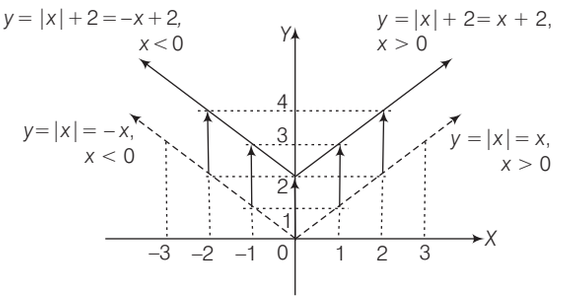
x	–1	–2	–3
y	1	2	3

$\therefore$ Locate the points (–1, 1), (–2, 2), (–3, 3) and join them.

So, we obtained graph of $y = |x|$.

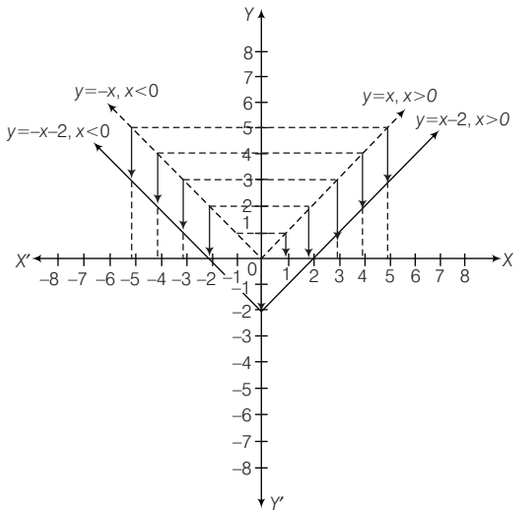


Now, to draw the graph of $y = |x| + 2$ and the graph of $|x|$ is shifted upwards by 2 units as shown below.



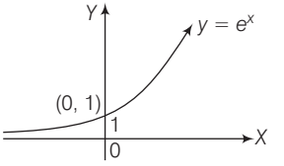
Example 2 Plot $y = |x|$ and $y = |x| - 2$.

Sol. First, we plot the graph of $y = |x|$ as explained in Example 1, then shift the graph of $|x|$ through 2 units downwards as shown below.



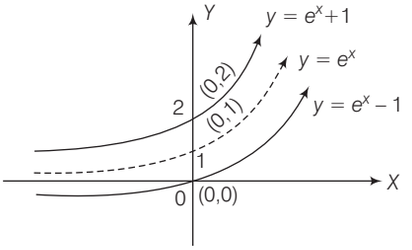
Example 3 Plot $y = e^x$, $y = e^x + 1$ and $y = e^x - 1$.

Sol. We know, $y = e^x$ (exponential function) could be plotted as shown below which cuts the Y-axis at $(0,1)$.



$\Rightarrow y = e^x + 1$ is shifted upward by 1 unit such that it intersects Y-axis at (0, 2) and $y = e^x - 1$ shifted downwards by 1 unit. Such that it intersects Y-axis at $(0,0)$.

The graph of the given functions is shown below.



Exercise for Session 1

■ **Directions** (Q. Nos. 1 to 8) *Plot the following functions.*

1. $y = x^2 + 1$
2. $y = x^2 - 1$
3. $y = x^3 + 1$
4. $y = x^3 - 1$
5. $y = \sin x + 1$
6. $y = \sin x - 1$
7. $y = (\log_e x) + 1$
8. $y = (\log_e x) - 1$

Session 2

When $f(x)$ Horizontally Transforms to $f(x \pm a)$, where a is any Positive Constant, When $f(x)$ Transforms to $af(x)$ or $\frac{1}{a} f(x)$, When $f(x)$ Transforms to $f(ax)$ or $f(x/a)$, When $f(x)$ Transforms to $f(-x)$, When $f(x)$ Transforms to $-f(x)$

For $f(x) \to f(x \pm a)$

For $f(x) \to f(x-a)$, First, draw the graph of $f(x)$, then shift the graph of $f(x)$ through 'a' units towards right such that distance between the graphs of $f(x)$ and $f(x-a)$ is same and is equal to 'a' units.

For $f(x) \to f(x+a)$, First, draw the graph of $f(x)$, then shift the graph of $f(x)$ through 'a' units towards left such that the distance between the graphs of $f(x)$ and $f(x+a)$ is same and is equal to 'a' units.

Graphically, it could be stated as shown in figure.

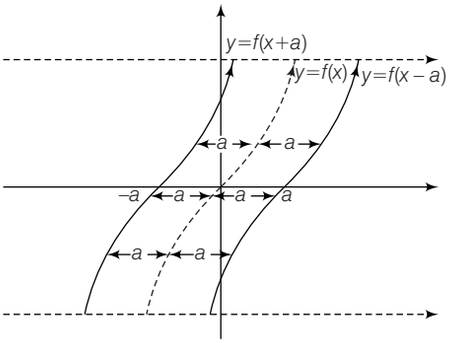


Figure 4.2

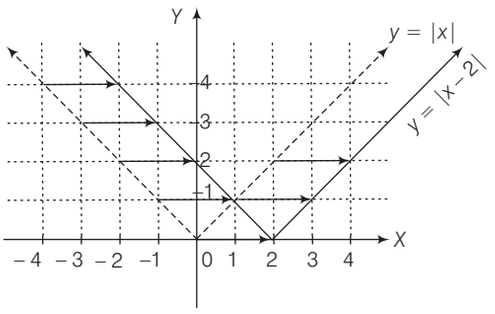
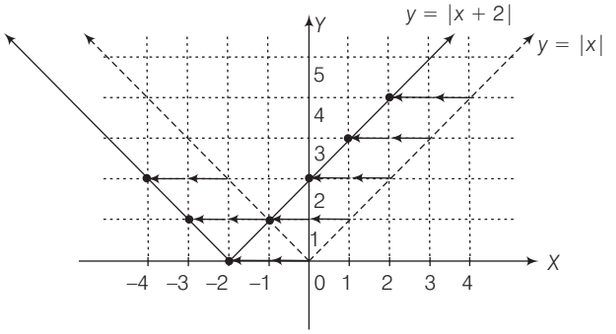
Example 4 ***Plot*** $y = |x|$ ***and*** $y = |x-2|$ **.**

Sol. First we plot the graph of $y = |x|$ as explained in Example 1, then shift the graph of $|x|$ through '2' units towards right as shown below.



Example 5 Plot $y = |x|$ and $y = |x+2|$.

Sol. First we plot the graph of $y = |x|$ as explained in Example 1, then shift the graph of $|x|$ through '2' units towards left.

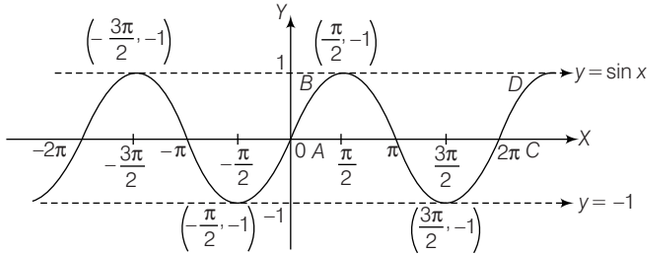


Example 6 ***Plot*** $y = \sin\left(x+\frac{\pi}{4}\right)$ ***and*** $y = \sin\left(x-\frac{\pi}{4}\right)$ **.**

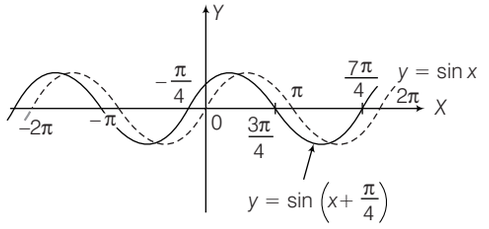
Sol. Let us consider $y = \sin x$, domain of sine functions is R and range is $[-1, 1]$. sin x increases strictly from -1 to 1 as x increases from $-\frac{\pi}{2}$ to $\frac{\pi}{2}$, decreases strictly from 1 to -1 as x increases from $\frac{\pi}{2}$ to $\frac{3\pi}{2}$. Also, for $y = \sin x$.

x	-2π	$-\frac{3\pi}{2}$	$-\pi$	$-\frac{\pi}{2}$	0	$\frac{\pi}{2}$	π	$\frac{3\pi}{2}$	2π
y	0	1	0	-1	0	1	0	-1	0

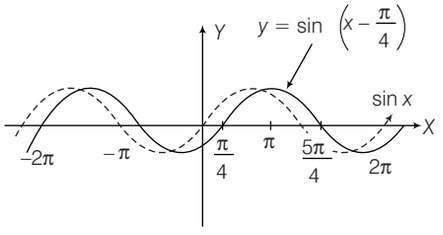
Locate the points $(-2\pi,0)$, $\left(-\frac{3\pi}{2},1\right)$, $(-\pi,0)$, $\left(-\frac{\pi}{2},-1\right)$, $(0,0)$, $\left(\frac{\pi}{2},1\right)$, $(\pi,0)$, $\left(\frac{3\pi}{2},-1\right)$ and $(2\pi,0)$ on the graph paper, then we get the graph of $\sin x$ as shown below.



Now, for the graph of $y = \sin\left(x + \frac{\pi}{4}\right)$ shift the graph of $y = \sin x$ through $\frac{\pi}{4}$ towards left as shown below.

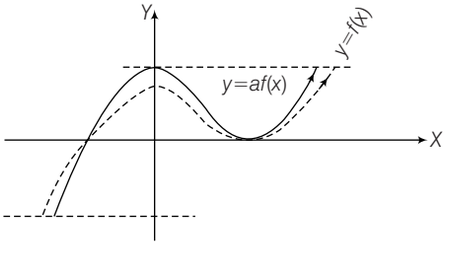


And for the graph of $y = \sin\left(x - \frac{\pi}{4}\right)$, shift the graph of $y = \sin x$ through $\frac{\pi}{4}$ towards right as shown below.



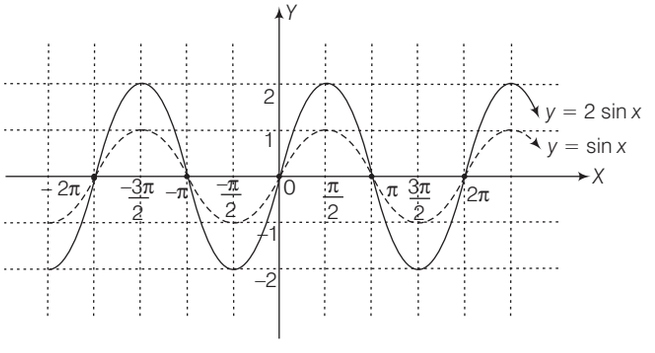
$f(x) \to \{af(x)\}, a > 1$

First draw the graph of $f(x)$, then stretch the graph of $f(x)$, 'a' times along Y-axis.



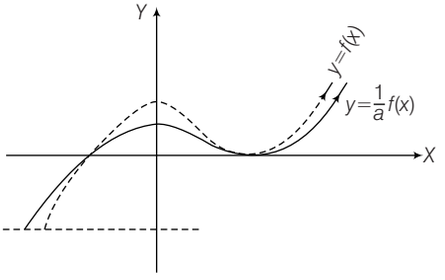
Example 7 Plot $y = \sin x$ and $y = 2\sin x$.

Sol. First we draw the graph of $\sin x$ as explained in Example 6, then stretch the graph of $\sin x$ by 2 times along the Y-axis, we get the graph of $2\sin x$ as shown below.



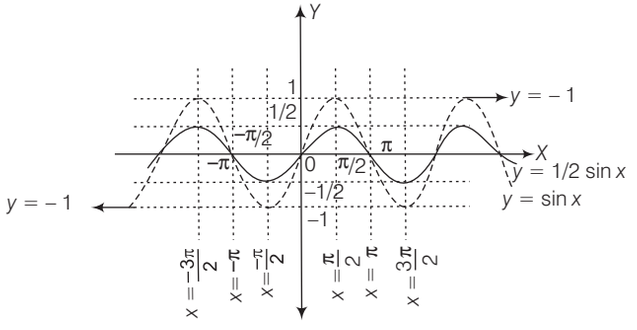
$f(x) \to \frac{1}{a} f(x), a > 1$

First, draw the graph of $f(x)$, then shrink the graph of $f(x)$, 'a' times along Y-axis. As shown in the figure.



Example 8 Plot $y = \sin x$ and $y = \frac{1}{2}\sin x$.

Sol. First we draw the graph of $y = \sin x$ as explained in Example 6, then shrink the graph of $\sin x$ by 2 times along Y-axis, we get the graph of $\frac{1}{2}\sin x$ as shown below.



$f(x) \to f(ax), a > 1$

First draw the graph of $f(x)$, then shrink the graph of $f(x)$, 'a' times along X-axis as shown in figure.

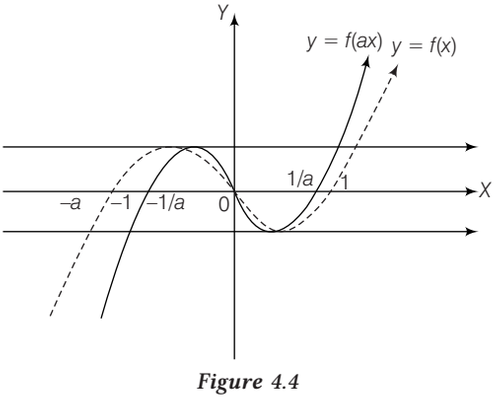


Figure 4.4

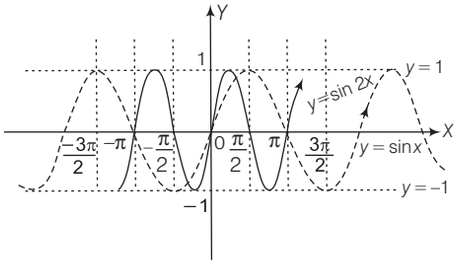
Example 9 Plot $y = \sin x$ and $y = \sin 2x$.

Sol. First draw the graph of $\sin x$ as explained in Example 6, then shrink the graph of $\sin x$, 2 times along X-axis, we get the graph of $\sin 2x$ as shown below.



$f(x) \to f\left(\frac{x}{a}\right), a > 1$

First draw the graph of $f(x)$, then
stretch the graph of $f(x)$, 'a' times along X-axis, as shown in figure.

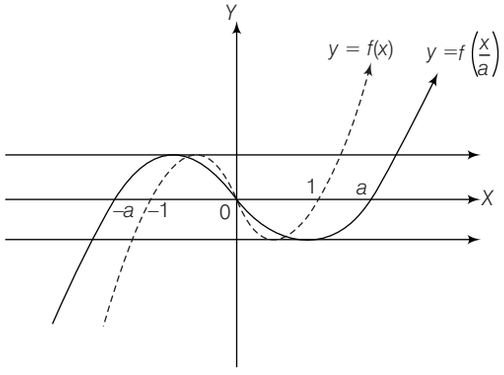


Figure 4.5

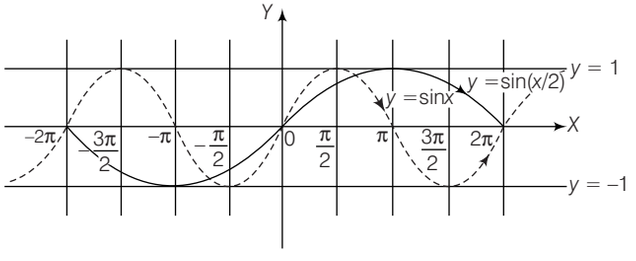
Example 10 Plot $y = \sin x$ and $y = \sin \frac{x}{2}$.

Sol. First we draw the graph of $\sin x$ as explained in Example 6, then stretch the graph of $\sin x$, 2 times along X-axis, we get the graph of $\sin \frac{x}{2}$ as shown below.



$f(x) \to f(-x)$

To draw $y = f(-x)$, take the image of the curve $y = f(x)$ in the Y-axis as plane mirror or turn the graph of $f(x)$ by 180° about Y-axis.

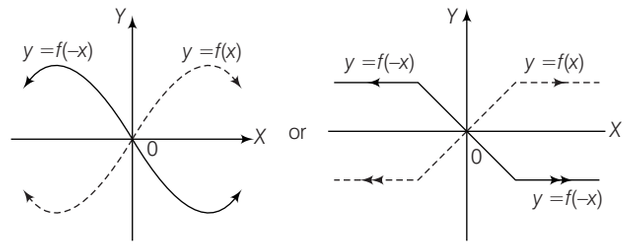


Figure 4.6

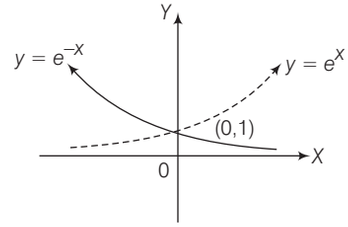
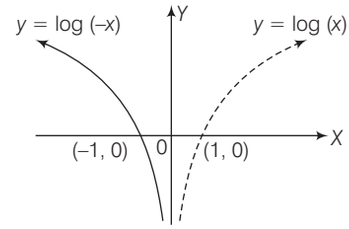
Example 11 Draw the graph of $y = e^{-x}$, when the graph of $y = e^{x}$ is known.

Sol. As $y = e^{x}$ is given, then $y = e^{-x}$ is the image in Y-axis as plane mirror. Thus, it can be drawn as shown in the figure.



Example 12 Draw graph of $y = \log(-x)$, when the graph of $y = \log(x)$ is given.

Sol. As $y = \log(x)$ is given and $y = \log(-x)$ is the image in Y-axis as plane mirror. Thus, it can be drawn as shown in figure.



$f(x) \to -f(x)$

To draw $y = -f(x)$ take image of $f(x)$ in the X-axis as plane mirror or turn the graph of $f(x)$ by 180° about X-axis.

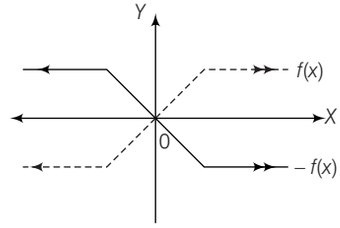


Figure 4.7

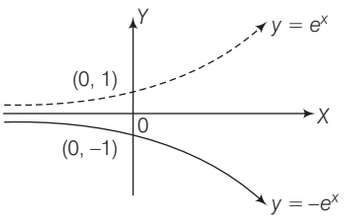
Example 13 Draw the graph of $y = -e^x$, when the graph of $y = e^x$ is known.

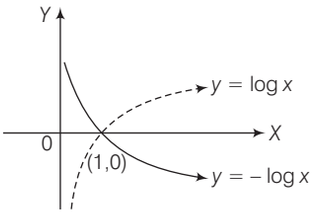
Sol. As $y = e^x$ is given, then $y = -e^x$ is the image of e^x in the X-axis as plane mirror.

Thus, it can be plotted as shown in figure



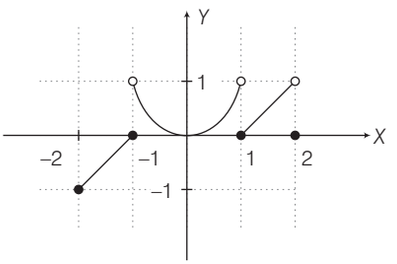
Example 14 Draw the graph of $y = -\log(x)$, when the graph of $y = \log x$ is known.

Sol. As $y = \log x$ is given, then $y = -\log x$ is the image of $\log x$ in the X-axis as plane mirror. Thus, it can be drawn as shown in figure.



Exercise for Session 2

1. Consider the following function f, whose graph is given below.



Draw the graph of the following functions.

(i) $f(x+1)$ (ii) $f(x-1)$ (iii) $-f(x)$ (iv) $f(-x)$

(v) $2f(x)$ (vi) $\frac{1}{2}f(x)$ (vii) $f(2x)$ (viii) $f\left(\frac{x}{2}\right)$

Session 3

To Draw $y = f(|x|)$, When $f(x)$ is Given, $f(x)$ Transforms to Draw $|f(|x|)|$, i.e. $f(x) \to |f(|x|)|$ To Draw $|y| = f(x)$

$f(x) \to |f(x)|$

When $y = f(x)$ is given

We know that $|f(x)| = \begin{cases} f(x), & \text{if } f(x) \geq 0 \\ -f(x), & \text{if } f(x) \leq 0 \end{cases}$

Hence, $y = |f(x)|$ is drawn in two steps

(i) In the step I, leave the positive part of $f(x)$, (i.e. the part of $f(x)$ above X-axis) as it is.

(ii) In the step II, take the image of negative part of $f(x)$, (i.e. the part of $f(x)$ below X-axis) in the X-axis as plane mirror.

Or

Take the mirror image (in X-axis) of the portion of the graph of $f(x)$ which lies below X-axis.

Or

Turn the portion of the graph of $f(x)$ lying below X-axis by 180° about X-axis.

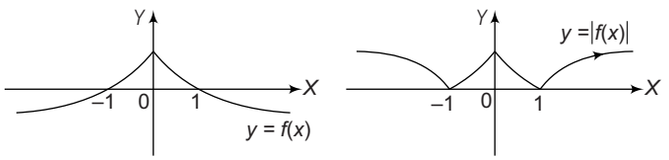


Figure 4.8

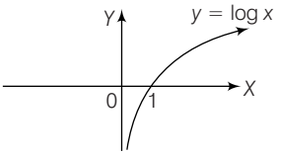
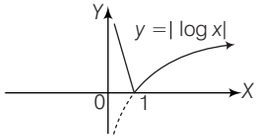
Example 15 Draw the graph of $y = |\log x|$, when the graph of $y = \log(x)$ is known.

Sol. To draw the graph of $y = |\log x|$, we have to proceed in two steps.

(i) In the first step, leave the positive part of $y = \log x$, i.e. the part of $y = \log x$ above X-axis as it is.



(ii) In the second step, take the image of negative part of $y = \log x$, i.e. the part below X-axis in the X-axis as plane mirror. Thus, the graph can be



Remark

The above transformation of graph is very important in explaining the differentiability of $f(x)$.

From above example we could say, $y = \log x$ is differentiable for $(0, \infty)$.

But $y = |\log x|$ is differentiable for $(0, \infty) - \{1\}$. As, we have a sharp edge at $x = 1$ (which indicates that it is not differentiable at $x = 1$).

$f(x) \to f(|x|)$

When $f(x)$ is given

We know that, $y = f|x| = \begin{cases} f(x), & \text{if } x \geq 0 \\ f(-x), & \text{if } x \leq 0 \end{cases}$.

Hence, again $f(|x|)$ could be drawn in two steps

(i) In the step I, leave the graph lying right side of the Y-axis, as it is.

(ii) In the step II, take the image of $f(x)$ in the Y-axis as plane mirror.

The part of $f(x)$ lying left side of the Y-axis (if it exists) is omitted.

e.g. Let us assume the graph of $f(x)$ as shown

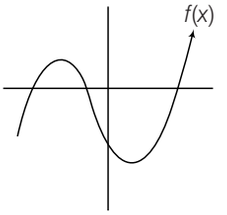


Figure 4.9

Now, **On the right of Y-axis** Plot the graph of $f(x)$ as such

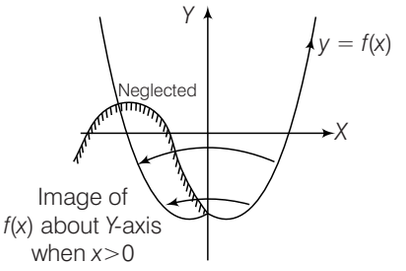

Figure 4.10

On the left of *Y*-axis Take the mirror image of the graph of $f(x)$ (of the portion lying on right of *Y*-axis).

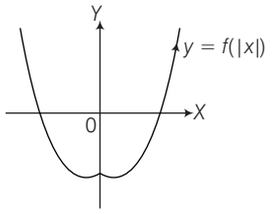

Figure 4.11

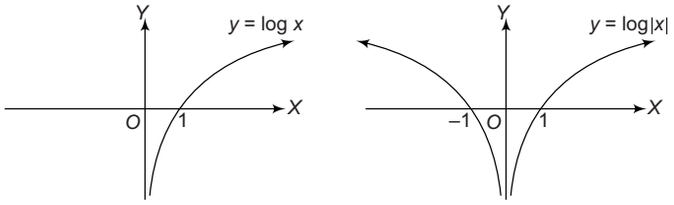
Example 16 Draw the graph of $y = \log|x|$, when graph of $y = \log(x)$ is given.

Sol. We know, $y = \log|x|$ could be drawn in two steps

(i) In step I, leave the graph lying right side of *Y*-axis as it is.

(ii) In step II, take the image of $f(x)$ in the *Y*-axis as plane mirror.

Thus, it can be plotted as shown in figure.



Note $f(|x|)$ is always an even function.

$f(x) \to |f(|x|)|$

Here, we plot $y = |f(|x|)|$ when graph of $f(|x|)$ is given, in two steps

(i) In step I, $f(x)$ transforms to $|f(x)|$.

(ii) In step II, $|f(x)|$ transforms to $|f(|x|)|$.

or

(i) $f(x) \to |f(x)|$ (ii) $f(x) \to |f(|x|)|$

e.g. Let graph for $f(x)$

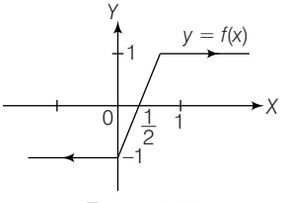


Figure 4.12

Now, $f(x) \to |f(x)|$ can be shown as,

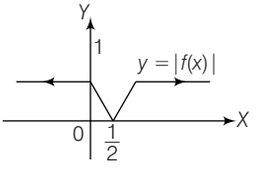

Figure 4.13

Again, $|f(x)| \to |f(|x|)|$ can be shown as,

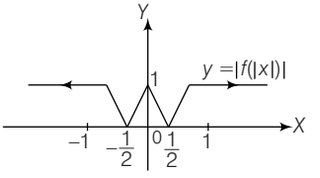

Figure 4.14

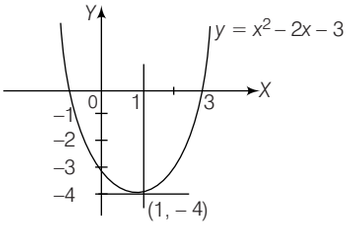
Example 17 Draw the graph for $y = \left||x|^2 - 2|x| - 3\right|$, if the graph for $y = x^2 - 2x - 3$ is given.

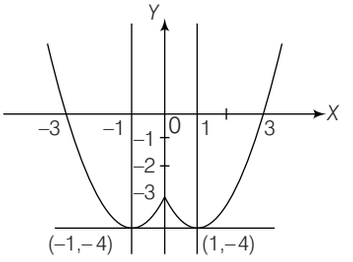
Sol. First we draw the graph for $y = x^2 - 2x - 3$

$\Rightarrow \quad (y + 4) = (x - 1)^2$



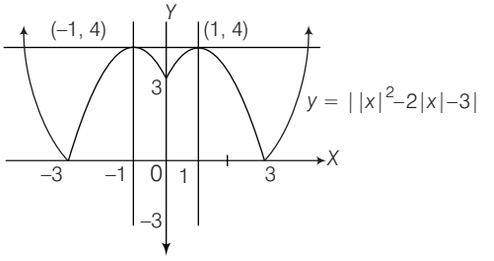
Now, we form $f(x) \to f(|x|)$,

i.e. $y = x^2 - 2x - 3 \Rightarrow y = |x|^2 - 2|x| - 3$ as shown below



In next step, we transform $f(x) = |f(|x|)|$,

i.e. $y = |x|^2 - 2|x| - 3 \to ||x|^2 - 2|x| - 3|$ as shown below



Remarks

Above mentioned transformations are very useful in explaining continuity and differentiability of functions as, if $y = \log(x)$, then

(i) $y = \log|x|$ can be plotted as shown in figure (4.15).

(ii) $y = |\log|x||$ can be plotted as shown in figure (4.16).

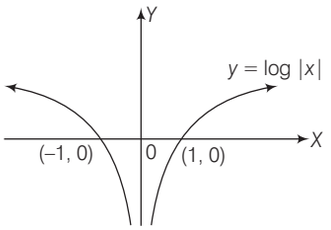


Figure 4.15

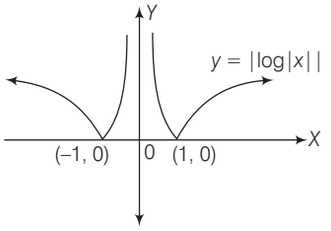

Figure 4.16

While discussing the case (i), we could say that it is continuous for all $x \in R - \{0\}$ and differentiable for all $x \in R - \{0\}$. Again, while discussing the case (ii), we could say that it is continuous for all $x \in R - \{0\}$ and differentiable at all $x \in R - \{-1,0,1\}$.
(As now it has sharp edges at $\{-1,1\}$ and is broken at $\{0\}$).

$|y| = f(x) \rightarrow y = f(x)$

When $y = f(x)$ is given

Clearly, $|y| > 0$, if $f(x) < 0$, graph of $|y| = f(x)$ would not exist.

And if $f(x) \geq 0$, $|y| = f(x)$ would be given as $y = \pm f(x)$.

Hence, the graph of $|y| = f(x)$ exists only in the regions, where $f(x)$ is non-negative and will be reflected about X-axis only when $f(x) \geq 0$. Region where $f(x) < 0$ will be neglected.

Or

To draw the graph of $|y| = f(x)$, we use following steps

(i) Remove the portion of the graph, which lies below X-axis.
[$\because$ the equation $|y| = f(x)$ is not satisfied when $f(x)$ is negative.]

(ii) Plot the remaining portion of the graph and also take its mirror image in the X-axis.
[$\because$ when $f(x) > 0$, then $y = \pm f(x)$]

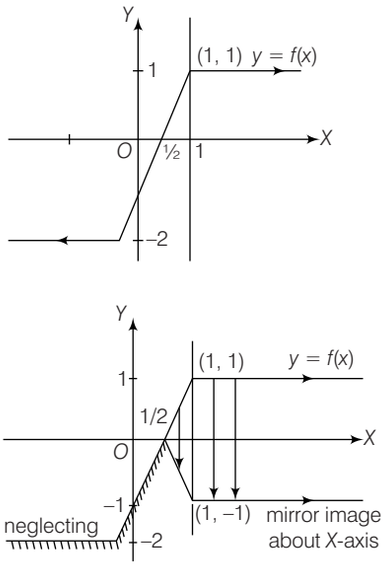

Figure 4.17

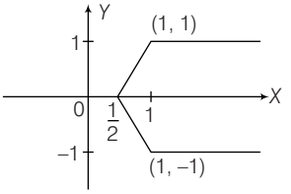
Finally, it is as shown

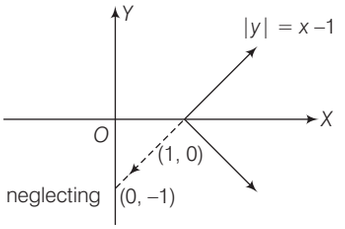


***Graph,* $|y| = f(x)$**
Figure 4.18

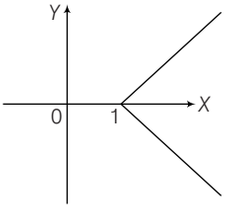
Example 18 Draw the graph for $|y| = (x - 1)$.

Sol. We know, here $|y| = (x - 1)$ exists only when $(x-1)$ is positive. Clearly $y = x - 1$ represent straight line the passing through (0, 1) and (0, –1).

$\therefore$ Neglecting negative values and will be reflected about X-axis. Thus, it can be drawn as shown.



Finally, it is shown as



Graph for $|y| = x - 1$

Example 19 Draw the graph for $|y| = (x - 1)(x - 2)$.

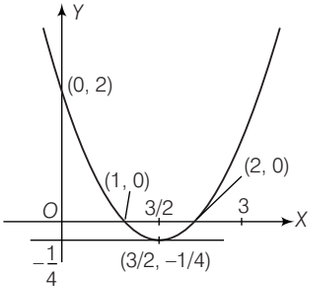
Sol. First we plot $y = (x - 1)(x - 2)$

$$\Rightarrow \quad y = x^2 - 3x + 2 \Rightarrow \left(x - \frac{3}{2}\right)^2 = \left(y + \frac{1}{4}\right)$$

It represent a parabola opening upwards having vertex $\left(\frac{3}{2}, -\frac{1}{4}\right)$.

It intersect X-axis at (0, 1) and (2, 0) and Y-axis at (0, 2).

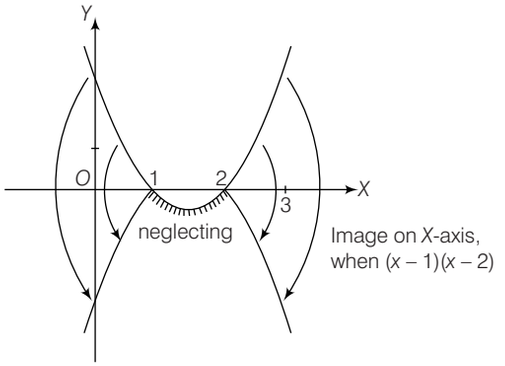
Thus, we can plot the figure as shown below.



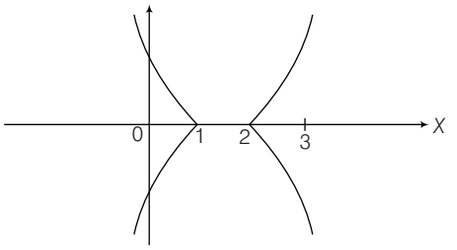
We know, $|y| = (x-1)(x-2)$ exists only, when $(x-1)(x-2) \geq 0$ and neglecting, if $(x-1)(x-2) < 0$.

Now, $f(x)$ will be reflected about X-axis, when $(x-1)(x-2) > 0$.

Thus, it can be plotted as shown.



Finally, $|y| = (x-1)(x-2)$ can be shown as

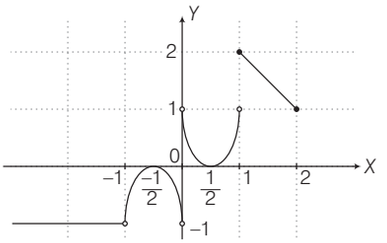


Summary

- $y = f(x)$ to $y = -f(x)$ — *Flip about the X-axis.*
- $y = f(x)$ to $y = f(-x)$ — *Flip about the Y-axis.*
- $y = f(x)$ to $y = |f(x)|$ — *Reflect the parts of the graph that lie in the lower half (negative parts) into the upper half of the axes.*
- $y = f(x)$ to $y = f(|x|)$ — *Discard the left part of the graph (for $x < 0$) and take a reflection of the right part of the graph into the left half of the axes.*
- $y = f(x)$ to $|y| = f(x)$ — *Discard the lower part of the graph ($f(x) < 0$) and take a reflection of the upper part of the graph into the lower half of the axes.*
- $y = f(x)$ to $y = f(x) + k$ — *Shift the graph $|k|$ units upwards or downwards depending on whether k is positive or negative respectively.*
- $y = f(x)$ to $y = f(x + k)$ — *Advance (shift left) or delay (shift right) the graph by $|k|$ units depending on whether k is positive or negative, respectively.*
- $y = f(x)$ to $y = kf(x)$ — *Stretch or compress the graph along the Y-axis depending on whether $|k| > 1$ or $|k| < 1$, respectively. Also, flip it about the X-axis, if k is negative (this latter statement follows from part 1).*
- $y = f(x)$ to $y = f(kx)$ — *Stretch or compress the graph along the X-axis depending on whether $|k| < 1$ or $|k| > 1$, respectively. Also, flip it about the Y-axis, if k is negative.*

Exercise for Session 3

1. Consider the following function f, whose graph is given below.



Draw the graph of the following functions.

(i) $|f(x)|$ (ii) $f(|x|)$ (iii) $|f(|x|) - 1|$

2. Plot the following functions.

(i) $y = |x^2 - 2x - 3|$ (ii) $y = x^2 - 2|x| - 3$ (iii) $y = |\log_2 x|$ (iv) $y = |\log_2 |x||$

(v) $y = \log_2 |1 - x|$ (vi) $y = \log_2 (2-x)^2$ (vii) $y = |\cos |x||$ (viii) $y = |2 - 2^x|$

(ix) $y = \sin(|x|)$ (x) $y = \cos(|x|)$

3. Plot the following functions.

(i) $|f(x)| = \log_2 x$ (ii) $|f(x)| = \log_2 (-x)$

4. Find the number of solutions of $\sin \pi x = |\log_e |x||$.

5. Find the number of solutions of

(i) $2^{|x|} = \sin x^2$ (ii) $\sin x = x^2 + x + 1$

Session 4

To draw $y = [f(x)]$, when the graph of $y = f(x)$ is given and $[\cdot]$ denotes greatest integer fuctions; To draw $y = f([x])$ when the graph of $y = f(x)$ is given; When $f(x)$ transforms to $y = f(\{x\})$; where $\{\cdot\}$ denotes fractional part of x, i.e. $\{x\} = x - [x]$; When $f(x)$ and $g(x)$ are Two Functions and are transformed to their Sum; To draw $f(x) \to 1/f(x) = h(x)$, To draw $y = f(x) \cdot \sin x$, When $f(x)$ & $g(x)$ are given, then find $h(x) = \max(f(x), g(x))$ or $h(x) = \min(f(x), g(x))$

To Draw $y = [f(x)]$

Where, $[\cdot]$ denotes greatest integral function {i.e. now y cannot be fraction}.

Here, in order to draw $y = [f(x)]$ mark the integer on Y-axis. Draw the horizontal lines through integers till they intersect the graph. Draw vertical dotted lines from these intersection points.

Finally, draw horizontal lines parallel to X-axis from any intersection point to the nearest vertical dotted line with blank dot at right end in case $f(x)$ increases.

Or

To plot $y = [f(x)]$, we use the following steps

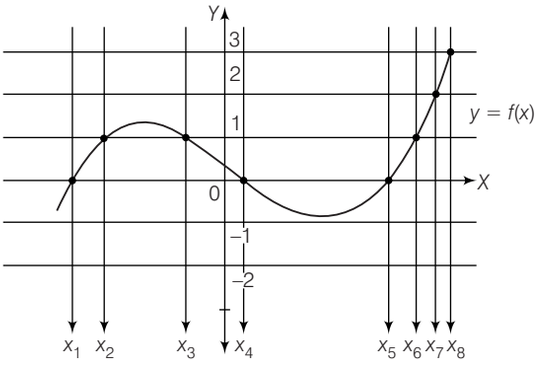
***Step* I** Plot $f(x)$.

***Step* II** Mark the intervals of unit length with integers as end points on Y-axis.

***Step* III** Mark the corresponding intervals {with the help of graph of $f(x)$} on X-axis.

***Step* IV** Plot the value of $[f(x)]$ for each of the marked intervals.

Graphically, it could be shown as



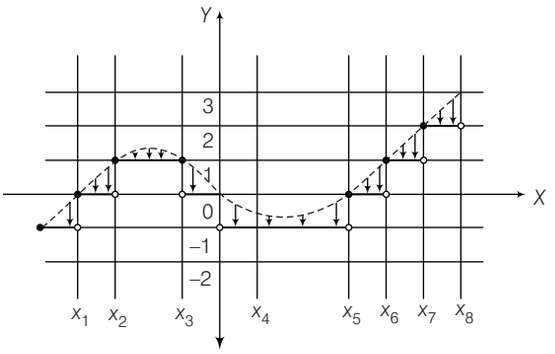


Figure 4.19

Example 20 Draw the graph of $y = [x^3]$, when $-2^{1/3} \le x \le 2^{1/3}$.

Sol. Here, in order to draw the graph of $y = [x^3]$.

***Step* I** First we draw the graph at $y = x^3$.

The function $f(x) = x^3$ is called the cube function. The domain and range of cube function is R. Since, $y = x^3$ is an odd function, so its graph is symmetrical in opposite quardrant.

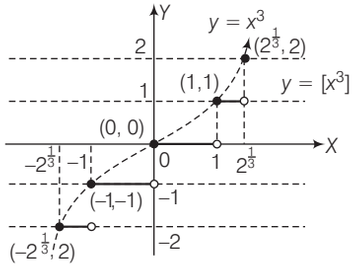
For $y = x^3$, we have following table.

x	0	1	$2^{1/3}$	-1	$-2^{1/3}$
y	0	1	2	-1	-2

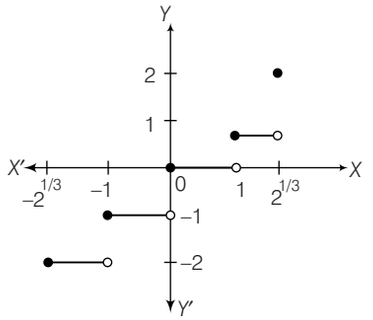
Now, plot the points (0,0) (1,1), $(2^{1/3},2)$, $(-1,-1)$ and $(-2^{1/3},2)$ and join them by free hand, we get the graph of $y = x^3$.

***Step* II** Draw horizontal lines through integers located on Y-axis till they intersect the graph.

***Step* III** Draw vertical dotted lines from these intersection points to intersect X-axis.



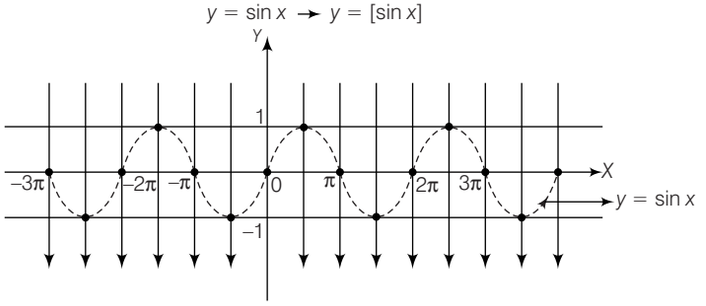
***Step* IV** Finally, draw horizontal lines parallel to X-axis from any intersection point to the nearest vertical dotted line with blank dot at right end.



***Graph for* $y = [x^3]$, $x \in [-2^{1/3}, 2^{1/3}]$**

Example 21 *Draw the graph of* $y = [\sin x]$.

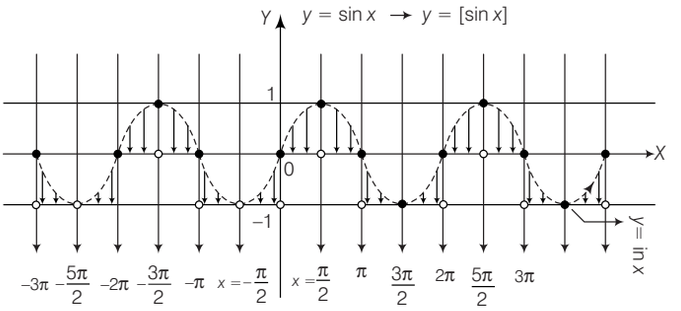
***Sol Step* I** First we draw the graph of $y = \sin x$ as (explained in Example 6) shown below.

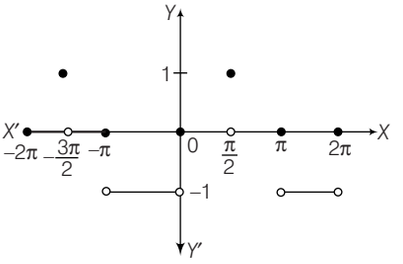


***Step* II** Now, draw horizontal lines through integers located as Y-axis till they intersect the graph.

***Step* III** Draw vertical lines from the intersection points to intersect X-axis.

***Step* IV** Finally, draw horizontal lines parallel to X-axis from any intersection point to the nearest vertical dotted line with blank dot at right end as shown below.





***Graph for* $y = [\sin x]$**

To draw $y = f[x]$

when the graph of $y = f(x)$ is given, following steps are used.

***Step* I** Plot the straight lines parallel to Y-axis for integral value of x, i.e. $n = \ldots -3, -2, -1, 0, 1, 2, 3$.

***Step* II** Now, mark the points of which $x = -3, x = -2, x = -1, x = 0, x = 1, \ldots$ on the curve.

***Step* III** Take the lower marked point for x (say) if $n < x < n + 1$, then take the point at $x = n$ and draw a horizontal line to the nearest vertical line formed by $x = n + 1$, proceeding in this way, we get required curve.

Mark the integers on the X-axis. Draw vertical lines till they intersect the graph of $f(x)$. From these intersection points, draw horizontal lines (parallel to X-axis) to meet the nearest right vertical line with a blank dot on each nearest right vertical line which can be shown as in the figure.

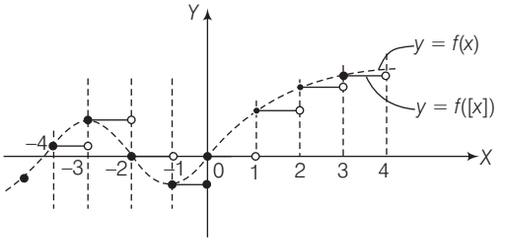


Figure 4.20

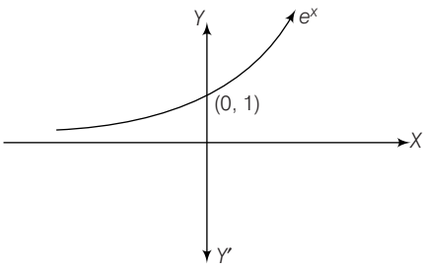
Example 22. Draw the curve $y = e^{[x]}$.

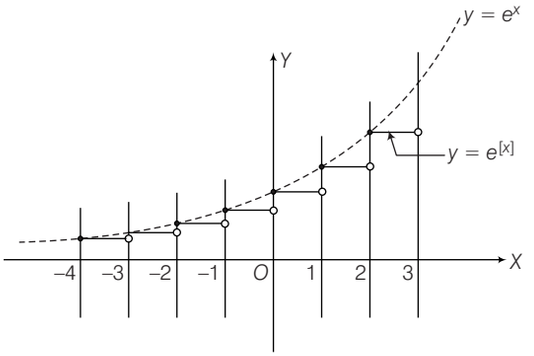
Sol. ***Step* I.** First we draw $y = e^x$ as shown below by figure.



***Step* II.** Draw straight lines parallel Y-axis for integer values of x.

***Step* III.** Now, mark the points as the curve for $n = -4, -3, -2, -1, 0, 1, 2, 3, \ldots$

***Step* IV.** Now, take the lower value of x $(= -4)$ and draw a horizontal line to the nearest vertical line with a blank dot at left end, as shown in figure given below.



To Plot $y = f(\{x\})$

Graph of $f(\{x\})$ can be obtained from the graph of $f(x)$ by following rule. ''Retain the graph of $f(x)$ for values of x lying between interval $[0, 1)$. Now, it can be repeated for rest of the points. (taking periodicity 1).

Now, obtained function is graph for $y = f(\{x\})$.

Graphically, it could be stated as

(i) Graph for $y = f(x)$ (ii) Graph for $y = f(\{x\})$

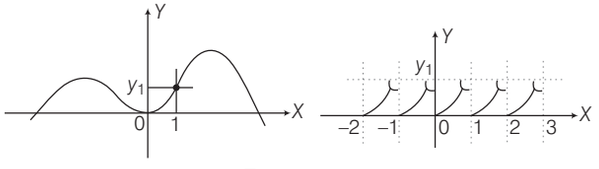


Figure 4.21

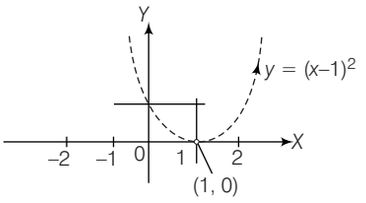
Example 23. ***Draw the graph for*** $y = (\{x\} - 1)^2$.

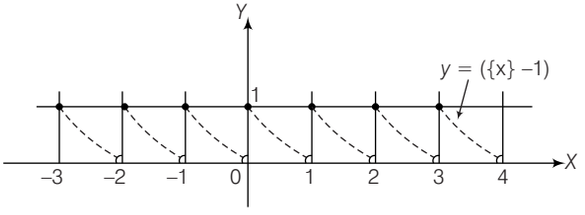
Sol. First we will draw the graph for $y = (x-1)^2$, clearly it represent a parabola opening upward and having vertex (1, 0) which could be ploted as shown below.



Graph for $y = (x-1)^2$

Now, to plot $y = (\{x\} - 1)^2$ retain the graph for the interval $x \in [0, 1)$ and repeat for length one as shown below.

Graph for $y = (\{x\} - 1)^2$



To Plot $y = f(x) + g(x)$, when $a \le g(x) \le b$

There is no direct approach, but we can use the following steps :

If maximum or minimum value of any one is known.

***Step* I** Find the maximum and minimum value of $g(x)$ say $a \le g(x) \le b$.

***Step* II** Plot the curve $f(x)$ between $f(x) + a$ to $f(x) + b$, i.e. $f(x) + a \le h(x) \le f(x) + b$.

***Step* III**

When $g(x) = 0$

$\Rightarrow \quad h(x) = f(x)$

***Step* IV**

When $g(x) > 0$, then $h(x) > f(x)$, i.e. the graph of $h(x)$ lies above the graph of $f(x)$.

***Step* V** When $g(x) < 0$, then $h(x) < f(x)$, i.e. the graph of $h(x)$ lies below the graph of $f(x)$.

The procedure is illustrated by following example.

Example 24 Plot $y = x + \sin x$.

Sol. Here, $y = f(x) + g(x) = x + \sin x$

where $f(x) = x$ and $g(x) = \sin x$.

As we know, $g(x) = \sin x \in [-1, 1]$

$\therefore \quad x - 1 \le y \le x + 1$ ...(i)

To sketch the curve between two parallel line $y = x + 1$ and $y = x - 1$.

Here, $g(x) = 0 \Rightarrow y = x$ ...(ii)

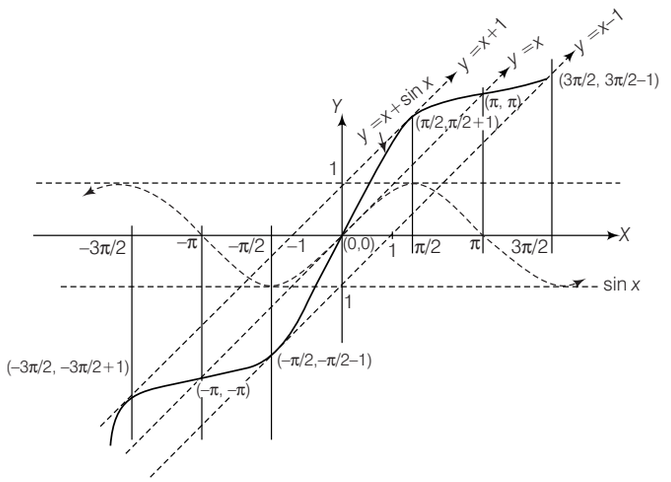
Also, when $g(x) > 0$

$\Rightarrow \quad x + \sin x > x$ ...(iii)

and when $g(x) < 0$

$\Rightarrow \quad x + \sin x < x \quad \ldots(iv)$

Using Eqs. (i), (ii), (iii) and (iv), we have the following graph.



When $f(x)$ Transforms to $\dfrac{1}{f(x)} = h(x)$

(i) when $f(x)$ increases, then $h(x)$ decreases.

(ii) when $f(x)$ decreases, then $h(x)$ increases.

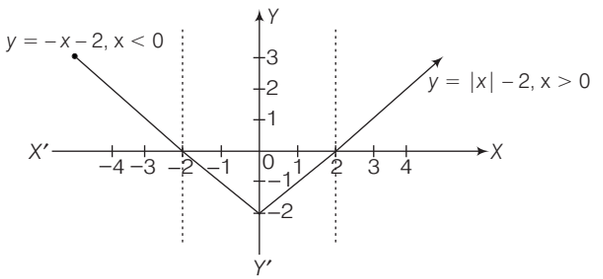
(iii) as $f(x) \to 0, h(x) \to +\infty$.

(iv) as $f(x) \to \infty, h(x) \to 0$.

(v) when $f(x) = \pm 1$, then $h(x)$ is also equal to ± 1.

Example 25 Plot $y = |x| - 2$ and hence $f(x) = \dfrac{1}{|x| - 2}$.

Sol. First we plot $y = |x| - 2$ as explained in Example 2. The graph is shown below.



Here, (i) $y = |x| - 2$ increases when $x > 0$

$\Rightarrow \quad f(x) = \dfrac{1}{|x| - 2}$ decreases when $x > 0$

and (ii) $y = |x| - 2$ decreases when $x < 0$

$\Rightarrow \quad f(x) = \dfrac{1}{|x| - 2}$ increases when $x < 0$

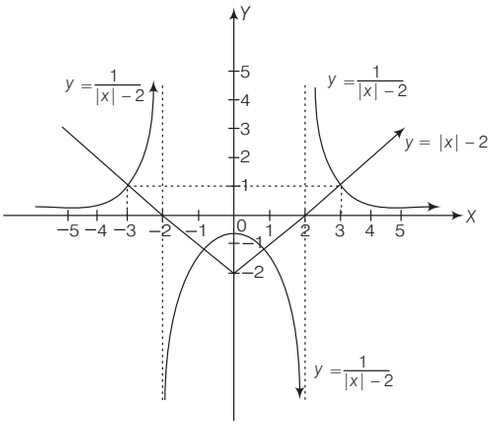
(iii) As, $y \to 0 \Rightarrow x = \pm 2 \Rightarrow f(x) \to \infty$ as $x = \pm 2$

(iv) As, $f(x) \to 0$, i.e. $\dfrac{1}{|x| - 2} \to 0$ as $x \to \infty$

and when $x \to \infty \Rightarrow y = |x| - 2 \to \infty$

(v) $y = \pm 1 \Rightarrow f(x) = \pm 1$

$\therefore$ $f(x)$ could be plotted as,



To Plot the Graph of $y = f(x) \cdot \sin x$, when Graph of $y = f(x)$ is given

Clearly, $-f(x) \le f(x) \cdot \sin x \le f(x) \quad [\text{as } -1 \le \sin x \le 1]$

Hence, graph for $y = f(x) \cdot \sin x$ would be lying between the graph of $y = f(x)$ and $y = -f(x)$. It amounts to just drawing graph of $\sin x$ in between the graphs of $y = \pm f(x)$.

The procedure is illustrated by following example.

Example 26 Let $f(x) = \begin{cases} x \sin \dfrac{1}{x}, & x \neq 0 \\ 0, & x = 0 \end{cases}$

and $g(x) = \begin{cases} x^2 \sin \dfrac{1}{x}, & x \neq 0 \\ 0, & x = 0 \end{cases}$.

Discuss the graph for $f(x)$ and $g(x)$, and evaluate the continuity and differentiability of $f(x)$ and $g(x)$.

Sol. We will first try to graphically understand the behaviour of these two functions and then verify our results analytically. Notice that no matter what the argument of the sine function is, its magnitude will always remain between -1 and 1.

Therefore, $\left| x \sin \dfrac{1}{x} \right| \le |x|$ and $\left| x^2 \sin \dfrac{1}{x} \right| \le |x|^2$

This means that the graph of $x \sin \dfrac{1}{x}$ will always lie between the lines $y = \pm x$ and the graph of $x^2 \sin \dfrac{1}{x}$ will always lie between the two curves $y = \pm x^2$. Also, notice that as $|x|$ increases, $\dfrac{1}{x}$ decreases in a progressively slower manner while when $|x|$ is close to 0, the increase in $\dfrac{1}{x}$ is very fast (as $|x|$ decreases visualise the graph of $y = 1/x$).

This means that near the origin, the variation in the graph of $\sin\frac{1}{x}$ will be extremely rapid because the successive zeroes of the graph will become closer and closer. As we keep on increasing x, the variation will become slower and slower and the graph will 'spread out'.

For example, for $x > \frac{1}{\pi}$ there will not be finite root of the function. Only when $x \to \infty$, $\sin\frac{1}{x}$ will again approach 0.

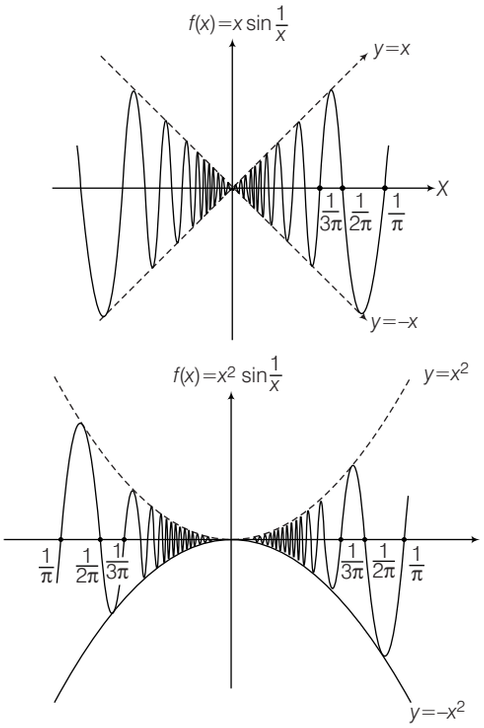


Figure 4.22

Remarks

Notice how the lines $y = \pm x$ 'envelope' the graph of the function in the first case and the curves $y = \pm x^2$ 'envelope' the graph of the function in the second case.

The envelopes shrink to zero vertical width at the origin in both cases. Therefore, we must have

$$\lim_{x \to 0} x \sin\frac{1}{x} = 0 \text{ and } \lim_{x \to 0} x^2 \sin\frac{1}{x} = 0.$$

(This is also analytically obvious; $\sin\frac{1}{x}$ is a finite number between -1 and 1; when it gets multiplied by x (where $x \to 0$) the whole product gets infinitesimally small).

Now lets try to get a 'feel' on what will happen to the derivatives of these two functions at the origin.

For $f(x) = x \sin\frac{1}{x}$, the slope of the envelope is constant (± 1).

Thus, the sinusoidal function inside the envelope will keep on oscillating as we approach the origin, while shrinking in width due to the shrinking envelope. The slope of the curve also keeps on changing and does not approach a fixed value.

However, for $g(x) = x^2 \sin\frac{1}{x}$, the slope of the envelope is itself decreasing as we approach the origin, apart from shrinking in width. This envelope will 'compress' or 'harmmer out' or 'flatten' the sin oscillations near the origin. What should therefore happen to the derivative? It should become 0 at the origin!

Let us 'zoom in' on the graphs of both the functions around the origin, to see what is happening.

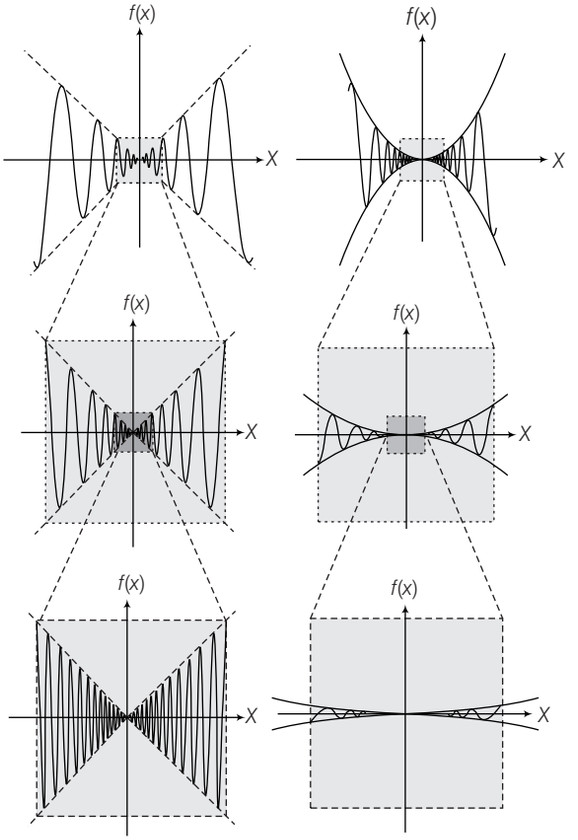

Figure 4.23

These graphs are not very accurate and are only of an approximate nature; but they do give us some feeling on the behaviour of these two functions near the origin.

The $x \sin\frac{1}{x}$ graph keeps 'continuing' in the same manner no matter how much we zoom in; however, in the $x^2 \sin\frac{1}{x}$ graph, the decreasing slope of the envelope itself tends to flatten out the curve and make its slope tend to 0. Hence, the derivative of $x \sin\frac{1}{x}$ at the origin will not have any definite value, while the derivative of $x^2 \sin\frac{1}{x}$ will be 0 at the origin.

Lets verify this analytically

(i) $\boldsymbol{f(x) = x \sin\frac{1}{x}}$ **at** $\boldsymbol{x = 0}$.

$$\text{LHD} = \text{RHD} = \lim_{h \to 0} \frac{f(h) - f(0)}{h} = \lim_{h \to 0} \frac{h \sin\frac{1}{h}}{h} = \lim_{h \to 0} \left(\sin\frac{1}{h}\right)$$

This limit, as we know does not exist; hence, the derivative for $f(x)$ does not exist at $x = 0$

(ii) $f(x) = x^2 \sin\frac{1}{x}$ at $x = 0$

$$\text{LHD} = \text{RHD} = \lim_{h\to 0}\frac{h^2\sin\frac{1}{h} - 0}{h} = \lim_{h\to 0} h\sin\frac{1}{h} = 0.$$

To Find $h(x) = \max(f(x), g(x))$ or $h(x) = \min(f(x), g(x))$ when $f(x)$ and $g(x)$ are given

(i) $h(x) = \max\{f(x), g(x)\}$

$$\because \quad h(x) = \begin{cases} f(x), & \text{when } f(x) > g(x) \\ g(x), & \text{when } f(x) < g(x) \end{cases}$$

To draw the graph of $y = \max\{f(x), g(x)\}$, first we draw the graphs of both the functions $f(x)$ and $g(x)$ and find their point of intersection.

Then, we find any two consecutive points of intersection. In between these points $f(x) > g(x)$, then in order to draw the graph of $\max\{f(x), g(x)\}$, we take those segments of $f(x)$ for which $f(x) > g(x)$ between any two consecutive points of intersection of $f(x)$ and $g(x)$.

(ii) $h(x) = \min\{f(x), g(x)\}$

$$\because \quad h(x) = \begin{cases} f(x), & \text{when } f(x) < g(x) \\ g(x), & \text{when } g(x) < f(x) \end{cases}$$

Similarly, in order to draw the graph of $\min\{f(x), g(x)\}$ we take those segments of $f(x)$ for which $f(x) < g(x)$, between any two consecutive points of intersection of $f(x)$ and $g(x)$.

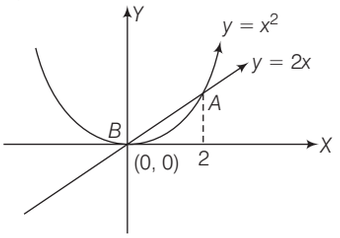
Example 27 *Draw graph for* $y = \max\{2x, x^2\}$ *and discuss the continuity and differentiability.*

Sol. Here, to draw, $y = \max\{2x, x^2\}$.

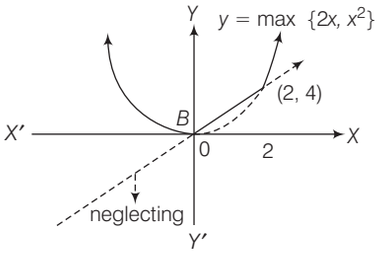
First, plot $y = 2x$ and $y = x^2$ on graph and put $2x = x^2$

$\Rightarrow x = 0, 2$ (i.e. their point of intersection).

Clearly, $y = x^2$ represent a parabola open upward with vertex (0, 0) and $y = 2x$ represent a straight line pointing through (0, 0).



Now, since $y = \max\{2x, x^2\}$ we have to neglect the curve below the point of intersections thus, the required graph is, as shown below.



Thus, from the given graph $y = \max\{2x, x^2\}$, we can say $y = \max\{2x, x^2\}$ is continuous for all $x \in R$.

But $y = \max\{2x, x^2\}$ is differentiable for all $x \in R - \{0,2\}$. As at $x = 0, 2$ curve has corner point.

Remarks

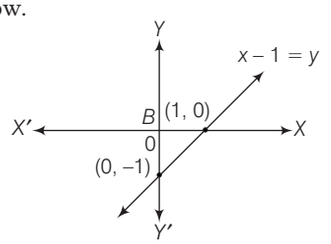
One must remember the formula, we can write

$$\max\{f(x), g(x)\} = \frac{f(x) + g(x)}{2} + \left|\frac{f(x) - g(x)}{2}\right|$$

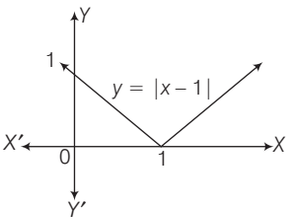
$$\text{and } \min\{f(x), g(x)\} = \frac{f(x) + g(x)}{2} - \left|\frac{f(x) - g(x)}{2}\right|.$$

Example 28 *Draw the graph for* $y = |2 - |x - 1||$.

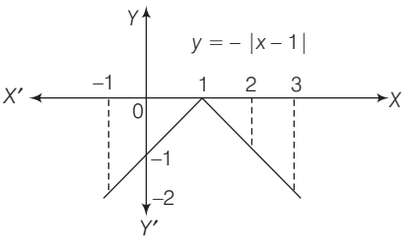
Sol. First we plot $y = x - 1$, it is a straight line intersecting X and Y-axes at (1, 0) and (0, −1), respectively. The graph is shown below.



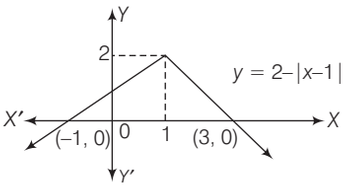
$\Rightarrow$ Now, we plot $y = |x - 1|$, For this, the portion of the graph remain same which lines above the X-axis and reflect the negative portion of the graph about X-axis.



$\Rightarrow$ Now, to plot $y = -|x - 1|$ take the mirror image of the graph of $|x - 1|$ in the X-axis as plane mirror.

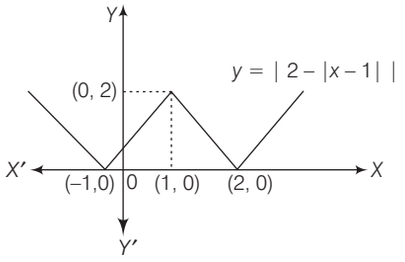


To find the graph of $2-|x-1|$. Shift the graph of $y=-|x-1|$ upward through 2 units.



To find the graph of $|2-|x-1||$, reflect the negative portion of the graph of $2-|x-1|$ in X-axis.

Thus, $y=|2-|x-1||$ can be plotted as shown below.



Remark

From above figure we could say $y=|2-|x-1||$ is not differentiable at $x=\{-1, 1, 3\}$ as sharp edges at $x=-1, 1, 3$.

Example 29 Let $h(x)=\min\{x; x^2\}$ for every real number of x. Then, which one of the following is true?

[IIT JEE 1998]

(a) h is not continuous for all x

(b) h is differentiable for all x

(c) $h'(x)=1$, for all x

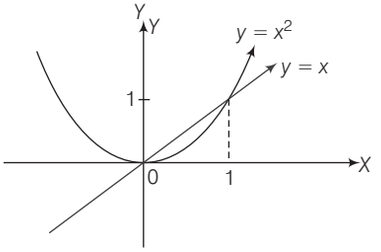
(d) h is not differentiable at two values of x

Sol. Here, $h(x)=\min\{x; x^2\}$ can be drawn on graph in two steps.

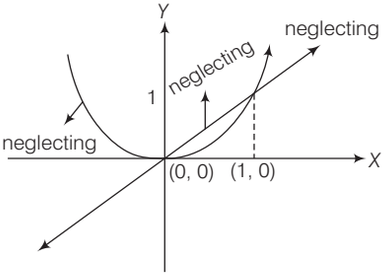
(a) Draw the graph of $y=x$ and $y=x^2$, also find their point of intersection.

i.e. $x=x^2 \Rightarrow \quad x=0, 1$

Thus, points of intersection are (0, 0) and (1,1).



(b) To find $h(x)=\min\{x; x^2\}$ neglecting the graph above the point of intersection, we get



Thus, from the given graph,

$$h(x)=\begin{cases} x, & x\le 0 \text{ or } x\ge 1 \\ x^2, & 0\le x\le 1 \end{cases}$$

which shows $h(x)$ is continuous for all x. But not differentiable at $x=\{0, 1\}$.

Thus, $h(x)$ is not differentiable at two values of x.

Hence, (d) is the correct answer.

Exercise for Session 4

1. Plot the following, where [.] denotes greatest integer function.

(i) $f(x)=[x^2]$, when $-2\le x\le 2$ (ii) $f(x)=[|x|]$ (iii) $f(x)=[|x-2|]$ (iv) $f(x)=[|x|-2]$

(v) $f(x)=\sin^{-1}(\sin|x|)$ (vi) $f(x)=[\cos^{-1}x]$ (vii) $f(x)=\cos(x-[x])$ (viii) $f(x)=[\sin^{-1}(\sin x)]$

2. Plot the graph for $f(x)=\min(x-[x], -x-[-x])$.

3. Find the area enclosed by the curves

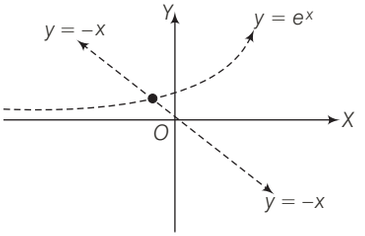
(i) $\max(|x|, |y|)=1$ (ii) $\max(2|x|, 2|y|)=1$ (iii) $\max(|x+y|, |x-y|)=1$

JEE Type Solved Examples :
Single Option Correct Type Questions

● **Ex. 1** *The number of real solutions of the equation* $e^x + x = 0$ *is*

(a) 0 (b) 1
(c) 2 (d) None of these

Sol. (*b*) It is evident from figure that the curves $y = e^x$ and $y = -x$ intersect exactly at one point. So, the equation $e^x = -x$ or $e^x + x = 0$ has one real solution.

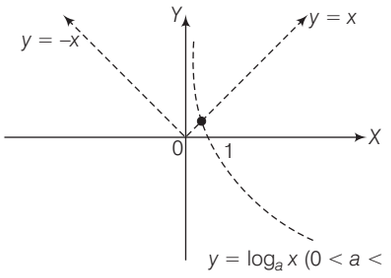


● **Ex. 2** *The number of real solutions of the equation* $\log_a x = |x|, 0 < a < 1$, *is*

(a) 0 (b) 1
(c) 2 (d) None of these

Sol. (*b*) The number of real solutions of the equation $\log_a x = |x|$ is equal to the number of points of intersection of the curves.

$y = \log_a x$ and $y = |x| \quad (0 < a < 1)$



It is evident from the graph that the two curves intersect at one point only.

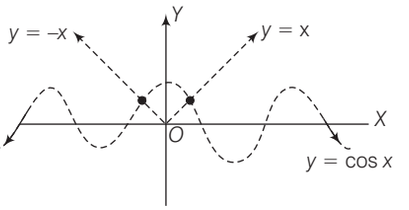
∴ One real solution lying in (0, 1).

● **Ex. 3** *The number of solutions of the equation* $|x| = \cos x$ *is*

(a) 0 (b) 1
(c) 2 (d) 3

Sol. (*c*) The number of real solutions of the equation $|x| = \cos x$ is equal to the number of point of intersection of the curves.

$y = |x|$ and $y = \cos x$ shown as;



It is evident from the graph that the two curves intersect at two points only.

∴ Two real solutions lying in $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$.

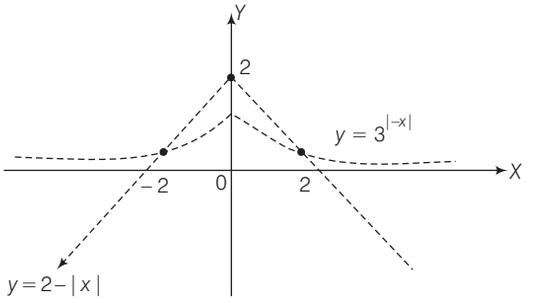
● **Ex. 4** *How many roots does the following equation possess* $3^{|x|}\{|2 - |x||\} = 1$?

(a) 1 (b) 2 (c) 3 (d) 4

Sol. (*b*) Here, $3^{|x|}\{|2 - |x||\} = 1$

$\Rightarrow \quad 2 - |x| = 3^{-|x|}$

In order to determine the number of roots, it is sufficient to find the points of intersection of the curves $y = 2 - |x|$ and $y = 3^{-|x|}$, shown as;



We observe the two curves intersect at two points.
∴ Two real solutions ∈ (–2, 2).

● **Ex. 5** *The number of real solutions of the equation* $x^2 = 1 - |x - 5|$ *is*

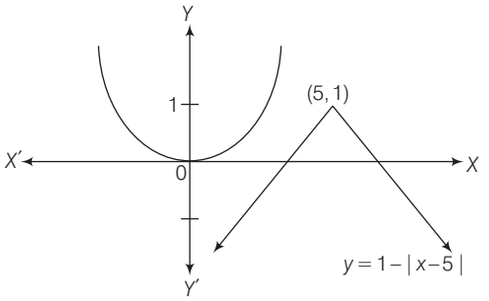
(a) 1 (b) 2
(c) 4 (d) None of these

Sol. (*d*) The number of real solutions of the equation

$$x^2 = 1 - |x - 5|$$

is equal to the number of points of intersection of the curves.

$y = x^2$ and $y = 1 - |x - 5|$, shown as;



It is evident from the graph that the two curves do not intersect.

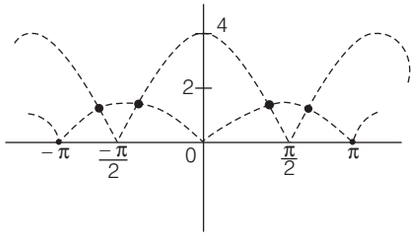
∴ No solution.

● ***Ex. 6*** *Number of solutions for* $2^{\sin|x|} = 4^{|\cos x|}$ *in* $[-\pi, \pi]$ *is equal to*

(a) 2 (b) 4
(c) 6 (d) 8

Sol. (*b*) The total number of solutions for the given equation is equal to the number of points of intersection of curves $y = 4^{|\cos x|}$ and $y = 2^{\sin|x|}$.

Clearly, the two curves intersect at four points. So, there are four solutions of the given equation.



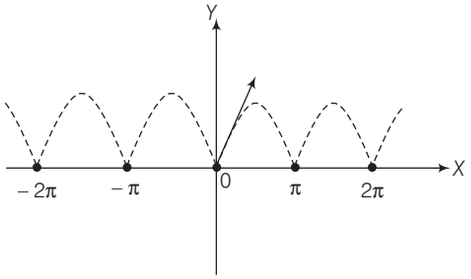
● ***Ex. 7*** *Number of roots of* $|\sin|x|| = x + |x|$ *in* $[-2\pi, 2\pi]$ *is*

(a) 2 (b) 3
(c) 4 (d) 6

Sol. (*b*) The total number of solutions for the given equation is equal to the number of points of intersection of the curves.

$$y = |\sin|x||$$

and $$y = x + |x| = \begin{cases} 2x, & x \geq 0 \\ 0, & x < 0 \end{cases}$$



Clearly, the two curves intersect at three points.

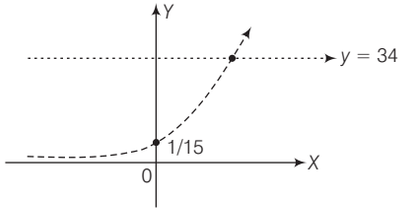
∴ There are three solutions.

● ***Ex. 8*** *The equation* $3^{x-1} + 5^{x-1} = 34$ *has*

(a) one solution (b) two solutions
(c) three solutions (d) four solutions

Sol. (*a*) The total number of solutions is same as the number of points of intersection of the curves.

$$y = 3^{x-1} + 5^{x-1} \text{ and } y = 34$$



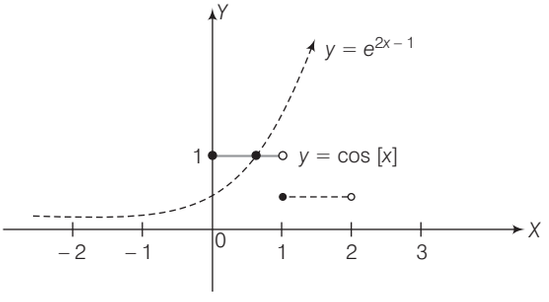
It is evident that these two curves intersect at exactly one point.

∴ Exactly one solution.

● ***Ex. 9*** *The number of solutions of the equation* $\cos[x] = e^{2x-1}$, $x \in [0, 2\pi]$, *where* [.] *denotes the greatest integer function is*

(a) 1 (b) 2
(c) 3 (d) 4

Sol. (*a*) It is evident from the graph the two curves intersect at only one point.



JEE Type Solved Examples :
More than One Correct Option Type Questions

● ***Ex. 10*** *Let* $g(x)=\sqrt{x-2k}, \forall\ 2k \le x < 2(k+1)$ *where,* $k \in I$, *then*

(a) $g(x)=\sqrt{x+2}, -2 \le x < 0$

(b) $g(x)=\sqrt{x-2}, 2 \le x < 4$

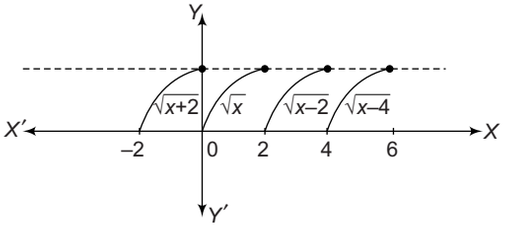
(c) $g(x)=\sqrt{x}, 0 \le x < 2$

(d) period of $g(x)$ is 2

Sol. (*a,b,c,d*) Given, $g(x)=\sqrt{x-2k}, \forall\ 2k \le x < 2(k+1), \forall\ k \in I$

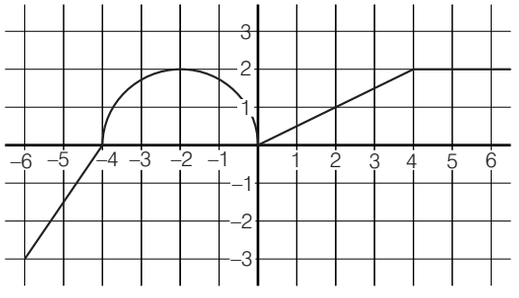
$$= \begin{cases} \ldots\ldots \\ \ldots\ldots \\ \sqrt{x+2}, & -2 \le x < 0 \\ \sqrt{x}, & 0 \le x < 2 \\ \sqrt{x-2}, & 2 \le x < 4 \\ \sqrt{x-4}, & 4 \le x < 6 \\ \ldots\ldots \\ \ldots\ldots \end{cases}$$

The graph of $g(x)$ is shown below

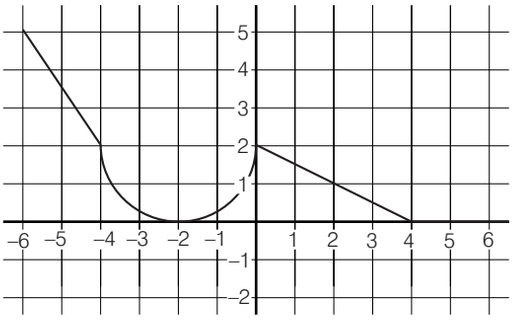


Clearly, $g(x)$ is periodic with period 2.

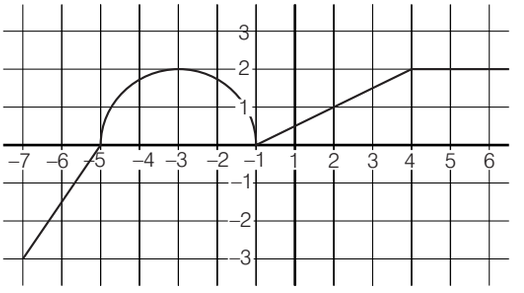
● ***Ex. 11*** *The graph of* $f(x)$ *is given below.*



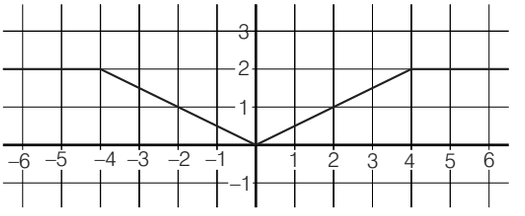
Then, (a) Graph of $-f(x)+2$ is



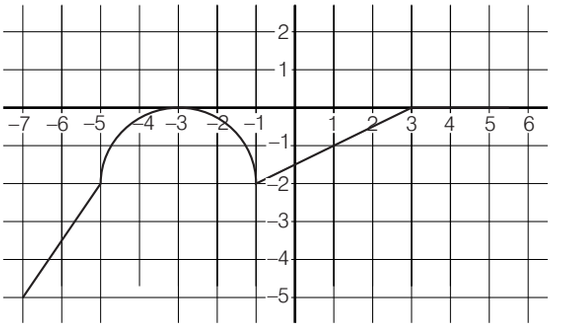
(b) Graph of $-f(x-1)$ is



(c) Graph of $f(|x|)$ is

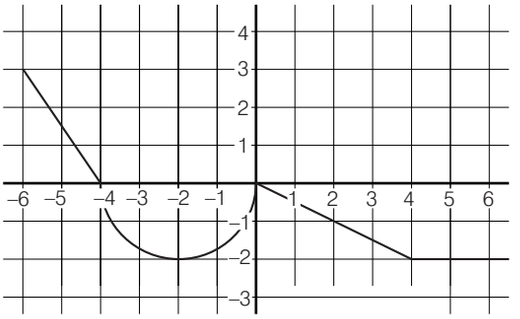


(d) Graph of $f(x+1)-2$ is

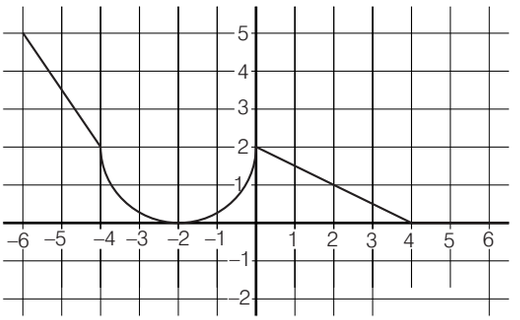


Sol. (*a,c,d*)

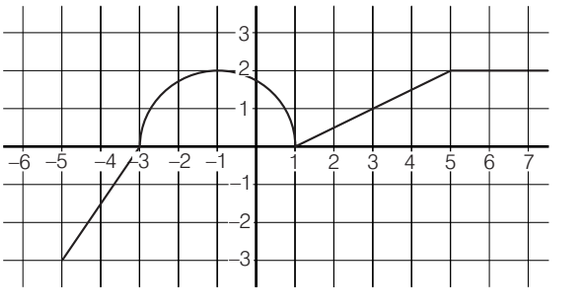
(a) For the graph of $-f(x)+2$, first flip the graph of $y=f(x)$ about, X-axis to get $y=-f(x)$



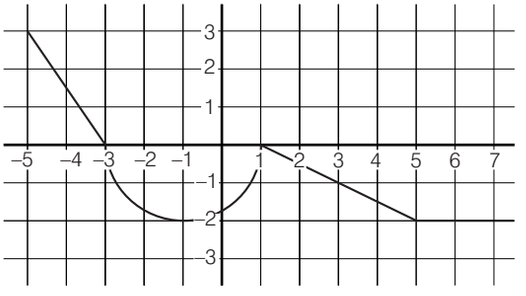
Now, shift the above graph 2 units upward to get $y=2-f(x)$



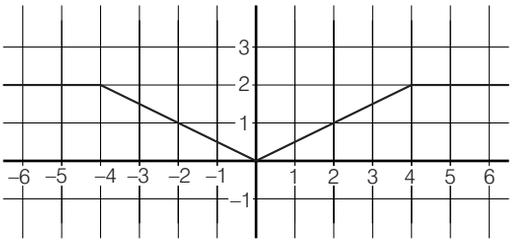
(b) First shift the graph of $f(x)$, through 1 unit right to get $y=f(x-1)$



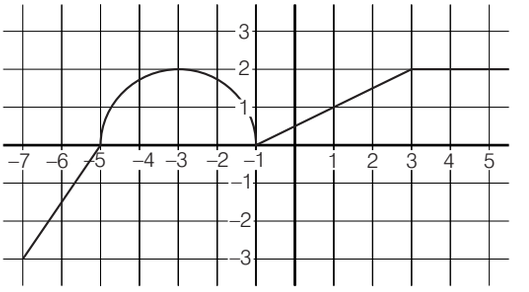
Now, flip the above graph about X-axis to get $y=-f(x-1)$



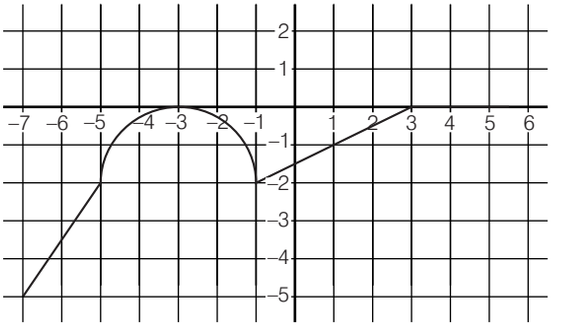
(c) For $y=f(|x|)$, neglect the graph of $y=f(x)$ for $x<0$, and take the mirror image of $y=f(x)$ for $x>0$ about Y-axis, keeping $y=f(x)$ for $x>0$



(d) For $y=f(x+1)-2$, shift the graph of $y=f(x)$, 1 unit left to get $y=f(x+1)$



Now, shift the above graph 2 units downwards to get $f(x+1)-2$



JEE Type Solved Examples :
Single Integer Answer Type Questions

● ***Ex. 12*** *The number of solutions of the equation* $[y+[y]]=2\cos x$, *where* $y=\frac{1}{3}[\sin x+[\sin x+[\sin x]]]$, *where* $[\cdot]$ *denotes the greatest integer function, is*

Sol. Here, $[y+[y]]=2\cos x$

or $[y]+[y]=2\cos x \quad [\because [x+h]=[x]+h, \forall\ x\in I]$

or $2[y]=2\cos x$

or $[y]=\cos x$ ...(i)

Also, $y=\frac{1}{3}[\sin x+[\sin x+[\sin x]]]$

$y=\frac{1}{3}(3[\sin x])$

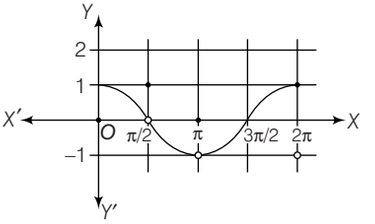
$y=[\sin x]$ ...(ii)

From Eqs. (i) and (ii), we have

$[[\sin x]]=\cos x$

or $[\sin x]=\cos x$

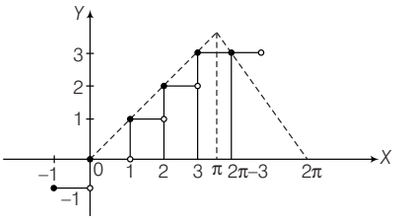
The graph of $y=[\sin x]$ and $y=\cos x$ is shown below.



∴ The number of solution zero.

● ***Ex. 13*** *The sum of the roots of the equation* $\cos^{-1}(\cos x)=[x]$, *where* $[x]$ *denotes greatest integer function, is*

Sol. The graph of $\cos^{-1}(\cos x)=[x]$ is shown below.

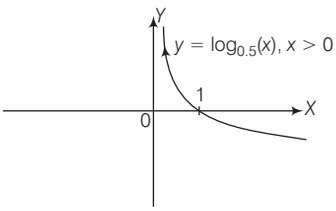


Solutions are clearly 0, 1, 2, 3 and $2\pi-3$.
Hence, there are 5 solutions.

Subjective Type Questions

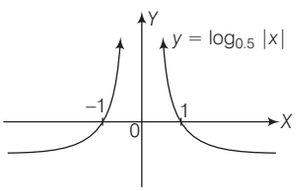
● ***Ex. 14*** *Sketch the graph of* $y=\log_{0.5}|x|$.

Sol. As we know, $y=\log_{0.5}x$ is a decreasing graph given as;



Since, $f(x)\to f(|x|)$, then taking the images about Y-axis for $x>0$

∴ $y=\log_{0.5}|x|$ could be plotted as;



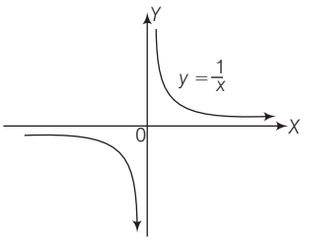
● ***Ex. 15*** *Sketch the graph for* $y=\left|\left|\frac{1}{x}\right|-3\right|$.

Sol. Here, we follow certain steps to plot

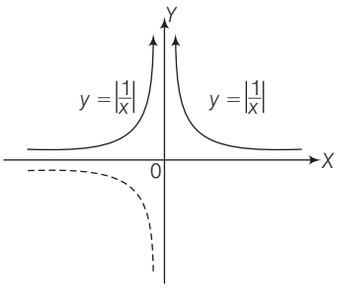
$y=\left|\left|\frac{1}{x}\right|-3\right|$, as first we plot $\frac{1}{x}$

and then successively $\left|\frac{1}{x}\right|$, $\left|\frac{1}{x}\right|-3$, $\left|\left|\frac{1}{x}\right|-3\right|$.

(i) The graph of $\frac{1}{x}$ is shown below

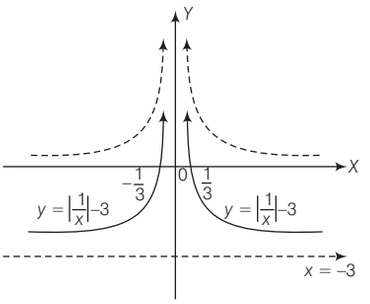


(ii) $\frac{1}{x} \to \left|\frac{1}{x}\right|$ To draw the graph of $\left|\frac{1}{x}\right|$ taking mirror images about X-axis for negative values of $\frac{1}{x}$ in the graph of $\frac{1}{x}$.



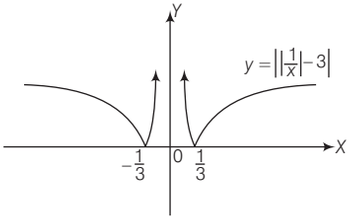
(iii) $\left|\frac{1}{x}\right| \to \left|\frac{1}{x}\right| - 3$

Shift the graph of $\left|\frac{1}{x}\right|$ through 3 units downward.



(iv) $\left|\frac{1}{x}\right| - 3 \to \left|\left|\frac{1}{x}\right| - 3\right|$

To draw the graph of $\left|\left|\frac{1}{x}\right| - 3\right|$, taking mirror images about X-axis for negative value of $\left|\frac{1}{x}\right| - 3$ in the graph of $\left|\frac{1}{x}\right| - 3$.

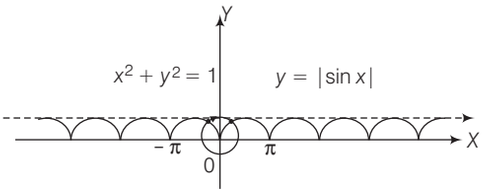


● ***Ex. 16*** *Find the number of solutions of the equations* $y = |\sin x|$ *and* $x^2 + y^2 = 1$.

Sol. To find the number of solutions of two curves we should find the point of intersection of two curves.

As we know, $x^2 + y^2 = 1$ is a circle and $y = |\sin x|$ is the image of negative values of $y = \sin x$ about X-axis. Thus, we can plot them as; which shows the two curves intersects at two points.

∴ Number of solutions is 2.



● ***Ex. 17*** *Find the number of solutions of* $4\{x\} = x + [x]$.

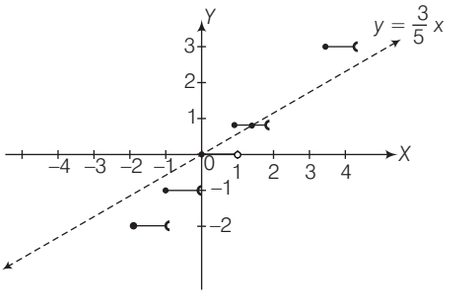
Sol. Here, $4\{x\} = x + [x]$

$\Rightarrow$ $4(x - [x]) = x + [x]$ $[\because \{x\} = x - [x]]$

$\Rightarrow$ $3x = 5[x]$

$\Rightarrow$ $[x] = \frac{3}{5}x$

To find their solution we plot the graph of both $y = [x]$ and $y = \frac{3}{5}x$,



i.e. The two graphs intersects when $[x] = 0$ and 1

$\Rightarrow$ $x = 0$ and $x = \frac{5}{3}$

● ***Ex. 18*** *Sketch the graph of* $\left|\sin x + \frac{1}{2}\right|$.

Sol. We follow certain steps to plot $\left|\sin x + \frac{1}{2}\right|$,

i.e. $\sin x \to \sin x + \frac{1}{2} \to \left|\sin x + \frac{1}{2}\right|$

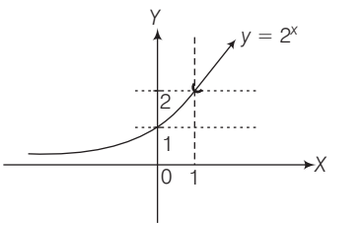
Remarks

Plotting graph of $f(x - [x])$:

Graph of $f(x - [x])$ can be obtained from the graph of $f(x)$ by the following rule.

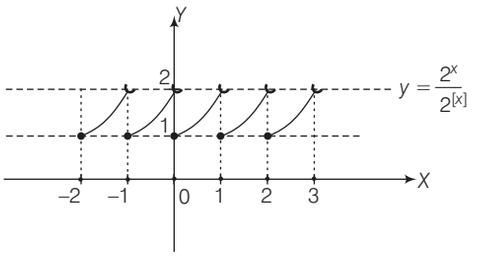
"Retain the graph of $f(x)$ for values of x lying between interval [0, 1). Now, it can be repeated for rest of points. Now, obtained function is periodic with period 1."

● ***Ex. 19*** *Sketch the graph of* $y = \dfrac{2^x}{2^{[x]}}$.



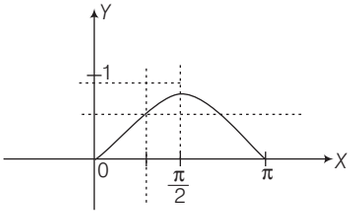
Sol. As we know, 2^x is exponential function and we want to transform it to $2^{x-[x]}$, it retains, the graph for $x \in [0, 1)$ and repeat for rest points.

Here, to retain graph between $x \in [0, 1)$, so we get

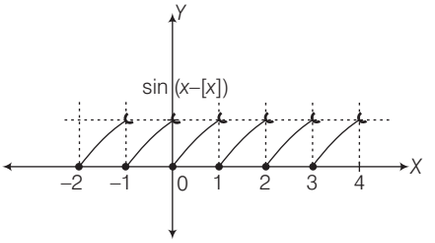


● ***Ex. 20*** *Sketch the region for* $y = \sin(x - [x])$.

Sol. We know, $y = \sin x$ is the periodic function. So, to plot the graph between $x \in [0, 1)$ and repeat for all values of x.

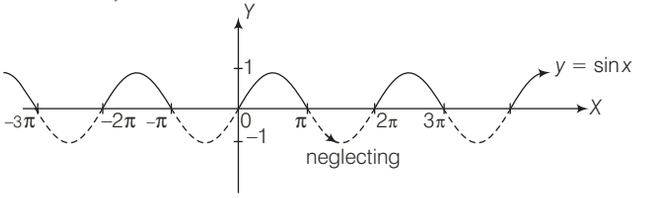


i.e. To retain the graph between $x \in [0, 1)$.

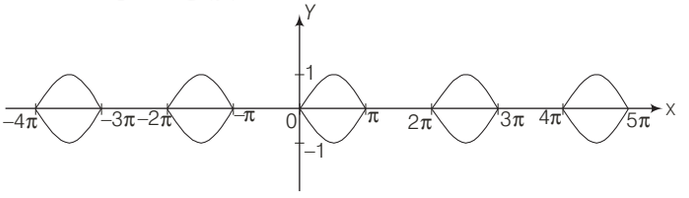


● ***Ex. 21*** *Sketch the region for* $|y| = \sin x$.

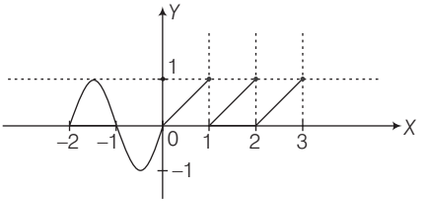
Sol. We know, $y = \sin x$ is a periodic function. So, to plot $|y| = \sin x$ neglect all the points for which y is negative and take the image for positive values of y about X-axis shown as;



Now, plotting, $|y| = \sin x$.



● ***Ex. 22*** *Consider the following function f whose graph is given below.*



Draw the graph of following functions.

(a) $f(x)+1$ (b) $f(x)-1$ (c) $-f(x)$

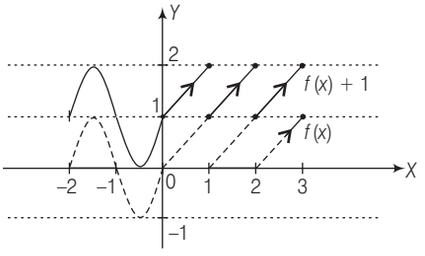
(d) $|f(x)|$ (e) $f(-x)$ (f) $f(|x|)$

(g) $2f(x)$ (h) $f(2x)$ (i) $[f(x)]$

(j) $f(x-[x])$

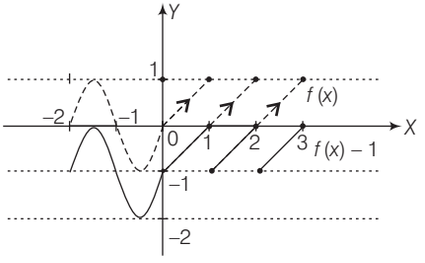
Sol. (a) $f(x) \to f(x)+1$

To draw the graph of $f(x)+1$, shift the graph of $f(x)$ through 1 unit upward.



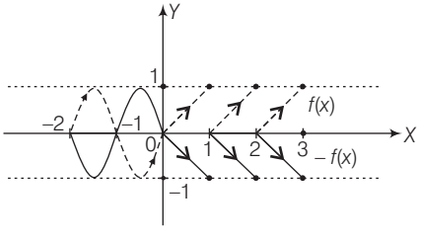
(b) $f(x) \to f(x)-1$

To draw the graph of $f(x)-1$, shift the graph of $f(x)$ through 1 unit downward.

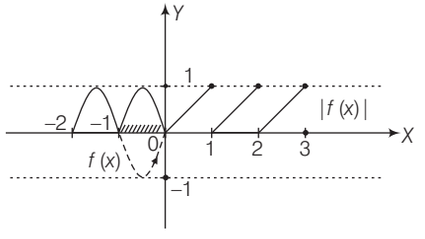


(c) $f(x) \to -f(x)$

To draw the graph of $-f(x)$. Take the image of $f(x)$ in the X-axis as plane mirror.

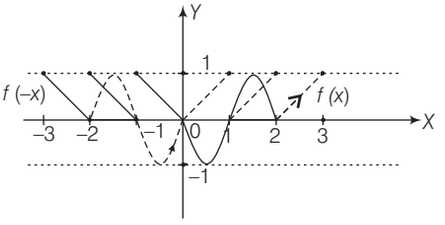


(d) $f(x) \to |f(x)|$, To draw the graph of $|f(x)|$ taking image for negative values of $f(x)$ about X-axis.



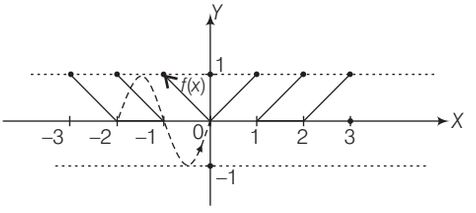
(e) $f(x) \to f(-x)$

To draw the graph of $f(-x)$ take the image of the curve $f(x)$ in the Y-axis as plane mirror.



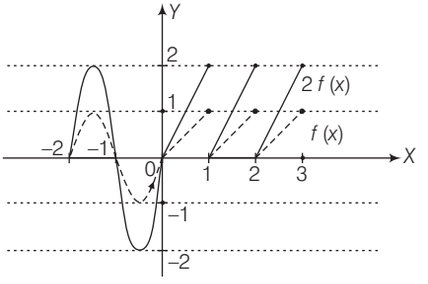
(f) $f(x) \to f(|x|)$

To draw the graph of $f|x|$ neglecting the graph for negative values of $f(x)$ and taking image for positive values of x about Y-axis.



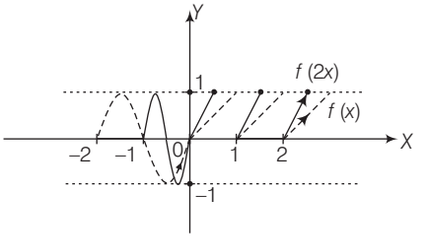
(g) $f(x) \to 2f(x)$

To draw the graph of $2f(x)$ stretch the graph of $f(x)$, 2 times along Y-axis.



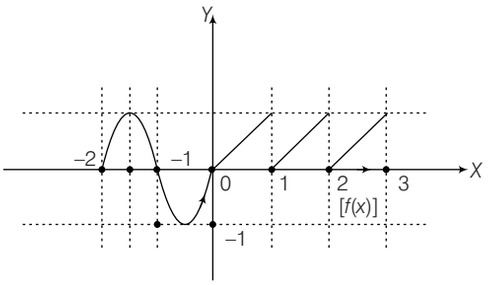
(h) $f(x) \to f(2x)$

To draw the graph of $f(2x)$, stretch the graph of $f(x)$, 2 times along X-axis.



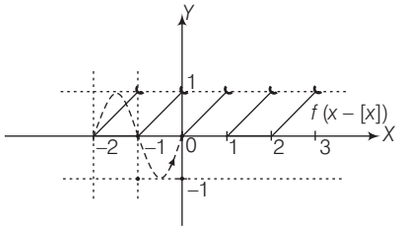
(i) $f(x) \to [f(x)]$

To draw $[f(x)]$ mark the integer on Y-axis. Draw the horizontal lines till they intersect the graph, now draw vertical dotted lines from these intersection point. Finally, draw horizontal lines parallel to X-axis from any intersection point to the nearest vertical dotted line with blank dot at right end.



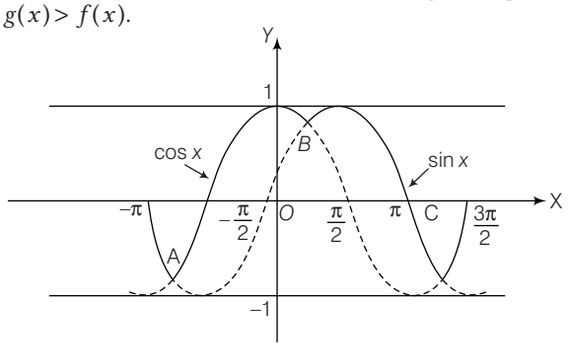
(j) $f(x) \to f(x-[x])$

Retain the graph of $f(x)$ for values of x lying between interval [0,1). Now, it can be repeated for rest of the point taking periodicity '1'.

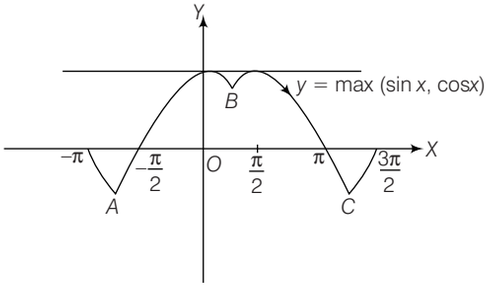


● ***Ex. 23*** *Sketch the graph of* $y = \max(\sin x, \cos x)$, $\forall\ x \in \left(-\pi, \frac{3\pi}{2}\right)$.

Sol. First plot both $y = \sin x$ and $y = \cos x$ by a dotted curve as can be seen from the graph in the interval $\left(-\pi, \frac{3\pi}{2}\right)$ and then darken those dotted line for which $f(x) > g(x)$ or $g(x) > f(x)$.



∴ **Graph of max $\{\sin x, \cos x\}$**

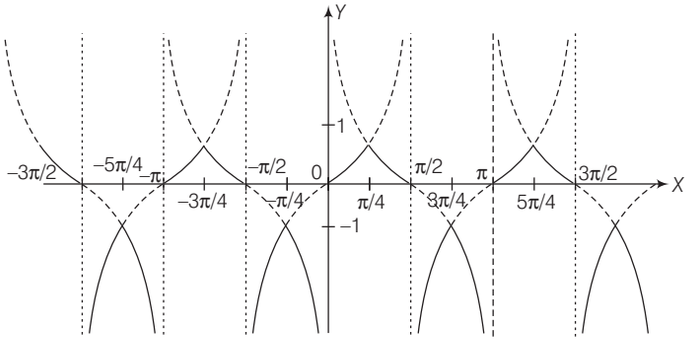


As from the above graph,

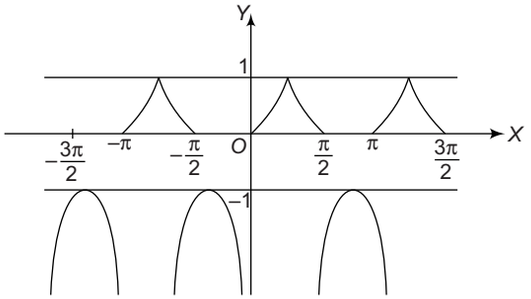
$$\max(\sin x, \cos x) = \begin{cases} \sin x, & -\pi < x \le -\frac{3\pi}{4} \\ \cos x, & -\frac{3\pi}{4} \le x \le \frac{\pi}{4} \\ \sin x, & \frac{\pi}{4} \le x \le \frac{5\pi}{4} \\ \cos x, & \frac{5\pi}{4} \le x \le \frac{3\pi}{2} \end{cases}$$

● ***Ex. 24*** *Sketch the graph for* $y = \min\{\tan x, \cot x\}$.

Sol. First plot both $f(x) = \tan x$ and $g(x) = \cot x$ by a dotted curve as can be seen from the graph and then darken those dotted lines for which $f(x) < g(x)$ and $g(x) < f(x)$.



∴ **Graph of min $\{\tan x, \cot x\}$**

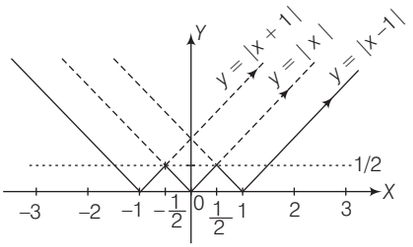


As from the graph, we have

$$\min\{\tan x, \cot x\} = \begin{cases} \ldots\ldots\ldots\ldots\ldots\ldots \\ \ldots\ldots\ldots\ldots\ldots\ldots \\ \tan x, & -\frac{\pi}{2} < x \le -\frac{\pi}{4} \\ \cot x, & -\frac{\pi}{4} \le x < 0 \\ \tan x, & 0 \le x \le \frac{\pi}{4} \\ \cot x, & \frac{\pi}{4} \le x \le \frac{\pi}{2} \\ \ldots\ldots\ldots\ldots\ldots\ldots \\ \ldots\ldots\ldots\ldots\ldots\ldots \end{cases}$$

● ***Ex. 25*** *Sketch the graph of* $y = \min\{|x|, |x-1|, |x+1|\}$.

Sol. First plot the graph for, $y = |x|$, $y = |x-1|$ and $y = |x+1|$ by a dotted curve as can be seen from the graph and then darken those dotted lines for $|x| < \{|x-1|, |x+1|\}$, $|x-1| < \{|x|, |x+1|\}$ and $|x+1| < \{|x|, |x-1|\}$.



As from the above graph,

$$\min\{|x|, |x-1|, |x+1|\} = \begin{cases} -(x+1), & x \le -1 \\ (x+1), & -1 \le x \le -\frac{1}{2} \\ -(x), & -\frac{1}{2} \le x \le 0 \\ x, & 0 \le x \le \frac{1}{2} \\ -(x-1), & \frac{1}{2} \le x \le 1 \\ (x-1), & 1 \le x \end{cases}$$

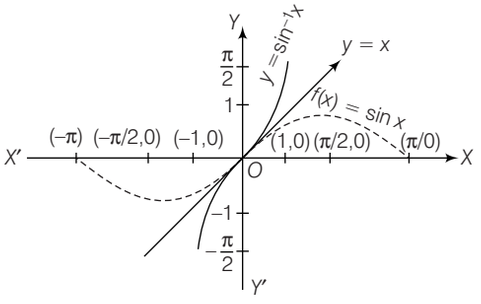
Remark

To plot the graph of $f^{-1}(x)$, take reflection of $f(x)$ in $y = x$ line as a mirror.

● ***Ex. 26*** *Sketch the graph of* $y = \sin^{-1} x, \forall\, x \in [-1, 1]$.

Sol. As, $-1 \le x \le 1 \Rightarrow -\frac{\pi}{2} \le \sin^{-1} x \le \frac{\pi}{2} \Rightarrow -\frac{\pi}{2} \le y \le \frac{\pi}{2}$

$\sin^{-1} x$ is the reflection of $\sin x$ about $y = x$ (as a mirror) when $x \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$.

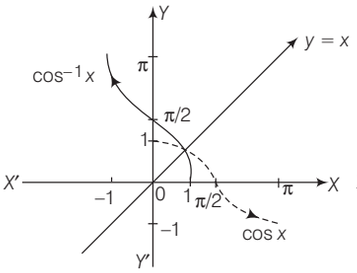


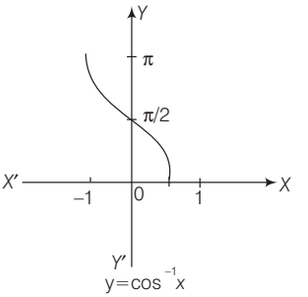
● ***Ex. 27*** *Sketch the graph for* $y = \cos^{-1} x, \forall\, x \in [-1, 1]$.

Sol. As, $-1 \le x \le 1$

$\Rightarrow \quad 0 \le \cos^{-1} x \le \pi \quad \Rightarrow \quad 0 \le y \le \pi$

$\therefore\ \cos^{-1} x$ is reflection of the graph of $\cos x, 0 \le x \le \pi$ in $y = x$ line as a mirror.

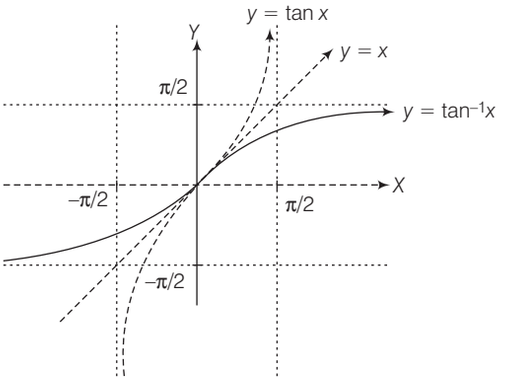




● ***Ex. 28*** *Sketch the graph for* $y = \tan^{-1} x, \forall\, x \in R$.

Sol. As, $x \in R \Rightarrow \frac{-\pi}{2} < \tan^{-1} x < \frac{\pi}{2} \Rightarrow \frac{-\pi}{2} < y < \frac{\pi}{2}$

$\therefore\ \tan^{-1} x$ is the reflection of the graph of $\tan x$, $\frac{-\pi}{2} < x < \frac{\pi}{2}$ in $y = x$ as a mirror.



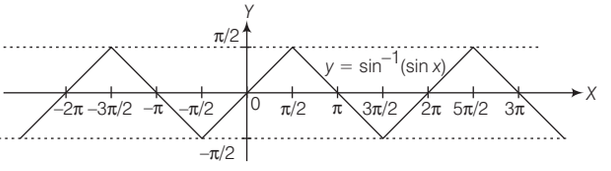
● ***Ex. 29*** *Sketch the graph for* $y = \sin^{-1}(\sin x)$.

Sol. As, $y = \sin^{-1}(\sin x)$ is periodic with period 2π.

$\therefore$ To draw this graph we should draw the graph for one interval of length 2π and repeat it for entire values of x. As we know,

$$\sin^{-1}(\sin x) = \begin{cases} (x), & \frac{-\pi}{2} \le x \le \frac{\pi}{2} \\ (\pi - x), & \frac{\pi}{2} \le x \le \frac{3\pi}{2} \text{ or } \pi - \frac{\pi}{2} \ge \pi - x \ge \pi - \frac{3\pi}{2} \\ & \text{or } -\frac{\pi}{2} \le \pi - x \le \frac{\pi}{2} \end{cases}$$

Thus, it has been defined for $\frac{-\pi}{2} \le x \le \frac{3\pi}{2}$, that has length 2π. So, its graph could be plotted as;



● ***Ex. 30*** *Sketch the graph for* $y = \cos^{-1}(\cos x)$.

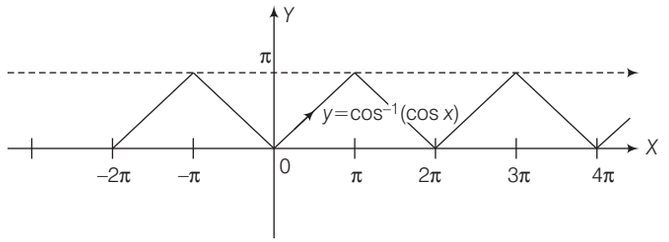
Sol. As, we have that $y = \cos^{-1}(\cos x)$ is periodic with period 2π.

$\therefore$ To draw this graph we should draw the graph for one interval of length 2π and repeat it for entire values of x of length 2π.

As we know,

$$\cos^{-1}(\cos x) = \begin{cases} x, & 0 \le x \le \pi \\ (2\pi - x), & \pi < x \le 2\pi \text{ or } 0 < 2\pi - x < \pi \end{cases}$$

Thus, it has been defined for $0 < x < 2\pi$, that has length 2π.
So, its graph could be plotted as;



● ***Ex. 31*** *Sketch the graph for* $y = \tan^{-1}(\tan x)$.

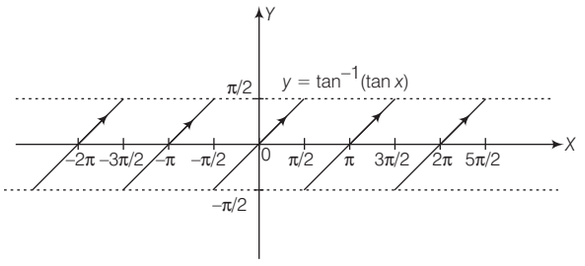
Sol. As, we have that $y = \tan^{-1}(\tan x)$ is periodic with period π.

$\therefore$ To draw this graph we should draw the graph for one interval of length π and repeat for entire values of x.

As we know, $\tan^{-1}(\tan x) = \left\{ x, \quad \frac{-\pi}{2} < x < \frac{\pi}{2} \right.$

Thus, it has been defined for $\frac{-\pi}{2} < x < \frac{\pi}{2}$ that has length π.

So, its graph could be plotted as;



● ***Ex. 32*** *Find the values of x graphically which satisfy* $\left|\frac{x^2}{x-1}\right| \le 1$.

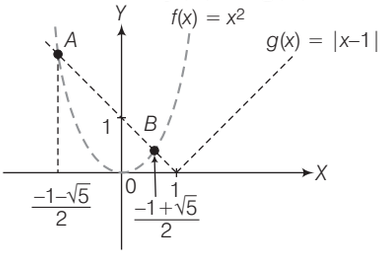
Sol. We have, $\left|\frac{x^2}{x-1}\right| \le 1$

$\Rightarrow$ $|x^2| \le |x-1|, \forall\ x \in R - \{1\}$

or $x^2 \le |x-1|, \forall\ x \in R - \{1\}$

Thus, to find the points for which $f(x) = x^2$ is less than or equal to $g(x) = |x-1|$.

Where the two functions $f(x)$ and $g(x)$ could be plotted as;



Thus, from the graph $f(x) \le g(x)$, when $x \in [A, B]$. So that, A and B are point of intersection of x^2 and $1 - x$.

$\therefore$ Solving $x^2 = 1 - x$, we get $x = \frac{-1-\sqrt{5}}{2} = A$

and $x = \frac{-1+\sqrt{5}}{2} = B.$

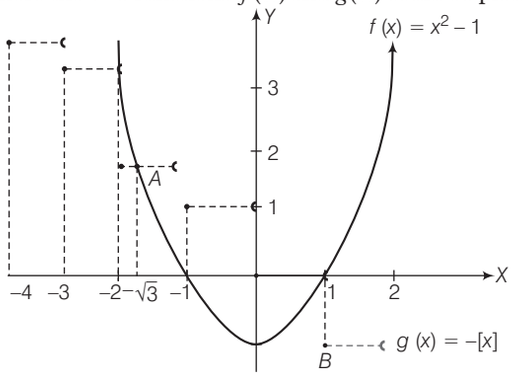
$\therefore$ $\left|\frac{x^2}{x-1}\right| \le 1$ is satisfied, $\forall\ x \in \left[\frac{-1-\sqrt{5}}{2}, \frac{-1+\sqrt{5}}{2}\right]$.

● ***Ex. 33*** *Find the values of x graphically satisfying* $[x] - 1 + x^2 \ge 0$ *; where [·] denotes the greatest integer function.*

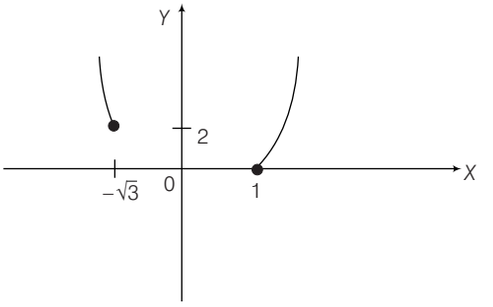
Sol. We have, $[x] - 1 + x^2 \ge 0 \Rightarrow x^2 - 1 \ge -[x]$

Thus, to find the points for which $f(x) = x^2 - 1$ is greater than or equal to $g(x) = -[x]$.

Where the two functions $f(x)$ and $g(x)$ could be plotted as;



Finally.



Thus, from the above graph $f(x) \geq g(x)$ when $x \in (-\infty, A] \cup [B, \infty)$, where A is point of intersection of $x^2 - 1$ and $-[x]$ when $-[x] = +2$.

$\therefore\ x^2 - 1 = +2$, i.e. $x = -\sqrt{3} = A$ and $B = 1$

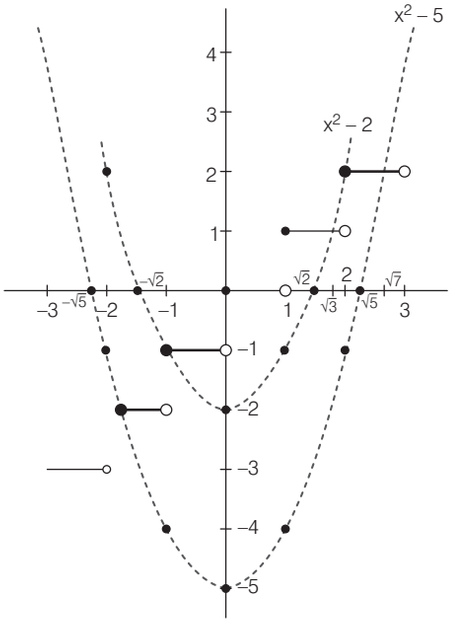
$\therefore\ [x] - 1 + x^2 \geq 0$ is satisfied, $\forall\ x \in (-\infty, -\sqrt{3}] \cup [1, \infty)$.

● ***Ex. 34*** *Find the values of x graphically which satisfy;* $-1 \leq [x] - x^2 + 4 \leq 2$, *where* $[.]$ *denotes the greatest integer function.*

Sol. We have, $-1 \leq [x] - x^2 + 4 \leq 2 \Rightarrow x^2 - 5 \leq [x] \leq x^2 - 2$

Thus, to find the points for which $f(x) = x^2 - 5$ is less than or equal to $g(x) = [x]$ and $g(x) = [x]$ is less than or equal to $h(x) = x^2 - 2$.

Where the three functions $f(x)$, $g(x)$ and $h(x)$ could be plotted as;



Thus, from the above graph; $x^2 - 5 \leq [x] \leq x^2 - 2$, when $x \in [A, B] \cup [C, D]$.

Where A and D is point of intersection of $x^2 - 5 = \pm 2$

$\Rightarrow x = -\sqrt{3}, \sqrt{7}$ B and C is point of intersection of $x^2 - 2 = \pm 1$

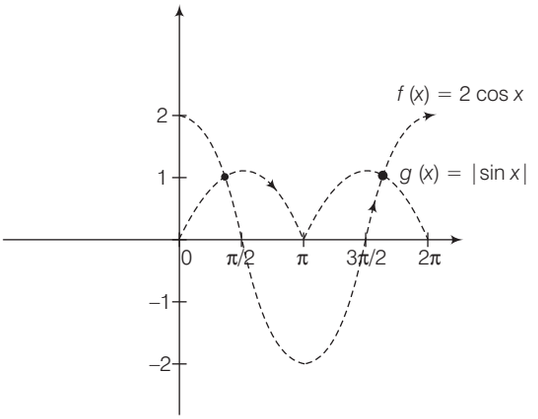
$\Rightarrow x = \sqrt{3}$

$\therefore\ -1 \leq [x] - x^2 + 4 \leq 2$ is satisfied, $x \in [-\sqrt{3}, -1] \cup [\sqrt{3}, \sqrt{7}]$.

● ***Ex. 35*** *Find the number of solutions of* $2\cos x = |\sin x|$ *when* $x \in [0, 4\pi]$.

Sol. As we know, the graph of both $f(x) = 2\cos x$ and $g(x) = |\sin x|$

$\therefore$ Their point of intersection are number of solutions.



Thus, from the above graph the two functions intersect at two points between $[0, 2\pi]$ and we know that $\cos x$ is periodic with period 2π, so it has same number of solutions for the interval $[2\pi, 4\pi]$.

$\therefore$ Total number of solutions of $2\cos x = |\sin x|$ when $x \in [0, 4\pi]$ is 4.

● ***Ex. 36*** *Sketch the curves*

(i) $y = \sqrt{x - [x]}$ (ii) $y = [x] + \sqrt{x - [x]}$

(iii) $y = |[x] + \sqrt{x - [x]}|$

(where $[\cdot]$ denotes the greatest integer function).

Sol. (i) Here, $0 \leq x - [x] < 1, \forall\ x \in R$ and

$x^2 \leq x \leq \sqrt{x}, \forall x \in [0,1)$

$\therefore\quad x - [x] \leq \sqrt{x - [x]}$

$$\Rightarrow\quad y = \sqrt{x - [x]} = \begin{cases} \sqrt{x-1}, & 1 \leq x < 2 \\ \sqrt{x}, & 0 \leq x < 1 \\ \sqrt{x+1}, & -1 \leq x < 0 \end{cases}$$

and so on.

In general, $y = \sqrt{x - [x]} = \sqrt{x}$, when $0 \leq x < 1$

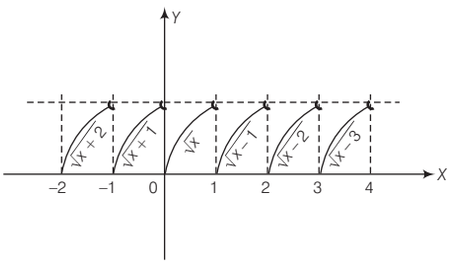
$y = \sqrt{x - [x]} = \sqrt{x - 1}$, when $1 \leq x < 2$

i.e. Shifting $\sqrt{x}$ by 1 unit on right side of X-axis

$y = \sqrt{x - [x]} = \sqrt{x - 2}$, when $2 \leq x < 3$,

then graph of $y = \sqrt{x - [x]}$.

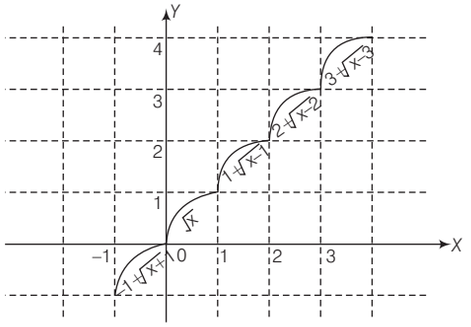
i.e. Shifting $\sqrt{x-1}$ by 1 unit on right side of X-axis and so on. Thus, the graph for $y = \sqrt{x - [x]}$ is shown as in figure, which is periodic with period 1.



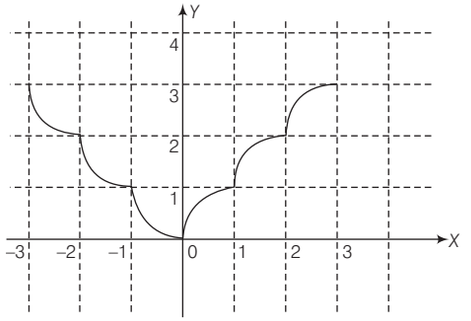
(ii) Again, $y = [x] + \sqrt{x - [x]} \Rightarrow y = k + \sqrt{x - k}$,
$k \le x < k + 1$; $k \in$ integer $-1 + \sqrt{x+1}, -1 \le x < 0$

$$\Rightarrow \qquad y = \begin{cases} \sqrt{x}, & 0 \le x < 1 \\ 1 + \sqrt{x-1}, & 1 \le x < 2 \\ 2 + \sqrt{x-2}, & 2 \le x < 3 \quad \text{and so on.} \end{cases}$$

Thus, the graph for $y = [x] + \sqrt{x - [x]}$ is obtained by the graph of $y = \sqrt{x - [x]}$ by translating it by $[x]$ units in upward or downward directions according as $[x] > 0$ or $[x] < 0$. The graph is shown as



(iii) Graph for $y = |[x] + \sqrt{x - [x]}|$ is obtained by reflecting the portion lying below X-axis of the graph of $y = [x] + \sqrt{x - [x]}$. About X-axis and keeping the portion lying above the X-axis (as it is).
Thus, the graph for $y = \left|[x] + \sqrt{x - [x]}\right|$ is shown below.



Graphical Transformations Exercise 1 :
Single Option Correct Type Questions

1. The number of real solutions of the equation $e^{|x|} - |x| = 0$ is
(a) 0 (b) 1 (c) 2 (d) None of these

2. The number of real solutions of the equation $3^{-|x|} - 2^{|x|} = 0$ is
(a) 0 (b) 1 (c) 2 (d) 3

3. The number of solutions of $3^{|x|} = |2 - |x||$ is
(a) 0 (b) 2 (c) 4 (d) infinite

4. The total number of solutions of the equation $|x - x^2 - 1| = |2x - 3 - x^2|$ is
(a) 0 (b) 1
(c) 2 (d) infinitly many

5. The equation $e^x = m(m+1), m < -1$ has
(a) no real root
(b) exactly one real root
(c) two real roots
(d) None of the above

6. The number of real solutions of the equation $1 - x = [\cos x]$ is
(a) 1 (b) 2
(c) 3 (d) 4

7. The number of roots of the equation $1 + 3^{x/2} = 2^x$ is
(a) 0
(b) 1
(c) 2
(d) None of the above

Graphical Transformations Exercise 2 :
More than One Option Correct Type Questions

8. The equation $x^2 - 2 = [\sin x]$, where $[\cdot]$ denotes the greatest integer function, has
(a) infinity many roots
(b) exactly one integer root
(c) exactly one irrational root
(d) exactly two roots

9. Consider the function $f(x) = \begin{cases} x - [x] - \frac{1}{2}, & \text{if } x \notin I \\ 0, & \text{if } x \in I \end{cases}$,
where $[\cdot]$ denotes greatest integer function and I is the set of integers, then $g(x) = \max\{x^2, f(x), |x|\}, -2 \le x \le 2$ is defined as
(a) $x^2, -2 \le x \le -1$
(b) $1 - x, -1 < x \le -\frac{1}{4}$
(c) $\frac{1}{2} + x, -\frac{1}{4} < x < 0$
(d) $1 + x, 0 \le x < 1$

10. If $f(x)$ is defined on $[-2, 2]$ and is given by $f(x) = \begin{cases} -1, & -2 \le x < 0 \\ x - 1, & 0 < x \le 2 \end{cases}$ and $g(x) = f|x| + |f(x)|$, then $g(x)$ is defined as
(a) $-x, -2 \le x \le 0$ (b) $x, -2 \le x \le 0$
(c) $0, 0 < x \le 1$ (d) $2(x-1), 1 < x \le 2$

Graphical Transformations Exercise 3 :
Statements I and II Type Questions

■ **Directions** (Q. Nos. 11 to 12) *This section is based on Statement* I *and Statement* II. *Select the correct answer from the code given below.*
(a) Both Statement I and Statement II are correct and Statement II is the correct explanation of Statement I
(b) Both Statement I and Statement II are correct but Statement II is not the correct explanation of Statement I
(c) Statement I is correct but Statement II is incorrect
(d) Statement II is correct but Statement I is incorrect

11. **Statement I** The graph of $y = \sec^2 x$ is symmetrical about the Y-axis.

Statement II The graph of $y = \tan x$ is symmetrical about the origin.

12. **Statement I** The equation $|(x-2) + a| = 4$ can have four distinct real solutions for x if a belongs to the interval $(-\infty, -4)$.

Statement II The number of point of intersection of the curve represent the solution of the equation.

Graphical Transformations Exercise 4 : Passage Based Questions

Passage I (Q. Nos. 13 to 14)

Let $f(x) = f_1(x) - 2f_2(x)$, *where*

$$f_1(x) = \begin{cases} \min\{x^2, |x|\}, & |x| \le 1 \\ \max\{x^2, |x|\}, & |x| > 1 \end{cases}$$

$$f_2(x) = \begin{cases} \min\{x^2, |x|\}, & |x| > 1 \\ \max\{x^2, |x|\}, & |x| \le 1 \end{cases},$$

and $$\text{let } g(x) = \begin{cases} \min\{f(t), & -3 \le t \le x, -3 \le x < 0\} \\ \max\{f(t), & 0 \le t < x, 0 \le x \le 3\}. \end{cases}$$

13. For $x \in (-1, 0)$, $f(x) + g(x)$ is

(a) $x^2 - 2x + 1$ (b) $x^2 + 2x - 1$

(c) $x^2 + 2x + 1$ (d) $x^2 - 2x - 1$

14. The graph of $y = g(x)$ in its domain is broken at

(a) 1 point (b) 2 points (c) 3 points (d) None of these

Passage II (Q. Nos. 15 to 16)

Consider the functions $f(x) = \begin{cases} x - 1, & -1 \le x \le 0 \\ x^2, & 0 \le x \le 1 \end{cases}$

and $g(x) = \sin x$.

If $h_1(x) = f(|g(x)|)$

and $h_2(x) = |f(g(x))|$.

15. Which of the following is not true about $h_1(x)$?

(a) It is a periodic function with period π

(b) The range is $[0, 1]$

(c) Domain R

(d) None of the above

16. Which of the following is not true about $h_2(x)$?

(a) The domain is R (b) It is periodic with period 2π

(c) The range is $[0, 1]$ (d) None of these

Graphical Transformations Exercise 5 : Matching Type Questions

■ **Directions** (Q.No. 17) *Choices for the correct combination of elements from Column I and Column II are given as option (a), (b), (c) and (d) out of which are correct.*

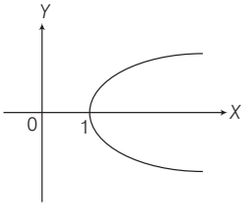
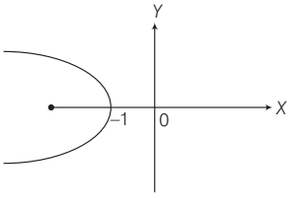
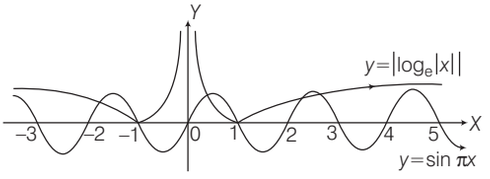
3. (i) $|f(x)| = \log_2 x$



(ii) $|f(x)| = \log_2(-x)$

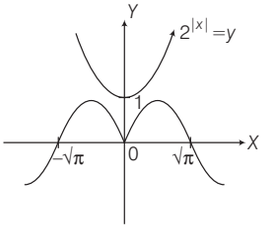


4. $\sin \pi x = |\log_e|x||$



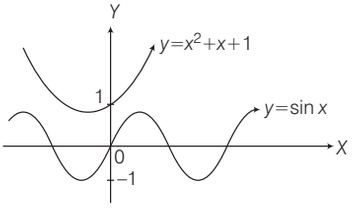
∴ Number of solutions is 6.

5. (i) $2^{|x|} = \sin x^2$



∴ No solution

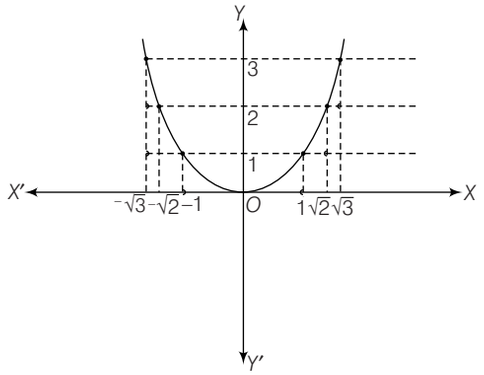
(ii) $\sin x = x^2 + x + 1$



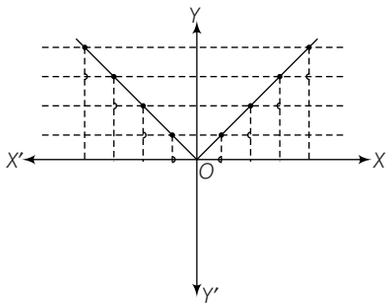
∴ No solution

Exercise for Session 4

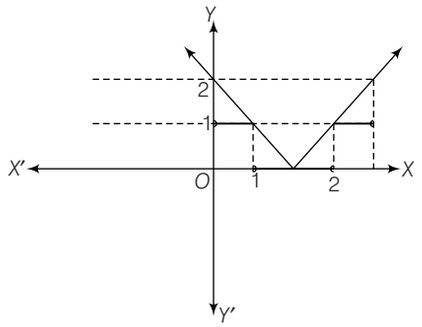
1. (i) Here, $f(x) = [x^2]$



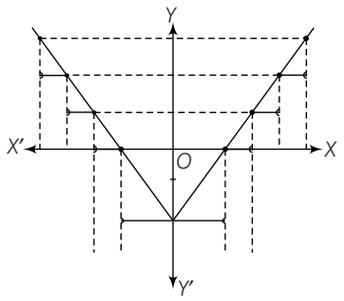
(ii) Here, $f(x) = [|x|]$



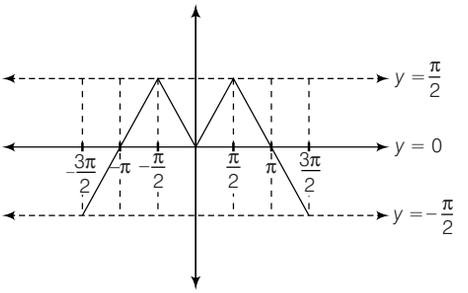
(iii) $f(x) = [(x-2)]$



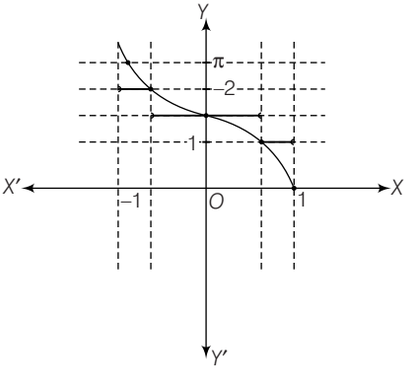
(iv) $f(x) = [|x|-2]$



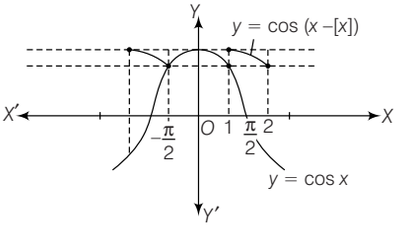
(v) $y = \sin^{-1}(\sin|x|)$



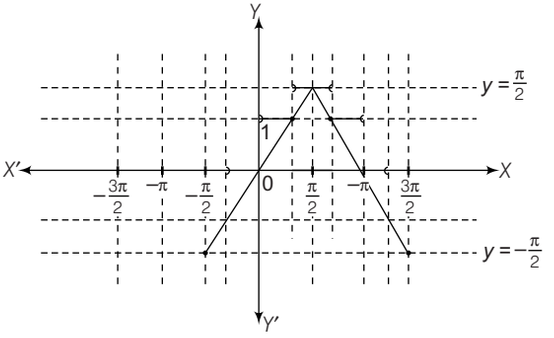
(vi) $y = [\cos^{-1} x]$



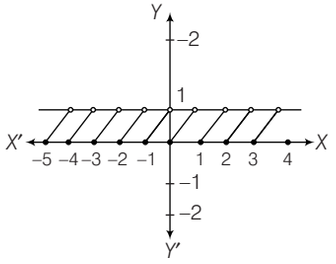
(vii) $f(x) = \cos(x - [x])$



(viii) $f(x) = [\sin^{-1}(\sin x)]$



2. Here, $f(x) = \min(x - [x], -x - [-x])$



3. (i) 4 sq units (ii) 1 sq unit (iii) 2 sq units

27. $f(x) = \begin{cases} x, & 0 \le x \le 1 \\ 2 - x, & 1 < x \le 2 \\ 0, & x > 2 \end{cases}$

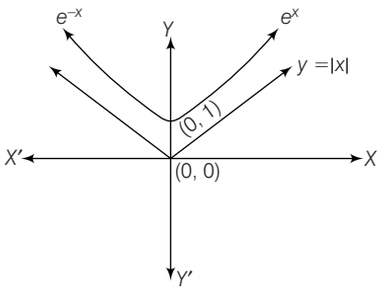
28. $D = R - \{(0,1], 2, 3, 4, [5, 6\}$.

Solutions

1. Given, $e^{|x|} - |x| = 0 \Rightarrow e^{|x|} = |x|$

Now, the number of solution will be the point of intersection of $y = e^{|x|}$ and $y = |x|$.

Both of the curves shown below



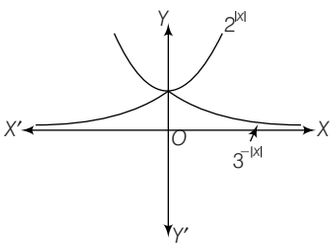
Clearly, from the graph we see that the both curves do not intersect.

∴ No solution.

2. Given, $3^{-|x|} - 2^{|x|} = 0 \Rightarrow 3^{-|x|} = 2^{|x|}$

Now, we plot the graph $y = 3^{-|x|}$

and $y = 2^{|x|}$ as shown below

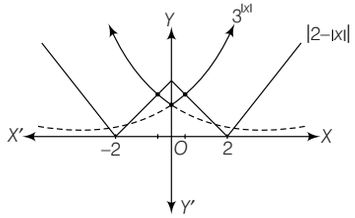


Clearly, the two curves intersect at one points.

Hence, the number of solutions is 1.

3. Given, $3^{|x|} = |2 - |x||$

The graph of $y = 3^{|x|}$ and $y = |2 - |x||$ is shown below



Clearly, both the curve intersect of two points.

∴ Number of solutions is 2.

4. Given, $\left| x - x^2 - 1 \right| = \left| 2x - 3 - x^2 \right|$

Let $f(x) = x - x^2 - 1$ and $g(x) = 2x - 3 - x^2$

First we draw the graph of $f(x)$ and $g(x)$

then, transforms it into $|f(x)|$ and $|g(x)|$.

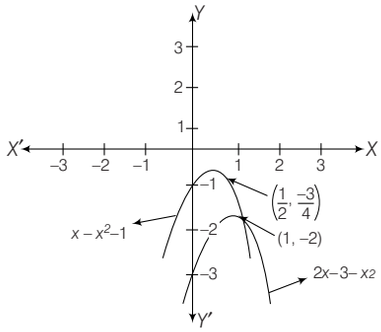
Here, $f(x) = x - x^2 - 1 = y \Rightarrow \left(x - \frac{1}{2}\right)^2 = -\left(y + \frac{3}{4}\right)$

Clearly, it represents a parabola having vertex $\left(-\frac{1}{2}, -\frac{3}{4}\right)$.

Also, $g(x) = 2x - 3 - x^2 = y \Rightarrow (x - 1)^2 = -(y + 2)$

It also represent a parabola having vertex $(1, -2)$.

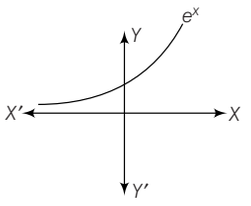
The graph of both curve is given below



Clearly, both the curves intersect at only one point.

∴ Number of solutions is 1.

5. Given, $e^x = m(m+1)$

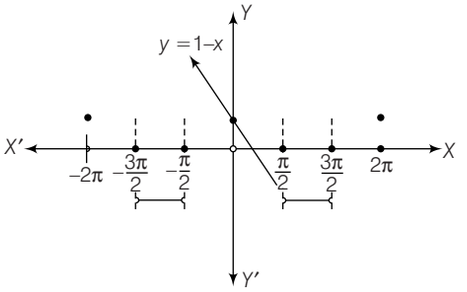


Clearly, for $m < -1$, it will represent a straight line parallel to X-axis which intersect the e^x at only one point.

Hence, exactly one real root.

6. Given, $1 - x = [\cos x]$

The graph of both the curves is given below

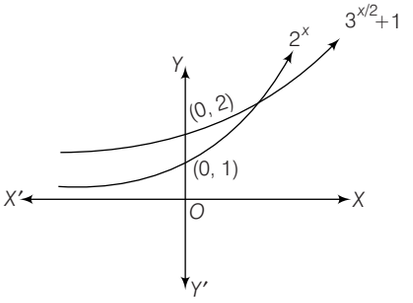


$y = 1 - x$ intersect the graph of $y = [\cos x]$ at exactly two points.

$\therefore$ Number of solutions is 2.

7. Given, $1 + 3^{x/2} = 2^x$

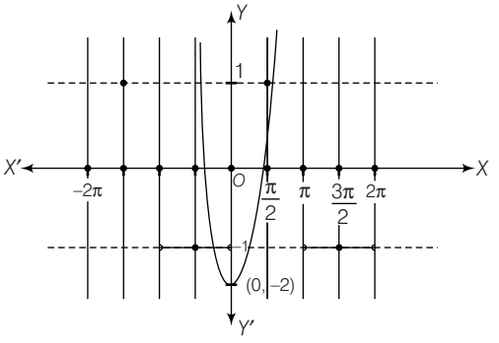
The graph is shown below



Clearly, both the curves intersect at one point.

8. Given, $x^2 - 2 = [\sin x]$

The graph of two curves is given below



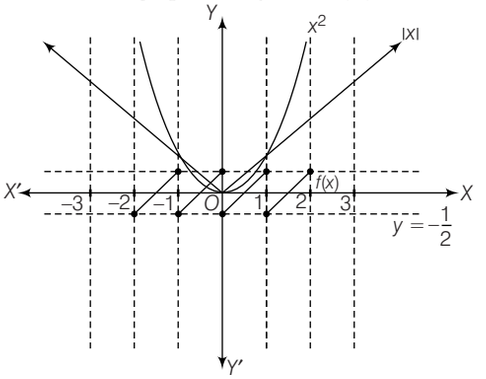
Clearly, the curve $y = x^2 - 2$ intersect the curves $y = [\sin x]$ at two points $(\sqrt{2}, 0)$ and $(-1, -1)$.

$\therefore$ Therefore, the solution has exactly one integer root and one irrational root.

9. Given, $f(x) = \begin{cases} x - [x] - \frac{1}{2}, & x \notin I \\ 0, & x \in I \end{cases}$

and $g(x) = \max\{x^2, f(x), |x|\}$

First we draw the graph of x^2, $f(x)$ and $|x|$ as shown below



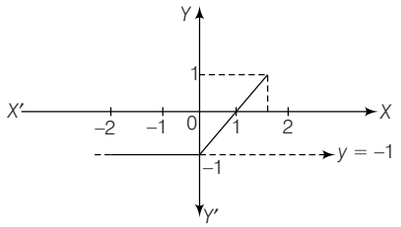
Clearly, from the graph

$$g(x) = \begin{cases} x^2, & -2 \le x \le -1 \\ 1 - x, & -1 < x \le -\frac{1}{4} \\ \frac{1}{2} + x, & -\frac{1}{4} < x < 0 \\ 1 + x, & 0 \le x < 1 \\ x^2, & 1 \le x \le 2 \end{cases}$$

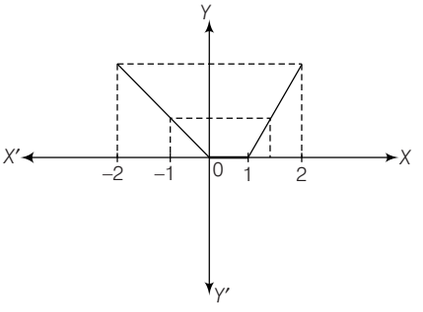
10. $f(x) = \begin{cases} -1 & -2 \le x < 0 \\ x - 1, & 0 < x \le 2 \end{cases}$

$g(x) = f(|x|) + |f(x)|$

The graph of $f(x)$ is shown below



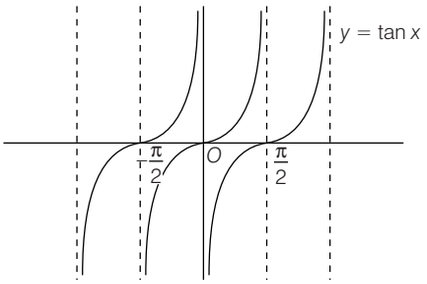
$\therefore$ $g(x) = |f(x)| + f(|x|)$ is shown below



Clearly, from the graph

$$g(x)=\begin{cases}-x, & -2\le x\le 0\\ 0, & 0<x<1\\ 2(x-1) & 1<x\le 2\end{cases}$$

11. We have the graph of $y=\tan x$ as shown below



Clearly, from the graph it is symmetrical about the origin.

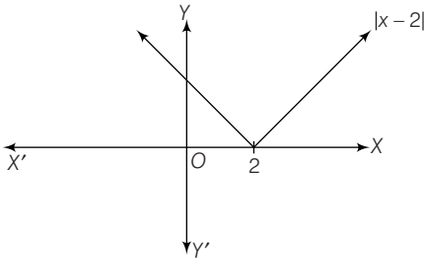
Also, derivative of an odd function is an even function and $\sec^2 x$ is derivative of $\tan x$.

Hence, both the statements are true and Statement II is a correct explanation of Statement I.

12. We know that, the number of point of intersection of two curve is the real solutions of the equation involving these functions.

Also, $||x-2|+a|=4$

$\Rightarrow$ $|x-2|=\pm\,4-a$



For four real roots $4-a>0$ and $-4-a>0$

$\Rightarrow$ $a\in(-\infty,-4)$

Both Statement I and Statement II are correct and Statement II is the correct explanation of Statement I

Sol. (Q.Nos. 13 to 14)

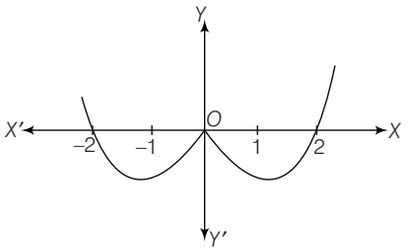
Here, $f_1(x)=x^2$

$f_2(x)=|x|$

or $f(x)=f_1(x)-2f_2(x)$

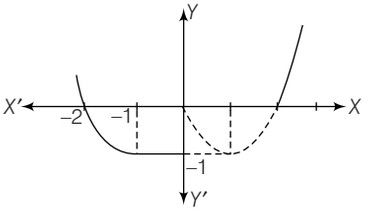
$=x^2-2|x|$

Graph for $f(x)$



Now, $g(x)=\begin{cases}f(x), & -3\le x<-1\\ -1, & -1\le x<0\\ 0, & 0\le x\le 2\\ f(x), & 2<x\le 3\end{cases}$

The graph of $g(x)$ is shown below



$$g(x)=\begin{cases}x^2+2x, & -3\le x<-1\\ -1, & -1\le x<0\\ 0, & 0\le x\le 2\\ x^2-2x, & 2<x<3\end{cases}$$

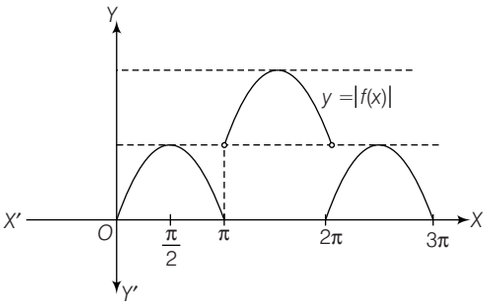
13. For $x\in(-1,0)$, $f(x)+g(x)=x^2+2x-1$

14. Obviously, the graph is broken at $x=0$, i.e. in one point.

15. Clearly, $h_1(x)=f(|g(x)|)=\sin^2 x$ has period π, range $[0,1]$ and domain R.

16. $h_2(x)=|f(g(x))|$

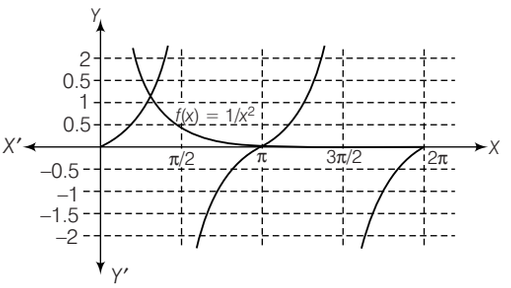
The graph for $h_2(x)$ is



It is clear from the graph that the function is periodic with period 2π and has range $[0,2]$.

17. Let $y=\tan x=\dfrac{1}{x^2}$

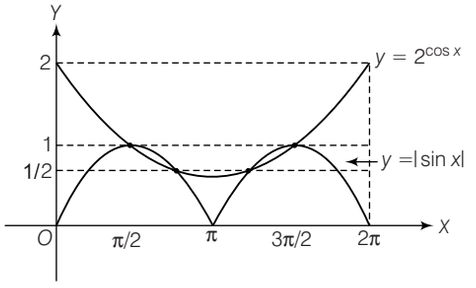
We plot the graph for $\tan x$ and $\dfrac{1}{x^2}$ as shown below



From the graph, it is clear that, it will have two real roots.

(b) $2^{\cos x}=|\sin x|$, $x\in[0,2\pi]$

Plotting the graph of $y = 2^{\cos x}$ and $y = |\sin x|$, as shown below



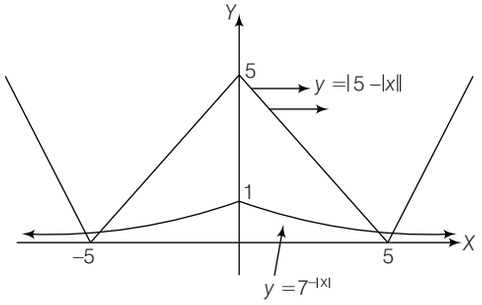
From the graph we see that the two curve meet at four points for $x \in [0, 2\pi]$.

So, the equation $2^{\cos x} = |\sin x|$ has four solutions.

(c) Given, $f(|x|) = 0$ has a real root or $f(x) = 0$ has four positive roots. Since, $f(x)$ is a polynomial of degree 5, $f(x)$ cannot have even number of real roots. Hence, $f(x)$ has all the five roots real and one root is negative.

(d) Here, $7^{|x|}(|5 - |x||) = 1$ or $|5 - |x|| = 7^{-|x|}$

Draw the graph of $y = 7^{-|x|}$ and $y = |5 - |x||$



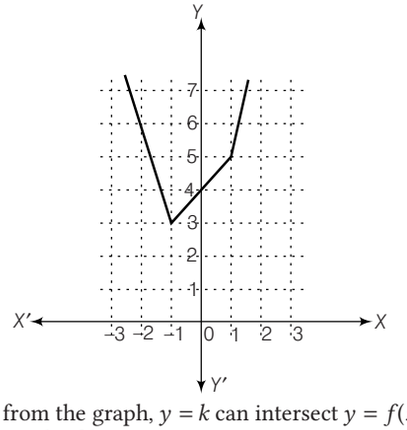
From the graph, the number of real roots is 4.

Hence, a → q; b → s; c → p; d → s.

18. Let $f(x) = x + 2|x + 1| + 2|x - 1|$

$$= \begin{cases} x - 2(x+1) - 2(x-1), & x < -1 \\ x + 2(x+1) - 2(x-1), & -1 \le x \le 1 \\ x + 2(x+1) + 2(x-1), & x > 1 \end{cases} = \begin{cases} -3x, & x < -1 \\ x + 4, & -1 \le x \le 1 \\ 5x, & x > 1 \end{cases}$$

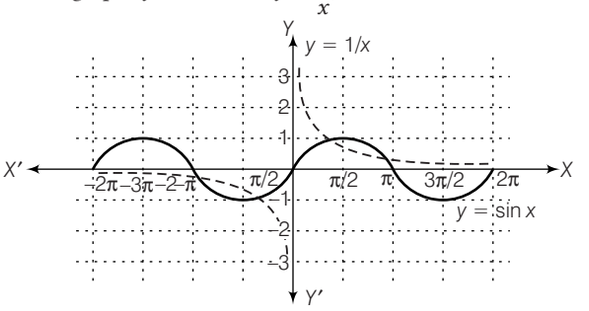
The graph of $f(x)$ is shown below



Clearly, from the graph, $y = k$ can intersect $y = f(x)$ at exactly one point only if $k = 3$.

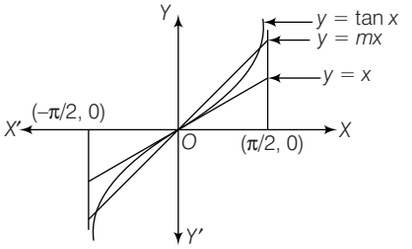
19. Here, $x \sin x = 1$ or $y = \sin x = \dfrac{1}{x}$

The roots of Eq. (i) will be given by the points of intersection of the graphs $y = \sin x$ and $y = \dfrac{1}{x}$, which is shown below.



Graphically, it is clear that the given equation has four roots.

20. In $\left(-\dfrac{\pi}{2}, 0\right)$, the graph of $y = \tan x$ lies below the line $y = x$, which is the tangent at $x = 0$ and in $\left(0, \dfrac{\pi}{2}\right)$, it lies above the line $y = x$.

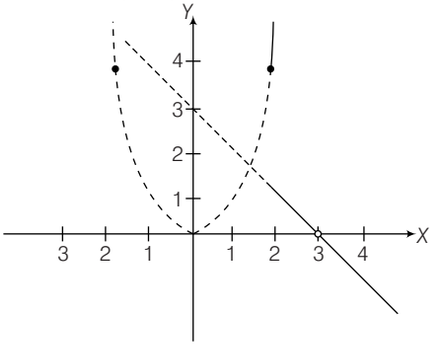


For $m > 1$, the line $y = mx$ lie, below $y = x$ in $\left(-\dfrac{\pi}{2}, 0\right)$ and above $y = x$ in $\left(0, \dfrac{\pi}{2}\right)$.

Thus, graph of $y = \tan x$ and $y = mx$, $m > 1$, meet at three points including $x = 0$ in $\left(-\dfrac{\pi}{2}, \dfrac{\pi}{2}\right)$ independent of m.

21. We have, $\dfrac{x^2}{1 - |x-2|} = 1$

(i) When $x \ge 2$, $\dfrac{x^2}{1-(x-2)} = 1 \Rightarrow \dfrac{x^2}{3-x} = 1$

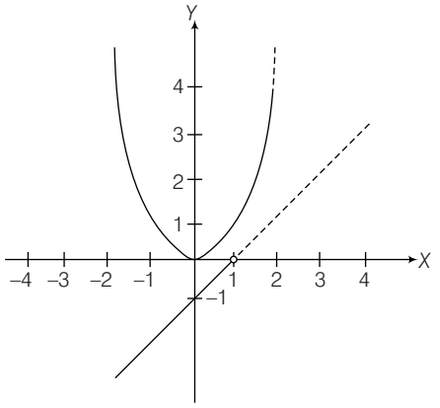


$\Rightarrow \quad x^2 = 3 - x, x \ne 3$

No point of intersection.

(ii) When $x < 2, \dfrac{x^2}{1-(2-x)} = 1 \Rightarrow \dfrac{x^2}{-1+x} = 1$

$\Rightarrow \quad x^2 = -1 + x, x \neq 1$



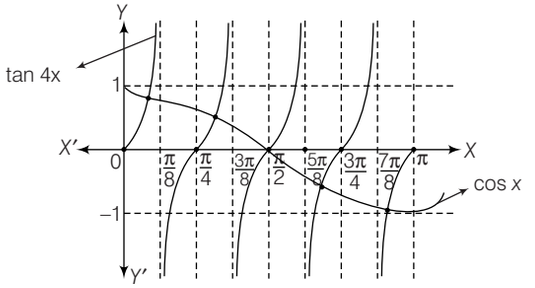
No point of intersection.

Here, the number of solution is zero.

22. Given, $\tan 4x = \cos x$

The number of solutions will be the point of intersection of curves $y = \tan 4x$ and $\cos x$

The graph of $y = \tan 4x$ and $y = \cos x$ is given below.



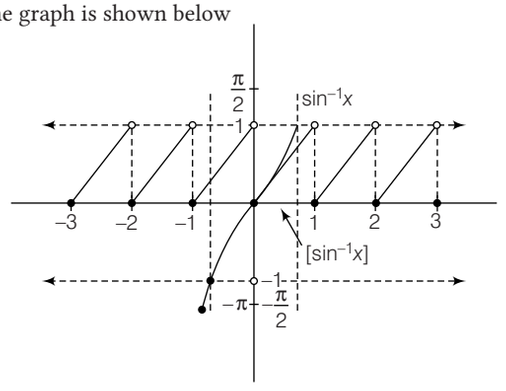
From the graph, it is clear that both curve intersect at five points.

∴Number of solutions is 5.

23. Given, $[\sin^{-1} x] = x - [x]$

The number of solution will be the point of intersection of $y = [\sin^{-1} x]$ and $y = x - [x] = \{x\}$

The graph is shown below



Clearly, the two graphs intersect at only one point.

∴ Number of solutions is 1.

24. Now, $|x + y| = 1$

$\Rightarrow \quad x + y = \pm 1$ ...(i)

and $\quad |x - y| = 1$

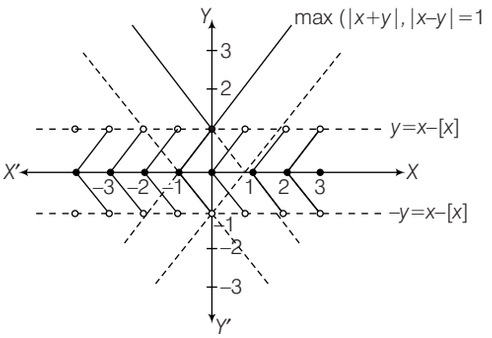
$\Rightarrow \quad x - y = \pm 1$ ...(ii)

Also, $\quad |y| = x - [x]$

$\Rightarrow \quad \pm y = x - [x]$

Here, we see that there is no point of intersection between the two curves.

Here, no ordered pair of (x, y) satisfy the given equations.



25. We have, $\quad |x + y - 1| + |2x + y + 1| = 1$

$\Rightarrow \pm (x + y - 1) \pm (2x + y + 1) = 1$

(i) $(x + y - 1) + (2x + y + 1) = 1$

$\Rightarrow \quad 3x + 2y = 1$ ...(i)

(ii) $+(x + y - 1) - (2x + y + 1) = 1$

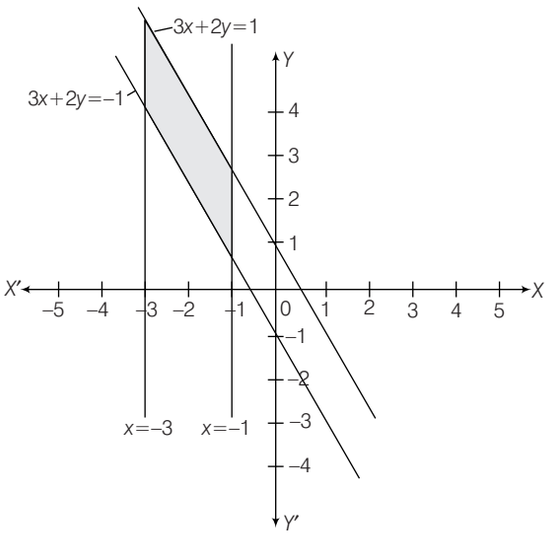
$\Rightarrow \quad -x = 3$ ...(ii)

(iii) $-(x + y - 1) + (2x + y + 1) = 1$

$\Rightarrow \quad x = -1$ ...(iii)

(iv) $-(x + y - 1) - (+2x + y + 1) = 1$

$\Rightarrow \quad -3x - 2y = 1$ ...(iv)

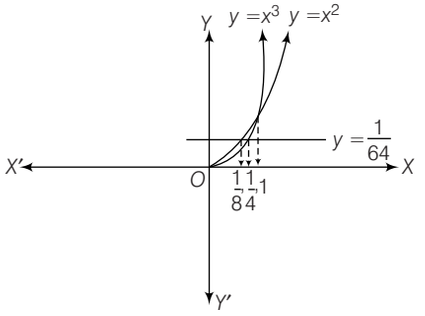


∴ Area of shaded region $= \int_{-1}^{-3} [(3x + 2y - 1) - (3x + 2y + 1)]dx$

$= \int_{-1}^{-3} -2\,dx = -2[x]_{-1}^{-3} = -2[-3 + 1] = 4$ sq units

26. Given, $f(x) = \max\left\{x^3, x^2, \frac{1}{64}\right\}, \forall\ x \in (0,\infty)$

Now, we draw the graph for the curves $y = x^3$, $y = x^2$ and $y = \frac{1}{64}$



Clearly, from the graph $f(x) = \begin{cases} \frac{1}{64}, & 0 < x \le \frac{1}{8} \\ x^2, & \frac{1}{8} < x < 1 \\ x^3, & x > 1 \end{cases}$

27. The line through (0, 0) and (1, 1) has slope $m = 1$ and y-intercept $b = 0$, so its equation is $y = x$. Thus, for the part of the graph f that joins (0, 0) to (1,1), we have $f(x) = x$, if $0 \le x \le 1$

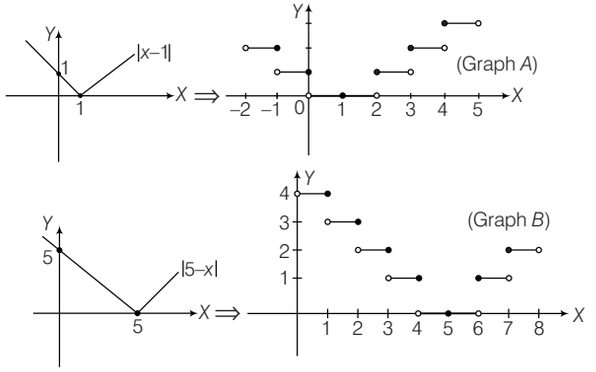
The line through (1, 1) and (2, 0) has slope $m = -1$, so its point slope form is $y - 0 = (-1)(x - 2)$ or $y = 2 - x$.

So, we have $f(x) = 2 - x$, if $1 < x \le 2$

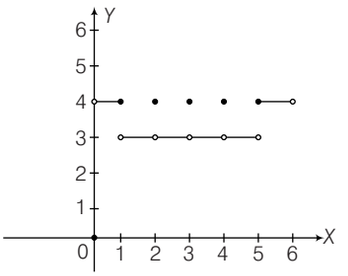
We also see that the graph of f coincides with the X-axis for $x > 2$. Putting this information together, we have the following three-piece formula for $f(x) = \begin{cases} x, & \text{if } 0 \le x \le 1 \\ 2 - x, & \text{if } 1 < x \le 2 \\ 0, & \text{if } x > 2 \end{cases}$

28. The denominator is a bit complicated and we need to analyse it in detail to determine, where it can become zero.

The fastest and easiest way would be to visualise the graph. Draw the graphs for $|x - 1|$ and $|5 - x|$, apply the greatest integer function of these graphs separately, then add them and find the values of x for which this sum becomes 4. For these values of x, the denominator of $f(x)$ becomes 0.

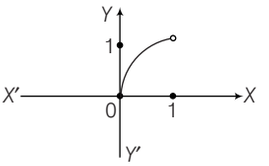


Now, add the graphs of A and B point by point

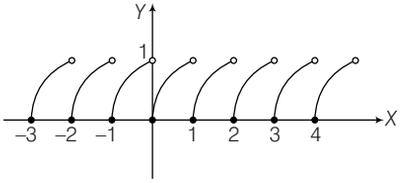


We see that the value of (graph A + graph B) is 4 for the following values of x : (0, 1], {2, 3, 4}, [5, 6).
Hence, domain $D = R / \{(0, 1], 2, 3, 4, [5, 6)\}$.

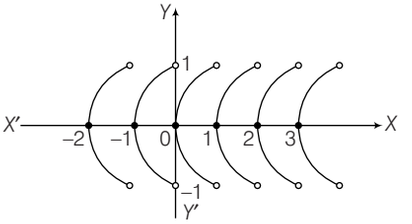
29. Let us first draw the graph for $y = \sqrt{\{x\}}$. Now, $\{x\}$ is the same as x for $0 \le x < 1$. In this interval, $\sqrt{\{x\}}$ will be the same as $\sqrt{x}$.



We can easily see that this same curve will be repeated in every previous and subsequent unit interval, since $\{x\}$ is the same in all such intervals. Hence, we obtain the graph of $y = \sqrt{\{x\}}$.



Now, we can easily draw $|y| = \sqrt{\{x\}}$ by taking a reflection in the X-axis.



30. In any interval $n \le x < n + 1$, (where n is an integer) $[x]$ has the value n. In any interval, therefore the graph of $y = -[x] + \sqrt{\{x\}}$ will be the graph of $\sqrt{\{x\}}$ – integer n.

e.g. $0 \le x < 1 \Rightarrow y = \sqrt{\{x\}}$; $1 \le x < 2 \Rightarrow y = -1 + \sqrt{\{x\}}$; $-1 \le x < 0 \Rightarrow y = 1 + \sqrt{\{x\}}$. The graph is drawn below

Session 1

Definition of Limits, Indeterminate Forms, L'Hospital's Rule, Evaluation of Limits

Definition of Limits

Let $\lim_{x \to a} f(x) = l$. It would mean that when we approach the point $x = a$ from the values which are just greater than or smaller than $x = a$, $f(x)$ would have a tendency to move closer to the value 'l'.

This is same as saying 'difference between $f(x)$ and l can be made as small as we feel like by suitably choosing x in the neighbourhood of $x = a$'.

Mathematically, we write this, as $\lim_{x \to a} f(x) = l$, which is equivalent of saying that, $|\boldsymbol{f(x) - l| < \varepsilon, \forall\ x}$ **whenever** $\boldsymbol{0 < |x - a| < \delta}$ **and** ε **and** δ **sufficiently small +ve numbers**.

It is clear from the above discussion that, if we are interested in finding the limit of $f(x)$ at $x = a$, the first thing we have to make sure that $f(x)$ is well defined in the neighbourhood of $x = a$ and not necessarily at $x = a$ (that means $x = a$ may or may not be in the domain of $f(x)$), because we have to examine its behaviour or tendency in the neighbourhood of $x = a$.

Following possibilities may arise :

(a) **Left tendency is same as its right tendency** As shown in figure 5.1, when we approach $x = a$ from the values which are just less than a, $f(x)$ has a tendency to move towards the value l (**left tendency**).

Similarly, when we approach $x = a$ from the values which are just greater than a, $f(x)$ has a tendency to move towards the value l (**right tendency**).

In this case, we say $f(x)$ has limit l at $x = a$,
i.e. $\boldsymbol{\lim_{x \to a} f(x) = l.}$

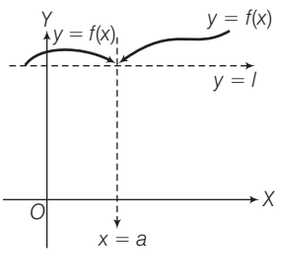

Figure 5.1

(b) **When the left tendency is not the same as its right tendency** Here, left tendency is l_1 and right tendency is l_2, clearly left tendency (l_1) is not same as right tendency (l_2). In this case, we say that the limit of $f(x)$ at $x = a$ will not exist.

i.e. $\boldsymbol{\lim_{x \to a} f(x) =}$ **Doesn't exist.**

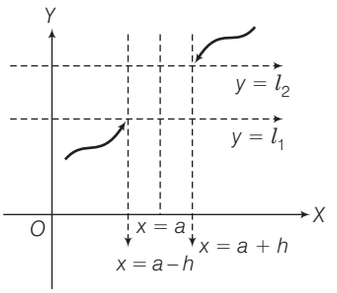

Figure 5.2

(c) **When the left tendency and/or right tendency is not fixed** As shown in the figure 5.3, it is clear that in this case, the function has **erratic** behaviour in the neighbourhood of $x = a$ and it will not be possible to talk about the left and right tendencies of the function in the neighbourhood of $x = a$.

In this case, we conclude that the limit of $f(x)$ at $x = a$ will not exist.

i.e. $\boldsymbol{\lim_{x \to a} f(x) =}$ **Doesn't exist.**

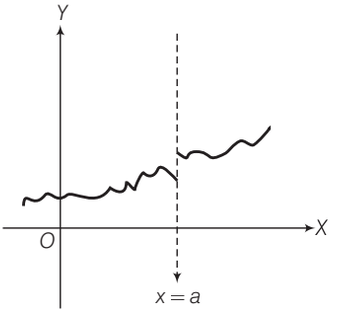

Figure 5.3

Remarks

1. Normally, students have the perception that limit should be a finite number. But, it is not always so. It is quite possible that $f(x)$ has infinite limit at $x = a$.
   If $\lim_{x \to a} f(x) = \infty$, it would simply mean that function has tendency to assume very large positive values in neighbourhood of $x = a$ (as shown in figure 5.4).

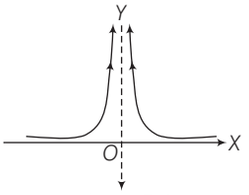

Figure 5.4

   For example $\lim_{x \to 0} \frac{1}{|x|} = \infty$

   which indicates the left tendency as well as right tendency are the same.
   Again, if $\lim_{x \to a} f(x) = -\infty$, it would simply mean that the function has tendency to assume very large negative values in the neighbourhood of $x = a$ as shown in figure 5.5.

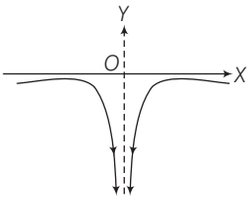

Figure 5.5

   For example (as shown in figure 5.5) $\lim_{x \to 0} \frac{-1}{|x|} = -\infty$

   At the end we discuss the case when left tendency is $(-\infty)$ and right tendency is $(+\infty)$ (i.e. $f(x)$ does not have unique tendency).
   Thus, in this case limit does not exist.

   For example $\lim_{x \to 0} \frac{1}{x}$ does not exist, since left tendency is $(-\infty)$ and right tendency is $(+\infty)$ as shown in figure 5.6.

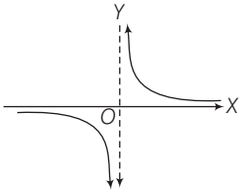

Figure 5.6

2. If $f(x)$ is well defined at $x = a$, it doesn't imply that $\lim_{x \to a} f(x) = f(a)$. Because, it is quite possible that $f(x)$ is well defined at $x = a$ but not in the neighbourhood of $x = a$ or $f(x)$ is well defined in the neighbourhood of $x = a$, but doesn't have a unique tendency.

Indeterminate Forms

If direct substitution of $x = a$ while evaluating $\lim_{x \to a}(x)$ leads to one of the following forms

$\frac{0}{0}, \frac{\infty}{\infty}, \infty - \infty, 1^{\infty}, 0^{0}, \infty^{0}, \infty \times 0$ then it is called indeterminate form.

e.g. $\lim_{x \to 1} \frac{x^2 - 1}{x - 1} = \frac{0}{0}$ indeterminate form.

$\lim_{x \to a} \frac{x^n - a^n}{x - a} = \frac{0}{0}$ indeterminate form.

$\lim_{x \to 0} \frac{\sin x}{x} = \frac{0}{0}$ indeterminate form.

Infinity (∞) is a symbol and not a number. It is a symbol for the behaviour of a variable which continuously increases and passes through all limits. Thus, the statement $x = \infty$ is meaningless, we should write $x \to \infty$.

Similarly, $-\infty$ is a symbol for the behaviour of a variable which continuously decreases and passes through all limits. Thus, the statement $x = -\infty$ is meaningless, we should write $x \to -\infty$.

Also, $\frac{1}{x} \to 0$, if $x \to +\infty$ and $\frac{1}{x} \to 0$, if $x \to -\infty$.

We cannot plot ∞ on paper. Infinity does not obey laws of elementary algebra.

(i) $\infty + \infty = \infty$ is indeterminate

(ii) $\infty - \infty$ is indeterminate.

L'Hospital's Rule

This rule states that, if $\lim_{x \to a} \frac{f(x)}{g(x)}$, reduces to $\frac{0}{0}$ or $\frac{\infty}{\infty}$.

Then, differentiate numerator and denominator till this form is removed.

i.e. $\lim_{x \to a} \frac{f(x)}{g(x)} = \lim_{x \to a} \frac{f'(x)}{g'(x)}$, provided the later limit exists.

But, if it again take form $\left(\frac{0}{0} \text{ or } \frac{\infty}{\infty}\right)$,

then $\lim_{x \to a} \frac{f(x)}{g(x)} = \lim_{x \to a} \frac{f'(x)}{g'(x)} = \lim_{x \to a} \frac{f''(x)}{g''(x)}$

and this process is continued till $\left(\frac{0}{0} \text{ or } \frac{\infty}{\infty}\right)$ form is removed.

Remark

L'Hospital's rule is applicable to only two indeterminate forms $\left(\frac{0}{0} \text{ or } \frac{\infty}{\infty}\right)$.

e.g. Evaluate $\lim_{x \to 2} \frac{x^6 - 24x - 16}{x^3 + 2x - 12}$.

Sol. We have, $\lim_{x \to 2} \frac{x^6 - 24x - 16}{x^3 + 2x - 12}$ $\left[\frac{0}{0} \text{ form}\right]$

$= \lim_{x \to 2} \frac{6x^5 - 24}{3x^2 + 2}$ [by L'Hospital's rule]

$= \frac{6(2)^5 - 24}{3(2)^2 + 2} = \frac{168}{14} = 12$

Frequently Used Series Expansions

1. $e^x = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \ldots$

2. $a^x = 1 + \frac{x \cdot \log a}{1!} + \frac{(\log a)^2 x^2}{2!} + \ldots$

[where, $a \in R^+$]

3. $(1+x)^n = 1 + \frac{nx}{1!} + \frac{n(n-1)x^2}{2!} + \frac{n(n-1)(n-2)x^3}{3!} + \ldots n \in R$ and $|x| < 1$

4. $\log(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \ldots$

[where $-1 \le x \le 1$]

5. $\frac{x^n - a^n}{x - a} = x^{n-1} + x^{n-2}a + x^{n-3}a^2 + \ldots + a^{n-1}$

6. $(1+x)^{1/x} = e\left(1 - \frac{x}{2} + \frac{11x^2}{24} + \ldots\right)$

7. $\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \ldots$

8. $\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \ldots$

9. $\tan x = x + \frac{x^3}{3} + \frac{2}{15}x^5 + \frac{17}{315}x^7 + \ldots$

10. $\sin^{-1} x = x + \frac{1^2}{3!}x^3 + \frac{1^2 \cdot 3^2}{5!}x^5 + \frac{1^2 \cdot 3^2 \cdot 5^2}{7!}x^7 + \ldots$

11. $\tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} + \ldots$

12. $\sec^{-1} x = 1 + \frac{x^2}{2!} + \frac{5x^4}{4!} + \frac{61x^6}{6!} + \ldots$

13. $(\sin^{-1} x)^2 = \frac{2}{2!}x^2 + \frac{2 \cdot 2^2}{4!}x^4 + \frac{2 \cdot 2^2 \cdot 4^2}{6!}x^6 + \ldots$

14. $x \cot x = 1 - \frac{x^3}{3} + \frac{x^4}{45} - \frac{2x^6}{945} + \ldots$

15. $\sec x = 1 + \frac{x^2}{2} + \frac{5x^4}{24} + \frac{61x^6}{720} + \ldots$

16. $x \operatorname{cosec} x = 1 + \frac{x^2}{6} + \frac{7x^4}{360} + \frac{31x^6}{15120} + \ldots$

Example 1 Evaluate $\lim_{x \to 0} \frac{x \tan 2x - 2x \tan x}{(1 - \cos 2x)^2}$.

[IIT JEE 1999]

Sol. We have, $\lim_{x \to 0} \frac{x \tan 2x - 2x \tan x}{(1 - \cos 2x)^2}$

$$= \lim_{x \to 0} \frac{x\left[2x + \frac{2^3x^3}{3} + 2\frac{2^5x^5}{15} + \ldots\right] - 2x\left[x + \frac{x^3}{3} + 2\frac{x^5}{15} + \ldots\right]}{(2\sin^2 x)^2}$$

$$= \lim_{x \to 0} \frac{x^4\left(\frac{8}{3} - \frac{2}{3}\right) + x^6\left(\frac{64}{15} - \frac{4}{15}\right) + \ldots}{4\left(x - \frac{x^3}{3!} + \frac{x^5}{5!} - \ldots\right)^4}$$

$$= \lim_{x \to 0} \frac{2 + 4x^2 + \ldots}{4\left(1 - \frac{x^2}{3!} + \ldots\right)^4} = \frac{2}{4} = \frac{1}{2}$$

Evaluation of Limits

Now, according to our plan, first of all we shall learn the evaluation of limits of different forms and then learn the existence of limits.

There are eight indeterminate or meaningless forms, which are

(i) $\frac{0}{0}$ (ii) $\frac{\infty}{\infty}$ (iii) $\infty - \infty$ (iv) $\infty \times \infty$

(v) $\infty \cdot 0$ (vi) 0^0 (vii) ∞^0 (viii) 1^∞

We will divide the problems of evaluation of limits in five categories, which are

1. Limit of algebraic functions
2. Trigonometric limits
3. Logarithmic limits
4. Exponential limits
5. Miscellaneous forms

Now, we discuss one by one in details.

Limit of Algebric Functions

In this section, we evaluate limit of algebraic functions when variable tends to a finite or infinite value. While evaluating algebraic limits the form $\frac{0}{0}, \frac{\infty}{\infty}$ and $\infty - \infty$ arise, which we will discussed here.

(i) $\frac{0}{0}$ Form

This form can be resolved by factorisation method, rationalisation method or by using the formula $\lim_{x \to a} \frac{x^n - a^n}{x - a} = na^{n-1}$, which are discussed below.

(a) Factorisation Method

In this method, numerators and denominators are factorised. The common factors are cancelled and the rest output is the result.

Example 2 Evaluate $\lim_{x\to 1}\dfrac{x^2-3x+2}{x-1}$.

Sol. **Method I** We have, $\lim_{x\to 1}\dfrac{x^2-3x+2}{x-1}$ $\left[\dfrac{0}{0}\text{ form}\right]$

$$=\lim_{x\to 1}\frac{(x-1)(x-2)}{(x-1)}$$

[as $x^2-3x+2=(x-1)(x-2)$]

$$=\lim_{x\to 1}(x-2) \qquad [\text{as } x-1\neq 0]$$

$$=1-2=-1$$

Method II We have, $L=\lim_{x\to 1}\dfrac{x^2-3x+2}{x-1}$ $\left[\dfrac{0}{0}\text{ form}\right]$

So, applying L'Hospital's rule,

$$L=\lim_{x\to 1}\frac{2x-3}{1}=\frac{2-3}{1}=-1$$

[i.e. differentiating numerator and denominator separately]

Example 3 ***Evaluate*** $\lim_{x\to 1}\dfrac{x^3-x^2\log x+\log x-1}{x^2-1}$.

Sol. We have, $\lim_{x\to 1}\dfrac{x^3-x^2\log x+\log x-1}{x^2-1}$

$$=\lim_{x\to 1}\frac{(x^3-1)-(x^2-1)\log x}{(x^2-1)} \qquad \left[\frac{0}{0}\text{ form}\right]$$

$$=\lim_{x\to 1}\frac{(x-1)\{x^2+x+1-(x+1)\log x\}}{(x-1)(x+1)}$$

$$\left[\because x^3-1=(x-1)(x^2+x+1),\ x^2-1=(x-1)(x+1)\right]$$

$$=\lim_{x\to 1}\frac{x^2+x+1-(x+1)\log x}{(x+1)}$$

$$=\frac{1^2+1+1-(1+1)\log 1}{1+1}=\frac{3}{2} \qquad [\text{as } \log 1=0]$$

(b) Rationalisation Method

Rationalisation is followed when we have fractional powers (like $\frac{1}{2},\frac{1}{3}$ etc.) on expressions in numerator or denominator or in both. After rationalisation the terms are factorised which on cancellation gives the result.

Example 4 Evaluate $\lim_{h\to 0}\dfrac{\sqrt{x+h}-\sqrt{x}}{h}$.

Sol. **Method I** We have, $\lim_{h\to 0}\dfrac{\sqrt{x+h}-\sqrt{x}}{h}$

$$=\lim_{h\to 0}\frac{\sqrt{x+h}-\sqrt{x}}{h}\times\frac{\sqrt{x+h}+\sqrt{x}}{\sqrt{x+h}+\sqrt{x}} \qquad \left[\frac{0}{0}\text{ form}\right]$$

$$=\lim_{h\to 0}\frac{(x+h)-(x)}{h(\sqrt{x+h}+\sqrt{x})}=\lim_{h\to 0}\frac{h}{h(\sqrt{x+h}+\sqrt{x})}$$

$$=\lim_{h\to 0}\frac{1}{\sqrt{x+h}+\sqrt{x}}=\frac{1}{2\sqrt{x}}$$

Method II (L'Hospital's rule) We have,

$$L=\lim_{h\to 0}\frac{\sqrt{x+h}-\sqrt{x}}{h} \qquad \left[\frac{0}{0}\text{ form}\right]$$

$\therefore$ Applying L'Hospital's rule,

$$L=\lim_{h\to 0}\frac{\frac{1}{2\sqrt{x+h}}-0}{1}$$

[differentiating numerator and denominator w.r.t. h]

$$=\frac{1}{2\sqrt{x}}$$

Example 5 ***Evaluate*** $\lim_{x\to 2a}\dfrac{\sqrt{x-2a}+\sqrt{x}-\sqrt{2a}}{\sqrt{x^2-4a^2}}$.

Sol. We have, $\lim_{x\to 2a}\dfrac{\sqrt{x-2a}+\sqrt{x}-\sqrt{2a}}{\sqrt{x^2-4a^2}}$ $\left[\dfrac{0}{0}\text{ form}\right]$

$$=\lim_{x\to 2a}\frac{\sqrt{x-2a}+\dfrac{x-2a}{\sqrt{x}+\sqrt{2a}}}{\sqrt{x-2a}\sqrt{x+2a}}$$

$$=\lim_{x\to 2a}\frac{1}{\sqrt{x+2a}}+\frac{\sqrt{x-2a}}{\sqrt{x+2a}(\sqrt{x}+\sqrt{2a})}$$

$$=\frac{1}{\sqrt{4a}}=\frac{1}{2\sqrt{a}}$$

(c) Based on Standard Formula

$\lim_{x\to a}\dfrac{x^n-a^n}{x-a}=na^{n-1}$, where n is a rational number.

Proof Let $f(x)=\dfrac{x^n-a^n}{x-a}$

$$=x^{n-1}+ax^{n-2}+a^2x^{n-3}+\ldots+a^{n-1}$$

$$\therefore\ \lim_{x\to a}f(x)=\lim_{x\to a}(x^{n-1}+ax^{n-2}+a^2x^{n-3}+\ldots+a^{n-1})$$

$$=\underbrace{a^{n-1}+a\cdot a^{n-2}+a^2\cdot a^{n-3}+\ldots+a^{n-1}}_{n\text{ terms}}$$

$$=a^{n-1}+a^{n-1}+a^{n-1}+\ldots\text{ upto }n\text{ terms}=n\cdot a^{n-1}$$

Example 6 Evaluate $\lim_{x \to 2} \frac{x^3 - 2^3}{x - 2}$.

Sol. We have, $\lim_{x \to 2} \frac{x^3 - 2^3}{x - 2}$ $\left[\frac{0}{0} \text{ form}\right]$

$= 3(2)^{3-1}$ $\left[\because \lim_{x \to a} \frac{x^n - a^n}{x - a} = n \cdot a^{n-1}\right]$

$= 3(2)^2 = 12$

Example 7 Evaluate $\lim_{x \to 1} \frac{x + x^2 + \ldots + x^n - n}{x - 1}$.

Sol. We have, $\lim_{x \to 1} \frac{x + x^2 + x^3 + \ldots + x^n - n}{x - 1}$

$= \lim_{x \to 1} \frac{(x-1) + (x^2 - 1^2) + (x^3 - 1^3) + \ldots + (x^n - 1^n)}{(x-1)}$

$= \lim_{x \to 1} \left\{\frac{x-1}{x-1} + \frac{x^2 - 1^2}{x-1} + \frac{x^3 - 1^3}{x-1} + \ldots + \frac{x^n - 1^n}{x-1}\right\}$

$= 1 + 2(1)^{2-1} + 3(1)^{3-1} + \ldots + n(1)^{n-1}$

$= 1 + 2 + 3 + \ldots + n$

$= \frac{n(n+1)}{2}$

Example 8 The value of $\lim_{\substack{x \to 1 \\ y \to 0}} \frac{y^3}{x^3 - y^2 - 1}$ as $(x, y) \to (1, 0)$ along the line $y = x - 1$ is

(a) 1

(b) –1

(c) 0

(d) Doesn't exist

Sol. As, $y \to x - 1$ or $x \to y + 1$

$\therefore$ $\lim_{y \to 0} \frac{(y)^3}{(y+1)^3 - y^2 - 1}$

Using L, Hospital's rule,

$\lim_{y \to 0} \frac{3y^2}{3(y+1)^2 - 2y} = \lim_{y \to 0} \frac{6y}{6(y+1) - 2}$

$= \frac{0}{6} = 0$

Hence, (c) is the correct answer.

(ii) Algebraic Function of ∞ Type

(a) $\frac{\infty}{\infty}$ Form

First we should know the limiting values of a^x $(a > 0)$ as $x \to \infty$. *See the graphs of this function.*

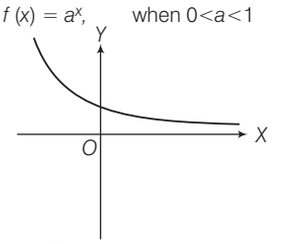

Figure 5.7

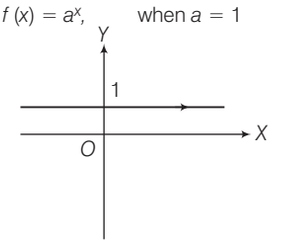

Figure 5.8

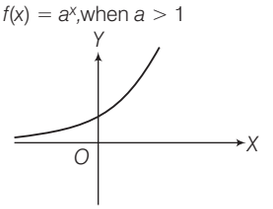

Figure 5.9

Now, see the graph for a^x, when $a > 1$. This graph appears to touch X-axis in the negative side of X-axis and thereafter it increases rapidly. This is why because $\lim_{x \to -\infty} a^x \to 0$, again you will also find the result,

$$\lim_{x \to \infty} a^x \to \infty$$

Thus, we have $\lim_{x \to \infty} a^x = \begin{cases} \infty, & \text{if } a > 1 \\ 1, & \text{if } a = 1 \\ 0, & \text{if } 0 \le a < 1 \end{cases}$

This type of problems are solved by taking the highest power of the terms tending to infinity as common from numerator and denominator. That is after they are cancelled and the rest output is the result (or apply L'Hospital's rule).

Example 9 ***Evaluate*** $\lim_{x \to \infty} \frac{x^2 + 5}{x^2 + 4x + 3}$.

Sol. Let $L = \lim_{x \to \infty} \frac{x^2 + 5}{x^2 + 4x + 3}$

Dividing numerator and denominator by x^2, we get

$$L = \lim_{x \to \infty} \frac{1 + \frac{5}{x^2}}{1 + \frac{4}{x} + \frac{3}{x^2}} = \frac{1 + 0}{1 + 0 + 0} = 1$$

[because $\frac{K}{x} \to 0$, when $x \to \infty$, where K is any constant]

Aliter We have, $L = \lim_{x \to \infty} \frac{x^2 + 5}{x^2 + 4x + 3}$ $\left[\frac{\infty}{\infty} \text{ form}\right]$

Applying L'Hospital's rule, $L = \lim_{x \to \infty} \frac{2x}{2x + 4}$ $\left[\frac{\infty}{\infty} \text{ form}\right]$

Again, applying L'Hospital's rule, $L = \lim_{x \to \infty} \frac{2}{2} = 1$

Example 10 ***Evaluate*** $\lim_{n\to\infty}\dfrac{(n+2)!+(n+1)!}{(n+2)!-(n+1)!}$.

Sol. We have, $\lim_{n\to\infty}\dfrac{(n+2)(n+1)!+(n+1)!}{(n+2)(n+1)!-(n+1)!}$

$$=\lim_{n\to\infty}\frac{(n+1)![n+2+1]}{(n+1)![n+2-1]}=\lim_{n\to\infty}\frac{(n+3)}{(n+1)}\quad\left[\frac{\infty}{\infty}\text{ form}\right]$$

$$=\lim_{n\to\infty}\frac{1+3/n}{1+1/n}=\frac{1+0}{1+0}=1\qquad\left[\because\frac{1}{n}\to 0,\ \text{as } n\to\infty\right]$$

(b) $\infty-\infty$ Form

Such problems are simplified (generally rationalised) first, thereafter they generally acquire $\left(\dfrac{\infty}{\infty}\right)$ form.

Example 11 ***Evaluate*** $\lim_{x\to\infty}(x-\sqrt{x^2+x})$.

Sol. We have, $\lim_{x\to\infty}(x-\sqrt{x^2+x})$

$$=\lim_{x\to\infty}\frac{x-\sqrt{x^2+x}}{1}\times\frac{x+\sqrt{x^2+x}}{x+\sqrt{x^2+x}}\qquad[\infty-\infty\text{ form}]$$

$$=\lim_{x\to\infty}\frac{x^2-(x^2+x)}{x+\sqrt{x^2+x}}=\lim_{x\to\infty}\frac{-x}{x+\sqrt{x^2+x}}$$

$$=\lim_{x\to\infty}\frac{-x}{x\left\{1+\sqrt{1+\dfrac{1}{x}}\right\}}$$

$$=\lim_{x\to\infty}\frac{-1}{1+\sqrt{1+\dfrac{1}{x}}}=-\frac{1}{2}\qquad\left[\because\frac{1}{x}\to 0,\ \text{as } x\to\infty\right]$$

Example 12 ***Evaluate*** $\lim_{x\to\infty}(\sqrt{x^2+x+1}-\sqrt{x^2+1})$.

Sol. We have, $\lim_{x\to\infty}(\sqrt{x^2+x+1}-\sqrt{x^2+1})\qquad[\infty-\infty\text{ form}]$

$$=\lim_{x\to\infty}\frac{(\sqrt{x^2+x+1}-\sqrt{x^2+1})}{1}\times\frac{(\sqrt{x^2+x+1}+\sqrt{x^2+1})}{(\sqrt{x^2+x+1}+\sqrt{x^2+1})}$$

$$=\lim_{x\to\infty}\frac{(x^2+x+1)-(x^2+1)}{\sqrt{x^2+x+1}+\sqrt{x^2+1}}$$

$$=\lim_{x\to\infty}\frac{x}{\sqrt{x^2+x+1}+\sqrt{x^2+1}}$$

$$=\lim_{x\to\infty}\frac{1}{\sqrt{1+\dfrac{1}{x}+\dfrac{1}{x^2}}+\sqrt{1+\dfrac{1}{x^2}}}=\frac{1}{1+1}=\frac{1}{2}$$

$$\left[\because\frac{1}{x}\to 0,\ \text{as } x\to\infty\right]$$

An Important Result

If m, n are positive integers and $a_0, b_0\neq 0$ and non-zero real numbers, then

$$\lim_{x\to\infty}\frac{a_0x^m+a_1x^{m-1}+\ldots+a_{m-1}x+a_m}{b_0x^n+b_1x^{n-1}+\ldots+b_{n-1}x+b_n}$$

$$=\begin{cases}0, & m<n\\ \dfrac{a_0}{b_0}, & m=n\\ \infty, & m>n\ \text{ when } a_0b_0>0\\ -\infty, & m>n\ \text{ when } a_0b_0<0\end{cases}$$

Example 13 ***Evaluate*** $\lim_{x\to\infty}\dfrac{ax^2+b}{x+1}$, ***when*** $a\geq 0$.

Sol. Here, if $a\neq 0$; $\lim_{x\to\infty}\dfrac{ax^2+b}{x+1}$

[as degree of numerator > degree of denominator]

$$=\lim_{x\to\infty}\frac{ax^2+b}{x+1}=\infty\qquad[\text{as } a>0]$$

Again, if $a=0$; $\lim_{x\to\infty}\dfrac{0\cdot x^2+b}{x+1}=\lim_{x\to\infty}\dfrac{b}{x+1}=0$

[as degree of numerator < degree of denominator]

$$\therefore\quad\lim_{x\to\infty}\frac{ax^2+b}{x+1}=\begin{cases}\infty, & a>0\\ 0, & a=0\end{cases}$$

Example 14 ***If*** $\lim_{x\to\infty}\left(\dfrac{x^2+1}{x+1}-ax-b\right)=0$, ***find the values of*** a ***and*** b.

Sol. Given, $\lim_{x\to\infty}\left(\dfrac{x^2+1}{x+1}-ax-b\right)=0$

$$\Rightarrow\lim_{x\to\infty}\frac{x^2+1-ax^2-ax-bx-b}{x+1}=0$$

$$\Rightarrow\lim_{x\to\infty}\frac{x^2(1-a)-x(a+b)+(1-b)}{x+1}=0$$

Since, the limit of above expression is zero.

$\therefore$ Degree of numerator < Degree of denominator.
So, numerator must be a constant, i.e. a zero degree polynomial.

$\therefore\qquad 1-a=0$ and $a+b=0$

Hence, $\qquad a=1$ and $b=-1$

Example 15 ***If*** $\lim_{x\to\infty}\left(\dfrac{x^2+1}{x+1}-ax-b\right)=2$, ***find the values of*** a ***and*** b.

Sol. We have, $\lim_{x\to\infty}\left(\dfrac{x^2+1}{x+1}-ax-b\right)$

$$=\lim_{x\to\infty}\frac{x^2(1-a)-x(a+b)+(1-b)}{(x+1)}=2$$

Since, limit of above expression is a finite non-zero number.

$\therefore$ Degree of numerator = Degree of denominator

$\Rightarrow \quad 1-a=0 \quad \Rightarrow \quad a=1$

Putting $a=1$ in above limit, we get

$$\lim_{x\to\infty}\frac{-x\ (1+b)+(1+b)}{x+1}=2$$

$\Rightarrow \quad -(1+b)=2 \Rightarrow \ b=-3$

Hence, $a=1$ and $b=-3$.

Example 16 *If* $\lim_{x\to\infty}\left(\frac{x^2+1}{x+1}-ax-b\right)=\infty$, *find* a *and* b.

Sol. Given, $\lim_{x\to\infty}\left(\frac{x^2+1}{x+1}-ax-b\right)=\infty$

$$\Rightarrow \quad \lim_{x\to\infty}\frac{x^2(1-a)-x(a+b)+(1-b)}{x+1}=\infty$$

The limit of above expression is infinity.

$\therefore$ Degree of numerator > Degree of denominator

$\Rightarrow \quad 1-a>0\Rightarrow a\neq 1$

Hence, $a<1$ and b can assume any real value.

Example 17 Let $S_n=1+2+3+\cdots+n$ and $P_n=\frac{S_2}{S_2-1}\cdot\frac{S_3}{S_3-1}\cdot\frac{S_4}{S_4-1}\cdots\frac{S_n}{S_n-1}$, where $n\in N\ (n\geq 2)$. Find $\lim_{n\to\infty}P_n$.

Sol. As, $S_n=\frac{n(n+1)}{2}$

$$\Rightarrow \quad S_n-1=\frac{n(n+1)}{2}-1=\frac{n^2+n-2}{2}=\frac{(n+2)(n-1)}{2}$$

$$\therefore \quad \frac{S_n}{S_n-1}=\left(\frac{n}{n-1}\right)\left(\frac{n+1}{n+2}\right)$$

$$\Rightarrow \quad P_n=\left(\frac{2}{1}\cdot\frac{3}{2}\cdot\frac{4}{3}\cdots\frac{n}{n-1}\right)\left(\frac{3}{4}\cdot\frac{4}{5}\cdot\frac{5}{6}\cdots\frac{n+1}{n+2}\right)$$

$$=\left(\frac{n}{1}\right)\left(\frac{3}{n+2}\right)$$

$$\therefore \quad \lim_{n\to\infty}P_n=\lim_{n\to\infty}\frac{3n}{n+2}=3$$

Example 18 If $\lim_{n\to\infty}\frac{1}{(\sin^{-1}x)^n+1}=1$, x lies in the interval

(a) $(-\sin 1, \sin 1)$ (b) $(-1, 1)$

(c) $(0, 1)$ (d) $(-1, 0)$

Sol. Here, $\lim_{n\to\infty}\frac{1}{(\sin^{-1}x)^n+1}=1$ is possible only, if

$$-1<\sin^{-1}x<1$$

$$\Rightarrow \quad x\in(-\sin 1, \sin 1)$$

Hence, (a) is the correct answer.

Exercise for Session 1

1. If $f(a)=2, f'(a)=1, g(a)=-1, g'(a)=-2$, then $\lim_{x\to a}\frac{g(x)f(a)-g(a)f(x)}{x-a}$ is

(a) -5 (b) 3 (c) -3 (d) 5

2. The value of $\lim_{x\to 0}\frac{x\cos x-\log(1+x)}{x^2}$ is

(a) 1 (b) $\frac{1}{4}$ (c) $\frac{1}{2}$ (d) None of these

3. The value of $\lim_{x\to 0}\frac{e^{x^2}-\cos x}{x^2}$ is

(a) $\frac{3}{2}$ (b) $-\frac{3}{2}$ (c) $\frac{1}{2}$ (d) $-\frac{1}{2}$

4. The value of $\lim_{x\to a}\frac{\cos x-\cos a}{\cot x-\cot a}$ is

(a) $-\sin^3 a$ (b) $\cos^3 a$ (c) $\sin^3 a$ (d) $\cot a$

5. The value of $\lim_{x \to 0} \left(\frac{1}{x^2} - \cot x \right)$ is

(a) 0 (b) 1

(c) $\frac{1}{4}$ (d) None of these

6. The value of $\lim_{x \to \infty} (\sqrt{a^2x^2 + ax + 1} - \sqrt{a^2x^2 + 1}), (a > 0)$ is

(a) $\frac{1}{2}$ (b) $-\frac{1}{2}$

(c) Doesn't exist (d) None of these

7. The value of $\lim_{n \to \infty} \frac{1^3 + 2^3 + 3^3 + \ldots + n^3}{(n^2 + 1)^2}$ is

(a) $\frac{1}{4}$ (b) $\frac{1}{2}$

(c) $\frac{1}{2\sqrt{2}}$ (d) None of these

8. The value of $\lim_{n \to \infty} \frac{1 \cdot n + 2 \cdot (n-1) + 3 \cdot (n-2) + \ldots + n \cdot 1}{1^2 + 2^2 + \ldots + n^2}$ is

(a) 1 (b) −1

(c) $\frac{1}{\sqrt{2}}$ (d) $\frac{1}{2}$

9. The value of $\lim_{n \to \infty} \frac{a^n + b^n}{a^n - b^n}$, (where $a > b > 1$) is

(a) 1 (b) −1

(c) $\frac{1}{2}$ (d) $\frac{1}{\sqrt{2}}$

Session 2

Trigonometric Limits

Trigonometric Limits

To evaluate trigonometric limits the following results are given below

(i) $\lim_{x\to 0}\frac{\sin x}{x}=1$ **(ii)** $\lim_{x\to 0}\frac{\tan x}{x}=1$

(iii) $\lim_{x\to 0}\frac{\sin^{-1} x}{x}=1$ **(iv)** $\lim_{x\to 0}\frac{\tan^{-1} x}{x}=1$

(v) $\lim_{x\to 0}\frac{\sin x^{0}}{x}=\frac{\pi}{180^{\circ}}$ **(vi)** $\lim_{x\to 0}\cos x=1$

(vii) $\lim_{x\to a}\frac{\sin(x-a)}{x-a}=1$ **(viii)** $\lim_{x\to a}\frac{\tan(x-a)}{x-a}=1$

Example 19 Evaluate $\lim_{x\to 0}\frac{1-\cos x}{x^2}$.

Sol. We have, $\lim_{x\to 0}\frac{1-\cos x}{x^2}$

$$=\lim_{x\to 0}\frac{2\sin^2 x/2}{x^2}=\lim_{x\to 0}\frac{2}{4}\frac{\sin^2 x/2}{x^2/4}\qquad\left[\frac{0}{0}\text{ form}\right]$$

$$=\lim_{x\to 0}\frac{1}{2}\left(\frac{\sin x/2}{x/2}\right)^2=\frac{1}{2}(1)^2=\frac{1}{2}$$

Example 20 Solve $\lim_{x\to 0}\frac{1-\cos(1-\cos x)}{\sin^4 x}$

Sol. $\lim_{x\to 0}\frac{1-\cos(1-\cos x)}{\sin^4 x}=\lim_{x\to 0}\frac{1-\cos\left(2\sin^2\frac{x}{2}\right)}{x^4}\Big/\frac{\sin^4 x}{x^4}$

$$=\lim_{x\to 0}\frac{1-\cos\left(2\sin^2\frac{x}{2}\right)}{x^4}\Big/\lim_{x\to 0}\left(\frac{\sin x}{x}\right)^4$$

$$=\lim_{x\to 0}\frac{2\sin^2\left(\sin^2\frac{x}{2}\right)}{x^4}\Big/1$$

$$=\lim_{x\to 0}2\cdot\left(\frac{\sin\left(\sin^2\frac{x}{2}\right)}{\sin^2\frac{x}{2}}\cdot\frac{\sin^2\frac{x}{2}}{4\cdot\frac{x^2}{4}}\right)^2$$

$$=2\times\frac{1}{4^2}=\frac{1}{8}$$

Example 21 ***Evaluate*** $\lim_{x\to\infty}2^{-x}\sin(2^x)$.

Sol. Since, $2^{-x}=\frac{1}{2^x}$. We know that, as $x\to\infty, 2^x\to\infty$

$\therefore$ The given limit $= 0\times$

[A finite number between -1 and $+1$] $=0$

Hence, $\lim_{x\to\infty}\frac{\sin(2^x)}{(2^x)}=0$

Example 22 Evaluate $\lim_{x\to\infty}e^x\sin(d/e^x)$.

Sol. When $x\to\infty, e^x\to\infty$

But, angle of sine $=\frac{d}{e^x}=\frac{\text{finite}}{\infty}=0$

$\therefore$ The given limit $=\lim_{x\to\infty}\frac{\sin(d/e^x)}{1/e^x}=\lim_{\frac{d}{e^x}\to 0}\frac{\sin d/e^x}{d/e^x}\times d$

$$=1\times d=d$$

Example 23 Evaluate $\lim_{x\to\infty}\sqrt{\frac{x-\sin x}{x+\cos^2 x}}$.

Sol. We have, $\lim_{x\to\infty}\sqrt{\frac{x-\sin x}{x+\cos^2 x}}=\lim_{x\to\infty}\sqrt{\frac{x\left(1-\frac{\sin x}{x}\right)}{x\left(1+\frac{\cos^2 x}{x}\right)}}$

$$=\lim_{x\to\infty}\sqrt{\frac{1-\frac{\sin x}{x}}{1+\frac{\cos^2 x}{x}}}=\sqrt{\frac{1-0}{1+0}}=1$$

Example 24 ***Evaluate*** $\lim_{x\to y}\frac{\sin^2 x-\sin^2 y}{x^2-y^2}$.

Sol. $\lim_{x\to y}\frac{\sin^2 x-\sin^2 y}{x^2-y^2}=\lim_{x\to y}\frac{\sin(x+y)\sin(x-y)}{(x+y)(x-y)}$

$$=\lim_{x\to y}\frac{\sin(x+y)}{(x+y)}\times\lim_{x\to y}\frac{\sin(x-y)}{(x-y)}=\frac{\sin(2y)}{2y}\times 1$$

[as $x\to y\ \Rightarrow (x-y)\to 0$, but $x+y\to 2y$]

$$=\frac{\sin 2y}{2y}$$

Example 25

$\lim_{x\to\infty}[(x+5)\tan^{-1}(x+5)-(x+1)\tan^{-1}(x+1)]$ ***is equal to***

(a) π (b) 2π

(c) $\frac{\pi}{2}$ (d) None of these

Sol. Here, $\lim_{x\to\infty}((x+5)\tan^{-1}(x+5)-(x+1)\tan^{-1}(x+1))$

$$=\lim_{x\to\infty}(x+5)\left\{\frac{\pi}{2}-\cot^{-1}(x+5)\right\}-(x+1)\left\{\frac{\pi}{2}-\cot^{-1}(x+1)\right\}$$

$$=\lim_{x\to\infty}2\pi-\frac{\tan^{-1}\left(\frac{1}{x+5}\right)}{\left(\frac{1}{x+5}\right)}+\frac{\tan^{-1}\left(\frac{1}{x+1}\right)}{\left(\frac{1}{x+1}\right)}=2\pi$$

Hence, (b) is the correct answer.

Example 26 Evaluate $\lim_{x\to 0}\frac{\sin(\pi\cos^2 x)}{x^2}$.

[IIT JEE 2001]

Sol. $\lim_{x\to 0}\frac{\sin(\pi\cos^2 x)}{x^2}=\lim_{x\to 0}\frac{\sin\{\pi(1-\sin^2 x)\}}{x^2}$

$$=\lim_{x\to 0}\frac{\sin(\pi-\pi\sin^2 x)}{x^2}$$

$$=\lim_{x\to 0}\frac{\sin(\pi\sin^2 x)}{x^2}=\lim_{x\to 0}\left\{\frac{\sin(\pi\sin^2 x)}{\pi\sin^2 x}\times\frac{\pi}{1}\times\frac{\sin^2 x}{x^2}\right\}$$

$$=\lim_{x\to 0}\frac{\sin(\pi\sin^2 x)}{\pi\sin^2 x}\times\pi\times\lim_{x\to 0}\frac{\sin^2 x}{x^2}$$

$$=1\times\pi\times 1=\pi$$

Example 27 Let $a=\min\{x^2+2x+3, x\in R\}$ and $b=\lim_{\theta\to 0}\frac{1-\cos\theta}{\theta^2}$. The value of $\sum_{r=0}^{n}a^r\cdot b^{n-r}$ is

Sol. Here, $a=\min\{x^2+2x+3, x\in R\}$

i.e. $x^2+2x+3=x^2+2x+1+2$

$$=(x+1)^2+2$$

$\therefore$ a is minimum, when $x=-1$, i.e. $a=2$

Again, $b=\lim_{\theta\to 0}\frac{2\sin^2\theta/2}{\theta^2}=\lim_{\theta\to 0}\frac{2}{4}\cdot\frac{\sin^2\theta/2}{\theta^2/4}$

$$=\lim_{\theta\to 0}\frac{2}{4}\cdot\frac{\sin^2\theta/2}{(\theta/2)^2}=\frac{1}{2}$$

Hence, $\sum_{r=0}^{n}a^r\,b^{n-r}=\sum_{r=0}^{n}2^r\cdot\left(\frac{1}{2}\right)^{n-r}$

$\Rightarrow$ $\frac{1}{2^n}\{2^0+2^2+2^4+\ldots+2^{2n}\}$

$\Rightarrow$ $\frac{1}{2^n}\left\{\frac{1(4^{n+1}-1)}{4-1}\right\}=\frac{4^{n+1}-1}{2^n\times 3}$

[i.e. sum of $(n+1)$ terms of GP]

$\therefore$ $\sum_{r=0}^{n}a^r\,b^{n-r}=\frac{4^{n+1}-1}{2^n\times 3}$

Example 28 Evaluate

$$\lim_{n\to\infty}\cos\left(\frac{x}{2}\right)\cos\left(\frac{x}{4}\right)\cos\left(\frac{x}{8}\right)\ldots\cos\left(\frac{x}{2^n}\right).$$

Sol. Here, $\lim_{n\to\infty}\cos\left(\frac{x}{2^n}\right)\cos\left(\frac{x}{2^{n-1}}\right)\ldots\cos\left(\frac{x}{8}\right)\cos\left(\frac{x}{4}\right)\cos\left(\frac{x}{2}\right)$

We know, $\cos A\cos 2A\cos 2^2A\ldots\cos 2^{n-1}A=\frac{\sin 2^nA}{2^n\sin A}$

Thus, $\lim_{n\to\infty}\cos\left(\frac{x}{2^n}\right)\cos\left(\frac{x}{2^{n-1}}\right)\ldots\cos\left(\frac{x}{8}\right)\cos\left(\frac{x}{4}\right)\cos\left(\frac{x}{2}\right)$

$$=\lim_{n\to\infty}\frac{\sin 2^n\left(\frac{x}{2^n}\right)}{2^n\sin\left(\frac{x}{2^n}\right)}=\lim_{n\to\infty}\frac{\sin x}{2^n\sin\left(\frac{x}{2^n}\right)}$$

$$=\sin x\cdot\lim_{n\to\infty}\frac{1}{2^n\sin\left(\frac{x}{2^n}\right)}\cdot\frac{x}{x}$$

$$=\frac{\sin x}{x}\cdot\lim_{n\to\infty}\frac{1}{2^n\sin\left(\frac{x}{2^n}\right)}\cdot x$$

$$=\frac{\sin x}{x}\cdot 1=\frac{\sin x}{x}\left[n\to\infty,\frac{x}{2^n}\to 0\text{ and }\lim_{\theta\to 0}\frac{\theta}{\sin\theta}=1\right]$$

Exercise for Session 2

1. If $\lim_{x \to 0} (x^{-3} \sin 3x + ax^{-2} + b)$ exists and is equal to zero, then

(a) $a = -3,\ b = \frac{9}{2}$ (b) $a = 3, b = \frac{9}{2}$

(c) $a = -3, b = \frac{-9}{2}$ (d) None of these

2. The value of $\lim_{x \to a} \frac{x \sin a - a \sin x}{x - a}$ is

(a) $a \sin a - \cos a$ (b) $\sin a - a \cos a$

(c) $\cos a + a \sin a$ (d) $\sin a + a \cos a$

3. The value of $\lim_{x \to \pi} \frac{\sqrt{2 + \cos x} - 1}{(\pi - x)^2}$ is

(a) $\frac{1}{4}$ (b) $\frac{1}{2}$

(c) 2 (d) Doesn't exist

4. The value of $\lim_{\theta \to \pi/4} \frac{(\sqrt{2} - \cos\theta - \sin\theta)}{(4\theta - \pi)^2}$ is

(a) $\frac{1}{16\sqrt{2}}$ (b) $\frac{1}{16}$

(c) $\frac{1}{8\sqrt{2}}$ (d) $\frac{1}{2\sqrt{2}}$

5. The value of $\lim_{x \to \pi/4} \frac{(\cos x + \sin x)^3 - 2\sqrt{2}}{1 - \sin 2x}$ is

(a) $\frac{\sqrt{3}}{2}$ (b) $-\frac{3}{\sqrt{2}}$

(c) $\frac{1}{2}$ (d) $-\frac{1}{\sqrt{2}}$

Session 3

Logarithmic Limits, Exponential Limits

Logarithmic Limits

In this section, we will deal with the problems based on expansion of logarithmic series, which is given below

$$\log(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} + \ldots \infty$$

where, $-1 \le x \le 1$ and it should be noted that the expansion is true only if the base is e. To evaluate the logarithmic limit, we use $\lim_{x \to 0} \frac{\log(1+x)}{x} = 1$.

Example 29 Evaluate $\lim_{x \to a} \frac{\log\{1+(x-a)\}}{(x-a)}$.

Sol. We have, $\lim_{x \to a} \frac{\log\{1+(x-a)\}}{(x-a)}$

Let $x - a = y$, when $x \to a$; $y \to 0$

$\therefore$ The given limit $= \lim_{y \to 0} \frac{\log\{1+y\}}{y} = 1$

Example 30 ***Evaluate*** $\lim_{h \to 0} \frac{\log_{10}(1+h)}{h}$.

Sol. We have, $\lim_{h \to 0} \frac{\log_{10}(1+h)}{h} = \lim_{h \to 0} \frac{\log_e(1+h) \times \log_{10} e}{h}$

$$= \lim_{h \to 0} \frac{\log_e(1+h)}{h} \times \log_{10} e$$

$$= \log_{10} e \times 1 = \log_{10} e \qquad \left[\because \lim_{x \to 0} \frac{\log(1+x)}{x} = 1\right]$$

Example 31 ***Evaluate*** $\lim_{x \to 0} \frac{\log(5+x) - \log(5-x)}{x}$.

Sol. We have, $\lim_{x \to 0} \frac{\log\left\{5\left(1+\frac{x}{5}\right)\right\} - \log\left\{5\left(1-\frac{x}{5}\right)\right\}}{x}$

$$= \lim_{x \to 0} \frac{\log 5 + \log\left(1+\frac{x}{5}\right) - \log 5 - \log\left(1-\frac{x}{5}\right)}{x}$$

$$= \lim_{x \to 0} \frac{\log\left(1+\frac{x}{5}\right)}{5\left(\frac{x}{5}\right)} - \frac{\log\left(1-\frac{x}{5}\right)}{-5\left(-\frac{x}{5}\right)} = \frac{1}{5} + \frac{1}{5} = \frac{2}{5}$$

$$\left[\because \lim_{x \to 0} \frac{\log(1+x)}{x} = 1\right]$$

Example 32 Evaluate $\lim_{h \to 0} \frac{\log_e(1+2h) - 2\log_e(1+h)}{h^2}$.

[IIT JEE 1999]

Sol. We have, $\lim_{h \to 0} \frac{\log_e(1+2h) - 2\log_e(1+h)}{h^2}$

$$= \lim_{h \to 0} \frac{\left[(2h) - \frac{(2h)^2}{2} + \frac{(2h)^3}{3} - \ldots \infty\right] - 2\left(h - \frac{h^2}{2} + \frac{h^3}{3} - \ldots\right)}{h^2}$$

$$= \lim_{h \to 0} \frac{-h^2 + 2h^3 - \ldots}{h^2}$$

$$= \lim_{h \to 0} \frac{h^2\{-1 + 2h - \ldots\}}{h^2}$$

$$= \lim_{h \to 0} \{-1 + 2h - \ldots\} = -1$$

Example 33 ***Solve*** $\lim_{x \to \infty} \left\{x - x^2 \cdot \log\left(1+\frac{1}{x}\right)\right\}$.
